Executive Summary

This report is an addendum to the Final Feasibility Study (FS) Report for Parcel E (Engineering/Remediation Resources Group, Inc. [ERRG], 2012). Parcel E is located within Hunters Point Shipyard (HPS) in San Francisco, California. The FS Report and this addendum are part of ongoing efforts by the Department of the Navy (Navy) to address hazardous substances at Parcel E in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The FS Report and this addendum are meant to provide the necessary information to support an informed risk management decision on which remedy appears to be most appropriate for Parcel E.

Contaminated sites at Parcel E were designated as Installation Restoration (IR) sites based on information developed during previous investigations. IR sites were in most cases identified by a two-digit number; for example, IR-02. Chemical site characterization activities and sampling data were mostly planned and organized by IR site. Radiological investigations were generally conducted based upon the radiological history of each individual IR site or building.

In 2008, the Navy finalized a Revised Remedial Investigation (RI) Report for Parcel E that evaluated the nature and extent of nonradioactive chemicals at Parcel E, and quantified the potential risk to future site users from exposure to nonradioactive chemicals (Barajas and Associates, 2008). Similarly, the Final FS Report for Parcel E focused on evaluating potential remedial alternatives to address risks to future site users from exposure to nonradioactive chemicals (ERRG, 2012). As a result, this radiological addendum was prepared to characterize the extent of radioactive chemicals at Parcel E, and evaluate the potential risk to future site users from exposure to radioactive chemicals. Based on the risk assessment results, remedial alternatives were developed and evaluated to address potential risks from radionuclides of concern (ROCs) at Parcel E. Both nonradioactive and radioactive chemicals will be addressed together in the proposed plan and the record of decision (ROD).

Based on the amended redevelopment plan for HPS (San Francisco Redevelopment Agency [SFRA], 2010b), two reuse areas are proposed for Parcel E: the Shipyard South Multi-Use District and the Shipyard Shoreline Open Space Land Use District. To facilitate data presentation in this radiological addendum, the Navy subdivided these two reuse areas into smaller redevelopment blocks. The redevelopment blocks and their proposed reuse are listed below. Each of the zoning designations listed below is defined in Section 1.1 of this radiological addendum.

- Redevelopment Blocks MU-1, MU-2, and MU-3 are part of the Shipyard South Multi-Use District that is planned for Mixed Use
- Redevelopment Blocks EOS-1 through EOS-4, EOS-5A, EOS-5B, and EOS-5C are part of the Shipyard Shoreline Open Space Land Use District that is planned for open space
- The railroad right-of-way comprising IR-52 is part of the City and County of San Francisco's redevelopment plan for the Bayview Hunters Point redevelopment project adjoining HPS (SFRA, 2010a), and is planned for predominantly light industrial reuse. The railroad right-of-way comprising IR-52 is not radiologically impacted and therefore does not require evaluation in this radiological addendum.

In 2004, a Historical Radiological Assessment (HRA) was prepared for HPS that summarized the history of Navy radiological operations at HPS (Naval Sea Systems Command, 2004). The HRA identified the following radiologically impacted areas at Parcel E:

- | | |
|---|--|
| <ul style="list-style-type: none"> ▪ Building 406 ▪ Building 414 ▪ Former Building 500 Series Site, which includes the following sites and surrounding area: <ul style="list-style-type: none"> • Building 500 • Building 503 Site • Building 506 Site • Building 507 Site • Building 508 Site • Building 509 Site • Building 510 Site • Building 510A Site • Building 517 Site • Building 520 Site • Building 521 ▪ Building 529 Site ▪ Building 701 Site ▪ Building 704 Animal Pens ▪ Building 704 Former Radioactive Storage Yard ▪ Building 707 and Kennels | <ul style="list-style-type: none"> ▪ Building 707B Site ▪ Building 707C Site ▪ Building 707 Triangle Area ▪ Building 708 ▪ Building 807 Site ▪ Building 810 ▪ Building S-719 Site (suspected incinerator site in IR-02 Northwest) ▪ Shack 79 Site ▪ Shack 80 Site ▪ IR-02 (Bay Fill Area) ▪ IR-03 (Former Oil Reclamation Ponds Area) ▪ IR-04 (Former Scrap Yard) ▪ Former Salvage Yard ▪ Parcel E Shoreline ▪ Piers 2 and 3 (including Building 527) ▪ Sanitary Sewer System ▪ Storm Drain Lines ▪ Septic Sewer Lines |
|---|--|

Each radiologically impacted area is described in [Table ES-1](#).

Two general sources of potential radioactive contamination exist at Parcel E:

1. Naval Radiological Defense Laboratory (NRDL) activities at the former 500 series buildings, Building 707 Triangle Area, and other buildings formerly occupied by NRDL
2. Historic waste disposal activities that occurred along the shoreline, primarily at IR-02

Additional radiological activities at Parcel E include:

- Practical and applied research on radiation decontamination methods and on the effects of radiation on living organisms and natural and synthetic materials, primarily conducted within the former 500 series buildings and within the Building 707 Triangle Area
- Disposal of radioluminescent commodity items (such as dials, gauges, and deck markers) within IR-02 and IR-03
- Disposal of industrial debris and metal slag with radioactive anomalies at the Metal Debris Reef
- Potential discharge of small amounts of low-level radioactive liquids into drains at NRDL buildings (potentially leading to sanitary sewer, storm drain, and septic sewer lines)

ES.1. RADIONUCLIDES IN SOIL

Several radiological investigations have been conducted at radiologically impacted sites at Parcel E, including basewide investigations (such as site reconnaissance), investigations performed throughout Parcel E, and focused decommissioning surveys and investigations within Parcel E. In addition, the Navy has performed several interim removal actions at Parcel E that have involved excavation and off-site disposal of low-level radioactive waste (LLRW). The most extensive and recent of the radiological investigations, the Phase V investigation, was performed in 2002 and 2003 prior to the issuance of the HPS HRA ([Naval Sea Systems Command, 2004](#)). The purpose of the Phase V investigation was to support the release of buildings or areas that had been identified as areas where radioactive materials had been used or areas where previous removal actions to remove known contamination had occurred. The objective of the Phase V investigation at Parcel E was to demonstrate whether residual radioactivity on the surface met predetermined release criteria.

The Phase V investigation involved the collection of over 300 soil samples primarily within the location of current and former series 500 buildings and the Building 707 Triangle Area. Soil samples were collected within the upper 6 inches of the ground surface and analyzed for the radionuclides of concern (ROCs) at each site, based upon historical use of the site. In general, two primary ROCs were evaluated at most of the sites: cesium-137 (^{137}Cs) and radium-226 (^{226}Ra). For evaluation purposes, the activities for each ROC were compared against the corresponding release criterion to provide the following general assessment of the distribution of ROCs in surface soil at Parcel E.

- The extent of ^{137}Cs in surface soil exceeding the release criterion (0.113 picocurie per gram [pCi/g]) was moderately extensive.
- The extent of ^{226}Ra in surface soil exceeding the release criterion (1.82 pCi/g) was widespread.

As part of this radiological addendum, historical surface soil data for Parcel E were analyzed using the computer code Residual Radioactive (RESRAD) Model Version 6.5 (Argonne National Laboratory, 2009) to model radiological risk at the impacted sites. RESRAD incremental risk estimates for radionuclides were evaluated based upon the anticipated reuse of each of the impacted sites and are summarized as follows:

- For the residential exposure scenario, incremental radiological risk estimates range from 2E-05 (Building 529 Site) to 7E-03 (Building 707 Triangle Area).
- For the recreational user exposure scenario, incremental radiological risk estimates range from 5E-08 (Building 509 Site) to 7E-03 (IR-02 Southeast).

The estimated risks are of a comparable order of magnitude to incremental risks for nonradioactive chemicals. These results indicate that concentrations of radioactive and nonradioactive chemicals in surface soil pose a potential unacceptable risk to future site users, and remedial alternatives should be evaluated to address the potential risks. Although the extent of radioactive contamination in subsurface soil has not been defined, this radiological addendum conservatively assumes, consistent with the findings of the HRA, that potential radioactive chemicals may be present in subsurface soil at Parcel E and will therefore require analysis of remedial alternatives.

ES.2. RADIONUCLIDES IN GROUNDWATER

The groundwater data sets from two investigations, performed in 2001/2002 and 2007 through 2009, were used to evaluate the nature and extent of radionuclides in groundwater, and to evaluate whether groundwater contains radionuclides at concentrations that warrant further analysis in this radiological addendum.

During the radiological groundwater investigation performed in 2001 and 2002 as part of the Phase III Groundwater Data Gaps Investigation, isotope-specific data were collected from 24 A-aquifer monitoring wells within Parcel E. The investigation was intended to supplement data collected during previous investigations for radiological indicator parameters (gross alpha and gross beta). Supplemental data were necessary because prior results for gross alpha and gross beta were nonspecific, which did not allow the Navy to distinguish between natural and potentially site-related components of radioactivity in shallow groundwater. The analytical data from 2001/2002 were evaluated by simple (nonstatistical) threshold comparisons to fixed standards (drinking water criteria) and by statistical tests comparing the site data with fixed standards (one-sample statistical tests) (Tetra Tech EM Inc., 2004). To conduct the statistical analysis, the analytical data were compiled by study area prior to statistical evaluation. The results indicated the sum of ^{226}Ra and radium-228 (^{228}Ra) activities exceeded the drinking water standard at

select wells in IR-02 and IR-03; however, based on the results of the one-sample statistical tests, the mean activities of ^{226}Ra and ^{228}Ra at both IR-02 and IR-03 did not exceed the drinking water standard (Tetra Tech EM Inc., 2004).

Beginning in the first quarter 2007, groundwater samples from 20 A-aquifer wells in Parcel E were collected and analyzed for radionuclides as part of the Basewide Groundwater Monitoring Program. Groundwater samples were collected and analyzed on a quarterly basis through the first quarter 2009. In addition, a supplemental data collection event was conducted at Parcel E in 2008 to further evaluate the nature and extent of radionuclides in groundwater. In June and July 2008, groundwater samples were collected from an additional eight monitoring wells (seven in the A-aquifer and one in the deeper B-aquifer) and submitted to an off-site laboratory for radionuclide analyses of ^{137}Cs , ^{226}Ra , and strontium-90 (^{90}Sr). In addition, samples collected from monitoring well IR12MW14A were evaluated for plutonium-239. In the first quarter 2009, samples were collected from 12 A-aquifer wells and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . An additional sample was collected from monitoring well IR12MW14A for analysis of ^{239}Pu . Samples from A-aquifer monitoring well IR36MW09A and B-aquifer monitoring well IR36MW123B were analyzed exclusively for ^{226}Ra .

The radionuclide groundwater data collected in 2007 through 2009 were compiled as part of this radiological addendum and were evaluated, similar to the 2001/2002 investigation, by simple (non-statistical) threshold comparisons to fixed standards (drinking water criteria) and by statistical tests comparing the site data to fixed standards (one-sample statistical tests), if necessary. Based on the results of the simple threshold comparison to fixed standards, radionuclide activities in groundwater at Parcel E do not exceed drinking water standards. Because drinking water standards were not exceeded in any of the samples, the one-sample statistical test was not conducted. In addition, the comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria. This conservative evaluation is not representative of potential exposures to future site users because A-aquifer groundwater is not a potential source of drinking water, as documented in Section 2 and Appendix I of the RI Report (Barajas & Associates, Inc., 2008). Based upon the results of the comparison of radionuclide groundwater data with drinking water standards, groundwater does not appear to have been impacted by radionuclides at concentrations that warrant further evaluation in the FS. Furthermore, radionuclide activities in groundwater collected during 2007 through 2009 exhibited a decreasing trend when compared to the 2001/2002 data set. This finding is consistent with the HRA, which determined that a low potential existed for radioactive contamination in Parcel E groundwater based on historical information (Naval Sea Systems Support, 2004).

The RI Report concluded that nonradioactive chemicals in groundwater required analysis of remedial alternatives (Barajas & Associates, Inc., 2008). As a result, the FS Report evaluates remedial alternatives for groundwater that include monitoring, institutional controls, source removal, and

containment (ERRG, 2012). As a conservative measure, future monitoring will include analysis for radionuclides in groundwater to verify the conclusions of this radiological addendum.

ES.3. REMEDIAL INVESTIGATION CONCLUSIONS AND RECOMMENDATIONS

Parcel E has been adequately characterized, for both radioactive and nonradioactive chemicals, to support the development of a focused set of remedial alternatives, as described in the Final FS Report (ERRG, 2012) and this radiological addendum. The conclusion that adequate data exist, despite the known data gaps (primarily radionuclides in subsurface soil) at Parcel E, is consistent with U.S. Environmental Protection Agency (EPA) guidance for an RI/FS. Specifically, EPA RI/FS guidance states that “the objective of the RI/FS process is not the unattainable goal of removing all uncertainty, but rather to gather information sufficient to support an informed risk management decision regarding which remedy appears to be most appropriate for a given site” (EPA, 1988).

Based on the potential for radioactive contamination to exist in various radiologically impacted areas at Parcel E, the Navy developed the following remedial action objective (RAO) for ROCs in soil, structures, and sediment at Parcel E, including soils associated with sites of remediated storm drains, sanitary sewers, and septic system drain lines in Parcel E:

- Prevent exposure to ROCs at activity levels that exceed remedial goals (RGs) for all potentially complete exposure pathways.

The proposed RGs are consistent with the RODs for Parcels B, G, and D-1 and UC-1 (Navy, 2009a, 2009b, and 2009c, respectively).

ES.4. DEVELOPMENT OF REMEDIAL ALTERNATIVES

The Final FS Report for Parcel E developed remedial alternatives for soil, sediment, groundwater, and nonaqueous-phase liquids containing nonradioactive chemicals that pose a risk to humans and wildlife (ERRG, 2012). The remedial alternatives for radionuclides evaluated in this radiological addendum complement the remedial alternatives evaluated in the FS Report, by identifying additional actions that are needed to meet the RAO for radioactively contaminated media (soil, sediment, and structures).

The remedial alternatives for radionuclides at Parcel E were developed by combining different technologies and process options previously identified and evaluated at other HPS sites. The target remediation areas were identified based on operational history, characterization data, and risk evaluations. Remedial alternatives were derived using experience and engineering judgment that formulated the process options into the most plausible site-specific response actions. In particular, the Navy’s experience at remediating radioactive contamination at other HPS sites was used to identify the most plausible remediation approaches for each contaminated medium, considering the site conditions and historical operations. In accordance with the strategy presented above, the Navy developed three remedial alternatives for radionuclides at Parcel E:

- Alternative R-1: No Action
- Alternative R-2: Survey, Removal, and Disposal (with 2-foot-thick soil cover and institutional controls at IR-02 and IR-03)
- Alternative R-3: Survey, Removal, and Disposal (with 3-foot-thick soil cover and institutional controls at IR-02 and IR-03)

Alternative R-1 would involve no remedial action. Radiologically impacted sites would be left as is without implementing any response actions (for example, monitoring, institutional controls, containment, or removal). The no action alternative is included throughout the FS process as required by the National Oil and Hazardous Substances Pollution Contingency Plan to provide a baseline for comparison with and evaluation of other alternatives.

Alternative R-2 consists of various actions necessary to prevent exposure to ROCs at activity levels that exceed RGs for all potentially complete exposure pathways. Alternative R-2 consists of the following components:

- **Scoping or Characterization Surveys:** The Navy would perform scoping or characterization surveys in accordance with Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) (U.S. Department of Defense et al., 2000) and consistent with the recommendations in the HRA (Naval Sea Systems Support, 2004). For the purposes of this radiological addendum, it is assumed that radiologically impacted sites will require either a scoping or a characterization survey, followed by some level of remediation and a final status survey. The exception to this assumption is for building sites (Buildings 406, 414, 701, and 708) where scoping surveys and remediation were previously completed; at these sites, only a final status survey is required.
- **Soil, Sediment, and Debris Removal:** Soil, sediment, and debris containing ROCs at activities exceeding the RGs, as identified during scoping or characterization surveys, would be excavated, characterized, and disposed of at an off-site facility licensed to receive LLRW. Excavation would extend as deep as necessary to remove soil, sediment, and debris containing ROCs at activities exceeding the RGs, except for IR-02 and IR-03. At these sites, excavation would generally be limited to the upper 1 foot of soil. However, excavation of soil may extend deeper, if necessary, to ensure that the residual radiological risk at the final ground surface would be within the risk management range specified in the NCP (10^{-6} to 10^{-4}). Surface scans and sampling would be performed in conjunction with the removal effort, but prior to the necessary final status surveys, to ensure that RAOs are met. Once complete, all excavations would be backfilled to the existing ground surface with soil that meets appropriate acceptance criteria for radioactive and nonradioactive chemicals.
- **Structure Decontamination and Partial Demolition:** Building materials containing elevated radioactivity would be removed by either scabbling or partial demolition, and wastes would be characterized and disposed of at an off-site facility licensed to receive LLRW. Surface scans and sampling would be performed in conjunction with the removal effort, but prior to the necessary final status surveys, to ensure that RAOs are met.

- **Structure Decontamination and Complete Demolition:** This process would consist of (1) removing building materials containing elevated radioactivity by either scabbling or partial demolition, (2) characterizing and disposing of wastes at an off-site facility licensed to receive LLRW, and (3) performing surface scans and sampling in conjunction with the removal effort to ensure that RAOs are met. The partial removal of radioactive contamination would be followed by complete demolition of the structure. Demolition debris would be properly screened, segregated, and disposed of at an appropriate off-site facility.
- **Final Status Surveys:** Final status surveys would be performed in accordance with MARSSIM (U.S. Department of Defense et al., 2000) following removal, decontamination, and demolition. Surveys would consist of a combination of surface scans and sampling to verify that RGs have been met. Survey results would be compiled and reported to support regulatory agency approval of the Navy's findings.
- **Soil Cover, Shoreline Protection, and Institutional Controls (IR-02 and IR-03 only):** A characterization survey would be performed at IR-02 and IR-03 to identify ROCs within the upper 1 foot of soil that would be removed and disposed of off site. Once complete, all excavations would be backfilled to the existing ground surface with soil that meets appropriate acceptance criteria for radioactive and nonradioactive chemicals. Subsequently, a 2-foot-thick soil cap would be installed at and above original grade at IR-02 and IR-03. The soil cover would be underlain by a demarcation layer, consisting of a permeable geosynthetic material and magnetic marking tape, to ensure proper identification of the bottom of the soil cap. Institutional controls, consisting of land use and activity restrictions, would be implemented to prevent exposure to potential residual radioactivity in soil left in place and preserve the integrity of the soil cap. Institutional controls would also be implemented to prevent exposure to potential radioactivity in groundwater at IR-02 and IR-03.

Alternative R-3 involves all of the components of Alternative R-2, but includes a 3-foot-thick soil cover in place of the 2-foot-thick soil cover specified in Alternative R-2. Alternative R-3 consists of various actions necessary to prevent exposure to ROCs at activity levels that exceed RGs for all potentially complete exposure pathways, with a thicker soil cover to provide additional shielding from residual radioactivity at IR-02 and IR-03.

ES.5. DETAILED AND COMPARATIVE ANALYSES OF REMEDIAL ALTERNATIVES

The alternatives are evaluated using the following criteria specified in the National Oil and Hazardous Substances Pollution Contingency Plan: (1) overall protection of human health and the environment; (2) compliance with applicable or relevant and appropriate requirements; (3) long-term effectiveness and permanence; (4) reduction of toxicity, mobility, or volume through treatment; (5) short-term effectiveness; (6) implementability; and (7) cost. The first two are threshold criteria that must be satisfied for a remedy to be eligible for selection, and the next five are balancing criteria used to evaluate the comparative advantages and disadvantages of the remedies. Two additional modifying criteria (state and community acceptance) are evaluated after agency and public comments are received on the FS Report and proposed plan.

Alternatives R-2 and R-3 meet the two threshold criteria and would serve as an effective and permanent remedy in the long-term. The protectiveness of Alternatives R-2 and R-3 is demonstrated through the post-remediation risk analysis. RESRAD modeling using the residential RGs as surrogate concentrations, combined with a clean soil cover of 2 feet, results in an incremental cancer risk of 2E-07 for the future residential receptor and 2E-08 for the future recreational receptor. Assuming a clean soil cover of 3 feet, RESRAD modeling results in an incremental cancer risk of 7E-09 for the future residential receptor and 5E-10 for the future recreational receptor.

Table ES-2 summarizes the comparative analysis, showing each alternative's rating under the two threshold criteria and five balancing criteria. The no action alternative (Alternative R-1) would not be effective in protecting human health and the environment. Alternatives R-2 and R-3 would be effective remedial alternatives for Parcel E. Alternative R-2 offers improved implementability and a lower cost relative to Alternative R-3. The remedy for Parcel E will be selected in the ROD following comment on the FS Report and the proposed plan.

Tables

Table ES-1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
406	MU-2	¹³⁷ Cs, ²²⁶ Ra	Shipping, packing, and preserving	Mixed Use
414	MU-2	²²⁶ Ra	LLRW storage area for RI IDW; Public Works/Supply storehouse	Mixed Use
500	MU-2	¹³⁷ Cs, ²²⁶ Ra	NRDL storage, barracks, bachelor officers' quarters, and NRDL administrative offices	Mixed Use
500 Building Series	Various	²⁴¹ Am, ¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Original RADLAB/NRDL Administrative and Laboratory Facilities and Outdoor Storage	Various
503 Site (Demolished)	MU-2	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Ships Galley and Military Support Services and NRDL contaminated laundry facility	Mixed Use
506 Site (Demolished)	MU-2 / EOS-4	²⁴¹ Am, ¹³⁷ Cs, ³ H, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Radioactive waste containers stored on pad behind building; NRDL biology and health physics laboratories; animal, nuclear, and physical chemistry laboratories; radioactive waste storage tank located behind building; NRDL chemistry laboratories; radiochemistry laboratory; NRDL instrument repair, darkroom, and densitometer for film badges; counting rooms; electro-physical and surface chemistry laboratories; administrative offices; storerooms; duty watch berthing; personnel decontamination; and RADLAB/NRDL Headquarters and main facility prior to move to Building 815 in 1955	Mixed Use / Open Space
507 Site (Demolished)	MU-2 / EOS-4	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	NRDL biology laboratories, NRDL change house and animal quarters; Radiological Decontamination Center, Biochemistry Branch, Physiology-Psychology Branch, and Experimental Pathology Branch	Mixed Use / Open Space

Table ES-1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
508 Site (Demolished)	MU-2	^{137}Cs , ^{226}Ra , ^{90}Sr	NRDL chemistry branch, library, personnel branch, photographic section of publications branch, radiological safety branch, barracks, health services division, chemical technology and nucleonics division, security division, health physics division, employee relations branch, and pathology laboratory	Mixed Use
509 Site (Demolished)	EOS-4	^{137}Cs , ^{90}Sr	Library	Open Space
510 Site (Demolished)	EOS-4	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Weapons test sample storage, non-NRDL training facility, NRDL radiation facility, glassblowing, woodworking, and machine shops; physics branch; nuclear radiation branch; and research engineering section physics branch	Open Space
510A Site (Demolished)	EOS-4	^{137}Cs , ^{90}Sr	NRDL kevatron facility, NRDL x-ray facility, SUPSHIPS record storage, and fire research facility	Open Space
517 Site (Demolished)	EOS-4	^{137}Cs , ^{60}Co , ^{90}Sr	Former brig and NRDL cobalt animal irradiation facility	Open Space
520 Site (Demolished)	MU-2 / EOS-3	^{137}Cs , ^{226}Ra , ^{90}Sr	Shipyards dental clinic and NRDL administrative offices	Mixed Use / Open Space
521 Site	EOS-4	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Power plant; also one of two suspected sites of fuel oil burning from three OPERATION CROSSROADS target ships	Open Space
527	n/a	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Motor generator building (located on an offshore pier that is not planned to be reused)	N/A
529 Site (Demolished)	MU-2	^{137}Cs , ^3H , ^{226}Ra , ^{90}Sr	NRDL isotope storage facility (vault) and neutron generator	Mixed Use
701 Site	MU-3	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Storage building that NRDL requested for "temporary" (120 days) storage of samples in 1947	Mixed Use

Table ES-1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
704 Area Animal Pens	MU-1	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Animal pens for NRDL	Mixed Use
704 Former Radioactive Storage Yard	MU-1	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Radioactive material storage area	Mixed Use
707 and Kennels	MU-1	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Research animal facility used by NRDL for animal breeding and housing; waste processing and storage facility, formerly leased to Pet Express as an animal clinic	Mixed Use
707B Site (Demolished)	MU-1	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	NRDL animal colony	Mixed Use
707C Site (Demolished)	MU-1	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Nuclear weapons test support and experimentation and equipment issue and receiving area	Mixed Use
707 Triangle Area	MU-1	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr, ²³⁵ U	NRDL radioactive waste receiving, packaging, and storage area and suspected septic tank and leach field from early operations	Mixed Use
708	MU-1	¹³⁷ Cs, ⁹⁰ Sr	Research animal facility, bio-medical facility and animal psychology facility	Mixed Use
807 Site (Demolished)	MU-3	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Scrap yard processing shed	Mixed Use
810	MU-3 / EOS-5B	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	LLRW and IDW storage location; storehouse, paint shop, and paint and oil storage	Mixed Use / Open Space
S-719 Site (Demolished)	EOS-1	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Incinerator; potentially used by NRDL animal facility at Building 707	Open Space
Shack 79 Site (Demolished)	MU-2	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	NRDL support for radioactive material	Mixed Use

Table ES-1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
Shack 80 Site (Demolished)	MU-2	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	NRDL support; shack reported to have been moved from behind Building 506 to Building 704 area for "lab operations"	Mixed Use
IR-02 (Bay Fill Area)	EOS-1 / EOS-2 / EOS-3 / EOS-4	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Bay Fill Area was used for disposal of assorted shipyard wastes, which included ⁹⁰ Sr and ²²⁶ Ra devices. The area known as IR-02 Northwest and Central contains a suspected concentration of these devices. Potentially used for disposal of wastes from decontamination of OPERATION CROSSROADS ships.	Open Space
IR-03 (Former Oil Reclamation Ponds Area)	EOS-3	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	HPS fuel oil reclaiming plant; possible area for disposal of assorted shipyard wastes, which may have included ⁹⁰ Sr and ²²⁶ Ra devices and oil	Open Space
IR-04 (Former Scrap Yard)	MU-3	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Post-disassembly area for metals, equipment, and other unusable items from the salvage yard that could have contained ²²⁶ Ra devices and other contaminants	Mixed Use
Former Salvage Yard	MU-3 / MU-1	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Predisposal disassembly area for metals, equipment, and other reusable items that could have contained ²²⁶ Ra devices and other contaminants	Mixed Use
Parcel E Shoreline	EOS-1 / EOS-2 / EOS-3 / EOS-4	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Debris disposal	Open Space
Sanitary Sewer System	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Sanitary sewer system	Various
Storm Drain Lines	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Combined storm and sanitary sewer drains	Various
Septic Sewer Lines	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Septic sewage system (predating sanitary sewer system; potentially associated with impacted Building 810)	Various

Section 1. Introduction

This report is an addendum to the Final Feasibility Study (FS) Report for Parcel E (Engineering/Remediation Resources Group, Inc. [ERRG], 2012). Parcel E is located within Hunters Point Shipyard (HPS), San Francisco, California, as shown on [Figure 1](#). The FS Report and this addendum are part of ongoing efforts by the Department of the Navy (Navy) to address hazardous substances at Parcel E in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).

The FS is a mechanism for evaluating potential remedial options to address risks to future site users from CERCLA hazardous substances. As the lead response agency, the Navy has authority over evaluation of remedial options, selection of the remedial alternative, and overall public participation at HPS. The Navy is coordinating with the U.S. Environmental Protection Agency (EPA) Region 9, the Department of Toxic Substances Control (DTSC), and the San Francisco Bay Regional Water Quality Control Board (Water Board) in accordance with a Federal Facility Agreement (FFA) that provides a procedural framework and schedule for the CERCLA cleanup process at HPS (Navy, EPA, DTSC, and RWQCB, 1991). The Navy, EPA, DTSC, and Water Board representatives are collectively referred to as the Base Realignment and Closure Cleanup Team (BCT) for HPS.

The Navy finalized a Revised Remedial Investigation (RI) Report for Parcel E that evaluated the nature and extent of nonradioactive chemicals at Parcel E, and quantified the potential risk to future site users from exposure to nonradioactive chemicals (Barajas and Associates, 2008). Similarly, the Final FS Report for Parcel E focused on evaluating potential remedial options to address risks to future site users from exposure to nonradioactive chemicals (ERRG, 2012). As a result, this radiological addendum (1) presents characterization data for radioactive chemicals at Parcel E, (2) quantifies the potential risk to future site users from exposure to radioactive chemicals, and (3) develops and evaluates remedial alternatives for potential radionuclides of concern (ROCs) at Parcel E. Both chemical and radiological contaminants will then be addressed together in the proposed plan and the record of decision (ROD).

This report was prepared in accordance with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (Title 40 of the Code of Federal Regulations [40 CFR], Part 300) and used pertinent guidance documents from the EPA. Key EPA guidance used to prepare this report includes, but was not limited to, the following documents:

- “Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA, Interim Final” (EPA, 1988)
- “Technology Screening Guide for Radioactively Contaminated Sites” (EPA, 1996)
- “Establishment of Cleanup Levels for CERCLA Sites with Radioactive Contamination, Attachment A” (EPA, 1997a)
- “A Guide to Developing and Documenting Cost Estimates During the Feasibility Study” (EPA, 2000a)

1.1. PARCEL E STUDY AREAS

Contaminated sites at Parcel E were designated as Installation Restoration (IR) sites based on information developed during the previous investigations. IR sites were in most cases identified by a two-digit number; for example, IR-02. Chemical site characterization activities and sampling data were mostly planned and organized by IR site. Radiological investigations were generally conducted based upon the radiological history of each individual IR site or building. Consistent with the FS Report, this radiological addendum uses redevelopment blocks, adjusted by the Navy to facilitate data presentation and evaluation, as the basis for developing remedial alternatives to address potential unacceptable radiological risk present within Parcel E.

The Revised RI Report, as well as the Draft FS Report and Draft Radiological Addendum, were based on City and County of San Francisco’s (CCSF) original redevelopment plan for HPS, which was published in 1997. In 2010, CCSF published an amended redevelopment plan, which resulted in significant changes to the proposed land use for Parcel E (San Francisco Redevelopment Agency [SFRA], 2010b). Specifically, the amended redevelopment plan identifies two land use districts within the Parcel E boundaries: the Shipyard South Multi-Use District, encompassing the central and northern portion of Parcel E, and the Shipyard Shoreline Open Space District, encompassing the shoreline area and the southern portion of Parcel E. Accordingly, the redevelopment blocks evaluated in the radiological addendum and the corresponding evaluation of remedial alternatives have changed significantly from the draft version of the radiological addendum.

For the purposes of this radiological addendum, the Navy divided Parcel E into smaller evaluation areas in three sequential steps. First, the Navy divided Parcel E into general reuse areas based on the CCSF amended redevelopment plan for HPS (SFRA, 2010b). Second, each reuse area at Parcel E was divided into “redevelopment blocks” to facilitate data presentation in this radiological addendum. Third, conceptual roadways within each reuse area were incorporated into Navy-defined redevelopment blocks that corresponded with planned reuse boundaries and IR sites, where possible. Figure 2 shows the boundaries of reuse areas, redevelopment blocks, and IR sites at Parcel E.

The large number of IR sites at Parcel E, coupled with the numerous past investigations performed at these sites, does not lend itself to a concise summary of historical operations at Parcel E. Table 2-1 of the

FS Report outlines the correlation between the redevelopment blocks and IR Sites, and Table 2-2 of the FS Report lists the buildings at Parcel E by redevelopment block. Table 2-3 of the FS Report summarizes the previous investigations at Parcel E (both chemical and radiological), along with the objectives and conclusions of each investigation (ERRG, 2012).

Radiologically impacted areas at Parcel E were identified in Volume II of the Historical Radiological Assessment (HRA) (Naval Sea Systems Command [NAVSEA], 2004)¹. As defined in the HRA, radiologically impacted areas have the potential for radioactive contamination based on historical information or are known to contain or have contained radioactive contamination. Radiologically impacted areas at Parcel E are depicted on Figure 3, and ROCs at each impacted area are presented in Table 1. Historic uses of each impacted area are described in further detail in Section 2.

As noted on Figure 2, the proposed roadway along Crisp Avenue does not contain chemicals in soil or groundwater requiring evaluation in the FS Report, thus this area was not included in the Navy-defined redevelopment blocks. However, this area contains storm drain and sanitary sewer lines (part of IR-50) that were determined to be radiologically impacted in the HRA (NAVSEA, 2004). These lines are being removed under a basewide removal action to address potential radioactive contamination (Navy, 2006a). Removal of the storm drain and sanitary sewer lines along Crisp Avenue will expedite closure and transfer of this area, which will be used as a utility corridor. Similar to the approach used at other HPS parcels, the Navy has established an interim designation for Crisp Avenue (Parcel UC-3) to reflect its plan to separate this future utility corridor from the rest of Parcel E. The Navy will describe the subdivision of Parcel E in the proposed plan. In addition, the railroad right-of-way comprising IR-52 is part of CCSF's redevelopment plan for the Bayview Hunters Point redevelopment project adjoining HPS (SFRA, 2010a) and is planned for predominantly light industrial reuse. The Navy plans to include IR-52 as part of future Parcel UC-3 because it is directly adjacent to Crisp Avenue. The railroad right-of-way comprising IR-52 is not radiologically impacted and therefore does not require evaluation in this radiological addendum.

1.2. PURPOSE AND SCOPE

As discussed in the NCP, the purpose of the RI/FS process is to assess site conditions and evaluate remedial alternatives to the extent necessary to select a remedy. During the FS process, remedial alternatives are developed by incorporating medium-specific technologies into cleanup alternatives. For this radiological addendum, the process consists of the following general steps:

¹ In September 2004, the Navy divided Parcel E into two parcels (E and E-2). Discussions within this report that reference documents published prior to September 2004 refer to the remaining portions of Parcel E (following the creation of Parcel E-2).

- Compile available site data for the ROCs identified in the HRA, evaluate the nature and extent of ROCs in various environmental media and man-made structures, and quantify the potential risk to future site users from exposure to ROCs.
- Develop remedial action objectives (RAOs) specifying the ROCs and media of concern, exposure pathways, and remedial goals (RGs) that permit a range of treatment and containment alternatives to be developed. The RAOs are developed based on chemical-specific applicable or relevant and appropriate requirements (ARARs) and the risk evaluation results included in this radiological addendum.
- Develop RGs based on the RAOs, the risk evaluation results, and the ARARs.
- Develop general response actions (GRAs) for each medium defining containment, removal, treatment, or institutional actions, singly or in combination, that may be taken to satisfy the RAOs for the site. Identify volumes or areas to which GRAs would apply.
- Identify and screen remedial technologies for each GRA to determine which technologies could be implemented technically and cost effectively at the site.
- Identify and screen process options for each remedial technology that are most appropriate for use at the site.
- Develop radiological-specific remedial alternatives by combining retained process options. The radiological-specific remedial alternatives address ROCs in the media of concern and are separate from the remedial alternatives in the FS Report that address nonradioactive chemicals.
- Evaluate the radiological-specific alternatives against the evaluation criteria established by the NCP and against each other.

The BCT will use the FS Report and this radiological addendum to assist in evaluating the appropriate remedial actions for Parcel E to allow transfer of the property to CCSF. Following the FS, a preferred alternative will be presented by the Navy in a proposed plan. Following public review and comment, a final remedy will be jointly selected by the Navy and EPA, with concurrence from DTSC and Water Board, and documented in a ROD.

1.3. ORGANIZATION OF ADDENDUM

This report has six sections, including this introduction, and is consistent with the organization of the Final FS Report. The remaining sections present the radiological-specific results of the FS process for Parcel E, as summarized below.

- **Section 2 – Site Characterization and Risk Evaluation**, summarizes site characterization information for HPS and Parcel E, including (1) the environmental setting and radiological history of HPS and Parcel E; (2) previous radiological investigations and removal actions at Parcel E; (3) the nature and extent of radioactive chemicals in soil and groundwater; and (4) the conceptual site model (CSM). A screening-level evaluation of potential risks from exposure to ROCs is also summarized in [Section 2.5](#).

- **Section 3 – Remedial Action Objectives, Applicable or Relevant and Appropriate Requirements, General Response Actions, and Process Options**, presents radiological-specific RAOs, RGs, and ARARs for Parcel E based on the site characterization and risk evaluation results. GRAs are then identified that address the RAOs and ARARs. Process options associated with each GRA are screened for technical effectiveness, implementability, and cost.
- **Section 4 – Development of Remedial Alternatives**, presents a detailed description of the radiological-specific remedial alternatives that were developed based on the retained process options in [Section 3](#) that will satisfy the RAOs. Process options recommended for consideration are assembled, singularly or in combination, to create the remedial alternatives.
- **Section 5 – Detailed and Comparative Analysis of Remedial Alternatives**, presents the evaluation of each radiological-specific remedial alternative developed in [Section 4](#) against the NCP’s evaluation criteria and against each other to evaluate their relative advantages and disadvantages with respect to the nine evaluation criteria.
- **Section 6 – References**, includes the documents and supporting information used to prepare this addendum.

Figures and tables are included following the text. In addition, the following appendices are presented to support this radiological addendum.

- **Appendix A:** Radionuclide Data in Soil and Groundwater
- **Appendix B:** Parcel E Risk Screening Analysis (RESRAD)
- **Appendix C:** Applicable or Relevant and Appropriate Requirements
- **Appendix D:** Remedial Alternative Cost Summary
- **Appendix E:** Responses to Regulatory Agency Comments on the Draft and Draft Final Radiological Addendum to the FS Report for Parcel E

Section 2. Site Characterization and Risk Evaluation

This section describes radiological site characterization information concerning HPS and Parcel E and provides a screening-level evaluation of potential risks from exposure to ROCs. [Section 2.1](#) provides the physical characteristics of HPS and Parcel E and briefly presents the radiological history of each impacted site at Parcel E. [Section 2.2](#) discusses previous radiological investigations conducted at Parcel E—including basewide investigations (such as the site reconnaissance), specific investigations, and decommissioning surveys performed throughout Parcel E—and interim removal actions at Parcel E that have involved excavation and off-site disposal of low-level radioactive waste (LLRW). [Section 2.3](#) discusses the available soil and groundwater data used to evaluate the nature and extent of ROCs at Parcel E. [Section 2.4](#) describes the CSM, and [Section 2.5](#) provides a quantitative screening-level risk evaluation of potential risks to human health from exposure to radionuclides in soil and groundwater at Parcel E. The risk evaluation does not consider potential radioactivity at existing structures because data are inadequate to support such an evaluation; however, this radiological addendum assumes that the radiologically impacted structures, as conservatively identified in the HRA, will require remedial option analysis (in [Sections 3, 4, and 5](#)).

2.1. SITE DESCRIPTION, PHYSICAL CHARACTERISTICS AND RADIOLOGICAL HISTORY

The following sections describe the physical characteristics of Parcel E, and briefly summarize the radiological history of each impacted site at Parcel E.

2.1.1. Location and Physical Characteristics

HPS is located in southeast San Francisco on a peninsula that extends east into San Francisco Bay, and is currently divided into 10 parcels, as shown on [Figure 1](#). In 1992, the Navy divided HPS into five contiguous parcels (A through E). In 1996, the Navy added a sixth parcel (Parcel F), which encompasses immediately adjacent areas of San Francisco Bay; Parcel F is referred to as the “offshore area.” In September 2004, the Navy divided Parcel E into two parcels (Parcels E and E-2) to facilitate closure of the former landfill at IR-01/21 and its adjacent areas ([Figure 2](#)). In December 2004, the Navy transferred Parcel A to the SFRA. In July 2008, the Navy subdivided Parcel D into four separate parcels (Parcels D-1, D-2, G, and UC-1) and separated the western edge of Parcel C to create Parcel UC-2; these changes were made to expedite closure and transfer of the new parcels. In August 2012, concurrent with the final version of the Parcel E FS Report, the Navy changed the boundary between Parcels E and E-2 to better align the

CERCLA documentation with the CCSF's amended redevelopment plan for HPS (SFRA, 2010b). The August 2012 boundary change is shown on Figure 2 and is discussed further below.

Parcel E includes about 139 acres of relatively flat shoreline and lowland coast along the southwestern portion of HPS (Figure 1). Parcel E is bounded to the north by non-Navy property; to the east by Parcels D-1, G, and UC-1; to the south by intertidal shoreline areas along San Francisco Bay; and to the west by Parcel E-2 and non-Navy-property. Parcel E contains 44 buildings, and the adjoining offshore area contains 14 ship berths and 2 piers.

Parcel E was created by filling in the bay margin with various materials, including native soil, rock, and sediments, as well as construction and industrial debris. Figures 1-7 through 1-12 from the Final Revised RI Report are aerial photographs of Parcel E that document the expansion of Parcel E into the bay at various stages of filling history (Barajas & Associates, Inc., 2008).

Geographic units at Parcel E include IR sites and redevelopment blocks. As described in Section 1.1, contaminated sites at HPS were designated as IR sites based on information developed during the previous investigations. The CCSF designated redevelopment blocks for Parcel E in accordance with the planned future reuse. Consistent with the FS Report, this radiological addendum uses redevelopment blocks, adjusted by the Navy to facilitate data presentation and evaluation, as the basis for developing remedial alternatives to address potential unacceptable radiological risk present within Parcel E. Accordingly, references to redevelopment blocks contained elsewhere in this radiological addendum refer to the Navy-defined redevelopment blocks. The Navy acknowledges that the boundaries of individual redevelopment blocks may be revised during redevelopment; the ROD will list the boundaries of the reuse categories consistent with CCSF's redevelopment plan (SFRA, 2010b).

In 1997, CCSF's redevelopment plan assigned reuse categories to all of HPS by redevelopment blocks (SFRA, 1997) and consisted of 13 redevelopment blocks. Land uses within the 13 redevelopment blocks included mixed use, industrial, research and development, maritime-industrial, and open space. As discussed in Section 1.1, the CCSF published an amended redevelopment plan in 2010, which resulted in significant changes to the proposed land use for Parcel E (SFRA, 2010b). Based on the CCSF's amended redevelopment plan (SFRA, 2010b), two land use districts are now located on Parcel E: the Shipyard South Multi-Use District and the Shipyard Shoreline Open Space District. The two districts and their proposed land uses are described below.

The Shipyard South Multi-Use District encompasses the central and northern portion of Parcel E. The proposed principal land uses in Shipyard South Multi-Use District include athletic and recreational facilities; office and industrial uses; multi-media and digital arts uses; institutional uses; retail sales and services; and civic, arts, and entertainment (SFRA, 2010b). The Shipyard South Multi-Use District also includes a proposed new stadium for the San Francisco 49ers (located in adjoining Parcel G with support facilities proposed at Parcel E). If the new stadium is not developed in this district, the principal uses

allowed would be residential and institutional uses. As previously discussed, the Navy subdivided the Shipyard South Multi-Use District into smaller redevelopment blocks to facilitate the data presentation in this FS Report. These Navy-defined redevelopment blocks in Parcel E are MU-1, MU-2, and MU-3.

The Shipyard Shoreline Open Space District encompasses the shoreline area and the southern portion of Parcel E. The principal land uses in the Shipyard Shoreline Open Space District include active and passive recreation, plazas and promenades, wetlands restoration, and ancillary commercial use (SFRA, 2010b). Similar to the Shipyard South Multi-Use District, the Navy subdivided the Shipyard Shoreline Open Space District into smaller redevelopment blocks (EOS-1 through EOS-4, EOS-5A, EOS-5B, and EOS-5C) to facilitate the data presentation in this FS Report. As noted on Figure 2, the proposed roadway along the existing Crisp Avenue does not contain chemicals in soil or groundwater requiring evaluation in the FS Report, thus this area was not included in the Navy-defined redevelopment blocks. In addition, the railroad right-of-way comprising IR-52 is part of the CCSF's redevelopment plan for the Bayview Hunters Point redevelopment project adjoining HPS (SFRA, 2010a), and is planned for predominantly light industrial reuse.

In some cases, IR sites are completely contained within redevelopment blocks and, in other cases, the IR sites cross redevelopment block boundaries. Figure 2 shows Parcel E, the reuse area boundaries, the redevelopment blocks, and the IR site boundaries. Table 1 outlines the correlation between the redevelopment blocks and the radiologically impacted sites. The August 2012 boundary change between Parcels E and E-2 involved moving a small area (0.98-acre in size) from Parcel E-2 to Parcel E. As shown on Figure 2, the small, 0.98-acre area is not located within an existing IR site boundary. As shown on Figure 3, the small, 0.98-acre area contains only radiologically impacted storm drain lines; further, there is no radiological soil or groundwater data within this small area.

2.1.2. Radiological History

A history of Navy radiological operations at HPS is provided in Volume II of the HRA (NAVSEA, 2004). The HRA concluded that low levels of radiological contamination exist within the confines of HPS. The review of previous radiological activities, cleanup actions, and release surveys identified no imminent threat or substantial risk to tenants or the environment of HPS or the local community (NAVSEA, 2004).

The HRA identified the following radiologically impacted areas at Parcel E (Figure 3):

- Building 406
- Building 414
- Former Building 500 Series Site, which includes the following sites and surrounding area:
 - Building 500
 - Building 503 Site

- Building 506 Site
- Building 507 Site
- Building 508 Site
- Building 509 Site
- Building 510 Site
- Building 510A Site
- Building 517 Site
- Building 520 Site
- Building 521
- Building 529 Site
- Building 701 Site
- Building 704 Animal Pens
- Building 704 Former Radioactive Storage Yard
- Building 707 and Kennels
- Building 707B Site
- Building 707C Site
- Building 707 Triangle Area
- Building 708
- Building 807 Site
- Building 810
- Building S-719 Site (suspected incinerator site in IR-02 Northwest)
- Shack 79 Site
- Shack 80 Site
- IR-02 (Bay Fill Area)
- IR-03 (Former Oil Reclamation Ponds Area)
- IR-04 (Former Scrap Yard)
- Former Salvage Yard
- Parcel E Shoreline
- Piers 2 and 3 (including Building 527)
- Sanitary Sewer System
- Storm Drain Lines
- Septic Sewer Lines

The operational history of each radiologically impacted area is described in the subsections below, along with the ROCs and the potential for radiological contamination. Table 1 summarizes the historical site use and associated ROCs. Radiological investigation history and remedial actions conducted at the impacted areas are discussed in detail in Section 2.2. The radiological assessment and classification for each radiologically impacted site is provided in Table 2. Unless otherwise indicated, the information presented in each subsection is derived from the HRA (NAVSEA, 2004). The piers and berths are considered part of the offshore area (Parcel F), but are included in this radiological addendum because they were not previously discussed in the FS Report for Parcel F. Building 527, a former electrical substation located on one of the piers extending from Parcel E, is also discussed within this radiological addendum for completeness.

2.1.2.1. Building 406

Building 406 is an approximately 40,000-square-foot wood-framed warehouse originally used for shipping, packing, and preserving operations, and was later used as an automotive repair garage. More recently, the Navy used Building 406 to store LLRW from various removal actions (Barajas & Associates, Inc., 2008). The ROCs at Building 406 are cesium-137 (^{137}Cs) and radium-226 (^{226}Ra). The HRA concluded that potential contamination is likely in this building, and that remediation and survey results from the Phase V investigation be reviewed for adequacy (relative to the RGs proposed in this radiological addendum). The Navy is currently addressing potential radiological contamination at Building 406 under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.2. Building 414

Building 414 is an approximately 172- by 243-foot wood-framed building originally used as a Public Works and Supply storehouse, and was later used as a storage area for LLRW during RI phase investigations. The ROC at Building 414 is ^{226}Ra . The HRA concluded that potential contamination is unlikely in this building, and that remediation and survey results from the Phase V investigation be reviewed for adequacy (relative to the RGs proposed in this radiological addendum). The Navy is currently addressing potential radiological contamination at Building 414 under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.3. Former Building 500 Series Site

The site comprising the former Building 500 Series is an area generally bounded by Manseau Street to the north, Hussey Street and the adjacent Parcel D-1 to the east, Mahan Street to the south, and I and J Streets to the west. This area is of particular radiological significance because it is the location of the original Radiation Laboratory (RADLAB, the precursor to Naval Radiological Defense Laboratory [NRDL]) and NRDL facilities. The radiological history of several of the individual series 500 buildings, as identified in

the HRA (NAVSEA, 2004), is discussed in the individual paragraphs below. In addition to the buildings described below, temporary structures were constructed, used, and removed, and radioactive materials were transported and stored outdoors. Accordingly, the entire Building 500 Series, including both the former and existing structures as well as the land, is considered radiologically impacted. The ROCs at the former Building 500 Series site are americium-241 (^{241}Am), ^{137}Cs , plutonium-239 (^{239}Pu), ^{226}Ra , and strontium-90 (^{90}Sr). The HRA concluded that potential contamination is likely at this site and recommended a Scoping Survey be conducted at the site (NAVSEA, 2004). The HRA further recommended that, if contamination is identified, a characterization survey be completed, to be followed by remediation and a Final Status Survey.

The Navy is currently addressing potential radiological contamination at the Building 500 Series, including both the former and existing structures as well as the land, under a basewide removal action (Navy, 2006a). The work is identified in the 2011 “Final Execution Plan, Parcel E 500 Series Area” (TtECI, 2011a) and the “Final Design Plan, Parcel E 500 Series Area” (TtECI, 2011b), and is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

Building 500

Building 500 is an approximately 13,450-square-foot two-story building originally used as barracks and Bachelor Officers Quarters, and was later used by NRDL as storage and administrative offices. The ROCs at Building 500 are ^{137}Cs and ^{226}Ra . The HRA concluded that potential contamination is unlikely in this building but recommended a Scoping Survey be conducted at the building. The HRA further recommended that, if contamination is identified, a characterization survey be completed, to be followed by remediation and a Final Status Survey.

Building 503 Site

Former Building 503 was an approximately 25,900-square-foot building formerly used as a Ships Galley and Military Support Services and later used by NRDL as a contaminated laundry facility. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1948, and demolished sometime between 1977 and 1979 (Barajas & Associates, Inc., 2008). Following demolition of Building 503, Building 606 was built in 1989 over the original building's location. The ROCs at former Building 503 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area if any drain piping remains and recommended a scoping survey be conducted at the building if the drain piping is accessible. If contamination is identified, a characterization survey would be completed, to be followed by remediation and a Final Status Survey.

Building 506 Site

Former Building 506 was an approximately 9,375-square-foot building formerly used as a location for various NRDL laboratories; radioactive waste containers were stored in a concrete pad behind the building. The building housed the controls of a low-voltage neutron generator, and rooms 35 and 35A were used to store hydrogen-3 (^3H , also referred to as tritium) targets (Tetra Tech EM Inc. [TtEMI], Levine-Fricke-Recon [LFR], and Uribe & Associates [U&A], 1997). The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished during the latter part of the 1970s (Barajas & Associates, Inc., 2008). The ROCs at former Building 506 are ^{241}Am , ^{137}Cs , ^3H , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in the drainage system and recommended a scoping survey be conducted. The HRA further recommended that, if contamination is identified, a characterization survey be completed, to be followed by remediation and a Final Status Survey.

Building 507 Site

Former Building 507 was an approximately 35- by 190-foot wooden-framed building formerly used by NRDL as a biological laboratory. NRDL operations were moved from Building 507 to Building 815 sometime in the late 1950s. Building 815 is located on an off-site formerly used defense site (FUDS), which was subsequently transferred to a private owner in 1984. The exact construction and demolition dates of former Building 507 are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime between 1977 and 1979 (Barajas & Associates, Inc., 2008). The ROCs at former Building 507 are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, primarily in the drain system, and recommended a characterization survey be conducted (NAVSEA, 2004). Remediation would likely be required based upon the results of the characterization survey, and would be followed by a Final Status Survey.

Building 508 Site

Former Building 508 was an approximately 35- by 190-foot wooden-framed building formerly used by NRDL as a physics laboratory. NRDL operations were moved from Building 508 to Building 815 sometime in the late 1950s. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime between 1977 and 1979 (Barajas & Associates, Inc., 2008). The ROCs at former Building 508 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, primarily in the drain system, and recommended a characterization survey be conducted of the site and drain system. The HRA further recommended that identified contamination be remediated, with a final status survey to be completed following remediation.

Building 509 Site

Former Building 509 was an approximately 50- by 100-foot building formerly used as a library. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s (Barajas & Associates, Inc., 2008). The ROCs at former Building 509 are ^{137}Cs and ^{90}Sr . The HRA concluded that, based on previous radiological surveys that included anomalous readings between Buildings 509 and 517 (former irradiation facility), potential contamination is likely in this area, and recommended a characterization survey be conducted of the site and drain system. The HRA further recommended that identified contamination be remediated, with a final status survey to be completed following remediation.

Building 510 Site

Former Building 510 was an approximately 30- by 85-foot building formerly used by NRDL as a radiation facility. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s (Barajas & Associates, Inc., 2008). The ROCs at former Building 510 are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, and recommended a characterization survey be conducted of the site and drain system. The HRA further recommended that identified contamination be remediated, with a final status survey to be completed following remediation.

Building 510A Site

Former Building 510A was an approximately 20- by 30-foot building formerly used by NRDL and designated as a kevatron facility. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s (Barajas & Associates, Inc., 2008). The ROCs at former Building 510A are ^{137}Cs and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, including any remaining drain system piping, and recommended a characterization survey be conducted of the site and any remaining drain system piping. The HRA further recommended that identified contamination be remediated, with a final status survey to be completed following remediation.

Building 517 Site

Former Building 517 was an approximately 50- by 50-foot building formerly used by NRDL as a cobalt irradiation facility for animals. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s (Barajas & Associates, Inc., 2008). The ROCs at former Building 517 are ^{137}Cs , cobalt-60 (^{60}Co), and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, and recommended a characterization survey be conducted of the site and remaining drainage system. The HRA further recommended that identified contamination be remediated, with a final status survey to be completed following remediation.

Building 520 Site

Former Building 520 was an approximately 7,040-square-foot building formerly used as the Shipyard Dental Clinic and later by NRDL as administrative offices. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s, along with the other 500 series buildings (Barajas & Associates, Inc., 2008). The ROCs at former Building 520 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that, based on previous radiological surveys, contamination exists in this area and is likely present in the drain system piping based upon radium contamination found immediately adjacent to the building foundation (NAVSEA, 2004). The HRA recommended a characterization survey be conducted of the site and remaining drainage systems, with remediation if contamination is identified and a final status survey to be completed following remediation.

Building 521

Building 521 is an approximately 7,040-square-foot concrete building formerly used as the power plant. This building is one of two suspected sites of fuel oil burning from three OPERATION CROSSROADS2 target ships. Construction began on Building 521 in 1948 and ended in 1949 (Barajas & Associates, Inc., 2008). The ROCs at Building 521 are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, but recommended a scoping survey be conducted at the site.

Building 529 Site

Former Building 529 was an approximately 17- by 29.5-foot building with an underground isotope storage vault and waste sump, and was formerly used by NRDL as an isotope storage facility and housed the Cockcroft-Walton neutron generator. The exact construction and demolition dates of the building are unknown; however, the building was likely constructed sometime prior to 1950, and demolished sometime in the 1970s (Barajas & Associates, Inc., 2008). When the building was renovated for installation of the neutron generator, the vault was filled with compacted sand and capped with 8 inches of concrete. The ROCs at former Building 529 are ^{137}Cs , ^3H , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination exists in this area, and recommended a characterization survey based on the presence of the isotope storage vault and contamination found in the drainage system. The HRA further recommended that the survey results from the Phase V investigation be reviewed, and that the drainage system be remediated in known areas of contamination with a final status survey to be completed following remediation.

2 OPERATION CROSSROADS was the code name for the atomic weapons testing performed in July 1946 at the lagoon of the Bikini Atoll (part of the Marshall Islands in the Pacific Ocean). The conduct of OPERATION CROSSROADS and the resultant decontamination of ships that participated in the tests had a significant effect upon HPS that are discussed further in Section 6.2 of the HRA (NAVSEA, 2004).

2.1.2.4. Building 701 Site

Former Building 701 was an approximately 50- by 110-foot building formerly used for “temporary” (less than 120 days) storage of samples, and was still in use by NRDL in 1950 and listed as used by NRDL in 1954. The exact construction and demolition dates of the building are unknown. The ROCs at former Building 701 are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, and that remediation and survey results from the Phase V investigation be reviewed for adequacy (relative to the RGs proposed in this radiological addendum). The Navy is currently addressing potential radiological contamination at the Building 701 site under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.5. Building 704 Area Animal Pens

The Building 704 area animal pens were located immediately south of Building 704 and measured approximately 18 feet by 20 feet and 20 feet by 12 feet. The exact construction and demolition dates of the animal pens are unknown. The ROCs at the Building 704 area animal pens are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, but recommended a scoping survey be conducted for the area. The Navy is currently addressing potential radiological contamination at the Building 704 site, including the animal pen area, under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.6. Building 704 Former Radioactive Storage Yard

The location immediately south of Building 704, to the west of the former animal pens, was identified on a 1949 map as a “Radioactive Material Storage” area. The ROCs at the Building 704 Radioactive Material Storage Area are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, and recommended a scoping survey be conducted at the site. The Navy is currently addressing potential radiological contamination at the Building 704 site, including the former radioactive storage yard, under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.7. Building 707 and Kennels

Building 707 is an approximately 13,000-square-foot building, including kennels, formerly used by NRDL as a research facility for animal breeding (including animal kennels). A concrete pad adjacent to the west side of Building 707 was formerly used by NRDL to store drums of radioactive waste prior to their shipment to an off-site licensed disposal facility (TtEMI, LFR, and U&A, 1997). The building was constructed in 1950 (Barajas & Associates, Inc., 2008). The ROCs at Building 707 are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination exists in this area, and recommended a characterization survey based on historical information concerning the drainage systems and identified contamination

under the concrete pad. The HRA further recommended that the survey results from the Phase V investigation be reviewed, and that the concrete pad be remediated in known areas of contamination with a final status survey to be completed following remediation. The Navy is currently addressing potential radiological contamination at Building 707, including the former animal kennels, under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.8. Building 707B Site

An exact description of former Building 707B is not available; however, it is believed to have been an approximately 50- by 20-foot Quonset hut used by NRDL as an animal colony. The exact construction and demolition dates for the building are unknown. The ROCs at the Building 707B Site are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is unlikely in this area, but recommended an additional characterization survey as part of the Building 707 Triangle Area surveys, with remediation if contamination is identified and a final status survey to be completed following remediation (NAVSEA, 2004).

2.1.2.9. Building 707C Site

An exact description of former Building 707C is not available; however, Building 707C is believed to have been an approximately 50- by 20-foot Quonset hut used as nuclear weapons test support experimentation and equipment issue and receiving area. The exact construction and demolition dates for the building are unknown. The ROCs at the Building 707C Site are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, but recommended an additional characterization survey as part of the Building 707 Triangle Area surveys, with remediation if contamination is identified and a final status survey to be completed following remediation.

2.1.2.10. Building 707 Triangle Area

The Building 707 Triangle Area is an approximately 223,000-square-foot, triangle-shaped area bounded by J Street, I Street, and 6th Avenue. The Building 707 Triangle Area was used by NRDL as a radioactive waste receiving, packaging, and storage area, and is the location of a suspected septic tank and leach field from early operations. The ROCs at the Building 707 Triangle Area are ^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr , and uranium-235 (^{235}U). The HRA concluded that contamination exists in this area, and recommended a characterization survey, remediation, and resurvey of areas exceeding release criteria, with a final status survey to be completed following remediation. The Navy is currently addressing potential radiological contamination at the Building 707 Triangle Area, including the Building 707B and 707C sites, under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.11. Building 708

Building 708 is an approximately 50- by 20-foot Quonset hut located adjacent to Building 707. Building 708 was used as a research animal facility, biomedical facility, and animal psychology facility. The ROCs at Building 708 are ^{137}Cs and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, and that remediation and survey results from the Phase V investigation be reviewed for adequacy (relative to the RGs proposed in this radiological addendum).

2.1.2.12. Building 807 Site

Former Building 807 was an approximately 60- by 28-foot building of unknown construction, and was formerly used as a scrap yard processing shed. Building 807 may have previously received materials from ship decontamination activities. The ROCs at Building 807 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, and recommended a Scoping Survey for the site, with a characterization survey to be completed if contamination is identified and a final status survey to be completed following remediation.

2.1.2.13. Building 810

Building 810 is an approximately 30,000-square-foot building formerly used to store LLRW and investigation-derived waste, and also used as a storehouse, paint shop, and paint and oil storage building. At the center of the building is a large sliding door with a small access window. A loading dock is located on the south side of the building. The ROCs at Building 810 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination exists in soil around the loading dock, and recommended a scoping survey for the building and loading dock. A characterization survey was also recommended for areas surrounding the known contaminated area, with remediation to be completed if contamination is identified and a final status survey to be completed following remediation. The Navy is currently addressing potential radiological contamination at Building 810 under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.14. Building S-719 Site

Former Building S-719 was an approximately 30- by 24-foot building located within IR-02 Northwest. Former Building S-719 was believed to have been used as an incinerator and was potentially used by the NRDL animal facility at Building 707. The construction and demolition dates of former Building S-719 are unknown. The ROCs at the Building S-719 Site are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is unlikely in this area, but recommended a scoping survey, with characterization survey if contamination is identified and a final status survey to be completed as the final action.

2.1.2.15. Shack 79 Site

Shack 79 was identified in a list of shipyard shacks, and was located behind Building 506. Shack 79 was formerly used by NRDL as a support area for radioactive material. The construction and demolition dates of Shack 79 are unknown. The ROCs at the Shack 79 Site are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that potential contamination is likely in this area, and recommended a characterization survey for the site, with remediation to be completed if contamination is identified and a final status survey to be completed following remediation.

2.1.2.16. Shack 80 Site

The Shack 80 Site was identified in a list of shipyard shacks, and was located behind Building 506. Shack 80 was formerly used by NRDL as a support area. The construction and demolition dates of Shack 80 are unknown. Shack 80 was reportedly moved from behind Building 506 to the Building 704 area for laboratory operations. The ROCs at the Shack 80 Site are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination exists in this area, and recommended remediation of known areas of contamination, with a final status survey to be completed following remediation.

2.1.2.17. IR-02 (Bay Fill Area)

IR-02 is an irregularly shaped land area, immediately adjacent to and east of IR-01 (located on Parcel E-2) and immediately south of J Street, comprising approximately 1,941,376 square feet. Historical radiological operations at IR-02 included disposal of radioluminescent commodity items (such as dials, gauges, and deck markers) and potential disposal of sandblast wastes from decontamination of ships used in OPERATION CROSSROADS. The ROCs at IR-02 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination exists in this area, and recommended a characterization survey, with remediation of areas of elevated radioactivity, and a final status survey to be completed following remediation.

2.1.2.18. IR-03 (Former Oil Reclamation Ponds Area)

IR-03 is an irregularly shaped land area measuring approximately 45,000 square feet and located within IR-02 Central. IR-03 was the location of the former HPS fuel oil reclaiming plant, and is a possible disposal area for assorted shipyard wastes, which may have included ^{226}Ra and ^{90}Sr devices and oil. The ROCs at IR-03 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is likely in this area, and recommended a scoping survey, and a characterization survey with remediation of areas of elevated radioactivity and a final status survey to be completed following remediation.

2.1.2.19. IR-04 (Former Scrap Yard)

IR-04 is an irregularly shaped property, measuring approximately 100 by 600 feet, bounded by Spear Avenue to the east and south, the Building 812 access road to the west, and Building 810 to the north. IR-04 was formerly used as a post-disassembly area for metals, equipment, and other unusable items from the former salvage yard. These items may have contained ^{226}Ra devices and other contaminants. The ROCs at

IR-04 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is known in this area, and recommended remediation of known areas of contamination, further characterization of boundary areas and remediation if additional contamination is identified, followed by a final status survey to be completed following remediation. The Navy is currently addressing potential radiological contamination at IR-04 under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.1.2.20. Former Salvage Yard

The former salvage yard is an irregular pentagonal-shaped property, measuring approximately 75,000 square feet, bounded by Spear Avenue to the north and 6th Avenue to the east. The former salvage yard was used as a pre-disposal disassembly area for metals, equipment, and other unusable items. These items may have contained ^{226}Ra devices and other contaminants. The ROCs at the former salvage yard are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is likely in this area, and recommended a scoping survey, with a characterization survey and remediation if contamination is identified, followed by a final status survey to be completed following remediation. No previous radiological investigations have been performed at the former salvage yard.

2.1.2.21. Parcel E Shoreline

The intertidal shoreline area is composed of approximately 1.5 miles of shoreline along the San Francisco Bay, including Parcels E and E-2. The Parcel E shoreline was previously used as a debris disposal area. The ROCs at the Parcel E shoreline are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is known in this area, and recommended a characterization survey with remediation of areas of elevated radioactivity and a final status survey to be completed following remediation.

2.1.2.22. Piers 2 and 3 (including Building 527)

Piers 2 and 3 are located adjacent to the southeast end of Parcel E and were formerly used as a berthing site for OPERATION CROSSROADS ships and other vessels with potential radioactive contamination. Pier 2 consists of former ship berths 30 through 35, and Pier 3 consists of former ship berths 37 through 42. Building 527 is an approximately 408-square-foot concrete building located on Pier 2 and was formerly used as an electrical substation. Historical documents that were reviewed as part of the HRA also indicate that a similar structure (former Building 528) was located on Pier 3; however, the building is no longer present. The ROCs at Piers 2 and 3 and the associated structures are ^{137}Cs , ^{239}Pu , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is likely in this area, and recommended a scoping survey for the site (NAVSEA, 2004).

2.1.2.23. Sanitary Sewer System

Consistent with regulations at the time the NRDL operated at HPS, small amounts of low-level radioactive liquids may have been released into drains at NRDL buildings that discharged into the

sanitary sewer system. Evidence of such releases was initially found at Buildings 351A and 364 located in Parcel G, which prompted the Navy to initiate an interim removal action to remove and remediate potentially contaminated sanitary sewer lines throughout various HPS parcels (B, C, D-1, D-2, E, E-2, G, UC-1, and UC-2). The ROCs for the sanitary sewer system are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The sanitary sewer system is considered by the HRA to likely be contaminated and is recommended for a characterization survey, followed by remediation of areas of elevated radioactivity and a final status survey to be completed following remediation. The Navy is currently removing the portion of the sanitary sewer system that extends into Parcel E under a basewide removal action (Navy, 2006a). The work is identified in the 2010 “Final Execution Plan, Crisp Road Sanitary Sewer and Storm Drain Removal” (TtECI, 2010a), and is being performed in accordance with the 2010 “Base-Wide Storm Drain and Sanitary Sewer Removal Final Project Work Plan, Revision 4” (TtECI, 2010b).

2.1.2.24. Storm Drain Lines

The original sanitary sewer system at HPS was combined with the storm drain system and used the same conveyance piping and 40 separate discharge outfalls into the bay. Three separate projects, beginning in 1958, were completed to separate the sanitary sewer and storm drain systems, but complete separation of the two systems was never achieved. Based on this history and the potential discharge of small amounts of low-level radioactive liquids into drains at NRDL buildings, the storm drain lines at HPS Parcels B, C, D-1, D-2, E, E-2, G, UC-1, and UC-2 are considered radiologically impacted and are being removed under an interim removal action concurrent with the sanitary sewer system. The ROCs for the storm drain lines are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The storm drain lines are considered by the HRA to likely be contaminated and are recommended for a characterization survey with remediation of areas of elevated radioactivity and a final status survey to be completed following remediation. The Navy is currently removing the portion of the storm drain system that extends into Parcel E under a basewide removal action (Navy, 2006a). The work is identified in the 2010 “Final Execution Plan, Crisp Road Sanitary Sewer and Storm Drain Removal” (TtECI, 2010a), and is being performed in accordance with the 2010 “Base-Wide Storm Drain and Sanitary Sewer Removal Final Project Work Plan, Revision 4” (TtECI, 2010b).

2.1.2.25. Septic Sewer Lines

Prior to construction of the sanitary sewer and storm drain system, individual buildings may have used septic drain fields to dispose of liquid wastes, including potentially small amounts of low-level radioactive liquids. Construction documentation for septic sewer lines does not exist; however, septic sewer lines were discovered during a radiological survey at the Building 707 Triangle Area and sewer lines may be present at other radiologically impacted buildings. The ROCs for the septic sewer lines are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The septic sewer lines are considered by the HRA to likely be contaminated and are recommended for a characterization survey with remediation of areas of elevated radioactivity and a final status survey to be completed following remediation. The Navy is currently addressing potential radiological contamination at the Building 707 Triangle Area, including the identified septic sewer lines,

under a basewide removal action (Navy, 2006a). The work is being performed in accordance with the 2007 “Base-Wide Radiological Work Plan, Revision 1” (TtECI, 2007a).

2.2. PREVIOUS RADIOLOGICAL INVESTIGATIONS AND REMOVAL ACTIONS

Multiple radiological investigations have been conducted at Parcel E, beginning in 1955. The investigations included basewide investigations (such as site reconnaissance), investigations performed throughout Parcel E, and focused decommissioning surveys and investigations within Parcel E. In addition, the Navy has performed several interim removal actions at Parcel E that have involved excavation and off-site disposal of LLRW. The following subsections describe the previous radiological investigations and removal actions performed at Parcel E.

2.2.1. Previous Radiological Investigations

Numerous investigations of potential radiological contamination have been performed throughout HPS, including Parcel E. Radiological investigations performed at Parcel E include:

- NRDL Surveys to Decommission NRDL Buildings (1955)
- NRDL Survey for Disestablishment (1969)
- U.S. Atomic Energy Commission (AEC) Confirmatory Surveys (1969 to 1970)
- Radiological Affairs Support Office (RASO) Survey of Former NRDL Buildings (1978)
- Site Reconnaissance (1988 to 1989)
- Phase I Radiological Investigation (1991)
- Phase II Radiological Investigation (1993)
- EPA Study of Parcel E Soil (1993)
- Phase III Radiological Investigation (1996 to 1997)
- Interim Parcel E Radiation Risk Assessment (1997)
- Phase IV Radiological Investigation (1999)
- Interim Investigation between Phase IV and Phase V Radiological Investigations (2001)
- Radiological Groundwater Investigation (2001 to 2002)
- Phase V Radiological Investigation (2002 to 2003)
- Characterization of the Metal Debris Reef Area (2004)
- Radiological Groundwater Investigation (2007 and 2008)

A brief summary of radiological investigations performed at Parcel E is provided in the following subsections. For each investigation, the methods used to evaluate the ROCs and associated release criteria were current at the time of the survey and are briefly described, if available. Unless otherwise

indicated, the information presented in each subsection is derived from the HRA (NAVSEA, 2004). Specific soil, structure, and groundwater characterization data from these investigations are presented in Section 2.3. Table 3 summarizes the study areas evaluated under the various radiological investigations.

2.2.1.1. NRDL Surveys to Decommission NRDL Buildings (1955)

In March 1955, NRDL consolidated most of its facilities into Building 815, located on an off-site FUDS that was subsequently transferred to a private owner in 1984, and conducted radiological surveys in the buildings it formerly used for free release to HPS. At Parcel E, decommissioning surveys were conducted in Buildings 506, 507, 508, and 510. No site-specific survey or decontamination procedures are available. However, under AEC guidelines, all NRDL buildings were required to be thoroughly surveyed and decontaminated prior to abandonment or release for unrestricted reuse. For final clearance, former NRDL facilities were required to meet the residual contamination levels established by the Navy Bureau of Medicine and Surgery for decontamination of Navy facilities and equipment. The release criteria used in the NRDL surveys are listed below.

- Gamma contact dose rate less than 1.8 millirems per hour (mrem/hr)
- Beta dose rate less than 9 milliRoentgens equivalent physical per hour
- Fixed beta-gamma contamination less than 10,000 disintegrations per minute per square centimeter (dpm/cm²)
- Removable beta-gamma contamination less than 4,000 dpm/cm²
- Fixed alpha contamination less than 500 dpm/cm²
- Removable alpha contamination less than 1 dpm/cm²

2.2.1.2. NRDL Survey for Disestablishment (1969)

In April 1969, the NRDL was closed (“disestablished”) and all radiological operations were suspended. Surveys were performed in areas where operations with general radioactive materials (G-RAM) were conducted to ensure applicable radiological release criteria were met. Termination of the AEC licenses required the transfer of all G-RAM sources to other licensed operations or disposal at a licensed off-site disposal facility. In addition, all areas involving G-RAM-related operations occupied by NRDL required decontamination, if necessary, to reduce residual radioactivity to acceptable levels for unrestricted reuse. At Parcel E, the NRDL Health Physics Division surveyed and decontaminated Buildings 506, 529, and 707.

The surveys consisted of measuring alpha and beta-gamma radiation levels and collecting swipe samples to detect removable contamination. Any NRDL areas found to be radioactively contaminated were further decontaminated by removal of all radioactive source material; washing or scrubbing with detergents or other cleansing agents; chipping, sandblasting, vacuuming, and high-pressure steam cleaning; and dismantling of radioactive material for disposal at a licensed facility.

Following decontamination, the AEC Division of Compliance conducted a final inspection of all areas. A localized contaminated area was considered decontaminated by AEC using the release criteria listed below.

- Gamma dose rate at 1 centimeter above the surface area less than 0.2 mrem/hr
- Removable beta-gamma activity less than 1,000 disintegrations per minute per 100 square centimeters (dpm/100 cm²)
- Fixed alpha activity less than 500 dpm/100 cm²
- Removable alpha activity less than 100 dpm/100 cm²

2.2.1.3. AEC Confirmation Surveys (1969 to 1970)

In September 1969 through January 1970, AEC conducted confirmation surveys of facilities previously vacated by NRDL. In Parcel E, the surveys included Buildings 506, 517, 529, and the Building 707 area concrete waste preparation pad. AEC granted final clearance based on an independent survey consisting of spot checks for radioactivity in areas previously cleared by NRDL. The surveys included measuring alpha, beta, and gamma radiation levels and swipe testing for removable contamination. The survey results demonstrated that the former NRDL facilities met the *de minimis* levels required for release for unrestricted reuse, which are listed below.

- Average beta-gamma dose rate at 1 centimeter above the surface area less than 0.2 mrem/hr
- Removable beta-gamma activity less than 1,000 dpm/100 cm²
- Fixed alpha activity less than 500 dpm/100 cm²
- Removable alpha activity less than 100 dpm/100 cm²

2.2.1.4. RASO Survey of Former NRDL Buildings (1978)

Following a July 1978 RASO survey in which Building 815, located on an off-site FUDS that was subsequently transferred to a private owner in 1984, was found to exceed revised allowable release criteria from U.S. Nuclear Regulation Commission (NRC), RASO conducted cursory surveys at other former facilities that could potentially exceed the revised release criteria. In September and October 1978, RASO surveyed Buildings 506, 517, 529, and 707 in Parcel E. The surveys consisted of alpha and beta scans and swipe sampling for alpha and beta-gamma activity. Soil, paint scrapings, wood scrapings, and other bulk samples were also collected for analysis of radionuclides.

2.2.1.5. Site Reconnaissance (1988 to 1989)

In 1988, Harding Lawson Associates conducted a preliminary surface radiation survey to determine if radioactivity levels at HPS posed unacceptable exposure risks to RI fieldworkers. Project activities included a surface gamma survey for radiation at surface locations at the IR-02 (Bay Fill Area) at

Parcel E. The surface gamma survey was conducted at predetermined on- and off-site locations to obtain background measurements, and at the nodal points of a 50- by 50-foot grid over the entire IR-02 area. Gamma readings were measured at the ground surface and at 1 meter above ground surface at each grid node and along grid lines. An area of five anomalous gamma readings was also surveyed in more detail using a 10- by 10-foot grid spacing, as well as a ground scanning method (Harding Lawson Associates, 1990).

2.2.1.6. Phase I Radiological Investigation (1991)

In 1991, the Navy began radiation investigations at HPS in four main phases as part of the RI program. Also during this period, an interim radiation risk assessment and a shoreline characterization survey were performed at Parcel E.

The Phase I radiological investigation included the following tasks: (1) air monitoring; (2) a surface confirmation radiation survey (SCRS), collection and analysis of soil samples; (3) collection of radon flux canisters at or near the location of surface anomalies; and (4) collection and analysis of groundwater samples.

Phase I particulate air monitoring was conducted in 1991 to determine the background airborne particulate alpha and beta radioactivity levels at several locations, including Parcel E. The gross alpha and gross beta airborne particulate concentrations were well within safety standards for airborne concentrations of general radioactive materials in outdoor air (PRC Environmental Management, Inc. [PRC], 1992).

The purpose of the Phase I SCRS was to determine and confirm the nature and surficial extent of radium-bearing devices in several disposal areas at HPS within Parcel E, including the IR-02 (Bay Fill Area), IR-03 (Former Oil Reclamation Ponds Area), IR-14, and IR-15. A local grid coordinate system was developed for the Phase I SCRS to map and relocate radioactive material detected during the surface walkover survey. Each grid section was 300-feet by 300-feet square, with each section further subdivided into 30-foot by 30-foot subgrids. During the Phase I SCRS, gamma readings greater than twice the background level were considered potential radioactive point source anomalies associated with buried radium-containing devices (PRC, 1992).

When elevated gamma readings were observed, the location, gamma measurements, and exposure measurements were recorded and a biased soil sample was collected to identify the radioisotopes (PRC, 1992). To provide additional characterization information, systematic soil samples were also collected at random, unbiased locations at a frequency of one sample per 2 acres. All soil samples were analyzed at an off-site laboratory using gamma spectroscopy to identify and quantify gamma-emitting radioisotopes. In total, 79 soil samples were collected at Parcel E during the Phase I SCRS. Soil sample results from the Phase I SCRS are discussed further in Section 2.3. Soil sample locations for the Phase I

SCRS are provided on [Figures 4 and 5](#). Based on the results of the Phase I SCRS, a recommendation was made for further investigation.

In total, 158 radon flux canister samples were collected at ground surface locations at or near selected radioactive anomalies and other areas with elevated gamma activity. Ten of the samples were collected at IR-14, and 148 samples were collected at IR-02. Flux canister samples were analyzed for radon gas, a radioactive gas emitted into soil from the decay of ^{226}Ra . The analytical results were quantified as a radon flux rate value in picocuries per square meter per second ($\text{pCi}/\text{m}^2\text{-s}$). Analytical results for the 158 radon flux canister samples collected at Parcel E are summarized below.

- Twenty-one samples (all at IR-02) had no detectable levels of radon gas, with radon flux rates quantified as zero $\text{pCi}/\text{m}^2\text{-s}$
- Seventy-eight samples (9 at IR-14 and 69 at IR-02) exhibited very low levels of radon gas at or below the average background radon flux rate ($0.17 \text{ pCi}/\text{m}^2\text{-s}$)
- Nineteen samples (1 at IR-14 and 18 at IR-02) exhibited low levels of radon gas within twice the average background flux rate, with radon flux rates ranging from 0.18 to $0.31 \text{ pCi}/\text{m}^2\text{-s}$
- Eight samples (all at IR-02) exhibited slightly elevated levels of radon gas within three times the average background flux rate, with radon flux rates ranging from 0.35 to $0.49 \text{ pCi}/\text{m}^2\text{-s}$
- Thirty-two samples (all at IR-02) exhibited elevated levels of radon gas greater than three times the average background flux rate, with radon flux rates ranging from 0.55 to $75 \text{ pCi}/\text{m}^2\text{-s}$

All but 7 of the 32 samples with elevated levels of radon gas were collected directly above areas with elevated gamma activity that were subsequently excavated as part of the removal action at IR-02 Northwest and Central ([Section 2.2.2.1](#)). The maximum radon flux rate measured at locations outside of the IR-02 Northwest and Central excavation area was $9.87 \text{ pCi}/\text{m}^2\text{-s}$. The average radon flux rate measured at Parcel E, excluding the elevated radon measurements from within the IR-02 Northwest and Central excavation area, during the Phase I investigation is $0.24 \text{ pCi}/\text{m}^2\text{-s}$; this average flux rate is comparable with the measured background flux rate ($0.17 \text{ pCi}/\text{m}^2\text{-s}$). In addition, the range of measured radon flux rates, excluding the elevated radon measurements from within the IR-02 Northwest and Central excavation area, are less than the threshold for radon emissions ($20 \text{ pCi}/\text{m}^2\text{-s}$) specified in the Uranium Mill Tailings Radiation Control Act (40 CFR Section [§] 192.02[b][1]).

Groundwater samples were collected at three wells at IR-02 Northwest, one well at IR-02 Central, and two wells at IR-02 Southeast. The wells were selected for sampling based upon the results of previous gross alpha and beta analysis of water samples from the wells. The samples were analyzed for gross alpha and beta radioactivity. However, the presence of dissolved and suspended solids in groundwater interfered with the analysis, and the results were considered inconclusive ([PRC, 1992](#)).

2.2.1.7. Phase II Radiological Investigation (1993)

In 1993, the Phase II radiological investigation was initiated at IR-02 to further investigate the distribution of ^{226}Ra -containing devices identified during the Phase I investigation. Twenty-seven 15-foot-deep test pits and three 100-foot-long trenches were excavated at IR-02 Northwest. One of the trenches extended about 40 feet across the site boundary into IR-02 Central. Seven 15-foot-long test pits were excavated at IR-02 Central along the IR-02 Northwest site boundary. The excavations were conducted at locations where point source anomalies were found during the Phase I SCRS. The test pits were excavated until Bay Mud or groundwater was encountered, or until the walls of the excavation became unstable. Trench and test pit depths ranged from 2.5 to 10.5 feet below ground surface (bgs), with an average depth of about 8 feet bgs. The locations of the test pits excavated during the Phase II radiological investigation are presented on [Figures 4 and 5](#).

The walls of each test pit were scanned for gamma-emitting radioactive material every 2 feet; the excavated soil and debris were also scanned for gamma activity. If elevated gamma readings were observed, the location, gamma measurements, and exposure measurements were recorded. During the Phase II investigation, gamma count rates greater than one and one-half times the background level were considered radioactive point source anomalies associated with buried radium-containing devices ([PRC, 1996](#)). The background gamma count rate in excavations varied from approximately 5,000 to 10,000 counts per minute (cpm), depending upon depth and debris content. If radioactive point source anomalies were found, they were further investigated by excavation and soil samples were collected for analysis at an off-site laboratory using gamma spectroscopy to identify the radioisotopes ([PRC, 1996](#)). Low-, medium-, and high-volume air samples were also collected during excavation activities to evaluate airborne radioactive particulates. Results of the Phase II investigation are discussed in detail in [Section 2.3](#).

Results of soil samples collected at IR-02 assisted in delineating an area containing a concentration of radium-containing devices that was subsequently removed during an interim removal action (Tetra Tech EC, Inc. [[TtECI](#)], 2007c).

2.2.1.8. EPA Study of Parcel E Soil (1993)

In 1993, EPA's National Air and Radiation Environmental Laboratory analyzed 13 soil samples from IR-02 Northwest to determine particle size, radionuclide distribution, and radionuclide content. The samples were collected from the ground surface down to a depth of 2 feet bgs. Results of the study indicated that most soil at Parcel E contained background concentrations of ^{226}Ra , and that limited soil contamination was associated with the presence of radium-containing devices ([EPA, 1994](#)). Selective removal of soil in the vicinity of identifiable sources and removal of the sources by particle-size separation was identified as a viable remedial alternative.

2.2.1.9. Phase III Radiological Investigation (1996 to 1997)

In 1996, the Phase III radiological investigation was initiated at Parcel E to address concerns regarding use, storage, and disposal of radioactive material during previous NRDL operations at HPS (TtEMI, LFR, and U&A, 1997). The goal of the Phase III investigation was the eventual release of all remaining former NRDL buildings at Parcel E for unrestricted reuse. Based on the recommendations of RASO, radiological surveys were conducted at sites where residual contamination was known to exist or where radiation surveys had not been performed as part of the termination process for a radioactive material license. Buildings or sites where either no radiological material was used or stored, or where previous radiological surveys had been performed and the site was subsequently released for unrestricted reuse, were excluded from the Phase III investigation. The Phase III investigation included former Buildings 506 through 510, 510A, 517, 529, and the Building 707 concrete pad area.

The Phase III investigations consisted of surface gamma walkover surveys and collection of soil, asphalt, concrete, and swipe samples. Ten- by 10-foot-square grids were used to map and identify anomalies identified during the surveys. Additionally, a static gamma survey was performed. Where elevated gamma readings were observed, the location, count rate, and exposure rate measurements were recorded and soil samples were collected to evaluate which gamma-emitting radionuclides were present above background levels. The locations of the soil samples collected during the Phase III radiological investigation are presented on [Figures 4 and 5](#).

2.2.1.10. Interim Parcel E Radiation Risk Assessment (1997)

As part of the Parcel E RI, the Navy performed a radiation risk assessment to evaluate potential risks associated with human exposure (for residential and industrial scenarios) to radionuclides detected at Parcel E (TtEMI, LFR, and U&A, 1997). The radiological risk assessment evaluated four sites at Parcel E (IR-02 Northwest, IR-02 Central, IR-02 Southeast, and IR-11/14/15), as well as IR-01/21, which is currently in Parcel E-2.

^{226}Ra and its radioactive daughter products (lead-210 [^{210}Pb] and radon-222 [^{222}Rn]) were identified as radionuclides of potential concern. Radiological data collected from the Phase I through Phase III investigation were used to quantitatively conduct the risk assessment. Risks were quantified for exposure to ^{226}Ra in soil and to ^{222}Rn in indoor air. Because the ^{222}Rn risk is only relevant if buildings are constructed in a radiologically impacted area, this risk was evaluated separately.

For purposes of the risk assessment, Parcel E was divided into 0.5-acre and 2,500-square foot exposure areas to represent industrial and residential land use, respectively. IR-02 and IR-11/14/15 are planned for open space and maritime-industrial land use (which does not include residential exposure), thus the industrial exposure scenario evaluated in the risk assessment was considered the most appropriate comparison for anticipated land use. Under the industrial land use scenario, workers were assumed to be

exposed to radionuclides through ingestion of soil, inhalation of airborne particulates, inhalation of ^{222}Rn gas, and external exposure.

For exposure to ^{226}Ra under the industrial exposure scenario, the risk assessment identified that nine exposure areas had calculated excess lifetime cancer risks between $1\text{E}-06$ and $1\text{E}-05$ for the reasonable maximum exposure (RME) case. All nine exposure areas with a risk of $1\text{E}-06$ and greater were located in IR-02 Northwest, in the vicinity of the Polychlorinated Biphenyl (PCB) Hot Spot Area. As discussed in [Section 2.2.2.3](#) below, a removal action was conducted in the PCB Hot Spot Area to remove radiological contaminants exceeding action levels. Accordingly, the radiological risks quantified in the previous radiological risk assessment are not reflective of current conditions.

For exposure to ^{222}Rn under the industrial exposure scenario, the risk assessment identified that 10 exposure areas had calculated excess lifetime cancer risks between $1\text{E}-05$ and $1\text{E}-04$ for the RME case, and an additional 6 exposure areas had calculated excess lifetime cancer risks between $1\text{E}-06$ and $1\text{E}-05$. All of the exposure areas were located within IR-02 Northwest and IR-02 Central. Accordingly, risks related to ^{222}Rn were not considered relevant because no buildings were constructed in the exposure areas. The assessment report concluded that health risks for exposure to ^{226}Ra in soil were not considered significant (TtEMI, LFR, and U&A, 1997). Please refer to additional information presented in [Sections 2.3 and 2.5](#) regarding updated soil characterization and risk analyses.

2.2.1.11. Phase IV Radiological Investigation (1999)

In 1999, the Phase IV radiological investigation was initiated to evaluate background activities of specific radionuclides and to further characterize the areas of anomalous count rates identified at the Building 707 concrete pad area during the Phase III investigation. The investigation consisted of the collection of 28 concrete and asphalt samples and 28 soil samples at the concrete pad area, comparison of detected concentrations with background concentrations, and evaluation of the risk posed to human health by radioactive isotopes. The locations of the soil samples collected during the Phase IV radiological investigation are presented on [Figure 4](#).

2.2.1.12. Interim Investigation between Phase IV and Phase V Radiological Investigations (2001)

A characterization survey of the shoreline of Parcel E and what is now Parcel E-2 was performed in 2001. Gamma scans were conducted over pre-positioned grids within approximately 50 feet of the mean tide line. Approximately 900 areas were noted during the survey with gamma levels that exceeded twice the background gamma radiation levels; the highest measurements were identified in the area known as the “metal reef” within IR-02 Southeast at Parcel E. Samples collected from those locations identified ^{226}Ra as the contaminant.

2.2.1.13. Radiological Groundwater Investigation (2001 and 2002)

In 2001 and 2002, a groundwater data gaps investigation (GDGI) was performed at various sites in Parcels E, E-2, and G to collect isotope-specific data for “radionuclides of interest,” defined as species that may be site-related or may be present in the environment as natural or anthropogenic background as known at the time (prior to issuance of the HRA) (TtEMI, 2004). The investigation was intended to supplement data collected during previous investigations for radiological indicator parameters (gross alpha and gross beta) because the nonspecific results for gross alpha and gross beta did not allow the Navy to distinguish between natural and potentially site-related components of radioactivity in shallow groundwater (within what is referred to as the “A-aquifer”).

The GDGI was conducted in three phases. Phase I, conducted from April through December 2000, consisted of the inspection, repair, and redevelopment of existing monitoring wells, with no groundwater sampling conducted. During the Phase II investigation, conducted from January through April of 2001, samples were collected from 35 A-aquifer monitoring wells, 2 B-aquifer monitoring wells, and 1 bedrock water-bearing zone monitoring well in Parcel E and analyzed for gross alpha and gross beta radiological indicators. In addition, groundwater samples from 13 of the A-aquifer wells located in IR-02 and IR-03 were analyzed for ^{226}Ra and ^{228}Ra .

During Phase III, conducted between July and August 2002, groundwater samples collected from 24 A-aquifer wells at Parcel E were analyzed for 44 specific isotopes. The wells and sampling events were selected to provide spatial and temporal coverage of Parcel E, background areas, and areas where radioactive materials were used or stored. Most of the wells were located within IR-02 and IR-03, with 18 wells located within IR-02, and 2 wells located within IR-03. Three wells were located within IR-14, and one well designated as a background well (IR12MW20A) was located within IR-12. Three (IR12MW20A, IR14MW10A, and IR14MW12A) of the 24 A-aquifer wells were also analyzed for ^3H , which was not included in the full suite of isotopes. An additional four A-aquifer wells (IR02MW89A, IR36MW11A, IR36MW135A, and IR72MW32A) were analyzed exclusively for ^3H . Wells were sampled twice between July and October 2002. Figure 6 identifies the monitoring wells sampled during the Phase II and Phase III of the GDGI. Wells that were analyzed exclusively for gross alpha and gross beta parameters are not presented on Figure 6.

2.2.1.14. Phase V Radiological Investigation (2002 to 2003)

The Phase V radiological investigation began in January 2002. The purpose was to support the release of buildings or areas that had been identified as areas where radioactive materials had been used or areas where previous removal actions to remove known contamination had occurred. The Phase V radiological investigation of Parcel E was performed in 2002 and 2003 prior to the issuance of the HPS HRA (NAVSEA, 2004).

Each site evaluated during the Phase V investigation was assessed for potential ROCs using scan surface contamination surveys for gamma radiation, fixed static (direct) gamma scans, alpha and beta static readings, dose rate measurements, alpha and beta swipes, ^3H swipes (if appropriate), and sample analysis. Solid samples were analyzed by alpha or gamma spectroscopy, or beta analysis if appropriate. The extent of survey coverage at each site followed protocols established in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) (U.S. Department of Defense et al., 2000). These protocols include prescribed densities for measurements and sample collection, ranging from Class 1 surveys (higher density of measurements and samples) to Class 3 surveys (lower density of measurements and samples). The extent of the surveys depended upon the MARSSIM area classification of each site. Class 1 surveys covered 100 percent of sites designated as Class 1 areas, and Class 2 and 3 surveys were performed at a subset of each area dependent upon the MARSSIM designation (50 percent of each Class 2 area received a Class 2 survey, and 20 percent of each Class 3 area received a Class 3 survey). If contamination was found during a Class 3 survey, a 100 percent characterization survey was conducted, followed by remediation (and associated support surveys), and a Class 1 final status survey. Results of the Phase V surveys are presented in [Section 2.3](#) and organized by individual study area or building within each redevelopment block. During the Phase V investigation, 16 reference surface soil samples (taken within 6 inches of the ground surface) were collected from areas within Parcels B, C, D, and E that were determined, in consultation with the Navy's RASO, to not be impacted by previous radiological operations at HPS. This determination was aligned with the historical records used to develop the HRA (NAVSEA, 2004). The average background concentration of ^{226}Ra was determined to be 0.82 picoCuries per gram (pCi/g). The data from the Phase V investigations are compiled in [Appendix A](#); however, the locations of the soil samples collected during the Phase V investigation are not available.

2.2.1.15. Characterization of the Metal Debris Reef Area (2004)

In support of the removal action at the Metal Debris Reef Area, site characterization was performed to further define the vertical and horizontal extent of the metal reef. The characterization activities were conducted from June through September 2004 and included (1) topographic and bathymetric surveys, (2) marine geophysics surveys, (3) landside geophysics surveys, (4) environmental resources surveys, (5) vibracoring and sonic drilling, and (6) sampling activities. The metal reef was found to comprise a volume of approximately 8,500 cubic yards of concrete debris, metal scrap, and metal slag extending to about 12 feet bgs. Site characterization activities involved collecting samples from offshore and onshore borings and analyzing the samples for radioactive and nonradioactive chemicals. Elevated activity levels of ^{137}Cs and ^{226}Ra and elevated concentrations of metals, PCBs, and pesticides were identified at the Metal Debris Reef Area (Tetra Tech FW, Inc. 2005). The metal reef and debris within the area were removed between 2005 and 2007 (see [Section 2.2.2.2](#)).

2.2.1.16. Radiological Groundwater Investigation (2007 through 2009)

Based on the results of the groundwater data gaps investigation, the Navy implemented a basewide groundwater monitoring program (BGMP) in 2004 (Barajas & Associates, 2008). Groundwater sampling for nonradioactive chemicals under the BGMP began in June 2004 and has been conducted on a quarterly basis since 2004. Groundwater data for radioactive chemicals were collected under the BGMP as part of several supplemental monitoring events. Beginning in the first quarter 2007, groundwater samples were collected from six A-aquifer wells (IR02MW126A, IR02MW147A, IR02MW149A, IR02MW179A, IR02MW209A, and IR02MWB-1) in Parcel E and submitted to an off-site laboratory for analysis of ^{137}Cs and ^{226}Ra (CE2-Kleinfelder JV, 2007a). Beginning in the second quarter 2007, wells IR02MW175A and IR02MW301A were added to the sampling protocol (CE2-Kleinfelder JV, 2007b). All eight wells were sampled quarterly for radionuclides through the third quarter 2008.

In 2008, a supplemental data collection event was conducted at Parcel E to further evaluate the nature and extent of radionuclides in groundwater. In June and July 2008, groundwater samples were collected from an additional eight monitoring wells (seven in the A-aquifer and one in the deeper B-aquifer) and submitted to an off-site laboratory for radionuclide analyses of ^{137}Cs , ^{226}Ra , and ^{90}Sr . In addition, samples collected from monitoring well IR12MW14A were evaluated for ^{239}Pu . Two rounds of sampling were conducted at each well, except at wells IR03MW218A2 and IR36MW123B, which were sampled once. In September 2008, groundwater samples were collected from wells IR02MW374A, IR02MW375A, and IR02MWB-2 and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . Figure 6 identifies the monitoring wells sampled during the 2008 supplemental BGMP. Sampling information from the supplemental BGMP is presented in the Semiannual Groundwater Monitoring Report for April to September 2008 (CE2-Kleinfelder JV, 2009). In the first quarter 2009, samples were collected from 12 A-aquifer wells and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . An additional sample was collected from monitoring well IR12MW14A for analysis of ^{239}Pu . Samples from A-aquifer monitoring well IR36MW09A and B-aquifer monitoring well IR36MW123B were analyzed exclusively for ^{226}Ra .

2.2.2. Previous Removal Actions

The Navy has performed several removal actions at Parcel E that have involved excavation and off-site disposal of LLRW. The following subsections briefly describe these previous removal actions. As discussed in Section 2.1.2, the Navy is currently performing removal actions at several radiologically impacted sites in Parcel E.

2.2.2.1. IR-02 Northwest and Central Area (2005 to 2007)

A time-critical removal action (TCRA) was conducted from 2005 to 2007 at IR-02 Northwest and Central to eliminate any threat posed by future migration and release of radioactive material or nonradioactive chemicals from the site to the surrounding environment (TtECI, 2007d). The removal action was designed to remove debris and other materials with radioactivity above the radiological remedial

objectives (RROs) within a predetermined excavation boundary based upon previous radiological investigations. The excavation was performed in a series of 6-inch or 12-inch lifts, to a maximum depth of approximately 11 feet bgs (TtECI, 2007d). Approximately 49,500 cubic yards of soil was excavated and screened ex situ to identify radioactive material. Out of this total volume, approximately 2,342 point sources and pieces of radioactively contaminated debris were identified, segregated, and disposed of off site as LLRW. In addition, three drums containing mixed waste with radiological contamination were disposed of off site.

Post-excavation radiological soil samples were collected and analyzed for ^{226}Ra , ^{137}Cs , and ^{90}Sr . Analytical results indicated the following:

- ^{137}Cs and ^{90}Sr results in post-excavation bottom and sidewall samples were all less than their respective RROs;
- ^{226}Ra results in 155 of 160 systematic grid samples were below the RRO;
- ^{226}Ra results in 59 of 63 random grid samples were below the RRO; and
- ^{226}Ra results in all 29 sidewall samples were below the RRO.

The RROs for radiological materials were achieved within the predetermined boundaries of IR-02. The nine samples with activities (ranging from 2.1 to 6.2 pCi/g) that exceeded the RRO for ^{226}Ra were isolated spatially and were collected at the bottom of the excavation at depths greater than 11 feet. The top 3 feet of the excavation was backfilled with clean imported soil that met chemical acceptance criteria presented in the TCRA Work Plan (TtECI, 2005). In addition, clean imported fill was placed at the bottom of the excavation to bridge standing water. The remaining excavation volume was backfilled with approximately 33,900 cubic yards of excavated soil that, following radiological screening, was released for use as backfill (TtECI, 2007d). A ground surface survey for gamma-emitting radionuclides was conducted within the unexcavated areas of IR-02 during demobilization. The surveys identified three locations outside of the TCRA boundary with elevated readings ranging from 10,000 to 89,000 cpm; no further investigation or removal was conducted at these areas (TtECI, 2007d).

Post-excavation soil data are presented in the “Final Removal Action Completion Report [RACR], IR-02 Northwest and Central” (TtECI, 2007d). Radiological analytical reports are provided in Appendix G of the RACR, with the sampling locations (and the results for the nine isolated samples with activities exceeding the RROs) depicted in Figure 4-3 of the RACR (TtECI, 2007d).

2.2.2.2. IR-02 Southeast Metal Debris Reef (2005 to 2007)

The TCRA at the Metal Debris Reef was performed in conjunction with removal of the Metal Slag Area located in the southeast portion of Parcel E. The purpose of the TCRA was to remove metal debris and slag containing low-level radiological material, as well as nonradiological chemical contamination incidental to the area. Site characterization was performed to delineate the vertical and lateral extents of

the metal debris and slag prior to excavation. The excavation was performed in a series of 12-inch lifts, to maximum depth of 4 feet bgs. After the initial excavation was completed, trenches were extended beyond the excavation perimeter to confirm the extent of metal debris and slag. No additional metal debris or slag was found at the edges of the excavation; as a result, the initial excavation boundaries did not require expansion (TtECI, 2007c).

Approximately 11,200 cubic yards of soil, metal slag, and debris was removed from the Metal Debris Reef and disposed of off site (TtECI, 2007c). Out of this total volume, approximately 1,626 cubic yards of soil and sediment was segregated as radiologically impacted. In addition, 131 radiological point sources (including devices, buttons, and pieces of radioactively contaminated debris) and approximately 31 cubic yards of metal debris were identified within the removal area (Navy, 2006b and 2006c; TtECI, 2007c).

The entire Metal Debris Reef excavation was backfilled with clean imported fill material that was tested prior to use (TtECI, 2007c). Post-excavation soil samples were collected and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . Analytical results for 191 of the 193 post-excavation soil samples met the specified RROs. The two samples with results that failed to meet the specified RROs were isolated and confirmed that no widespread radiological contamination was present at the Metal Debris Reef. In addition, residual radioactivity at the two isolated post-excavation soil sample locations is covered with clean soil, thereby preventing direct exposure to surrounding populations and wildlife (TtECI, 2007c). Post-excavation soil data are presented in the “Final Removal Action Completion Report, Metal Debris Reef and Metal Slag Area Excavation Sites” (TtECI, 2007c). Radiological analytical reports are provided in Appendix M of the RACR, with the sampling locations depicted on Figures 4-3 and 4-4 of the RACR (TtECI, 2007c).

2.2.2.3. PCB Hot Spot Area TCRA (2005 to 2007)

The TCRA at the PCB Hot Spot Area, which is located primarily in Parcel E-2 and within a small portion of Parcel E, was designed to remove PCB- and petroleum hydrocarbon-contaminated soil and debris, possibly containing LLRW. Excavation involved (1) removal of soils containing PCBs at concentrations greater than the depth-based removal action goals (1 milligram per kilogram [mg/kg] from the surface to 3 feet bgs and 100 mg/kg deeper than 3 feet bgs); (2) total petroleum hydrocarbons at concentrations greater than 3,500 mg/kg; or (3) radiological contaminants above the RROs. The removal action goals also included removal of free-phase petroleum hydrocarbons to the extent practicable. The excavation was performed in a series of 12-inch lifts to a maximum depth of 21 feet bgs. During excavation activities, oil-stained soil and free-phase product were observed along the western and southwestern sidewall of the excavation boundary; however, further excavation in these areas was not possible because of their proximity to San Francisco Bay. Visual observation and field-screening test kits of exploratory potholes excavated between the excavation and the bay identified contamination (including oil staining and free-phase product) (TtECI, 2007b).

Approximately 44,500 cubic yards of soil and debris was removed and disposed of off site as part of this removal action. Out of this total volume, 533 cubic yards of soil and fire brick was segregated as radiologically impacted. Also, 40 radiological devices, 78 cubic yards of metal debris, and 19 pieces of other radioactively contaminated debris were identified within the removal area (TtECI, 2007b). In addition to this radiologically impacted debris, 110 drums and 537 assorted waste containers were recovered from the central portion of the removal area and were characterized prior to off-site disposal. The drums, which were discovered in varying degrees of decay, contained grease, oil, soil, asphalt, and tar substances. Waste characterization data indicated that the drums contained various chemicals, including PCBs. Two of the drums contained mixed waste with radiological contamination. The small containers contained various laboratory chemicals, ranging from strong acids and bases to solvents, alcohols, and inorganic salts (TtECI, 2007b).

Post-excavation soil samples were collected and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr (the ROCs for IR-01/21 and IR-02). Analytical results for all post-excavation soil samples met the specified RROs. Post-excavation soil data are presented in the “Final Removal Action Completion Report, PCB Hot Spot Soil Excavation Site” (TtECI, 2007b). Radiological analytical results are provided in Appendix M of the RACR, with sampling locations depicted on Figures 4-10 through 4-11 of the RACR.

2.3. NATURE AND EXTENT OF RADIONUCLIDES IN SOIL AND GROUNDWATER

The soil and groundwater data derived from the various radiological investigations, as discussed in Section 2.2, were used to evaluate the nature and extent of ROCs in soil and groundwater at Parcel E. The nature and extent evaluation presented in this section documents that an adequate amount of data exist to support a screening-level human health risk assessment (HHRA) based on the planned reuse of Parcel E and to evaluate remedial alternatives for Parcel E. As identified in the HRA (NAVSEA, 2004), shoreline sediment (within the intertidal shoreline zone) and structures at Parcel E are also considered radiologically impacted; however, data are inadequate to support a detailed evaluation of the nature and extent of radionuclides in shoreline sediment and structures. In the absence of such data, this radiological addendum assumes that the radiologically impacted shoreline sediment and structures, as identified in the HRA, will require remedial option analysis (in Sections 3, 4, and 5).

2.3.1. Nature and Extent of Radionuclides in Soil (and associated structures)

2.3.1.1. Potential Sources of Radioactive Contamination and Impacted Media

Table 1 identifies each of the radiologically impacted areas at Parcel E and the ROCs at each area. Section 2.1.2 discussed the radiological operations at each impacted area and identified the potential sources of radioactive contamination. Two general sources of potential radioactive contamination exist at Parcel E: NRDL activities at the former 500 series buildings, Building 707 Triangle Area, and other buildings formerly occupied by NRDL; and historic waste disposal activities that occurred mainly along the shoreline, primarily IR-02. Additional radiological activities at Parcel E include:

- Practical and applied research on radiation decontamination methods and on the effects of radiation on living organisms and natural and synthetic materials, primarily conducted within the former 500 series buildings and within the Building 707 Triangle Area
- Disposal of radioluminescent commodity items (such as dials, gauges, and deck markers) within IR-02 and IR-03
- Disposal of industrial debris and metal slag with radioactive anomalies at the Metal Debris Reef
- Potential discharge of small amounts of low-level radioactive liquids into drains at NRDL buildings (potentially leading to sanitary sewer, storm drain, and septic sewer lines)

The HRA evaluated the potential for residual radioactive contamination at each impacted site based on historical information, previous radiological survey results, and site reconnaissance (NAVSEA, 2004). Table 2, as excerpted from the HRA, identifies the potential for various media (for example, surface soil, subsurface soil, groundwater, etc.) to contain radioactive contamination. As shown in Table 2, surface and subsurface soil are the most likely media to contain radioactive contamination at Parcel E.

2.3.1.2. Radionuclides Detected in Soil

The following paragraphs briefly discuss the detections of radionuclides in soil at Parcel E. The following discussion is focused on the results from the Phase V investigation, which evaluated whether residual radioactivity on the surface met the predetermined release criterion as summarized below.

- ^{226}Ra : 1 pCi/g greater than background, not to exceed 2 pCi/g³
- ^{90}Sr : 10.8 pCi/g
- ^{137}Cs : 0.13 pCi/g⁴
- ^{241}Am : 5.67 pCi/g
- ^{239}Pu : 14.0 pCi/g
- ^{235}U : 0.398 pCi/g
- ^{60}Co : 0.060 pCi/g

These release criteria were considered equivalent to EPA preliminary remediation goals (PRGs) for outdoor worker exposure to soil, based on agreements with EPA. For ^{226}Ra and ^{137}Cs , the outdoor worker release criteria are identical to the release criteria for future residents. The outdoor worker release criteria for ^{90}Sr , ^{241}Am , ^{239}Pu , ^{235}U , and ^{60}Co are greater than the residential release criteria; however, these differences were accounted for in this radiological addendum because (1) no radiologically impacted sites were eliminated from further evaluation (as part of the remedial option analysis in Sections 3, 4, and 5)

³ The ^{226}Ra release criterion was 5 pCi/g when the Phase V investigation was started but was subsequently reduced to 1 pCi/g above background; the uncertainty related to this change in criterion is discussed in Section 2.5.4.

⁴ The ^{137}Cs release criterion applied to this survey when conducted in 2002 is slightly higher than the one used today (0.113 pCi/g); however, this change does not directly impact the results of this survey.

based on the results from the Phase V data, and (2) the remedial option analysis considered both the outdoor worker and residential release criteria in developing remediation goals.

The discussion of radionuclide data presented in the following paragraphs is limited to the sites for which radiological data are available; to date, radiological data have not been collected at each radiologically impacted site discussed in [Section 2.1.2](#) and identified in [Table 2](#). In the absence of such data, this radiological addendum assumes that radiologically impacted subsurface soil, as identified in the HRA ([NAVSEA, 2004](#)), will require remedial option analysis (in [Sections 3, 4, and 5](#)).

Redevelopment Block MU-1

Building 707 and 707 Triangle Area

In 1969, NRDL conducted a radiological survey at Building 707; the building was decontaminated to background levels and released by NRDL for unrestricted reuse ([TtEMI, LFR, and U&A, 1997](#)). In January 1970, Building 707 was inspected and cleared by AEC for unrestricted reuse ([TtEMI, LFR, and U&A, 1997](#)).

In 1978, RASO conducted a survey consisting of alpha and beta-gamma scans and wipe sampling for alpha and beta-gamma activity. No areas of elevated radioactivity were identified in the building.

In 1997, the concrete pad adjacent to Building 707 was surveyed during the Phase III investigation ([TtEMI, LFR, and U&A, 1997](#)). The investigation consisted of a surface gamma walkover survey of the pad and surrounding area, collection and analysis of concrete and asphalt samples from 27 locations surrounding the pad, and collection and analysis of 52 wipe samples from the concrete pad. Thirteen (B707SS04 through B707SS16) of the 27 surface sampling locations were located on the asphalt. Soil samples were collected under two asphalt sampling locations (B707SS04 and B707SS14).

Two areas on the pad and two areas on the asphalt near the pad exhibited elevated gamma readings exceeding background. The two anomalous areas on the pad were located approximately 10 feet apart and had gamma count readings of 18,640 and 21,115 cpm, above the average background rate of 5,800 cpm for concrete. The two anomalous areas off the pad were located to the southeast of the pad on the asphalt near “J” Street. Gamma count readings (32,300 and 17,300 cpm) at these anomalies exceeded the background activity of 7,600 cpm for asphalt cover.

To further evaluate the anomalies, asphalt and concrete samples were collected from these areas. Three of the four anomalies were sampled; only one sample was collected from the pad because of the proximity of the two anomalies. The laboratory results indicated elevated activities of ^{137}Cs , ^{226}Ra , thorium-228, and thorium-232 exceeding their respective screening criteria ([TtEMI, LFR, and U&A, 1997](#)). The activities of ^{137}Cs ranged from 4,300 pCi/g to 7,000 pCi/g, exceeding the Navy’s ^{137}Cs

criterion for hot spots of 100 pCi/g. ^{226}Ra activities ranged from 51 to 61 pCi/g, exceeding the Navy's criterion of 5 pCi/g at the surface.

No radioisotopes were reported in the soil samples at activities exceeding background, except for one sample analyzed for ^{40}K , which was reported at an activity of 16 pCi/g, exceeding the background activity of 10 pCi/g. Gross alpha and gross beta measurements from the wipe samples did not exceed the acceptable contamination criteria for maximum activity, average activity, or removable acceptable surface activity. Based on the results of the Phase III investigation, additional investigation was recommended in the area of the concrete pad to address the anomalies.

In 1999, the Building 707 concrete pad was further investigated as part of the Phase IV investigation. The investigation included collection and analysis of 28 asphalt and concrete samples and 28 soil samples from areas near the anomalies identified in the Phase III investigation (TtEMI, 2000). At each of the anomalous locations, one sample was collected from the "hottest" area (as determined by 2-inch sodium iodide detector), three samples were detected in a 1-meter concentric ring from the central sampling location, and five samples were collected in a 4-meter ring from the central sampling location. At each sampling location, the concrete or asphalt was cored and sampled and underlying soil or soil aggregate was sampled. In addition, 10 asphalt and concrete samples and 10 soil samples were collected as background samples.

Results of the sampling indicated several radionuclides of concern (^{241}Am , ^{137}Cs , ^{60}Co , europium-152 [^{152}Eu], europium-154 [^{154}Eu], and ^{235}U) were present exceeding background by more than three standard deviations. To evaluate whether the Building 707 concrete pad area would require remediation, radionuclide activities were compared against site-specific derived concentration guideline levels (DCGLs) and decay-corrected PRGs. DCGLs were calculated for the ROCs exceeding background using RESRAD. ^{137}Cs was the only radionuclide that exceeded the site-specific DCGL of 13.1 pCi/g; the highest reported activity of ^{137}Cs was 84.2 pCi/g in sample location 707A1. The average activity of ^{137}Cs exceeded the PRG of 0.13 pCi/g. The maximum reported activities of ^{241}Am , ^{152}Eu , ^{154}Eu , and ^{235}U exceeded their respective PRGs; however, the average activities did not exceed the PRGs. The human health risk, calculated using RESRAD, posed by radioactive isotopes at the Building 707 concrete pad site ranged from 9E-06 to 1E-05 and is within the acceptable risk range (TtEMI, 2000).

In 2002, a MARSSIM scoping survey was conducted at the location of the Building 707 concrete pad area during the Phase V investigation. The designed surveillance area for the concrete pad was organized into 12 survey units, with each unit designated as a Class I area with a surface area not more than 100 square meters (m^2). Survey methods included static and scan measurements for gamma radiation, static and scan measurements for alpha and beta radiation, exposure rate measurements, and analysis of solid samples. Two solid samples were collected from each of the 12 survey units. ^{137}Cs exceeded the release criterion in 4 of the 12 survey units, with a maximum reported activity of 0.277 pCi/g in survey unit G. ^{226}Ra

exceeded the release criterion in 7 of the 12 survey units, with a maximum reported activity of 3.892 pCi/g in survey unit D. Based on the results of the Phase V investigation, a characterization survey and subsequent remedial action were recommended for the site.

The MARSSIM scoping survey also included the location of the Triangle Area during the Phase V investigation. The designed surveillance area for the Triangle Area was organized into seven survey units, with each unit designated as a Class I area with a surface area not more than 2,000 m². Survey methods included static and scan measurements for gamma radiation, static and scan measurements for alpha and beta radiation, exposure rate measurements, and analysis of solid samples. Sixteen solid samples were collected from each survey unit except for grid ATI, from which two samples were collected. ¹³⁷Cs and ²²⁶Ra exceeded the release criteria in each of the seven survey units. The maximum reported activities were 113.960 pCi/g for ¹³⁷Cs and 6.640 pCi/g for ²²⁶Ra, both located in survey unit ATI. ²³⁵U was also reported in each of the survey units at activities ranging from 0.519 pCi/g (survey unit API) to 1.615 pCi/g (survey unit ATI). Based on the results of the Phase V investigation, characterization surveys and subsequent remedial action were recommended for the site.

A final status survey was conducted in Building 707 during the Phase V survey. The survey consisted of collecting 16 static readings from each of 17 survey units within the building, with each survey unit not more than 100 m². The mean net alpha static measurements ranged from -9 to 4 dpm/100 cm² within the survey units, with maximum net alpha measurements ranging from -6 to 19 dpm/100 cm². Mean net beta static measurements ranged from -352 to 314 dpm/100 cm² within the survey units, with maximum net beta measurements ranging from 68 to 779 dpm/100 cm². In addition, 16 static readings were collected from each of 10 survey units in the kennels, with each survey unit not more than 100 m². The mean net alpha static measurements ranged from -4 to 24 dpm/100 cm² within the survey units, with maximum net alpha measurements ranging from 14 to 109 dpm/100 cm². Mean net beta static measurements ranged from 215 to 582 dpm/100 cm² within the survey units, with maximum net beta measurements ranging from 479 to 1,294 dpm/100 cm².

Redevelopment Block MU-2

Building 406

In 2002, a MARSSIM scoping survey was conducted in Building 406 during the Phase V investigation. The survey consisted of collecting 16 alpha and beta static readings from each of 57 survey units within the building. The mean net alpha static measurements ranged from -9 to 16 dpm/100 cm² within the survey units, with maximum net alpha measurements ranging from 3 to 57 dpm/100 cm². Mean net beta static measurements ranged from -839 to 1,625 dpm/100 cm² within the survey units, with maximum net beta measurements ranging from -442 to 2,656 dpm/100 cm². Areas containing ²²⁶Ra exceeding release criteria were identified, remediated, and the building was resurveyed.

Building 414

In 2002, a MARSSIM scoping survey was conducted at the location of Building 414 during the Phase V investigation. The investigation consisted of collection and analysis of two surface soil samples near the building for ^{137}Cs and ^{226}Ra . ^{137}Cs did not exceed the release criterion, with a maximum activity of 0.043 pCi/g. ^{226}Ra exceeded the release criterion in one of the two samples, with a maximum activity of 1.822 pCi/g.

Building 506 Site

Building 506 was first surveyed in 1955 as part of the NRDL decommissioning survey (NAVSEA, 2004). The NRDL release letter indicates the building was released for unrestricted reuse, with the caveat that a radiation monitor must accompany working parties on the sewer systems for monitoring until the drain lines are replaced. No other information is available regarding the 1955 NRDL survey at Building 506.

In 1969, NRDL conducted a radiological survey at Building 506 (TtEMI, LFR, and U&A, 1997). Results of wipe samples collected in rooms 35 and 35A indicated the presence of ^3H contamination, and several other areas and pieces of equipment were also contaminated with ^3H . Detectable contamination was removed by washing the affected areas and dismantling contaminated equipment, and contaminated areas were steam cleaned following decontamination. All radioactive waste and dismantled equipment was packaged and disposed of off site. Following completion of decontamination, Building 506 was resurveyed by NRDL personnel, and wipe samples indicated the site was decontaminated to background levels. In December 1969, Building 506 was inspected and cleared by the AEC for unrestricted reuse (TtEMI, LFR, and U&A, 1997).

In 1978, RASO conducted a survey consisting of alpha and beta-gamma scans and wipe sampling for alpha and beta-gamma activity. Three isolated locations of beta-gamma activity were detected, which were less than NRC guidelines.

In 1997, the location of former Building 506 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of 15 surface soil and 3 asphalt samples near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in soil or asphalt samples at activities exceeding background. Release of the Building 506 Area was not recommended because a potential buried point source was encountered behind Building 529, which was previously discussed above in the summary of the Building 529 Area.

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 506 during the Phase V investigation. Nine surface soil samples were collected near the former building and analyzed at the on-site laboratory for ^{241}Am , ^{137}Cs , and ^{226}Ra . ^{241}Am and ^{137}Cs activities did not exceed the release

criteria, with maximum reported activities of 0.197 and 0.069 pCi/g, respectively. ^{226}Ra exceeded the release criterion in two of the nine samples, with a maximum reported activity of 2.175 pCi/g.

Building 507 Site

Building 507 was first surveyed in 1955 as part of the NRDL decommissioning survey and was released for unrestricted reuse (NAVSEA, 2004). In December 1969, Building 507 was inspected and cleared by AEC for unrestricted reuse (TtEMI, LFR, and U&A, 1997).

In 1997, the location of former Building 507 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of six surface soil samples near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in the surface soil samples at activities exceeding background, except for one sample analyzed for ^{40}K , which was reported at an activity of 11 pCi/g, slightly exceeding the background activity of 10 pCi/g. Based on the results of the Phase III survey, the Building 507 Area was recommended to be released for unrestricted reuse.

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 507 as part of the Phase V investigation. Four surface soil samples were collected from a Class 3 Survey Unit near the former building and analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra ; one sample was also sent to an off-site laboratory for independent gamma quality assurance. ^{137}Cs did not exceed the release criterion in any of the samples, with a maximum reported activity of 0.099 pCi/g. ^{226}Ra exceeded the release criterion in one of the samples, with a reported activity of 4.402 pCi/g. Based upon the results of the scoping survey, New World Technology (NWT) concluded the original classification of the Building 507 was incorrect, and further characterization of the site should be performed to identify the extent of residual contamination, with remediation and a Class I survey to be completed after characterization is complete.

Building 508 Site

Building 508 was first surveyed in 1955 as part of the NRDL decommissioning survey and was released for unrestricted reuse (NAVSEA, 2004). In December 1969, Building 508 was inspected and cleared by AEC for unrestricted reuse (TtEMI, LFR, and U&A, 1997).

In 1997, the location of former Building 508 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of seven surface soil samples near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in the

surface soil samples at activities exceeding background. Based on the results of the Phase III survey, the Building 508 Area was recommended to be released for unrestricted reuse.

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 508 as part of the Phase V investigation. Four surface soil samples were collected from a Class 3 Survey Unit near the former building and analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra ; one sample was also sent to an off-site laboratory for independent gamma quality assurance. ^{137}Cs and ^{226}Ra activities did not exceed the release criteria in any of the samples, with maximum reported activities of 0.1267 and 1.0577 pCi/g, respectively. Statistical test applications and solid sample analysis results indicated the residual activity at the Building 508 site did not exceed the release criteria.

Building 520 Site

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 520 during the Phase V investigation. The investigation consisted of collection and analysis of three surface soil samples near the former building. The analysis of collected field data and solid sample analysis indicated the residual activity at Building 520 exceeded the release criteria, with ^{226}Ra reported at a maximum activity of 1.978 pCi/g at sample location S-1. According to the HRA, the radium contamination was found near the foundation of Building 520, indicating contamination was likely present in the drain system (NAVSEA, 2004). NWT recommended that sample location S-1 should be remediated, and new systematic samples should be collected in the area. NWT further recommended the area should be reclassified as a Class 1 or Class 2 area for survey purposes.

Building 529 Site

In 1969, NRDL conducted a radiological survey at Building 529; radiation was not detected in the building (TtEMI, LFR, and U&A, 1997). The stainless steel holding tank was decontaminated, and results from wipe samples following decontamination indicated the tank was decontaminated to background levels. Following decontamination, the tank was moved from the vicinity of Building 529. In December 1969, Building 529 was inspected and cleared by the AEC for unrestricted reuse (TtEMI, LFR, and U&A, 1997).

In 1978, RASO conducted a survey consisting of alpha and beta-gamma scans and wipe sampling for alpha and beta-gamma activity. No areas of elevated radioactivity were identified in the building (TtEMI, LFR, and U&A, 1997).

In 1997, the location of former Building 529 was surveyed during the Phase III investigation (TtEMI, LFR, and U&A, 1997). The investigation consisted of a surface gamma walkover survey and collection and analysis of four surface soil samples near the former building. One elevated gamma radiation reading was observed to the southwest of the former building, between former Buildings 529 and 520 near the foundation of former Building 520. The location of the elevated gamma reading was excavated to a depth of 12 inches bgs and gamma activity increased with depth, although no source was

found. At the surface, the gamma count reading was 11,205 cpm; at 4 inches, the count was 13,130 cpm; and at 12 inches, the count was 18,394 cpm, nearly three times background. Although the gamma anomaly was located near the foundation of former Building 520, it was associated in the Phase III investigation with former Building 529, since former Building 520 was not included in the Phase III investigation. Additional investigation was recommended to evaluate the area for the potential presence of a buried radium-containing device.

No radioisotopes were reported in the soil samples at activities exceeding background, except for one sample analyzed for potassium-40 (^{40}K), which was reported at an activity of 13 pCi/g, slightly exceeding the background activity of 10 pCi/g.

In 2002, a MARSSIM scoping survey at the location of former Building 529 during the Phase V investigation; contaminated underground piping was found in the area. Three surface soil samples were collected and analyzed at the on-site laboratory for ^{241}Am , ^{137}Cs , and ^{226}Ra ; one sample was also analyzed for ^{90}Sr . Radionuclide activities did not exceed the release criteria in any of the three soil samples.

Shack 79 Site

In 2002, a MARSSIM Class 3 scoping survey was conducted at the Shack 79 Site during the Phase V investigation. Two surface soil samples were collected near the former building and analyzed at the on-site laboratory for ^{241}Am , ^{137}Cs , and ^{226}Ra . ^{241}Am and ^{137}Cs activities did not exceed the residential release criteria, with maximum reported activities of 0.236 and 0.137 pCi/g, respectively. ^{226}Ra exceeded the release criterion in one of the two samples, with a maximum reported activity of 2.007 pCi/g.

Shack 80 Site

In 2002, a MARSSIM scoping survey was conducted at the Shack 80 Site during the Phase V investigation. Two surface soil samples were collected from a Class 3 survey unit near the former building and analyzed at the on-site laboratory for ^{241}Am , ^{137}Cs , and ^{226}Ra . ^{241}Am activities did not exceed the residential release criterion, with a maximum reported activity of 0.269 pCi/g. ^{137}Cs and ^{226}Ra exceeded the release criteria in both samples, with maximum reported activities of 39.682 and 6.156 pCi/g, respectively. Based on the results of the scoping survey, remedial actions were performed at the site.

Following remedial actions, 16 soil samples were collected from a Class 1 survey unit at the Shack 80 site. ^{137}Cs exceeded the release criterion in five samples, with a maximum reported activity of 2.4293 pCi/g. ^{226}Ra exceeded the release criterion in six samples, with maximum reported activity of 2.953 pCi/g. Based on the results of the Class 1 survey, additional remedial actions were performed at the site, and 16 additional samples were collected from a Class 2 survey unit to identify any potential contamination beyond the building footprint boundary. ^{137}Cs exceeded the release criteria in 11 samples, with a maximum reported activity of 7.7129 pCi/g. ^{226}Ra exceeded the release criteria in 12 samples, with maximum reported activity of 4.467 pCi/g.

Redevelopment Block MU-3

Building 701 Site

In 1991, the location of former Building 701 was surveyed during the Phase I investigation (TtEMI, LFR, and U&A, 1997). No radiological anomalies were found in the area.

In 2002, a MARSSIM scoping survey was conducted at the Building 701 Site during the Phase V investigation. Six surface soil samples were collected near the former building, and six subsurface soil samples were collected from a depth of 12 inches. Soil samples were analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra . ^{137}Cs and ^{226}Ra activities did not exceed the release criteria, with maximum reported activities of 0.039 and 1.206 pCi/g, respectively.

IR-04

In 2002, a MARSSIM scoping survey was conducted at IR-04 during the Phase V investigation. The area was divided into five survey units: three designated as a Class 1 area, encompassing up to 2,000 m² each, and two designated as a Class 2 buffer area surrounding the Class 1 areas. Sixteen soil samples were collected from each survey unit, for a total of 80 samples, and were analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra . ^{137}Cs and ^{226}Ra activities exceeded the release criteria in all survey units, with maximum reported activities of 1.039 pCi/g (in survey grid C) and 4.205 pCi/g (in survey grid D), respectively. Based on the results of the scoping survey, additional characterization and remedial action was recommended for the site.

Redevelopment Blocks EOS-1 through EOS-4

Building 509 Site

In 1997, the location of former Building 509 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of five surface soil samples and one asphalt sample near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in the surface soil or asphalt samples at activities exceeding background, except for one sample analyzed for ^{40}K , which was reported at an activity of 15 pCi/g, exceeding the background activity of 10 pCi/g. Release of the Building 509 Site was not recommended because elevated gamma readings were measured between former Buildings 509 and Building 517, which is discussed further below.

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 509 as part of the Phase V investigation. Six surface soil samples were collected from a Class 3 Survey Unit near the former building and analyzed at the on-site laboratory for ^{137}Cs . ^{137}Cs activities did not exceed the release criterion in any of the samples, with a maximum reported activity of 0.0632 pCi/g. Statistical test applications and solid sample analysis results indicated the residual activity at the Building 509 Site met the release criteria.

Building 510 and 510A Sites

Building 510 was first surveyed in 1955 as part of the NRDL decommissioning survey, and was released for unrestricted reuse (NAVSEA, 2004).

In 1997, the location of former Building 510 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of six surface soil samples near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in the surface soil samples at activities exceeding background, except for one sample analyzed for ^{40}K , which was reported at an activity of 11 pCi/g, slightly exceeding the background activity of 10 pCi/g. Based on the results of the Phase III investigation, the Building 510 Site was recommended to be released for unrestricted reuse.

In 1997, the location of former Building 510A was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of two surface soil samples near the former building. Several 1-minute gamma count measurements exceeded the background activity; however, these measurements could not be associated with an anomaly and were considered to be caused by variances in background activity. No radioisotopes were reported in the surface soil samples at activities exceeding background. Based on the results of the Phase III investigation, the Building 510A Site was recommended to be released for unrestricted reuse.

In 2002, a MARSSIM scoping survey was conducted at the location of former Buildings 510 and 510A as part of the Phase V investigation. Five surface soil samples were collected from a Class 3 survey unit near the former buildings and analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra . ^{137}Cs and ^{226}Ra activities did not exceed the release criteria in any of the samples, with maximum reported activities of 0.0406 and 1.644 pCi/g, respectively. Statistical test applications and solid sample analysis results indicated the residual activity at the Building 510 and 510A site met the release criteria.

Building 517 Site

In January 1970, Building 517 was inspected and cleared by AEC for unrestricted reuse (TtEMI, LFR, and U&A, 1997).

In 1978, RASO conducted a survey consisting of alpha and beta-gamma scans and wipe sampling for alpha and beta-gamma activity. No areas of elevated radioactivity levels were identified in the building.

In 1997, the location of former Building 517 was surveyed during the Phase III investigation. The investigation consisted of a surface gamma walkover survey and collection and analysis of three surface soil samples near the former building. One gamma count measurement (9,000 cpm) slightly above background (6,500 cpm) was observed near the northeast corner of the former building. No radioisotopes

were reported in the surface soil samples at activities exceeding background, except for one sample analyzed for ^{232}Th , which was reported at an activity of 0.96 pCi/g, slightly exceeding the background activity of 0.87 pCi/g. Based on the results of the Phase III investigation, the area around the elevated gamma count reading at Building 517 was recommended to be further assessed.

In 2002, a MARSSIM scoping survey was conducted at the location of former Building 517 during the Phase V investigation. Two surface soil samples were collected near the former building and analyzed for ^{137}Cs and ^{60}Co . The analysis of collected field data and solid sample analysis indicated the residual activity at the Building 517 met the release criteria; however, additional soil samples were recommended because the scan minimum detectable concentration for one of the isotopes of concern could not be achieved.

IR-02

In 1988, Harding Lawson Associates conducted a preliminary surface radiation survey to determine if radioactivity levels at HPS posed unacceptable exposure risks to RI fieldworkers. Project activities included a surface gamma survey for radiation at surface locations at Parcel E. The surface gamma survey was conducted at predetermined on- and off-site locations to obtain background measurements, and at the nodal points of a 50- by 50-foot grid over the entire IR-02 area. Gamma readings were measured at the ground surface and at 1 meter above ground surface at each grid node and along grid lines.

An area of five anomalous gamma readings in IR-02 was also surveyed in more detail using a 10- by 10-foot grid spacing, as well as a ground scanning method (NAVSEA, 2004). Twenty-four elevated readings were detected using the 10-by-10 foot grid spacing, and 8 more were identified using the ground scanning method. Anomalies detected between grid nodes were recorded, mapped, and included in a database. Anomalously high gamma radiation readings were only observed within a portion of IR-02 Northwest, which was characterized by surface debris and machinery parts. These anomalies were observed at small, isolated locations, suggesting the presence of discrete point sources of radioactivity such as buried ^{226}Ra -containing devices (Harding Lawson Associates, 1990).

In 1991, the Phase I radiological investigation was initiated to confirm the nature and extent of ^{226}Ra -containing devices in the disposal area at IR-02 Northwest. The Phase I investigation consisted of the following tasks: (1) a surface gamma walkover survey to establish the extent and locations of an anomalously high gamma readings found in the survey performed by Harding Lawson Associates; (2) collection of soil samples to establish whether radioisotopes other than ^{226}Ra were present at Parcel E; (3) collection of radon flux canister samples to assess the potential presence of radon gas that may be associated with ^{226}Ra -containing devices; and (4) air sampling to determine whether airborne radioactive contaminants posed a health risk to workers at HPS or the surrounding community.

To conduct the surface gamma walkover survey, a local grid coordinate system was developed to map and relocate radioactive material detected during the surface walkover survey. Each grid section was 300-feet by 300-feet square, with each section further subdivided into 30-foot by 30-foot subgrids. During the Phase I SCRS, gamma readings exceeding two times the background level were considered potential radioactive point source anomalies associated with buried radium-containing devices (PRC, 1992). When elevated gamma readings were observed, the location, gamma measurements, and exposure measurements were recorded and a biased soil sample was collected to identify the radioisotopes. To provide additional characterization information, systematic soil samples were also collected at random locations throughout Parcel E at a sampling frequency of one sample per 2 acres.

During the surface walkover survey, over 300 ^{226}Ra -containing point sources were observed in a centralized area at IR-02 Northwest that extended approximately 50 feet across the site boundary into IR-02 Central. The anomalous area was approximately 600 feet by 600 feet in size, and was centered approximately 500 feet west of Building 600. Various ^{226}Ra -containing devices were observed on the ground surface at IR-02 Northwest and were removed prior to soil sample collection. A few anomalously high gamma readings were also recorded in the intertidal area at IR-02 Northwest (PRC, 1992). Radioactive point source anomalies were not found at IR-03 or IR-11/14/15; a combination safe found at IR-11/14/15 had an anomalously high gamma activity associated with a dial on the door (PRC, 1992).

In total, 76 soil samples were collected from IR-02 within the current Parcel E boundary, and 3 soil samples were collected from IR-11/14/15. Thirteen soil samples collected from the disposal dump area at IR-02 Northwest exhibited ^{226}Ra activities above background, ranging from 4 to 3,900 pCi/g.

In addition to the soil sampling, 158 radon flux canister samples were collected at ground surface locations at or near selected radioactive anomalies and other areas with elevated gamma activity. Ten of the samples were collected at IR-14, and 148 samples were collected at IR-02. Flux canister samples were analyzed for radon gas, a radioactive gas emitted into soil from the decay of ^{226}Ra . The analytical results were quantified as a radon flux rate value in pCi/m²-s. Analytical results for the 158 radon flux canister samples collected at Parcel E are summarized below.

- Twenty-one samples had no detectable levels of radon gas, with radon flux rates quantified as 0 pCi/m²-s
- Seventy-eight samples exhibited very low levels of radon gas at or below the average background radon flux rate (0.17 pCi/m²-s)
- Nineteen samples exhibited low levels of radon gas within twice the average background flux rate, with radon flux rates ranging from 0.18 to 0.34 pCi/m²-s

- Five samples exhibited slightly elevated levels of radon gas within three times the average background flux rate, with radon flux rates ranging from 0.35 to 0.45 pCi/m²-s
- Thirty-five samples exhibited elevated levels of radon gas greater than three times the average background flux rate, with radon flux rates ranging from 0.47 to 74.96 pCi/m²-s

The 35 samples with elevated levels of radon gas were collected directly above areas with elevated gamma activity and were surrounded by nearby canister samples with very low or low levels of radon gas. The average radon flux rate (2.07 pCi/m²-s) measured at Parcel E during the Phase I investigation is well below the average radon emission rate (20 pCi/m²-s) specified in the Uranium Mill Tailings Radiation Control Act (40 CFR § 192.02[b][1]).

In 1991, Phase I particulate air monitoring was conducted to evaluate the background airborne particulate alpha and beta radioactivity levels at several locations, including Parcel E. Particulate air samples were collected from 35 locations at HPS, including Parcel E. The gross alpha and gross beta airborne particulate concentrations were well within safety standards for airborne concentrations of general radioactive materials in outdoor air (PRC, 1992).

In 1993, the Phase II radiological investigation was initiated at IR-02 to further investigate the distribution of ²²⁶Ra-containing devices identified during the Phase I investigation. Thirty-four 15-foot-deep test pits and 3 100-foot-long trenches were excavated at IR-02. Twelve test pits and 2 trenches were found to contain a total of 111 gamma-emitting point source anomalies. In total, 96 point sources, or approximately 90 percent, of the ²²⁶Ra-containing devices were found between the surface and 6.5 feet bgs. The remainder of the point sources was found distributed between 6.5 feet bgs and until Bay Mud was encountered; no point sources or elevated gamma count rates were found after Bay Mud was encountered.

Anomalous gamma count readings as high as 988,000 cpm were recorded during the investigation. Thirteen soil samples were collected from the trenches and test pits; ²²⁶Ra activity in soil samples collected from the trenches and test pits ranged from 46.28 pCi/g in the sample collected from test pit IR02TP17 to 20,949 pCi/g in the sample collected from test pit IR02TP23. A total volume of approximately 6,080 cubic feet of soil and debris was excavated from the test pits and trenches during the Phase II investigation and disposed of off-site at a licensed facility. The subsurface distribution of ²²⁶Ra-containing devices associated with the point sources was confined to an area approximately 400 feet by 250 feet in size, to a maximum depth of 9 feet bgs. Based on the results of the Phase II investigation, approximately 148,000 cubic feet of soil was estimated to contain radioactive sources.

Gross alpha or gross beta radioactivity was not reported above background levels during low-, medium-, and high-volume air sampling conducted during the Phase II investigation (PRC, 1996).

In 1993, EPA's National Air and Radiation Environmental Laboratory analyzed 13 soil samples from IR-02 Northwest to determine particle size, radionuclide distribution, and radionuclide content (EPA, 1994). Three of the samples exhibited elevated levels of ^{226}Ra , with a maximum activity of 318 pCi/g reported in sample A, which was collected from the disposal area. The remainder of the samples exhibited ^{226}Ra at activities comparable with background. ^{226}Ra was found to be approximately equal between particle size fractions in some of the samples, and sometimes preferring smaller fractions, indicating contamination by oxidation or fragmentation. The study concluded that based on background activities in 10 of the samples, a significant volume of soil at IR-02 Northwest may contain background levels of ^{226}Ra . The study further concluded that particle size separation could be accomplished by hydro-classification or a similar technology to remove radium sources, with removal of soil in the immediate vicinity of the radium sources.

2.3.1.3. Fate and Transport of Radioactive Chemicals in Soil

Radioactive chemicals, also referred to as radionuclides, are unstable and undergo spontaneous transformations at a constant rate by releasing energy until a stable state is reached. This transformation process is known as radioactive decay and is accompanied by the emission of at least one or more charged particles (for example, alpha and beta particles) or gamma rays. Alpha particles can travel only short distances and cannot penetrate human skin; the risks from alpha particles are from internal exposure of the particle from either inhalation or ingestion. Beta particles are generally absorbed in the skin and do not pass through the entire body, but in high enough quantities can cause cataracts to the lens of the eye. Gamma ray radiation can penetrate the human body with enough energy for the photon to interact with the body's cells. The table below lists the ROCs, their half-lives, and major radiations emitted when decaying (NAVSEA 2004). The radionuclides potentially present in Parcel E were either (1) buried along with excavated fill materials while increasing the footprint of HPS; (2) residue from decontamination of ships or workers; (3) residual contamination as a result of NRDL experiments or tests in structures or land areas; (4) residual contamination from shipyard operations; or (5) released into the sanitary sewers and storm drains.

Radionuclide	Half-Life	Radiation Emitted During Decay
Americium-241	7,370 years	Alpha and beta particles
Cesium-137	30 years	Beta particles, gamma rays
Cobalt-60	5.3 years	Beta particles, gamma rays
Hydrogen-3	12.35 years	Beta particles
Plutonium-239	24,100 years	Alpha particles, x-rays
Radium-226	1,600 years	Alpha and beta particles, and gamma rays
Strontium-90	29.1 years	Beta particles
Uranium-235	70,400,000 years	Alpha particles, x-rays

Each potential ROC is transported through the environment differently. Residual radioactivity, resulting from the disposal or discharge of radioactive material, may be present at Parcel E in soil. Residual radioactivity from soil may be transported to other secondary media; the degree of this potential transport is governed by the properties of each ROC, which are summarized briefly in [Table 4](#).

2.3.2. Nature and Extent of Radionuclides in Groundwater

The groundwater data derived from the 2001/2002 and 2007 to 2009 radiological investigations, as discussed in [Section 2.2](#), were used to evaluate the nature and extent of ROCs in groundwater at Parcel E. The nature and extent evaluation presented in this section documents that an adequate amount of data exist to determine whether or not groundwater contains radionuclides at concentrations that warrant further analysis in this radiological addendum. Additional information on the nature and extent of nonradioactive chemicals in groundwater at Parcel E is presented in the Final Revised RI Report ([Barajas & Associates, 2008](#)).

2.3.2.1. Summary of 2001/2002 Groundwater Investigation

The radiological groundwater investigation performed in 2001 and 2002 as part of the Phase III GDGI collected isotope-specific data from 24 A-aquifer monitoring wells within Parcel E. The investigation was intended to supplement data collected during previous investigations for radiological indicator parameters (gross alpha and gross beta) because the nonspecific results for gross alpha and gross beta did not allow the Navy to distinguish between natural and potentially site-related components of radioactivity in shallow groundwater (within what is referred to as the “A-aquifer”). [Figure 6](#) identifies the monitoring wells sampled during the 2001 and 2002 groundwater investigation.

The analytical data were evaluated by simple (nonstatistical) threshold comparisons to a fixed standard and by statistical tests comparing the site data with background data (two-sample statistical tests) and with fixed standards⁵ (one-sample statistical tests) ([TtEMI, 2004](#)). To conduct the statistical analysis, the analytical data were compiled by study area. The data set used for IR-02 consisted of 18 wells, for a total of 36 samples, and the data set used for IR-03 consisted of 2 wells, for a total of 4 samples. The data from IR-14 were grouped with the data from IR-34 and IR-71, located in Parcel D, for a total of 6 wells and 12 samples. The statistical test results are summarized by data set as follows:

⁵ Maximum contaminant levels (MCL) as outlined in Title 40 Code of Federal Regulations Part 141 were used as drinking water standards in the evaluation. For radionuclides other than radium and uranium, the drinking water comparison standard was calculated from the 4 mrem/year dose standard.

IR-02

- A simple threshold comparison of groundwater data from IR-02 for radionuclides with drinking water or other standards indicated the sum of ^{226}Ra and ^{228}Ra activities from one well (IR02MW101A2) exceeded the drinking water standard of 5 picocuries per liter (pCi/L). Thirty samples from a total of 16 wells exhibited activities of ^{40}K greater than 50 pCi/L, which is the standard for gross beta.
- Statistical testing comparing groundwater data from IR-02 and background areas indicated that the sum of ^{226}Ra and ^{228}Ra activities statistically exceeded the background data sets using a parametric statistical test (two-sample t-test), but did not statistically exceed the drinking water standard using a one-sample t-test.
- Statistical testing comparing groundwater data from IR-02 indicated that ^{40}K activities statistically exceeded the background data sets using the two-sample t-test, both including and excluding bay water samples. ^{40}K activity occurs naturally in seawater at about 300 pCi/L, as beta emissions, and bay water samples collected for this investigation produced an average of 280 pCi/L for ^{40}K . The arithmetic mean of ^{40}K activity at IR-02 was significantly lower, at 184.2 pCi/L.
- Statistical testing comparing groundwater data from IR-02 and background areas, excluding bay samples, indicated that the site data sets for ^{228}Ac , ^{40}K , and for the sum of ^{226}Ra and ^{228}Ra activities, statistically exceeded the background data sets using a nonparametric statistical test (Wilcoxon rank sum test).

IR-03

- A simple threshold comparison of groundwater data from IR-03 for radionuclides with drinking water or other standards indicated the sum of ^{226}Ra and ^{228}Ra activities from two wells (IR03MW218A2 and IR03MW218A3) exceeded the drinking water standard of 5 pCi/L. Four samples from a total of two wells exhibited activities of ^{40}K greater than 50 pCi/L.
- Statistical testing comparing groundwater data from IR-03 and background areas indicated that the sum of ^{226}Ra and ^{228}Ra activities statistically exceeded the background data sets using a two-sample t-test, but did not statistically exceed the drinking water standard using a one-sample t-test.
- Statistical testing comparing groundwater data from IR-03 indicated that ^{40}K activities statistically exceeded the background data sets using the two-sample t-test, both including and excluding bay water samples. ^{212}Pb activities significantly exceeded background levels, both including and excluding bay water samples.
- Statistical testing comparing groundwater data from IR-03 and background areas, excluding bay samples, indicated that the site data sets for ^{228}Ac , ^{40}K , ^{212}Pb , and the sum of ^{226}Ra and ^{228}Ra activities statistically exceeded the background data sets using the Wilcoxon rank sum test.

Other Areas

- A simple threshold comparison of groundwater data from other areas, including IR-14, IR-34, and IR-71, for radionuclides with drinking water or other standards indicated the sum of ^{226}Ra and ^{228}Ra activities did not exceed the drinking water standard of 5 pCi/L. Five samples from a total of four wells exhibited activities of ^{40}K greater than 50 pCi/L.
- Statistical testing comparing groundwater data from other areas indicated that 125-antimony (^{125}Sb) and thallium-208 (^{208}Th) activities statistically exceeded the background data sets using a parametric statistical test (two-sample t-test).
- Statistical testing comparing groundwater data from other areas and background areas, including bay samples, indicated that the site data sets for the sum of ^{125}Sb statistically exceeded the background data sets using the Wilcoxon rank sum test. When bay samples were excluded, ^{125}Sb , ^{40}K , and ^{208}Th statistically exceeded background.

The results indicated the sum of ^{226}Ra and ^{228}Ra activities exceeded the drinking water standard at select wells in IR-02 and IR-03; however, based on the results of the one-sample statistical tests, the mean activities of ^{226}Ra and ^{228}Ra at both IR-02 and IR-03 did not statistically exceed the drinking water standard. The investigation also concluded that naturally occurring ^{40}K in seawater is the main contributor to beta emissions measured in groundwater samples from nearshore monitoring wells within Parcel E. The gross beta values historically reported for samples collected from nearshore wells were dominated by beta emissions from natural ^{40}K in seawater, not beta emissions from radium isotopes. Background seawater contains the highest average activity of ^{40}K (280 pCi/L, beta) of all data groups, followed by nearshore IR sites, where saltwater intrusion has resulted in brackish groundwater conditions. This intrusion has altered the composition of nearshore groundwater, with corresponding changes in the radiological quality (especially gross beta emissions). The results of the radiological groundwater investigation are detailed in the Parcel E Groundwater Summary Report ([TtEMI, 2004](#)).

2.3.2.2. Summary of 2007 to 2009 Groundwater Investigation

Beginning in the first quarter 2007, groundwater samples from six A-aquifer wells in Parcel E were collected and analyzed for radionuclides as part of the BGMP. Groundwater samples were collected and analyzed on a quarterly basis through the first quarter 2009. In addition, a supplemental data collection event was conducted at Parcel E in 2008 to further evaluate the nature and extent of radionuclides in groundwater. In June and July 2008, groundwater samples were collected from an additional eight monitoring wells (seven in the A-aquifer and one in the deeper B-aquifer) and submitted to an off-site laboratory for radionuclide analyses of ^{137}Cs , ^{226}Ra , and ^{90}Sr . In addition, samples collected from monitoring well IR12MW14A were evaluated for ^{239}Pu . In the first quarter 2009, samples were collected from 12 A-aquifer wells and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . An additional sample was collected from monitoring well IR12MW14A for analysis of ^{239}Pu . Samples from A-aquifer monitoring well IR36MW09A and B-aquifer monitoring well IR36MW123B were analyzed exclusively for ^{226}Ra . No

additional radionuclide data were collected through the first quarter 2010, the most recent quarter for which data is available.

The radionuclide groundwater data collected in 2007 through 2009 were compiled as part of this radiological addendum and were evaluated, similar to the 2002 investigation, by simple (non-statistical) threshold comparisons to a fixed standard (such as drinking water standards) and by statistical tests comparing the site data to fixed standards (one-sample statistical tests), if necessary. To evaluate whether radionuclide activities exceeded drinking water standards, a tiered approach was used. Initially, the data were compiled and compared against drinking water standards using a simple threshold comparison. If the maximum activity in any of the samples exceeded the drinking water standard, a one-sample statistical test (t-test) was conducted to evaluate if the mean radionuclide activities statistically exceeded the drinking water standard.

The simple threshold comparison with drinking water standards revealed the following:

- ^{137}Cs was reported in 11 of the 87 samples in the data set, at activities ranging from 0.451 to 3.83 pCi/L. All reported activities were below the drinking water standard of 80 pCi/L.
- ^{239}Pu was not reported in any of the three samples in the data set.
- ^{226}Ra was reported in 15 of the 88 samples in the data set, at activities ranging from 0.482 to 1.27 pCi/L. All reported activities were below the drinking water standard of 5 pCi/L.
- ^{90}Sr was reported in 7 of the 37 samples in the data set, at activities ranging from 0.672 to 2.22 pCi/L. All reported activities were below the drinking water standard of 8 pCi/L.

Based on the results of the comparison, radionuclide activities in groundwater at Parcel E do not exceed drinking water standards. Since drinking water standards were not exceeded in any of the samples, the one-sample statistical test was not conducted.

2.3.2.3. Conclusions from Groundwater Investigations

The reported activities for radionuclides using current data, collected from 2007 to 2009, do not exceed drinking water standards. The results from the 2001/2002 investigation indicated the sum of ^{226}Ra and ^{228}Ra activities exceeded the drinking water standard at select wells in IR-02 and IR-03; however, based on the results of the one-sample statistical tests, the mean activities of ^{226}Ra and ^{228}Ra at both IR-02 and IR-03 did not exceed the drinking water standard. In addition, the comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria. This conservative evaluation is not representative of potential exposures to future site users because, as documented in Section 2 and Appendix F of the Revised RI Report (Barajas & Associates, Inc., 2008), A-aquifer groundwater is not a potential source of drinking water. Based on the results of the comparison of radionuclide groundwater data with drinking water

standards, groundwater does not appear to have been impacted by radionuclides at concentrations that warrant further evaluation in the FS.

These findings are consistent with the HRA that, as summarized in [Table 2](#), determined that a low potential existed for radioactive contamination in Parcel E groundwater based on historical information ([NAVSEA, 2004](#)). However, the Revised RI Report concluded that nonradioactive chemicals in groundwater required remedial option analysis ([Barajas & Associates, Inc., 2008](#)). The FS Report evaluates remedial alternatives for groundwater that include monitoring, institutional controls, source removal, and containment ([ERRG, 2012](#)). As a conservative measure, future monitoring will include analysis for radionuclides in groundwater to verify the conclusions of this radiological addendum.

2.4. CONCEPTUAL SITE MODEL

The CSM is an understanding of the dynamics of the site's environmental concerns and serves as a basis of the development of the RAO. The CSM is used to understand potential sources of contamination, migration pathways, and human receptors that the RAOs are intended to address. The conceptual site model for the nonradiological risk assessment is described in Section 2.4 of the Final Parcel E FS Report ([ERRG, 2012](#)). This section summarizes the CSM specific to the radiological risk assessment, and is discussed in detail in Section B3 of [Appendix B](#). The radiological CSM summarizes the sources of radioactive chemicals on site and presents the affected environmental media, the potential receptors, and potential exposure pathways through which receptors may receive radiological doses.

The computer code RESRAD Model Version 6.5 (Argonne National Laboratory [[ANL](#)], 2009) was used to perform dose and risk modeling of radiologically impacted sites at Parcel E. RESRAD was used to model the risk associated with radiologically impacted soil areas. RESRAD uses the isotopes specified as ROCs and automatically includes the long-lived daughter products of these isotopes. RESRAD incorporates various exposure pathways, and the user has the option of selecting or excluding specific pathways based upon the anticipated receptors, activities, and land use patterns. The radiological CSM for Parcel E is presented on Figure B-1 of [Appendix B](#) and indicates which pathways were considered active in the radiological risk assessment. Radiological pathways that are not active for this analysis are excluded from the CSM.

2.4.1. Sources of Site Contaminants

Details on the historical activities at Parcel E that contributed to the existing radiological contamination are presented in [Section 2.1](#) of this addendum. The primary potential sources of radiological contamination at Parcel E are past shipyard and NRDL operations, decontamination of ships that participated in atomic weapons testing, and the disposal of radioluminescent devices.

2.4.2. Affected Environmental Media

The HRA evaluated the potential for residual radioactive contamination at each impacted site based on historical information, previous radiological survey results, and site reconnaissance (NAVSEA, 2004). Table 2, as excerpted from the HRA, identifies the potential for various media (for example, surface soil, subsurface soil, groundwater, etc.) to contain radioactive contamination. As shown in Table 2, surface and subsurface soil are the most likely media to contain radioactive contamination at Parcel E. In addition, the HRA identified shoreline sediment and various structures at Parcel E with potential radioactive contamination (NAVSEA, 2004). As discussed in Section 2.3, this radiological addendum assumes that the radiologically impacted shoreline sediment and structures, as identified in the HRA, will require remedial option analysis (in Sections 3, 4, and 5).

As discussed in Section 2.3, A-aquifer groundwater at Parcel E contains ROCs at low activities that do not exceed drinking water standards at a statistically significant level (95 percent confidence level). In addition, the comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria. This conservative evaluation is not representative of potential exposures to future site users because, as documented in Section 2 and Appendix F of the Revised RI Report, A-aquifer groundwater is not a potential source of drinking water. Based on the results of the comparison of radionuclide groundwater data with drinking water standards, groundwater does not appear to have been impacted by radionuclides at concentrations that warrant further evaluation in the FS. This finding is consistent with the HRA that, as summarized in Table 3, determined that a low potential existed for radioactive contamination in Parcel E groundwater based on historical information (NAVSEA, 2004). Accordingly, the drinking water pathway was excluded from the RESRAD modeling.

2.4.3. Potentially Exposed Receptors

The 2010 redevelopment plan identifies planned reuses for the entire Parcel E area (SFRA, 2010b). Table 1 shows the impacted areas of Parcel E, the planned reuse, and associated exposure scenario.

The exposure scenario establishes the receptor parameters to be modeled. The potential receptors considered for evaluation were selected to be consistent with the 2010 redevelopment plan and are as follows:

- Resident (adult and child)
- Recreational user (adult and child)

For radiologically impacted areas at Parcel E located within areas planned for mixed use (redevelopment blocks MU-1 through MU-3), the residential receptor is evaluated because these areas may include

residential land use. For radiologically impacted areas located within areas designated for open space (EOS-1 through EOS-4 and EOS-5B), the recreational user scenario is evaluated.

While construction activities are anticipated to occur over various portions of Parcel E, the construction worker scenario is not associated with a planned reuse. Radiological risks to the construction worker would be of a lesser magnitude than for other receptors (industrial workers, residents, and recreational users) because of the shorter exposure duration. Accordingly, the construction worker scenario was not evaluated at Parcel E.

2.4.4. Exposure Pathways

As discussed in the HHRA in the Revised RI Report ([Barajas & Associates, 2008](#)), a complete exposure pathway consists of the following four elements:

- A source and mechanism of chemical release
- A retention or transport medium (or media in cases involving transfer of chemicals)
- A point of potential human contact with the contaminated medium (referred to as the exposure point)
- An exposure route (such as ingestion) at the contact point

If any of these elements is missing (except in a case where the source itself is the point of exposure), then the exposure pathway is considered incomplete. For example, if receptor contact with the source or transport medium does not occur, then the exposure pathway is incomplete and is not quantitatively evaluated for risk. Similarly, if human contact with an exposure medium is not possible, the exposure pathway is considered incomplete and is not evaluated.

The exposure pathways for contaminated soils at Parcel E present a more complicated analysis. The complete soil pathways, based on the four criteria listed above, are external radiation, soil ingestion, and inhalation. Ingestion of drinking water is not a complete exposure pathway for anticipated future receptors and is therefore not included in the RESRAD modeling.

2.4.4.1. External Radiation Pathway

The external radiation pathway is identified as potentially complete for all receptors. Exposure to external radiation is the result of radiation emanating from radionuclides present in soil on other contaminated media.

2.4.4.2. Soil Ingestion Pathway

The soil ingestion pathway is identified as potentially complete for all receptors. This pathway corresponds to direct ingestion of soil.

2.4.4.3. Inhalation Pathway

The inhalation pathway is identified as potentially complete for all receptors. This pathway corresponds to inhalation of radiologically contaminated dust and soil particles in outdoor air. Although exposure to radionuclides in outdoor air does not present a primary exposure pathway because dust mitigation and removal actions are adequately controlling airborne dust contamination, the HHRA conservatively considers potential exposure to contaminated soil that may migrate to outdoor air through wind suspension and volatilization.

2.5. RISK ASSESSMENT

This section evaluates potential risks to human health from exposure to radionuclides in soil at Parcel E. A screening-level radiological HHRA was conducted using the soil data derived from the Phase I and V radiological investigations, as discussed in [Section 2.3.1](#). The computer code RESRAD Model Version 6.5 (ANL, 2009) was used to perform dose and risk modeling of radiologically impacted sites at Parcel E. RESRAD uses the isotopes specified as ROCs and automatically includes the long-lived daughter products of these isotopes, specifically ^{210}Pb , which is a daughter product of ^{226}Ra .

As described in [Section 2.3.1](#), an adequate amount of soil data exist to support a screening-level HHRA based on the planned reuse of Parcel E, and to evaluate the focused set of remedial alternatives developed for Parcel E in the Final FS Report (ERRG, 2012). The following subsections discuss the HHRA methodology and results. The general objectives of the HHRA were to estimate potential human health risks associated with potential future land use scenarios and to provide a foundation for assessing the need for further response actions.

The HHRA calculated radiological cancer risks from exposure to ROCs in soil for each exposure pathway identified as complete. Risks were evaluated for RME; that is, the potential maximum exposure that is reasonably anticipated to occur at a site. As discussed in [Section 2.3.1.2](#) and presented in [Table 3](#), not every radiologically impacted site at Parcel E has been investigated. Accordingly, the screening-level HHRA was only conducted for sites for which radiological data are available. Radiologically impacted sites not evaluated in the HHRA are assumed to require remedial option analysis, which is detailed in [Sections 3, 4, and 5](#).

[Appendix B](#) details the HHRA methodology and results; this section provides an overview of the exposure scenarios and pathways and summarizes the results of the HHRA.

2.5.1. Potential Receptors and Exposure Pathways

The “Hunters Point Shipyard Redevelopment Plan” outlines the projected future uses for Parcel E (SFRA, 2010b). The reuses relevant to the Parcel E redevelopment blocks are mixed use and open space, as shown on [Figure 2](#). The two exposure scenarios applicable to these planned reuses are residential and recreational. As discussed in [Section 2.4.3](#), the residential receptor is evaluated for redevelopment blocks

planned for mixed use, which may include residential reuse; and the recreational receptor is evaluated for redevelopment blocks planned for open space reuse. These receptors are consistent with the 2010 redevelopment plan (SFRA, 2010b). In addition, a residential scenario was also evaluated for the entire parcel. While residential reuse of the entire parcel is not planned, the residential exposure scenario presents an upper-bound risk estimation from exposure to ROCs at the parcel.

Both direct exposure pathways (external radiation) and indirect exposure pathways (inhalation and soil ingestion) are evaluated.

The goal of the RESRAD risk modeling approach was to be as consistent as possible with assumptions and inputs used in the nonradiological HHRA in the Revised RI Report. To achieve this goal, development of representative parameters for receptor scenarios other than the RESRAD default was required. This development was achieved by following guidance from EPA; specifically, “Exposure Factors Handbook” and the “Risk Assessment Guidance for Superfund (RAGS)” (EPA, 1989 and 1997b). The guidance was also used to develop input parameters for the nonradiological HHRA in the Revised RI Report. Receptor-specific RESRAD values were selected from the guidance for industrial workers, residents, and recreational users. To achieve the best correlation with site-specific agreements, it was necessary to adjust each of the parameters based on receptor-specific information. The parameters used in the RESRAD modeling, along with the basis for each, are discussed in detail in [Appendix B](#).

2.5.2. Total and Incremental Dose and Risk Calculation Methodology and Results

Radiological dose and risk were estimated for each of the radiologically impacted areas for which data are available. For each area, RESRAD modeling was conducted based upon the maximum reported activity for each ROC. To estimate the incremental risk from impacted areas, background concentrations of the ROCs were subtracted from the maximum reported activity levels. If the background activity exceeded the maximum reported activity for a given ROC, the ROC was not modeled in the incremental risk calculations. To estimate the total radiological risk, the maximum activity values were used as the exposure point concentration, without subtracting the background values. The exposure point concentrations used to calculate the radiological risk are presented in [Table 5](#), along with the minimum, maximum, and mean activities for each ROC within each radiologically impacted area.

Total and incremental risk results are presented in [Table 6](#). The total and incremental risk results presented in [Table 6](#) are provided for both (1) planned reuse and (2) residential reuse across the entire parcel. The RESRAD incremental risk estimates for planned reuse are summarized as follows:

- For the residential exposure scenario, incremental radiological risk estimates ranged from 2E-05 (Building 529 Site) to 7E-03 (Building 707 Triangle Area)
- For the recreational user exposure scenario, incremental radiological risk estimates ranged from 5E-08 (Building 509 Site) to 7E-03 (IR-02 Southeast).

The RESRAD total risk estimates for planned reuse are summarized as follows:

- For the residential exposure scenario, total radiological risk estimates ranged from 2E-04 (Building 508 Site) to 7E-03 (Building 707 Triangle Area)
- For the recreational user exposure scenario, total radiological risk estimates ranged from 2E-07 (Building 509 Site) to 7E-03 (IR-02 Southeast).

2.5.3. Combined Chemical and Radiological Risk

Estimates of the lifetime risk of cancer to exposed individuals resulting from radiological and chemical risk assessments may be summed to determine the overall potential human health hazard associated with a site (EPA, 1989). To combine the chemical risk and radiological risk, the same approach used in the Parcel E Revised RI Report to calculate chemical risk must be taken; namely, calculating total risk from ROCs inclusive of background and calculating incremental risk from the ROCs present at activity levels that do not include background.

Table 6 presents the combined chemical and radiological risk at the site. To estimate the combined chemical and radiological risk, the incremental risk was derived by reviewing the RI and locating grid points close to the impacted soil areas and adding it to the estimated risk from the radiological ROCs. In some instances (such as the Building 701 Site), chemical risk is not available because no soil samples were collected in the vicinity and chemical risk was subsequently not assessed.

With some exceptions, such as the Building 707 Triangle Area and IR-02, the estimated risks are of a comparable order of magnitude to incremental risks for nonradioactive chemicals. The results indicate that concentrations of radioactive and nonradioactive chemicals in soil pose a potential unacceptable risk to future site users and remedial alternatives should be evaluated to address the potential risks. Although the extent of radioactive contamination in subsurface soil has not been defined, this radiological addendum conservatively assumes, consistent with the findings of the HRA, that potential radioactive chemicals may be present in subsurface soil at Parcel E and will therefore require remedial option analysis.

2.5.4. Uncertainty Analysis for Critical Assumptions

Appendix B provides a discussion of the input parameters and modeling results for the radiological dose and risk for each radiologically impacted site. The results were compared against the EPA-increased lifetime cancer risk of 1E-06 and the NRC dose limit of 25 millirems per year. EPA does not believe this NRC dose limit is protective of human health and the environment, and recommends a maximum dose limit of 15 millirems per year (EPA, 1997a). The remedial option analysis (in Sections 3, 4, and 5) will consider both risk-based RGs and the 15 millirems per year dose limit in developing remedial alternatives that are protective of human health and the environment.

The RESRAD (ANL, 2009) code is used to estimate the potential risk to an individual from exposure to residual radionuclides in soil or soil-like media. It was used to evaluate the risk associated with impacted soil areas in Parcel E.

The goal of the RESRAD risk modeling approach was to be as consistent as possible with assumptions and inputs used in the nonradiological HHRA in the Revised RI Report. To achieve this goal, the development of representative parameters for receptor scenarios other than the RESRAD default was required in accordance with EPA guidance (EPA, 1989 and 1997b). The EPA guidance was also used to develop input parameters for the nonradiological HHRA in the Revised RI Report. Receptor-specific RESRAD values were selected from the EPA guidance for recreational and construction users (EPA, 1989 and 1997b). The simplest approach to modeling these scenarios would have been to use the values suggested by previous researchers for the various RESRAD receptor types. However, the receptors defined in the Revised RI Report are not based upon the same assumptions used in developing the RESRAD receptor types. To achieve the best correlation, it was necessary to adjust each of the parameters based upon receptor-specific information.

The modeling was performed with conservative input parameters to ensure that uncertainties would be minimized and a separate set of models and results for uncertainty analysis would not be needed. Uncertainty analysis for the various modeling input parameters, as well as various assumptions required for the modeling, are discussed in Appendix B.

The modeling reported in Appendix B is based on the radiological data collected during the Phase I and Phase V investigations. The data collected during these investigations were analyzed to meet acceptance criteria (such as minimum detectable activities) that were based on the release criteria current at the time the investigations were performed; however, the current release criteria for certain ROCs are more conservative. The most notable example is ^{226}Ra , for which the release criterion at the time of the Phase V investigation was 5 pCi/g. The current release criterion for ^{226}Ra is 1 pCi/g above background (the background ^{226}Ra level for the Phase V investigation was 0.82 pCi/g). Because of the differences in release criteria, the accuracy of the data for certain ROCs may not meet current acceptance criteria and results in some degree of uncertainty for the risk screening analysis. However, this degree of uncertainty is acceptable because the risk screening analysis was only intended to provide a general estimate of radiological risks for ROCs that, in the case of ^{226}Ra , were known to consistently exceed current release criteria and warrant analysis of remedial alternatives in the FS.

Section 3. Remedial Action Objectives, Applicable or Relevant and Appropriate Requirements, General Response Actions, and Process Options

This section (1) presents the site-specific RAOs, including RGs, for soil, sediment, and structures at Parcel E based on the ROCs identified in the HRA and in [Table 1](#) of this radiological addendum (see [Section 3.1](#)); (2) identifies potential ARARs (see [Section 3.2](#)); and (3) presents a range of GRAs and associated process options that will satisfy the RAOs for soil, sediment, and structures (see [Section 3.3](#)). The GRAs and process options retained through the screening process are used in [Section 4](#) as the basis for developing remedial alternatives.

3.1. REMEDIAL ACTION OBJECTIVES

RAOs are medium-specific goals for protecting human health and the environment. In accordance with the NCP, 40 CFR, § 300.430 (e)(2)(i), RAOs for Parcel E were developed by specifying ROCs, media of concern, potential exposure pathways, and RGs. RAOs developed for Parcel E are based on the city’s planned reuse, which is considered the reasonably anticipated future use of the property as described in the HHRA presented in the Revised RI Report ([Barajas & Associates, Inc., 2008](#)) and the risk evaluation conducted to assess potential effects from radionuclides ([Appendix B](#) of this radiological addendum).

Exposure Scenario	Redevelopment Block	Planned Reuse
Residential	MU-1	Mixed Use
	MU-2	Mixed Use
	MU-3	Mixed Use
Recreational	EOS-1	Open Space
	EOS-2	Open Space
	EOS-3	Open Space
	EOS-4	Open Space
	EOS-5	Open Space

The reuses relevant to the Parcel E redevelopment blocks are mixed use and open space, as shown on [Figure 2](#). The two exposure scenarios applicable to these planned reuses are residential and recreational, as shown in the table to the above. As described in [Section 1.1](#), the railroad right-of-way comprising IR-52, which is planned for predominantly light industrial reuse, is not radiologically impacted and therefore does not require evaluation in this radiological addendum.

The following sections summarize the RAOs for protection of human health and the environment and present the RGs identified for soil, sediment, and structures.

3.1.1. Radionuclides of Concern

Table 1 identifies the ROCs at each radiologically impacted area at Parcel E. These ROCs include ^{241}Am , ^{137}Cs , ^{60}Co , ^3H , ^{239}Pu , ^{226}Ra , ^{90}Sr , and ^{235}U .

3.1.2. Media of Concern

The media of concern are soil, sediment, and structures at radiologically impacted sites in Parcel E.

3.1.3. Potential Exposure Pathways

As discussed in Section 2, potential exposure pathways at Parcel E include (1) planned mixed use reuse that is associated with a future residential exposure scenario and (2) planned open space reuse that is associated with a future recreational exposure scenario. Future residential users may be exposed to subsurface soil (from 0 to 10 feet bgs) through incidental ingestion of soil, inhalation of fugitive dust, and external radiation exposure. Future recreational users may be exposed to surface soil (from 0 to 2 feet bgs) through incidental ingestion of soil, inhalation of fugitive dust, and external radiation exposure. Although not associated with a planned reuse, construction workers may also be exposed to subsurface soil (0 to 10 feet bgs) through the same exposure pathways. Appendix B provides a detailed assessment of the recreational and construction worker exposure scenarios.

3.1.4. Remedial Action Objectives for Soil, Sediment, and Structures

The RAOs for radionuclides at Parcel E, in accordance with EPA guidance (EPA, 1988), are expressed in terms of the medium of concern and RGs. RGs established for Parcel E are presented in Table 7 and are consistent with the RGs selected for radiological-related remedies at HPS Parcels B, G, and D-1 and UC-1 (Navy, 2009a, 2009b, and 2009c, respectively). The following RAO was identified for remediation of ROCs at radiologically impacted sites at Parcel E, including soil, sediment, and structures:

- Prevent exposure to ROCs at activity levels that exceed RGs for all potentially complete exposure pathways.

The RGs are specified for industrial worker and residential exposure scenarios. Residential RGs will apply in all Parcel E areas. Although the residential exposure scenario does not apply to all Parcel E areas, the residential RGs will be used for the recreational exposure scenario at Parcel E. These more conservative RGs will enhance the protectiveness of the remedial action for Parcel E, particularly as it relates to future property transfer and the potential need to apply institutional controls for radionuclides (discussed in Section 3.3.1.3).

3.2. POTENTIAL APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS FOR RADIONUCLIDES

This section discusses the potential federal and state of California ARARs for remediation of ROCs at Parcel E. The potential ARARs identified in this section are discussed in detail in [Appendix C](#) of this addendum, and are intended to supplement the ARARs identified and discussed in the Final FS Report for Parcel E ([ERRG, 2012](#)).

CERCLA § 121(d) (Title 42 United States Code [USC] § 9621[d]), as amended, states that remedial actions on CERCLA sites must attain (or the decision document must justify the waiver of) any federal or more stringent state environmental standards, requirements, criteria, or limitations that are determined to be legally applicable or relevant and appropriate.

As the lead federal agency, the Navy has primary responsibility for identifying federal ARARs at HPS. Identification of potential state ARARs was initiated through Navy requests to DTSC, Water Board, and the San Francisco Bay Conservation and Development Commission. ARAR identification considers a number of site-specific factors, including potential remedial actions, compounds at the site, site physical characteristics, and the site location. ARARs are usually divided into three categories: chemical-specific, location-specific, and action-specific.

3.2.1. Potential Chemical-Specific Applicable or Relevant and Appropriate Requirements for Radionuclides

Chemical-specific ARARs are health- or risk-based numerical values or methods that, when applied to site-specific conditions, result in the establishment of numerical cleanup values. Chemical-specific ARARs for radionuclides are described in detail in [Appendix C](#) and are summarized below.

3.2.1.1. Soil

Appendix B (Sections B2.2.1 and B2.2.2) of the Final FS Report for Parcel E identifies potential federal and state chemical-specific ARARs for soil ([ERRG, 2012](#)). This subsection identifies additional regulations that pertain to remediation of soil at radiologically impacted areas.

The substantive provisions of the requirements summarized below are identified in Section C2 of [Appendix C](#) and are accepted as potential ARARs for all radiologically impacted areas at Parcel E, except for IR-02 and IR-03 ([Figure 3](#)). At these areas, potential radioactive contamination exceeding the proposed RGs would be removed; therefore, these areas would not require land use restrictions regarding exposure to radioactivity.

- 40 CFR § 192.12(b)(1) and 192.41(b)
- 40 CFR § 192.12(b)(2)
- 40 CFR § 192.12(a) and 192.32(b)(2)
- 10 CFR § 20.1301
- 10 CFR § 20.1402

The substantive provisions of the requirements summarized below are identified in Section C2 of [Appendix C](#) and are accepted as potential ARARs for IR-02, including sanitary sewer, storm drain, and septic sewer lines within IR-02 and IR-03, which will be transferred with engineering and institutional controls for radioactive chemicals.

- 40 CFR § 192.12(b)(1) and 192.41(b)
- 40 CFR § 192.12(b)(2)
- 10 CFR § 20.1301
- 10 CFR § 61.41

3.2.1.2. Air

The substantive provisions of the requirements summarized below are identified in Section C2 of [Appendix C](#) and are accepted as potential ARARs during implementation of the proposed remedial alternatives.

- Emission limitations under National Emissions Standards for Hazardous Air Pollutants (NESHAP) at 40 CFR, Part 61 Subpart H, § 61.92
- Emission limitations under NESHAP at 40 CFR, Part 61 Subpart I, § 61.102

These requirements are not potential ARARs for residual radioactive contamination remaining on site after the response action is complete.

3.2.1.3. Groundwater

Appendix B (Section B2.2.3) of the Final FS Report for Parcel E identifies potential federal and state chemical-specific ARARs for groundwater ([ERRG, 2012](#)). As discussed in [Sections 2.3 and 2.5](#), groundwater does not contain radionuclides at activity levels that warrant further evaluation in the FS. Therefore, no additional chemical-specific ARARs for groundwater are identified in this addendum.

3.2.1.4. Surface Water

Appendix B (Section B2.2.4) of the Final FS Report for Parcel E identifies potential federal and state chemical-specific ARARs for surface water (ERRG, 2012). No additional chemical-specific ARARs for surface water are identified in this addendum.

3.2.2. Potential Location-Specific Applicable or Relevant and Appropriate Requirements

Location-specific ARARs are restrictions placed on the concentrations of hazardous substances or the conduct of activities based on site characteristics or the site's immediate environment. Appendix B (Section B3) of the Final FS Report for Parcel E identifies potential location-specific ARARs (ERRG, 2012). No additional location-specific ARARs are identified in this addendum.

3.2.3. Potential Action-Specific Applicable or Relevant and Appropriate Requirements

Action-specific ARARs are technology- or activity-based requirements or limitations for remedial activities. These requirements are triggered by the specific remedial activities conducted at the site and indicate how a selected remedial alternative should be achieved. Appendix B (Section B4) of the Final FS Report for Parcel E identifies potential action-specific ARARs (ERRG, 2012). The chemical-specific ARARs identified in Section 3.2.1 also contain action-specific requirements. In addition, the substantive provisions of the following requirements regarding radioactive waste storage and control are accepted as potential ARARs during implementation of the proposed remedial alternatives.

- 10 CFR § 20.1801
- 10 CFR § 20.1802

The requirements listed above pertain to staging excavated soil containing ROCs exceeding the RGs prior to off-site disposal.

3.3. IDENTIFICATION OF GENERAL RESPONSE ACTIONS AND SCREENING OF TECHNOLOGIES AND PROCESS OPTIONS

This section identifies GRAs and evaluates available technologies and process options to address the RAO for Parcel E discussed in Section 3.1. Unlike nonradioactive chemicals, which have the ability to be altered by physical, chemical, or biological processes that can reduce or destroy the hazard itself, radioactive chemicals generally cannot be similarly altered or destroyed. As a result, response actions at radioactively contaminated sites use the concepts of "Time, Distance, and Shielding." Time allows the natural decay of the radionuclide to take place, resulting in reduction in risk to human health and the environment. Distance and shielding from the radioactive material rapidly reduce the risk from radiation by reduction of the intensity of the imparted energy (EPA, 1996). The following GRAs have been identified for soil, sediment, and structures at Parcel E:

Soil and Sediment

- **No Action:** Under this GRA, no further response action will be conducted at the radiologically impacted sites at Parcel E.
- **Institutional Controls:** This GRA includes legal controls that minimize the potential for human exposure to radioactively contaminated soil by limiting land or resource use and that protect the integrity of the remedial action.
- **Containment:** This GRA includes construction of a physical barrier (distance and shielding) to eliminate or reduce the potential of contaminant migration and exposure.
- **Removal and Disposal:** This GRA includes excavation of radioactively contaminated soil (or other subsurface debris), screening to segregate soil exceeding the RGs (Table 7), and disposal at an appropriate off-site waste disposal facility. This GRA also includes decontamination or demolition of aboveground structures to meet the RGs for surfaces (Table 7), with disposal of radioactively contaminated material at an appropriate off-site waste disposal facility.

Structures

- **No Action:** Under this GRA, no further response action will be conducted at the radiologically impacted sites at Parcel E.
- **Removal and Disposal:** This GRA includes decontamination or demolition of aboveground structures to meet the RGs for surfaces (Table 7), with disposal of radioactively contaminated material at an appropriate off-site waste disposal facility.

Technologies identified for each GRA underwent an initial screening and analysis. During the initial screening, the potential technology types were evaluated in terms of technical implementation, site conditions, waste characteristics, contaminant properties, and the ability to meet NCP requirements and the RAOs. Individual process options for viable technologies were then analyzed in terms of effectiveness, implementability, and cost. Table 8 identifies radiological-specific considerations for each technology and process option, and provides a basis for the selection of certain process options for addressing radioactive contamination in soil and structures at Parcel E. The following subsections discuss the radiological-specific considerations for technologies and process options evaluated for soil, sediment, and structures at Parcel E.

3.3.1. Technologies and Process Options for Soil and Sediment

GRAs identified for soil and sediment at Parcel E are: (1) no action, (2) institutional controls, (3) removal, and (4) containment. The technologies and process options evaluated in Table 8 are a subset of those evaluated in Section 3 of the Final FS Report (ERRG, 2012). Therefore, the following subsections briefly discuss the radiological-specific considerations for technologies and process options evaluated within each GRA. The results of the evaluation are summarized in Table 8.

3.3.1.1. No Action

The NCP requires that the no-action alternative be carried through the detailed analysis of alternatives. Under the no-action response, no remedial action would be taken. Soil and sediment would be left as is without implementing any institutional controls, containment, removal, treatment, or other mitigating actions. Because soil and sediment at Parcel E poses a risk to human health and the environment under the anticipated future land-use scenario, the no-action response would not be an effective alternative that meets the requirements of CERCLA. No cost would be associated with this option because no action would be taken. The no-action option will be retained for further evaluation as a remedial alternative for comparison only, as required under the NCP.

3.3.1.2. Institutional Controls

Institutional controls, as defined by the U.S. Department of Defense (DoD) (2001), are nonengineering measures limiting potential exposures to a site or medium of concern or ensuring that engineering measures designed to remediate a site, or limit access to a site, remain in place. Similarly, EPA defines institutional controls as “non-engineering measures designed to prevent or limit exposure to hazardous substances left in place at a site, or assure effectiveness of a selected remedy” (EPA, 2000b).

Institutional Controls in General

Institutional controls limit potential exposure to hazardous substances by restricting specified land uses and activities on the parcel. The following paragraphs discuss institutional controls that are included in the potential remedial alternatives for radionuclides at Parcel E. The discussion of institutional controls is consistent with that presented in the Final FS Report (ERRG, 2012); however, the Final FS Report for Parcel E includes additional information for institutional controls related to potential volatile organic compound (VOC) vapors. Institutional controls are legal and administrative mechanisms used to implement land use and activity restrictions that are used to limit the exposure of future landowner(s) and user(s) of the property to hazardous substances present on the property and to ensure the integrity of the remedial action. Institutional controls are required on a property where the selected remedial cleanup levels result in contamination remaining at the property above levels that allow for unlimited use and unrestricted exposure. Institutional controls will be maintained until the concentrations of hazardous substances in soil and sediment are at such levels to allow for unrestricted use and exposure. Implementation of institutional controls includes requirements for monitoring and inspections and reporting to ensure compliance with land use or activity restrictions.

Legal mechanisms include proprietary controls such as restrictive covenants, negative easements, equitable servitudes, and deed notices. Administrative mechanisms include notices, adopted local land use plans and ordinances, construction permitting, or other existing land use management systems that are intended to ensure compliance with land use or activity restrictions. The area requiring institutional

controls (ARIC) for CERCLA-regulated hazardous substances, including radionuclides, is presented on [Figure 7](#).

The Navy has determined that it will rely upon proprietary controls in the form of environmental restrictive covenants as provided in the “Memorandum of Agreement Between the United States Department of the Navy and the California Department of Toxic Substances Control” (hereinafter referred to as “Navy/DTSC MOA”) and attached covenant models ([Navy and DTSC, 2000](#)).

More specifically, land use and activity restrictions will be incorporated into two separate legal instruments as provided in the Navy/DTSC MOA:

1. Restrictive covenants included in one or more Quitclaim Deeds from the Navy to the property recipient.
2. Restrictive covenants included in one or more “Covenant to Restrict Use of Property” entered into by the Navy and DTSC as provided in the Navy/DTSC MOA and consistent with the substantive provisions of California Code of Regulations Title 22, § 67391.1.

The “Covenant(s) to Restrict Use of Property” will incorporate the land use and activity restrictions into environmental restrictive covenants that run with the land and that are enforceable by DTSC and any other signatory state entity against future transferees and users. The Quitclaim Deed(s) will include the identical land use and activity restrictions in environmental restrictive covenants that run with the land and that will be enforceable by the Navy against future transferees.

The activity restrictions in the “Covenant(s) to Restrict Use of Property” and Quitclaim Deed(s) shall be defined in the land use control remedial design (LUC RD) report that would be reviewed and approved by the FFA signatories and, if deemed necessary, implemented through a Parcel E Risk Management Plan (RMP) to be prepared by the CCSF and approved by the Navy and FFA signatories. The LUC RD report shall be referenced in the applicable Covenant to Restrict Use of Property and Deed.

In addition to being set forth in the “Covenant(s) to restrict Use of Property” and Quitclaim Deed(s) as described above, restrictions applied to specified portions of the property will be described in findings of suitability to transfer and findings of suitability for early transfer.

Access

The Deed and Covenant shall provide that the Navy and FFA signatories, where applicable, and for the California Department of Public Health (CDPH) in radiological ARICs ([Figure 7](#)), and their authorized agents, employees, contractors and subcontractors shall have the right to enter upon HPS Parcel E to conduct investigations, tests, or surveys; inspect field activities; or construct, operate, and maintain any response or remedial action as required or necessary under the cleanup program, including but not limited to monitoring wells, pumping wells, treatment facilities, and cap and containment systems.

Implementation

The Navy shall address and describe implementation of institutional controls and maintenance actions, including periodic inspections and reporting requirements in the preliminary and final RD reports to be developed and submitted to the FFA signatories and CDPH in regard to radionuclides for review pursuant to the FFA (see “Navy Principles and Procedures for Specifying, Monitoring and Enforcement of Land Use Controls and Other Post-ROD Actions” attached to the January 16, 2004, DoD memorandum titled “Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Record of Decision (ROD) and Post-ROD Policy” [DoD, 2004]). The preliminary and final RD reports are primary documents as provided in Section 7.3 of the FFA (Navy, EPA, DTSC, and Water Board, 1991).

Although the Navy may later transfer these procedural responsibilities to another party by contract, property transfer agreement, or through other means, the Navy shall retain ultimate responsibility for remedy integrity.

Activity Restrictions that Apply Throughout Parcel E

The following sections describe the institutional control objectives to be achieved through activity restrictions throughout Parcel E to ensure that any necessary measures to protect human health and the environment and the integrity of the remedy have been undertaken.

Restricted Activities

The following restricted activities throughout HPS Parcel E must be conducted in accordance with the “Covenant(s) to Restrict Use of Property,” Quitclaim Deed(s), the Operation and Maintenance Plan(s) (OMP), LUC RD report and, if required, the Parcel E RMP and any other work plan or document approved in accordance with these referenced documents:

- “Land disturbing activity,” which includes but is not limited to (1) excavation of soil and sediment; (2) construction of roads, utilities, facilities, structures, and appurtenances of any kind; (3) demolition or removal of “hardscape” (for example, concrete roadways, parking lots, foundations, and sidewalks); (4) any activity that involves movement of soil to the surface from below the surface of the land; and (5) any other activity that causes or facilitates the movement of groundwater known to be contaminated with radioactive or nonradioactive chemicals.
- Alteration, disturbance, or removal of any component of a response or cleanup action (including but not limited to pump-and-treat facilities, and soil cap and containment systems); groundwater extraction, injection, and monitoring wells and associated piping and equipment; or associated utilities.
- Extraction of groundwater and installation of new groundwater wells.
- Removal of or damage to security features (for example, locks on monitoring wells, survey monuments, fencing, signs, or monitoring equipment and associated pipelines and appurtenances).

Prohibited Activities

The following activities are prohibited throughout Parcel E:

- Growing produce in native soil for human consumption
- Use of groundwater

Additional Land Use Restrictions for IR-02 and IR-03 and Other Areas Designated for Open Space or Industrial Reuse

In addition to the specific activities prohibited below, IR-02 and IR-03 would be restricted to open space and recreational uses, unless written approval for other uses is granted by the FFA signatories and CDPH. In addition, the following land uses would be specifically prohibited unless written approval for such uses is granted by the FFA signatories and the CDPH in accordance with the “Covenant(s) to Restrict Use of the Property,” Quitclaim Deed(s), and LUC RD report:

- A residence, including any mobile home or factory built housing, constructed or installed for use as residential human habitation
- A hospital for humans
- A school for persons under 21 years of age
- A daycare facility for children

The restricted land uses identified above shall also apply to property areas in the Shipyard Shoreline Open Space District, as identified in the amended “Hunters Point Shipyard Redevelopment Plan” (SFRA, 2010b), unless written approval for such uses is granted by the FFA signatories in accordance with the “Covenant(s) to Restrict Use of the Property,” Quitclaim Deed(s), and LUC RD report. Parcel E property areas within the Shipyard Shoreline Open Space District are identified as Redevelopment Blocks EOS-1, EOS-2, EOS-3, EOS-4, and EOS-5 (Figure 2).

In addition, land use restrictions identified above shall also apply to property areas in IR-52 (Railroad Right-of-Way; see Figure 2), unless written approval for such uses is granted by the FFA signatories in accordance with the “Covenant(s) to Restrict Use of the Property,” Quitclaim Deed(s), and LUC RD report. The future reuse for IR-52 is predominantly light industrial, as identified in the redevelopment plan for the Bayview Hunters Point redevelopment project adjoining HPS (SFRA, 2010b).

Additional Activity Restrictions Related to Radionuclides at IR-02 and IR-03

Exposure to radioactive chemicals in the radiological ARIC, comprised of IR-02 and IR-03 (Figure 7), would be prevented by three separate components: (1) an engineered cover, consisting of clean imported fill and (in some areas) a low hydraulic conductivity layer, to provide adequate shielding against residual radioactivity; (2) permeable geosynthetic fabric to serve as a “demarcation layer” between soil cover and underlying soil with residual radioactivity; and (3) institutional controls to implement land use and

activity restrictions necessary to limit the exposure to radiological hazardous substances and to ensure the integrity of the remedial action.

In addition to the land use and activity restrictions specified earlier in this section, the following activity restrictions would apply in the radiological ARIC.

- Land-disturbing activities within the radiological ARIC, as defined above and including installation of water lines, storm drains, or sanitary sewers, below the demarcation layer, are strictly prohibited unless approved in writing by the FFA signatories and the CDPH. Any proposed land-disturbing activity within the ARIC for radionuclides shall be required to be described in a work plan that will include but not be limited to a radiological work plan, the identification of a radiological safety specialist, a soil management plan, soil sampling and analysis requirements, and a plan for off-site disposal of any excavated radionuclides by the transferee in accordance with federal and state law. This work plan must also specify appropriate procedures for the proper identification and handling of material potentially presenting an explosive hazard. This work plan must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures (including dispute resolution procedures) and timeframes that will be set forth in the Parcel E OMP and LUC RD report.
- Following implementation of an approved land-disturbing activity within the radiological ARIC, the integrity of the cover/cap must be restored upon completion of excavation as provided in the Parcel E OMP, LUC RD report, or similar document. A completion report describing the details of the implementation of the work plan, sampling and analysis (if required), off-site disposal (if required), and the restoration of the integrity of the cover/cap must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures (including dispute resolution procedures) and timeframes that will be set forth in the Parcel E OMP and LUC RD report.
- For land-disturbing activities, as defined above and including installation of water lines, storm drains, or sanitary sewers, above the demarcation layer, the LUC RD report, the OMP, or, if required, the Parcel E RMP or a project-specific work plan will list the procedures for ensuring that the cover is not disturbed or breached. The specific design of the cover shall be agreed to in the RD.

At the time of transfer, the areas that require this restriction will be surveyed to define the legal metes and bounds for inclusion in the property transfer documents. No variance or exemption from this restriction shall be allowed unless written approval is provided by the FFA signatories and CDPH. The OMP for Parcel E or LUC RD report shall address any necessary additional soil and radiological management requirements, for example inspections, monitoring, and reporting requirements for portions of Parcel E in the radiological ARIC.

3.3.1.3. Removal by Excavation

As identified in [Table 8](#), excavation and off-site disposal is the primary process option for the removal GRA. The following paragraphs evaluate the excavation and off-site disposal process option relative to effectiveness, implementability, and cost.

Consistent with EPA RI/FS guidance ([EPA, 1988](#)), the evaluation of process options should focus primarily on the following factors relating to effectiveness:

- The potential effectiveness of the process option in handling the estimated areas and volumes of contaminated media and meeting the RGs identified in the RAOs.
- The potential impacts to human health and the environment during the construction and implementation phase.
- The degree to which the process option is proven and reliable in addressing the site-specific contaminants and conditions.

Excavation and off-site disposal is an effective process option for soil at Parcel E and involves removing and transporting contaminated material off site to a licensed disposal facility. Important considerations with the removal and disposal process option include excavation volume, fugitive emissions, hauling distance, and disposal facility for final deposition. Residential RGs would apply to all excavations at Parcel E. Although the residential exposure scenario does not apply to all Parcel E areas, the more conservative RGs will enhance the protectiveness of the remedial action for Parcel E. Specifically, cleanup to residential RGs (which would allow for unlimited use and unrestricted exposure) are needed to transfer radiologically impacted areas without institutional controls for radionuclides. In areas where soil covers and institutional controls for radionuclides are required (such as IR-02 and IR-03), cleanup to residential RGs would help ensure that the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) will be within the risk management range specified in the NCP (10^{-6} to 10^{-4}). The excavation cleanup criteria would be specific to the reuse type and ROC-specific RAO specified in [Section 3.1](#). Excavation is effective and implementable for ROCs found in shallow soil at Parcel E; therefore, excavation and off-site disposal process options will be retained for development and evaluation of remedial alternatives. Excavation is also an effective process option for sediment, but one that requires additional dewatering effort, similar to that of soil excavated below the groundwater table prior to radiological screening and sampling.

At most radiologically impacted sites at Parcel E, radioactive contamination is present in shallow soil and is the result of historical operations at buildings or open storage areas. At these types of sites, removal by excavation is considered a practical and cost-effective means of achieving the ROC-specific RAO so that institutional controls for radionuclides are not required. However, the operational history at two sites at Parcel E, IR-02 and IR-03, involve historic filling with soil and construction debris and intermittent

disposal of various shipyard wastes, including radiological devices. The following paragraphs estimate the areas and volumes that would potentially require excavation and off-site treatment and disposal to address the RGs identified in the RAOs, and discuss the potential effectiveness and reliability of excavation and off-site treatment and disposal in addressing the estimated areas and volumes.

Complete removal of all radioactive contamination at IR-02 and IR-03 is not considered practical because it would potentially involve excavation of all fill material to the Bay Mud surface, located at depths ranging from 5 feet bgs to greater than 40 feet bgs (with an average depth to the Bay Mud surface of approximately 15 feet bgs). The estimated excavation volume would be over 1,000,000 cubic yards (estimated using the average depth to the Bay Mud surface, approximately 15 feet bgs, multiplied by the 44.6 acres comprising IR-02 and IR-03). Experience from removal actions in Parcels E and E-2 has provided useful information for evaluating potential waste excavation, including field production rates, types of wastes encountered, and level of effort to implement site-specific requirements (for example, the requirement to screen material excavated in Parcel E for radioactivity). However, the estimated excavation volume (1,000,000 cubic yards) is nearly 10 times the total volume of material removed at the four removal action areas at Parcels E and E-2 (113,400 cubic yards removed from the Metal Slag Area, PCB Hotspot Area, IR-02 Northwest and Central Removal Action Area, and Metal Debris Reef).

Excavation of such large volumes is possible but the overall effectiveness and reliability of such an option is complicated because of the following factors:

- Radiological screening, characterization, and confirmation sampling of all soils and debris transported from the site (for disposal and treatment) and to the site (for backfill and restoration)
- Locating and importing multiple, large-volume sources of backfill material that are free of contamination and do not contain metals concentrations in excess of existing ambient levels
- Groundwater inflow control for excavation below the water table
- Controls required to minimize, manage, treat (if necessary), and dispose of contaminated water during excavation and waste segregation processes
- Control of potential releases of chemicals from waste and soil during removal and transport through the surrounding neighborhood

In addition, this excavation scenario would likely require multiple years of continuous construction to complete, and the resulting traffic, noise, and emissions from heavy equipment operation would affect the local population. The environmental footprint related to implementation of this excavation scenario would be significant because of the large area and volume of material to be excavated. Based on the evaluation performed in the Final FS Report (ERRG, 2012), large-scale excavation scenarios generate significant greenhouse gas emissions and are very energy intensive when compared with scenarios involving containment and smaller-scale excavation. These challenges directly correspond to the high projected costs. The primary factors that result in the high costs of excavation and disposal are:

- Large volume of soil and sediment to be excavated and disposed of off site
- Large volume of soil and sediment to be screened for radiological contamination, sampled for characterization, and transported and treated or disposed of off site
- Large volume of imported clean fill required for backfill to restore the site

Overall, the potentially poor short-term effectiveness, implementation challenges, and high cost of excavating IR-02 and IR-03 to the Bay Mud surface do not offset the long-term effectiveness of such an action. Therefore, using the framework established in EPA guidance (EPA, 1988) and the NCP (55 Federal Register 8849, March 8, 1990), excavating IR-02 and IR-03 to the Bay Mud surface is not a feasible process option. Because excavation of IR-02 and IR-03 to the Bay Mud surface is not feasible, other process options must be identified that can prevent exposure of humans and wildlife to radionuclides in soil that exceed RGs. Excavation options for IR-02 and IR-03 will focus on removing (1) ROCs in the upper 1 foot of soil at concentrations exceeding RGs; (2) ROCs in deeper soil that are collocated with nonradioactive chemicals requiring removal (as discussed in Section 3.3.2.1.5 of the Final FS Report [ERRG, 2012]); and (3) ROCs in deeper soil that may result in the radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) exceeding the risk management range specified in the NCP (10^{-6} to 10^{-4}). Excavation of radioactive contamination in shallow soil would reduce exposure to humans, and then institutional controls and covers would be implemented in IR-02, as described in Sections 3.3.1.2 and 3.3.1.4, to effectively prevent exposure of humans to radioactive contamination in deeper soil. This remediation approach is consistent with the NCP, 40 CFR § 300.430 (a)(1)(iii)(B), that states that containment technologies are likely to be appropriate for sites with relatively low-level threats or where treatment is impractical.

3.3.1.4. Containment

Containment processes are intended to isolate contaminated soil or sediment to prevent direct exposure and contaminant migration. As discussed in Section 3.3.1.3, containment options are retained for evaluation at IR-02 and IR-03 because removal alone is not a practical means of achieving the ROC-specific RAO at these areas. At IR-02 and IR-03, containment would be used in combination with focused removal and institutional controls to achieve the ROC-specific RAO.

The most appropriate containment technology for soil at Parcel E is surface covers. Cover materials used to prevent direct exposure may include clean soil, asphalt, or concrete, and the material to be used will depend on the planned reuse associated with each redevelopment block. The planned reuse at IR-02 and IR-03 is open space; therefore, a clean soil cover is most compatible with this planned reuse. In addition, a clean soil cover would provide increased shielding from residual radioactivity as compared with an asphalt or concrete cover. Therefore, a clean soil cover is considered the most effective containment option for IR-02 and IR-03.

The general approach for implementing covers includes:

- Where covers are needed, areas will be covered with clean soil that will be vegetated to minimize erosion and prevent exposure of the underlying soil. Standard construction practices would likely be adequate to meet this performance standard.
- All covers must achieve a full cover over the entire redevelopment block that prevents exposure to the underlying soil with potential radioactive contamination.
- All existing or newly installed covers will need to be maintained. Maintenance includes inspections and repairs for covers left in place during future land use, and replacement of covers if future land use requires excavation or demolition of the covers during construction. Any modification of covers will be subject to the institutional controls described in [Section 3.3.1.2](#).

Covers are effective, so long as they are properly installed and maintained, and are replaced after excavation or demolition during redevelopment. The implementability and cost of covers are expected to be moderate because they are already in place at most of the redevelopment blocks at Parcel E. The implementability and cost of soil covers would vary based on thickness, with a thicker soil cover being slightly more difficult to implement over a large area (such as IR-02 and IR-03) and more costly as compared with a thinner soil cover.

The Navy has evaluated a 2-foot-thick soil cover at radiologically impacted areas of Parcel E-2 ([ERRG and RSRS, 2011](#)) and has selected a 3-foot-thick soil cover at radiologically impacted areas of Parcel B, IR-07 and IR-18 ([Navy, 2009a](#)). Although the operational histories at Parcel E-2 and Parcel B, IR-07 and IR-18 are distinct from the operational history of IR-02 and IR-03, there are enough similarities to warrant consideration of both a 2-foot- and 3-foot-thick soil cover as potentially viable options for IR-02 and IR-03. Each of these areas (Parcel E-2; Parcel B, IR-07 and IR-18; and Parcel E, IR-02 and IR-03) was used for disposal of shipyard wastes that may have included LLRW, but the types and volumes of LLRW potentially disposed of in these areas vary. To account for this potential variation, the covers would be implemented in a manner that (1) quantifies residual radioactivity (through surface scans and confirmation soil sampling) prior to cover construction, and (2) confirms that the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) is within the risk management range specified in the NCP (10^{-6} to 10^{-4}).

As discussed in [Section 2.2.1.12](#), surface scans performed along the IR-02 shoreline identified areas of elevated radioactivity that may indicate the presence of radionuclides at concentrations exceeding the RGs. In addition, previous investigations have identified nonradioactive chemicals in shoreline sediment that pose a risk to wildlife. As a result, the process options evaluated in the FS Report (Section 3.3.2.1.7) included containment of shoreline sediment ([ERRG, 2012](#)). These process options would also apply to the potential radioactive contamination within the shoreline sediment and are not repeated in this radiological addendum.

The cover and the shoreline protection process options will be retained for development and evaluation of remedial alternatives.

3.3.2. Technologies and Process Options for Structures

GRAs identified for structures at Parcel E are (1) no action, and (2) removal by decontamination and demolition. The results of the evaluation are summarized in [Table 8](#).

3.3.2.1. No Action

The NCP requires that the no-action alternative be carried through the detailed analysis of alternatives. Under the no-action response, no remedial action would be taken. Structures would be left as is without implementing any institutional controls, containment, removal, treatment, or other mitigating actions. No cost would be associated with this option because no action would be taken. The no-action option will be retained for further evaluation as a remedial alternative for comparison only, as required under the NCP.

3.3.2.2. Removal by Decontamination or Demolition

Removal by decontamination or demolition is an effective technology for structures at Parcel E and involves removing radioactive contamination and transporting contaminated material off site to a licensed disposal facility. Radiological surveys, performed in accordance with MARSSIM guidance (NUREG-1575; [U.S. Department of Defense et al., 2000](#)), are required to identify radioactive contamination prior to removal and to verify the effectiveness of the removal effort. Important considerations with the removal technologies include structure size, potential for reuse, extent of radioactive contamination, type of contaminated building material, air emissions, hauling distance, and disposal facility for final deposition. These factors help determine the most cost-effective means of achieving the RGs for structures, which are specific to the reuse type and ROC-specific RAO specified in [Section 3.1](#).

Decontamination of radioactively contaminated building materials is most commonly performed by scabbling. Scabbling is technically defined as roughly shaping rock or stone; however, in the context of radioactive decontamination, scabbling is more precisely defined as physically removing surface contamination from building material (such as wall, floors, ceilings, or other building components) and is performed using powered mechanical tools. Scabbling would typically be performed at structures with limited radioactive contamination or at structures where demolition is not practical or cost-effective.

Demolition would include destruction of structure areas or the entire structure found to have ROCs above the RGs. Demolition is performed using a combination of powered mechanical tools and heavy equipment. Demolition wastes must be properly screened and segregated prior to off-site disposal. Demolition would typically be performed at small structures where decontamination and post-remediation surveys are not practical or cost-effective.

Removal by decontamination or demolition is effective and implementable for ROCs found in structures at Parcel E; therefore, removal by decontamination or demolition will be retained for development and evaluation of remedial alternatives.

Section 4. Development of Remedial Alternatives

The remedial alternatives for radionuclides were developed to comply with the radiological-specific RAO and to supplement the remedial alternatives for nonradioactive chemicals identified in the Final FS Report (ERRG, 2012). Section 4.1 briefly describes, for informational purposes only, the remedial alternatives for nonradioactive chemicals identified in the Final FS Report. Section 4.2 details the remedial alternatives developed for radionuclides at Parcel E.

4.1. REMEDIAL ALTERNATIVES FOR NONRADIOACTIVE CHEMICALS

The Final FS Report for Parcel E developed remedial alternatives for soil, sediment, groundwater, and nonaqueous-phase liquids (NAPL) containing nonradioactive chemicals that pose a risk to humans and wildlife. The remedial alternatives were developed to address nonradioactive chemical contamination but proposed varying amounts of intrusive work within radiologically impacted areas. As a result, the alternatives, as presented in the Final FS Report, specify radiological control procedures to properly screen, segregate, characterize, and dispose of radioactive materials (ERRG, 2012). The remedial alternatives for radionuclides evaluated in this radiological addendum (see Section 4.2) are independent of the remedial alternatives evaluated in the FS Report and identify additional actions that are needed to meet the RAO for radioactively contaminated media (soil, sediment, and structures). Consistent with the remedy selection process for Parcels B, G, and D-1 and UC-1 (Navy, 2009a, 2009b, and 2009c, respectively), the Navy will identify preferred remedial alternatives for both nonradioactive chemicals and radionuclides in the proposed plan for Parcel E. The final remedy for Parcel E, to be selected in the ROD following public comment on the proposed plan, will specify the actions necessary to satisfy the RAOs established for both radionuclides and nonradioactive chemicals.

4.1.1. Soil and Sediment Alternatives

The following sections briefly summarize the remedial alternatives for soil and sediment, as presented in the Final FS Report for Parcel E (ERRG, 2012).

4.1.1.1. Alternative S-1 – No Action

For this alternative, no remedial action would take place. Soil and sediment would be left in place without any response actions (such as, institutional controls, monitoring, containment, removal, and treatment). The no action alternative is retained throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

4.1.1.2. Alternative S-2 – Covers, Institutional Controls, and Shoreline Protection

This alternative would involve covers, institutional controls, and shoreline protection, as well as engineering controls and monitoring to meet ARARs and RAOs. This alternative provides physical barriers to eliminate the exposure pathways to soil and sediment at Parcel E. Based on the ubiquitous nature of metals and some organic chemicals exceeding RGs at Parcel E, the cover alternative would be applied throughout redevelopment blocks with soil that contains chemicals of concern (COCs) that pose a potential unacceptable risk (based on currently planned land uses). Existing covers, such as concrete building foundations and asphalt parking lots, following appropriate rehabilitation, are considered adequate for this alternative. New covers are considered for construction only in areas where no covers exist. This alternative includes conservative assumptions for maintenance, upgrades, or repairs to the existing covers; the extent of these actions will be assessed in the RD and implemented for this alternative as necessary. In addition, the Navy would construct shoreline protection features to prevent contaminated soil and sediment from entering San Francisco Bay, and to integrate with the surface covers for onshore soil.

4.1.1.3. Alternative S-3 – Excavation and Off-Site Disposal of Tier 1 Locations, Followed by Covers, Institutional Controls, and Shoreline Protection

This alternative would involve excavation of Tier 1 locations with off-site disposal of contaminated soil at a permitted disposal facility. This alternative also provides for the covers, institutional controls, and shoreline protection discussed in Alternative S-2. In the FS Report, Tier 1 locations were defined as locations containing COCs at concentrations greater than 10 times the RG (ERRG, 2012). Alternative S-3 provides a permanent remedy to remove soil Tier 1 locations where excavation is feasible. Remaining low-risk contaminated soil is addressed by covers and institutional controls. The covers under this alternative would be used to prevent exposure to potential unacceptable risk posed by other COCs in soil (such as ubiquitous metals at concentrations above RGs).

4.1.1.4. Alternative S-4 – Excavation and Off-Site Disposal of Tier 1 and Tier 2 Locations, Followed by Covers, Soil Vapor Extraction, Institutional Controls, and Shoreline Protection

This alternative would involve excavation of Tier 1 and Tier 2 locations where RGs are exceeded, with off-site disposal at a permitted disposal facility. This alternative also provides for the covers, institutional controls, and shoreline protection discussed in Alternative S-2. In addition, this alternative includes soil vapor extraction (SVE) as a source reduction measure to address VOC-contaminated soil at the Building 406 VOC plume. Soil containing COCs at concentrations greater than or equal to 5 times the RGs (but less than 10 times the RGs) would be excavated where feasible to reduce the concentrations of the COCs in the environment. In the FS Report, such locations were defined as Tier 2 locations (ERRG, 2012). Tier 2 locations are distinct from the Tier 1 locations, which are defined as locations with COCs at concentrations greater than or equal to 10 times the RGs. Alternative S-4 provides a permanent remedy to remove Tier 1 and Tier 2 locations where excavation is feasible. Remaining low-risk contaminated soil

would be addressed by covers and institutional controls. The covers under this alternative would be used to prevent exposure to potential unacceptable risk posed by other COCs in soil (such as ubiquitous metals at concentrations above RGs).

4.1.2. Groundwater Alternatives

The following sections briefly summarize the remedial alternatives for groundwater, as presented in the Final FS Report for Parcel E (ERRG, 2012).

4.1.2.1. Alternative GW-1 – No Action

For this alternative, no remedial action would take place. Groundwater would be left in place without any response actions (such as, institutional controls, monitoring, containment, removal, and treatment). The no action alternative is retained throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

4.1.2.2. Alternative GW-2 – Institutional Controls and Long-Term Groundwater Monitoring

This alternative would involve institutional controls and long-term groundwater monitoring. Institutional controls would be implemented in areas where humans could be exposed to COCs at concentrations that pose a health risk. Long-term groundwater monitoring would serve a two-fold purpose. It would (1) provide awareness of the size and behavior of COC plumes, helping to ensure that chemicals do not migrate beyond controlled areas; and (2) provide baseline information on the size and behavior of plumes of chemicals of ecological concern to be used in preventing chemical discharge to San Francisco Bay.

4.1.2.3. Alternative GW-3A – Groundwater Containment, In-Situ Bioremediation, Monitored Natural Attenuation, and Institutional Controls

This alternative would involve (1) groundwater containment, (2) in-situ bioremediation (ISB) (both anaerobic and aerobic), (3) monitored natural attenuation (MNA), and (4) institutional controls. This alternative addresses plumes in nearshore areas using groundwater containment and addresses organic chemicals through anaerobic and aerobic ISB. Groundwater containment would consist of a low-permeability barrier effective in redirecting groundwater flow, rather than extraction and containment. The proposed groundwater containment system is discussed in detail in Section 4.3.3.1 of the Final FS Report for Parcel E (ERRG, 2012). Groundwater would be monitored during the bioremediation and natural attenuation phases of this alternative. Institutional controls for this alternative would be similar to those discussed for Alternative GW-2. Institutional controls would be implemented prior to active remediation and would remain in effect for as long as chemical concentrations in groundwater exceed residential RGs or soil vapor concentrations are found to pose an unacceptable risk through vapor intrusion.

4.1.2.4. Alternative GW-3B – Groundwater Containment, In-Situ Bioremediation, Zero-Valent Iron Reduction, Monitored Natural Attenuation, and Institutional Controls

This alternative would involve (1) groundwater containment, (2) anaerobic and aerobic ISB, (3) in-situ chemical reduction using zero-valent iron (ZVI), (4) MNA, and (5) institutional controls. This alternative attempts to more efficiently achieve remediation compared with Alternative GW-3A by using ZVI to address VOC concentrations at the Building 406 trichloroethene (TCE) plume, which contains the highest and most laterally extensive VOC concentrations at Parcel E. Because the risk of post-bioremediation rebound is highest at this plume, the cost and duration to remediate this plume could increase significantly. This would occur if a single ISB implementation does not have the treatment capacity to fully address the contaminant source at this plume and additional substrate injections are required. For this reason, a more aggressive treatment technology was incorporated into Alternative GW-3B to address the Building 406 TCE plume. Otherwise, this alternative is identical to Alternative GW-3A. As with Alternative GW-3A, groundwater would be monitored during the in-situ treatment and natural attenuation phases and institutional controls would be applied.

4.1.2.5. Alternative GW-4 – Groundwater Containment, In-Situ Bioremediation, Air Sparging, Monitored Natural Attenuation, and Institutional Controls

This alternative would involve (1) groundwater containment, (2), air sparging, (3) ISB, (4) MNA, and (5) institutional controls. As with Alternative GW-3B, this alternative provides a more aggressive treatment technology to address the Building 406 TCE plume. Air sparging is considered to address this plume because it would be relatively easy to implement if containment and SVE are implemented at this location under a soil alternative. This alternative could integrate soil and groundwater remediation at Building 406. This alternative would only be implemented if the SVE alternative for soil (Alternative S-4) is selected for implementation. Except for air sparging, this alternative is identical to Alternatives GW-3A and GW-3B.

4.1.3. Nonaqueous-Phase Liquids Alternatives

The following sections briefly summarize the remedial alternatives for NAPL at IR Site 03, as presented in the Final FS Report for Parcel E (ERRG, 2012).

4.1.3.1. Alternative N-1 – No Action

For this alternative, no remedial action would take place. Groundwater would be left in place without any response actions (such as, institutional controls, monitoring, containment, removal, and treatment). The no action alternative is retained throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

4.1.3.2. Alternative N-2 – Source Containment, Monitoring, and Institutional Controls

This alternative would involve source containment, followed by long-term groundwater monitoring and institutional controls. Source containment would be achieved by (1) limiting infiltration and direct

exposure with an engineered cover, and (2) isolating the NAPL source and contaminated groundwater with a vertical subsurface barrier. Long-term groundwater monitoring would provide information on the size and behavior of COC plumes to be used in preventing contaminant discharge to San Francisco Bay. Institutional controls, consisting primarily of restrictive covenants identifying specific land use and activity restrictions, would be implemented to prevent exposure to potential unacceptable risks posed by COCs in soil and groundwater. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.1.3.3. Alternative N-3 – Source Removal or Treatment, Containment, Monitored Natural Attenuation, and Institutional Controls

This alternative would involve a combination of source removal or treatment, containment, MNA, and institutional controls. The NAPL source would be removed or treated using multiple process options including excavation with off-site disposal, in-situ stabilization, and thermally enhanced extraction with off-site disposal. These actions would remove or treat the NAPL source to extent practical, but residual concentrations of chemicals posing a risk to humans and wildlife are expected to remain in the subsurface based on the nature and extent of NAPL contamination. The migration of the chemicals would be controlled through the containment portion of this remedial alternative. Remediation of any residual contamination would occur through MNA. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.1.3.4. Alternative N-4A – Source Removal or Treatment, Groundwater Treatment by In-Situ Bioremediation, Containment, Monitored Natural Attenuation, and Institutional Controls

This alternative would involve a combination of source removal or treatment, followed by groundwater treatment (by aerobic ISB), containment, MNA, and institutional controls. Alternative N-4A is the same as Alternative N-3, with the addition of ISB to remediate groundwater upon completion of NAPL removal or treatment. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.1.3.5. Alternative N-4B – Source Removal or Treatment, Groundwater Treatment by Steaming, Containment, Monitored Natural Attenuation, and Institutional Controls

This alternative would be a combination of source removal or treatment, followed by groundwater treatment (by steaming), containment, MNA, and institutional controls. Following removal of the NAPL source, this alternative assumes the thermal remediation system would further heat the groundwater to boil (or steam) and then extract the remaining volatile and semivolatile chemicals in groundwater. Otherwise, this alternative is identical to Alternative N-3. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.1.3.6. **Alternative N-5 – Source Removal by Excavation and NAPL Extraction/Treatment, In-Situ Bioremediation, Containment, Monitored Natural Attenuation, and Institutional Controls**

This alternative would involve a combination of source removal by excavation in the unsaturated zone, followed by NAPL extraction or treatment in the saturated zone, groundwater treatment by aerobic ISB, containment, MNA, and institutional controls. Alternative N-5 is the same as Alternative N-4, but includes the excavation of all potential source material in the unsaturated zone. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.1.3.7. **Alternative N-6 – Source Removal by Excavation, Monitored Natural Attenuation, and Institutional Controls**

This alternative would involve a combination of source removal by excavation in the unsaturated and saturated zones, followed by MNA and institutional controls. Alternative N-6 considers excavating to and below the groundwater table with the objective of removing the entire NAPL source and achieving clean closure of IR-03. The institutional controls would be a combination of those presented for Alternative S-2 and for Alternative GW-2.

4.2. **REMEDIAL ALTERNATIVES FOR RADIONUCLIDES**

The remedial alternatives for radionuclides at Parcel E were developed by combining different technologies and process options that were retained following the evaluation summarized in [Section 3](#). The target remediation areas were identified based on operational history, characterization data, and risk evaluations that were summarized in [Section 2](#).

Remedial alternatives were derived using experience and engineering judgment that formulated the process options into the most plausible site-specific response actions. In particular, the Navy's experience at remediating radioactive contamination at other HPS sites was used to identify the most plausible remediation approaches for each contaminated medium, considering the site conditions and historical operations. In addition, remedial alternatives are supported by the results of RESRAD modeling summarized in [Appendix B](#). The Navy's overall strategy for remediating radioactively contaminated media is summarized as follows:

- **Soil and Sediment:** The Navy's strategy is to remove (and dispose of off site) radiologically impacted soil and sediment to the maximum extent practical. At Parcel E, radiologically impacted soil would be removed from former building sites; trenches resulting from removal of sanitary sewer, storm drain, and septic sewer lines; and surface locations throughout IR-02 and IR-03. Radiologically impacted sediment would be removed from the Parcel E shoreline in conjunction with the establishment of shoreline protection measures (to be evaluated in the FS Report and selected in the ROD). As outlined in [Section 3.3.1.3](#), excavation and off-site disposal of all potential radioactive contamination in IR-02 and IR-03 are not practical based on poor short-term effectiveness, implementation challenges, and high cost. Excavation at IR-02 and IR-03 will focus

on removing (1) ROCs in the upper 1 foot of soil at concentrations exceeding RGs; (2) ROCs in deeper soil that are collocated with nonradioactive chemicals requiring removal (as discussed in Section 3.3.2.1.5 of the Final FS Report [ERRG, 2012]); and (3) ROCs in deeper soil that may result in the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) exceeding the risk management range specified in the NCP (10^{-6} to 10^{-4}). Excavation of radioactive contamination in shallow soil would reduce exposure to humans, and then institutional controls and covers would be implemented in IR-02, as described in Sections 3.3.1.2 and 3.3.1.4, to effectively prevent exposure of humans to radioactive contamination in deeper soil.

- **Structures:** The Navy's strategy is to remove ROCs throughout existing and former structures to eliminate complete exposure pathways to the potential receptors. The removal will be achieved by either decontamination, demolition, or a combination of both methods. This radiological addendum presents a preliminary removal approach at each radiologically impacted site; however, this removal approach will be further refined during the RD based on various factors, including structure size, potential for reuse, and the type and extent of radioactive contamination found during future scoping or characterization surveys.

As discussed in Section 3.3.1.4, soil covers are the most plausible containment option for the residual radioactivity at IR-02 and IR-03 (following removal activities, as described above). As discussed in Section 3.3.1.4, both a 2-foot-thick and 3-foot-thick soil cover warrant evaluation at IR-02 and IR-03.

In accordance with the strategy presented above, the Navy developed three remedial alternatives for radionuclides at Parcel E:

- **Alternative R-1 – No Action:** A no action alternative, as required by the NCP, to serve as a basis of comparison with other remedial alternatives.
- **Alternative R-2 – Survey, Removal, and Disposal (with 2-foot-thick soil cover and institutional controls at IR-02 and IR-03):** This alternative would involve removal at all Parcel E radiologically impacted sites except IR-02 and IR-03, where a 2-foot-thick soil cover and institutional controls will complement removal of radioactive contamination near the ground surface. Alternatives S-2, S-3, and S-4 in the Final FS Report (ERRG, 2012) each includes a 2-foot-thick soil cover at IR-02 and IR-03 to prevent exposure to nonradioactive chemicals. Alternative R-2 considers this same 2-foot-thick soil cover because it is necessary to evaluate the protectiveness from exposure to ROCs. However, the costs for the soil cover are not repeated in Alternative R-2 because they are already included in the cost estimates for Alternatives S-2, S-3, and S-4.
- **Alternative R-3 – Survey, Removal, and Disposal (with 3-foot-thick soil cover and institutional controls at IR-02 and IR-03):** This alternative would be identical to Alternative R-2 except that it would involve increasing the thickness of the soil cover to 3 feet at IR-02 and IR-03. Alternative R-3 will serve as a basis of comparison with Alternative R-2, so that the most effective containment alternative for IR-02 and IR-03 can be identified in the proposed plan and ROD. The soil cover costs for Alternative R-3 are limited to the additional 1 foot of soil cover because the cost for a 2-foot-thick soil cover is already included in the cost estimates for Alternatives S-2, S-3, and S-4.

For sites other than IR-02 and IR-03, the Navy elected to develop a single, focused remedial approach (common to Alternatives R-2 and R-3) to satisfy the RAO based on aligning the site conditions at Parcel E with site-specific experience at other HPS parcels, where remedial alternatives focused on complete removal of radiological contamination (and were supplemented with containment and institutional controls only where complete removal was not deemed practical). The remedial alternatives are discussed further in the following sections.

4.2.1. Alternative R-1 – No Action

Under Alternative R-1, no remedial action would be taken. Radiologically impacted sites would be left as is without implementing any response actions (for example, monitoring, institutional controls, containment, or removal). The no action alternative is included throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

4.2.2. Alternative R-2 – Survey, Removal, and Disposal (with 2-foot-thick soil cover and institutional controls at IR-02 and IR-03)

Alternative R-2 consists of various actions necessary to prevent exposure to ROCs at activity levels that exceed RGs for all potentially complete exposure pathways. [Table 9](#) summarizes the various components of Alternative R-2, including identifying portions of the alternative (such as the soil cover across most of IR-02 and IR-03) that were incorporated into remedial alternatives for nonradioactive chemicals presented in the FS Report. [Figure 8](#) identifies the locations where each component of Alternative R-2 is to be implemented. The various components of Alternative R-2 are discussed in the following sections.

4.2.2.1. Scoping or Characterization Surveys

The Navy would perform scoping or characterization surveys in accordance with MARSSIM and consistent with the recommendations in the HRA to identify areas with elevated radioactivity. The surface surveys would consist of a high-density gamma scan performed over a 50-foot by 50-foot grid system. The resulting 100 percent surface survey would be supplemented, as necessary, with additional scans or collection of soil samples to confirm the presence of ROCs identified during the surface survey. At IR-02 and IR-03, a radiological characterization surface scan will initially be conducted over 100 percent of the area to identify areas with elevated activity.

Scoping and characterization surveys at certain sites may be designed with a sufficient density of samples to serve as a final status survey if no residual radioactivity is found; however, for estimating purposes, this radiological addendum assumes that radiologically impacted sites will require either a scoping or a characterization survey, followed by some level of remediation and a final status survey. The only exception to this assumption are building sites (Buildings 406, 414, 701, and 708) where scoping surveys and remediation were previously completed; at these sites, only a final status survey is required.

4.2.2.2. Soil, Sediment, and Debris Removal

Soil, sediment, and debris containing ROCs at activities exceeding the RGs, as identified during scoping or characterization surveys, would be excavated, characterized, and disposed of at an off-site facility licensed to receive LLRW. Removal locations include former buildings; non-building sites (for example, IR-02 and the Building 707 Triangle Area); and sanitary sewer, storm drain, and septic sewer lines. Excavation depth at these locations would vary. At all sites other than IR-02 and IR-03, excavation would extend as deep as necessary to remove soil containing ROCs at activities exceeding the RGs. Surface scans and sampling would be performed in conjunction with the removal effort, but prior to the necessary final status surveys, to ensure that RAOs are met. Once complete, all excavations would be backfilled to the existing ground surface with soil that meets appropriate acceptance criteria for radioactive and nonradioactive chemicals.

At IR-02 and IR-03, soil containing ROCs at activities exceeding the RGs would be removed, with the excavation generally limited to the upper 1 foot of the ground surface. The Navy has demonstrated, through past evaluations performed for Parcel B, IR-07 and IR-18 (TtECI, 2012), and Parcel E-2 (ERRG and RSRS, 2011), that remediation of the upper 1 foot of the ground surface followed by installation of a clean soil cover would be protective of human health. However, given the historical operations at IR-02 and IR-03 and potential subsurface data gaps, it is possible that elevated activity levels may be encountered following surface remediation. Deeper soil excavation in IR-02 or IR-03 would be performed, if necessary, to verify that the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) is acceptable. The residual radiological risk at the final ground surface (based on residential exposure) would be within the risk management range specified in the NCP (10^{-6} to 10^{-4}). In preparing the RD, the Navy would work closely with the regulatory agencies to develop specific protocols for determining when deeper soil excavation is needed to verify that the residual radiological risk at the final ground surface is acceptable. In addition, the Navy would perform radiological risk modeling (using RESRAD or another model acceptable to the regulatory agencies), in conjunction with the final status survey for IR-02 and IR-03, to verify that the residual radiological risk is acceptable. As presented in Appendix D (Table D-12), Alternative R-2 assumes that 20 cubic yards of low-level radioactive waste would be generated for every 1,000 square meters of survey area (or about 5 percent of the volume within the upper 1 foot of a 1,000 square meter survey area). This assumption is consistent with the findings from previous radiological removal actions at Parcels E and E-2 (TtECI, 2007c and 2007d).

In general, sanitary sewer, storm drain, and septic sewer lines in IR-02 and IR-03 would be left in place because potential exposure to residual contamination in these lines would be controlled by cutting and capping the lines at the IR site boundaries and by the proposed soil cover and institutional controls. However, sanitary sewer, storm drain, and septic sewer lines may be partially removed in localized portions of IR-02 and IR-03 where lines are submerged below the groundwater table and intersect

groundwater contaminant plumes (thereby serving as potential preferential pathways). At these locations, the sanitary sewer, storm drain, and septic sewer lines would be cut and capped to control potential contaminant migration. As identified in the Final FS Report (ERRG, 2012), the groundwater contaminant plumes at IR-02 and IR-03 consist of various nonradioactive chemicals in localized areas of IR-02 Northwest and Central and IR-03.

At IR-02 and IR-03, deeper soil excavation may also be performed in conjunction with removal of nonradioactive soil hot spots or to support implementation of shoreline protection measures. As described in the Final FS Report (ERRG, 2012), risk associated with nonradioactive chemicals in soil would be mitigated through remedial alternatives that rely primarily on excavation and off-site disposal of hot spots and containment of remaining contamination.

4.2.2.3. Structure Decontamination and Partial Demolition

Building materials containing elevated radioactivity exceeding the RGs for surfaces (Table 7), as identified during scoping or characterization surveys, would be removed by either scabbling or partial demolition, and wastes would be characterized and disposed of at an off-site facility licensed to receive LLRW. Surface scans and sampling would be performed in conjunction with the removal effort, but prior to the necessary final status surveys, to ensure that RAOs are met. This radiological addendum assumes that it would be more cost-effective to perform partial demolition and decontamination at most larger complex structures; for estimating purposes, Buildings 406, 414, 500, 521, and 810 are assumed to fall within this category.

4.2.2.4. Structure Decontamination and Complete Demolition

Similar to the decontamination process described in Section 4.2.2.3, this process would consist of (1) building materials containing elevated radioactivity being removed by either scabbling or partial demolition, (2) wastes being characterized and disposed of at an off-site facility licensed to receive LLRW, and (3) surface scans and sampling being performed in conjunction with the removal effort to ensure that RAOs are met. The partial removal of radioactive contamination would be followed by complete demolition of the structure. Demolition debris would be properly screened, segregated, and disposed of at an appropriate off-site facility. This radiological addendum assumes that it would be more cost-effective to completely demolish relatively small buildings following decontamination; for estimating purposes, Buildings 527, 707, and 708 are assumed to fall within this category. In addition, the two piers offshore of Parcel E are assumed to require decontamination and demolition based on their deteriorating condition.

4.2.2.5. Final Status Surveys

Final status surveys would be performed at all radiologically impacted sites at Parcel E and in accordance with MARSSIM following removal, decontamination, and demolition. Surveys would consist of a

combination of surface scans and sampling to verify that RGs have been met. Survey results would be compiled and reported to support regulatory agency approval of the Navy's findings. In conjunction with the final status survey for IR-02 and IR-03, the Navy would perform radiological risk modeling (using RESRAD or another model acceptable to the regulatory agencies) to verify that residual radiological risk is within the risk management range specified in the NCP (10^{-6} to 10^{-4}).

4.2.2.6. Soil Cover, Shoreline Protection, and Institutional Controls (IR-02 and IR-03 only)

A characterization survey would be performed at IR-02 and IR-03 to identify ROCs within the upper 1 foot of soil that would be removed and disposed of off site. As described in [Section 4.2.2.2](#), deeper soil excavation in IR-02 or IR-03 would be performed, if necessary, to verify that the residual radiological risk at the surface (following backfilling of the excavation and installation of a demarcation layer and soil cover) is acceptable. Once complete, all excavations would be backfilled to the existing ground surface with soil that meets appropriate acceptance criteria for radioactive and nonradioactive chemicals. Subsequently, a 2-foot-thick soil cover would be installed at and above original grade at IR-02 and IR-03. The soil cover would be underlain by a demarcation layer, consisting of a permeable geosynthetic material and magnetic marking tape, to ensure proper identification of the bottom of the soil cover. [Figure 9](#) details the proposed cover types in IR-02 and IR-03.

The proposed soil cover and demarcation layer would effectively reduce the residual radiological risk at the final ground surface in accordance with the RAO. The residual radiological risk at the final ground surface (based on residential exposure) would not exceed the risk management range specified in the NCP (10^{-6} to 10^{-4}). The Navy would perform radiological risk modeling (using RESRAD or another model acceptable to the regulatory agencies), in conjunction with the final status survey for IR-02 and IR-03, to verify that residual radiological risk is acceptable.

At IR-02 and IR-03, deeper soil excavation may also be performed in conjunction with removal of nonradioactive soil hot spots or to support implementation of shoreline protection measures. As described in the Final FS Report ([ERRG, 2012](#)), risk associated with nonradioactive chemicals in soil would be mitigated through remedial alternatives that rely primarily on excavation and off-site disposal of hot spots and containment of remaining contamination.

The remedial alternatives evaluated in the Final FS Report ([ERRG, 2012](#)) include containment of the IR-02 and IR-03 shoreline. The shoreline protection, as specified for soil alternatives S-2 through S-4, includes excavation of shoreline material (including removal and disposal of potential radioactive contamination) and installation of protective features that would satisfy the RAOs specified in the FS Report and this radiological addendum. The specific type of shoreline protection (such as a rock revetment wall or other more natural options) was evaluated in the Final FS Report ([ERRG, 2012](#)). Institutional controls, consisting of land use and activity restrictions, would be implemented to prevent exposure to potential residual radioactivity in soil left in place and preserve the integrity of the soil cover.

As discussed in [Section 2.3.2.3](#), groundwater at IR-02 and IR-03 does not appear to have been impacted by radionuclides at concentrations that warrant further evaluation in the FS; however, as a conservative measure, future groundwater monitoring would include analysis for radionuclides to verify the conclusions of this radiological addendum.

4.2.3. Alternative R-3 – Survey, Removal, and Disposal (with 3-foot-thick soil cover and institutional controls at IR-02 and IR-03)

Alternative R-3 involves all of the components of Alternative R-2, but includes a 3-foot-thick soil cover in place of the 2-foot-thick soil cover specified in Alternative R-2. Alternative R-3 consists of various actions necessary to prevent exposure to ROCs at activity levels that exceed RGs for all potentially complete exposure pathways, with a thicker soil cover to provide additional shielding from residual radioactivity at IR-02 and IR-03. Alternative R-3 would consist of:

- Scoping or characterization surveys (discussed in [Section 4.2.2.1](#))
- Soil, sediment, and debris removal (discussed in [Section 4.2.2.2](#))
- Structure decontamination and partial demolition (discussed in [Section 4.2.2.3](#))
- Structure decontamination and complete demolition (discussed in [Section 4.2.2.4](#))
- Final status surveys (discussed in [Section 4.2.2.5](#))
- Soil cover, shoreline protection, and institutional controls at IR-02 and IR-03 only, as described in [Section 4.2.2.6](#), except for increasing the soil cover from 2 feet to 3 feet thick.

[Table 9](#) summarizes the various components of Alternative R-3, including identifying portions of the alternative (such as the soil cover across most of IR-02 and IR-03) that were incorporated into remedial alternatives for nonradioactive chemicals presented in the FS Report. [Figure 8](#) identifies the locations where each component of Alternative R-3 is to be implemented, and [Figure 9](#) details the proposed cover types in IR-02 and IR-03.

Section 5. Detailed and Comparative Analysis of Remedial Alternatives

This section provides a detailed and comparative analysis of the three remedial alternatives for radionuclides developed in [Section 4](#). The alternatives are evaluated using criteria based on the statutory requirements of CERCLA, as amended by the Superfund Amendments and Reauthorization Act, § 121; the NCP; and “Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA” (EPA, 1988). The NCP evaluation criteria are discussed further in the section below.

5.1. NATIONAL OIL AND HAZARDOUS SUBSTANCES POLLUTION CONTINGENCY PLAN CRITERIA

The first two NCP criteria are threshold criteria that must be satisfied for a remedy to be eligible for selection; the next five are balancing criteria used to evaluate the comparative advantages and disadvantages of the remedies; and the final two are modifying criteria evaluated after regulatory agency and public comments are received on the FS Report and proposed plan. The nine criteria are listed below.

Overall protection of human health and the environment: This criterion describes how each alternative, as a whole, protects human health and the environment and indicates how each hazardous substance source is to be eliminated, reduced, or controlled.

Compliance with ARARs: This criterion evaluates each alternative’s compliance with ARARs, or, if an ARAR waiver is required, how the waiver is justified. ARARs consider location-specific, chemical-specific, and cleanup action-specific concerns.

Long-term effectiveness and permanence: This criterion evaluates the effectiveness of each alternative in protecting human health and the environment after the remedial action is complete. Factors considered include magnitude of residual risks and adequacy and reliability of release controls.

Reduction of toxicity, mobility, or volume through treatment: This criterion evaluates the anticipated capability of each alternative’s specific treatment technology to reduce the toxicity, mobility, or volume of hazardous substances.

Short-term effectiveness: This criterion addresses the effectiveness of each alternative in protecting human health and the environment during the construction and implementation phase. Factors considered include:

- Exposure of the community during implementation
- Exposure of the workers during construction
- Environmental impacts
- Time required to complete the remedial action and achieve RAOs

Implementability: This criterion addresses the technical and administrative feasibility of implementing an alternative and the availability of the required services and materials during its implementation. Factors considered include:

- Ability to construct the technology
- Reliability of the technology
- Monitoring considerations
- Availability of equipment and specialists

Cost: This criterion evaluates the capital and operation and maintenance (O&M) costs for each alternative. Capital and O&M cost estimates are order-of-magnitude level estimates and have an expected accuracy of minus 30 to plus 50 percent (EPA, 2000a).

State Acceptance: This criterion evaluates technical and administrative issues and concerns the regulatory agencies may have about each alternative. This criterion will be assessed in the ROD after comments are received on the FS Report, this addendum, and the proposed plan.

Community Acceptance: This criterion evaluates issues and concerns the public may have about each alternative. This criterion will be assessed in the ROD after comments have been received on the FS Report, this addendum, and the proposed plan.

5.2. DETAILED EVALUATION OF RADIOLOGICAL REMEDIAL ALTERNATIVES

The following sections present a detailed evaluation of each remedial alternative for radionuclides relative to the two threshold and five balancing NCP criteria. The analysis presented in the following sections focuses on how each alternative performs relative to radiological-specific considerations. For example, estimated radiological risks based on post-remediation conditions are discussed to evaluate the overall protection of human health. Finally, the performance rating relative to each NCP criterion is identified.

5.2.1. Alternative R-1 – No Action

Under the no action alternative, no remedial action would take place. Soil and sediment would be left in place; structures would not be decontaminated, or demolished. The no action alternative would not involve any response actions (for example, monitoring, institutional controls, containment, removal, or other mitigating actions). The no action alternative is included throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

5.2.1.1. Overall Protection of Human Health and the Environment

This alternative would not provide adequate protection of human health and the environment because exposure to ROCs at concentrations exceeding the RGs would not be prevented (by institutional controls, removal, or containment). Therefore, the rating for Alternative R-1 for the overall protection of human health and the environment is not protective.

5.2.1.2. Compliance with Applicable or Relevant and Appropriate Requirements

There is no need to identify ARARs for the no action alternative because ARARs apply to “any removal or remedial action conducted entirely on-site” and “no action” is not a removal or remedial action. CERCLA § 121 (42 USC § 9621) cleanup standards for selection of a Superfund remedy, including the requirements to meet ARARs, are not triggered by the no action alternative (EPA, 1988). Therefore, a discussion of compliance with ARARs is not appropriate for Alternative R-1.

5.2.1.3. Long-Term Effectiveness and Permanence

The no action alternative would not provide long-term effectiveness or permanence because potential exposures to ROCs at activity levels exceeding the RGs would not be controlled. Consequently, the overall rating for Alternative R-1 for long-term effectiveness and permanence is not acceptable.

5.2.1.4. Reduction of Toxicity, Mobility, or Volume Through Treatment

The no action alternative would not reduce the toxicity, mobility, or volume of ROCs in soil, sediment, or structures through treatment. Therefore, the overall rating for Alternative R-1 for the reduction of mobility, toxicity, and volume through treatment is poor.

5.2.1.5. Short-Term Effectiveness

This alternative would not have any adverse short-term impacts because it would not involve remediation activities that might pose risks to the community, workers, or the environment. The site is currently fenced to prevent access. Because no response action would be taken, there would be no time required to complete Alternative R-1. The overall rating for Alternative R-1 for short-term effectiveness is excellent.

5.2.1.6. Implementability

No action, including implementing institutional controls or constructing and operating a remedial system, would be required to implement this alternative; therefore, Alternative R-1 would be very easily implemented and the overall rating for Alternative R-1 for implementability is excellent.

5.2.1.7. Cost

No capital or O&M costs are associated with Alternative R-1; therefore, the overall rating for Alternative R-1 for cost is excellent.

5.2.1.8. Summary of Detailed Analysis for Remedial Alternative R-1

Because Alternative R-1 did not meet the first threshold criterion (overall protection of human health and the environment), it is not considered an acceptable alternative, and is retained only to provide a baseline for comparison with and evaluation of other alternatives.

5.2.2. Alternative R-2 – Survey, Removal, and Disposal (with 2-foot-thick soil cover and institutional controls at IR-02 and IR-03)

Alternative R-2 would involve (1) scoping or characterization surveys in accordance with MARSSIM and consistent with the recommendations in the HRA; (2) excavation and off-site disposal of soil, sediment, and debris containing ROCs exceeding the RGs, as identified during scoping or characterization surveys, with excavation at IR-02 and IR-03 generally limited to 1 foot bgs; (3) decontamination and/or demolition of structures containing elevated radioactivity, as identified during scoping or characterization surveys; (4) final status surveys in accordance with MARSSIM; and (5) a 2-foot-thick soil cover, shoreline protection, and institutional controls to address residual radioactivity at IR-02 and IR-03. As discussed in [Section 4.2.2.2](#), deeper soil excavation in IR-02 or IR-03 would be performed, if necessary, to verify that the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) would be within the risk management range specified in the NCP (10^{-6} to 10^{-4}).

5.2.2.1. Overall Protection of Human Health and the Environment

Alternative R-2 would protect human health and the environment by preventing exposure to ROCs exceeding the RGs through a combination of removal, containment, and institutional controls. As shown on [Figure 8](#), radioactive contamination would be removed at most radiologically impacted sites and buildings at Parcel E prior to final status survey. Surface soil, sediment, and debris would be removed at IR-02 and IR-03 prior to placement of a 2-foot-thick soil cover underlain by a demarcation layer and at least 1 foot of on-site soil that would be free of radioactive contamination exceeding the RGs. The protectiveness of Alternative R-2 is demonstrated through the post-remediation risk analysis (summarized in [Section 5.2.2.3](#) and detailed in Section B6.1 of [Appendix B](#)). This alternative is also protective of human health and the environment through the use of institutional controls that restrict the reuse of the redevelopment blocks to those activities that would not present a potential unacceptable risk. Therefore, the rating for Alternative R-2 for the overall protection of human health and the environment is protective.

5.2.2.2. Compliance with Applicable or Relevant and Appropriate Requirements

Alternative R-2 would meet all chemical-, location-, and action-specific ARARs that come into effect during remedy implementation, including those radiological-related ARARs identified in [Appendix C](#). The overall rating for Alternative R-2 for compliance with ARARs is meets ARARs.

5.2.2.3. Long-Term Effectiveness and Permanence

The factors evaluated under long-term effectiveness and permanence include the magnitude of residual risks, adequacy of controls, and reliability of controls. Under Alternative R-2, the combination of removal, containment, and institutional controls would prevent exposure to ROCs exceeding the RGs. This remediation approach would be effective in the long-term, but would require ongoing inspections to enforce institutional controls and maintain the soil cover at IR-02 and IR-03. The effectiveness of Alternative R-2 is demonstrated through the post-remediation risk analysis (Section B6.1 of [Appendix B](#)). RESRAD modeling using the residential RGs as surrogate concentrations, combined with a clean soil cover of 2 feet, results in an incremental cancer risk of $2E-07$ for the future residential receptor and $2E-08$ for the future recreational receptor. The overall rating for Alternative R-2 for long-term effectiveness and permanence is very good.

5.2.2.4. Reduction of Toxicity, Mobility, or Volume through Treatment

As discussed in [Section 3](#), radionuclides generally cannot be altered or destroyed through treatment. As a result, Alternative R-2 does not contemplate any actions that would reduce the toxicity, mobility, or volume of radioactive contamination through treatment. Therefore, the overall rating for Alternative R-2 for the reduction of toxicity, mobility, or volume through treatment is poor.

5.2.2.5. Short-Term Effectiveness

Under Alternative R-2, the surrounding community and site workers could be exposed to dust, noise, and increased construction traffic during the estimated 2 years required to construct the cap and associated control systems. The risk of exposure to ROCs and other nonradioactive contaminants would be minimized through the use of institutional controls to ensure the proper training of site workers, engineering controls to minimize airborne dust, and site monitoring to track potential contaminant migration during construction. In addition, the risk of contaminant release into San Francisco Bay during construction in the adjacent areas would be alleviated through engineering controls (such as silt curtains and stormwater best management practices) to restrict transport of sediment. The overall rating for Alternative R-2 for the short-term effectiveness is good.

5.2.2.6. Implementability

Excavation and placement of a soil cover are established technologies that can be readily implemented using widely available commercial services, materials, and equipment. In addition, the institutional controls are administratively easy to implement. The most significant implementation challenge would be to locate an adequate volume of soil that meets the stringent acceptance criteria for radioactive and nonradioactive chemicals. Over 140,000 cubic yards of soil is estimated to be needed for a 2-foot-thick soil cover across the 44.6 acres comprising IR-02 and IR-03. This volume is very large, but is within the upper bound of soil volumes imported for large civil construction projects (such as, covers at moderate-sized landfills). It is assumed that the required volume and quality of import soil may be obtained from

local borrow sources; however, the import soil may need to be supplemented with borrow sources from a wider geographic area. The overall rating for Alternative R-2 for implementability is very good.

5.2.2.7. Cost

The total capital and O&M costs and parameters used to derive present worth costs for Alternative R-2 are presented in [Table 10](#) and detailed in [Appendix D](#). The overall rating for Alternative R-2 for cost is very good. Alternative R-2 would incur present worth costs of a projected \$34.9 million. The costs presented in [Table 10](#) and detailed in [Appendix D](#) are in addition to costs for the remedial alternatives for nonradioactive chemicals, as presented in the Final FS Report (ERRG, 2012). As discussed in [Section 4.2](#), the costs for the soil cover are not repeated in Alternative R-2 because they are already included in the cost estimates for Alternatives S-2, S-3, and S-4.

5.2.2.8. Summary of Detailed Analysis for Remedial Alternative R-2

The overall rating for Alternative R-2 is very good. Long-term exposure to ROCs would be reduced through excavation and off-site disposal. Soil covers and institutional controls would prevent exposure to all remaining ROCs at IR-02 and IR-03.

5.2.3. Alternative R-3 – Survey, Removal, and Disposal (with 3-foot-thick soil cover and institutional controls at IR-02 and IR-03)

Alternative R-3 would involve (1) scoping or characterization surveys in accordance with MARSSIM and consistent with the recommendations in the HRA; (2) excavation and off-site disposal of soil, sediment, and debris containing ROCs exceeding the RGs, as identified during scoping or characterization surveys, with excavation at IR-02 and IR-03 generally limited to 1 foot bgs; (3) decontamination and/or demolition of structures containing elevated radioactivity, as identified during scoping or characterization surveys; (4) final status surveys in accordance with MARSSIM; and (5) a 3-foot-thick soil cover, shoreline protection, and institutional controls to address residual radioactivity at IR-02 and IR-03. As discussed in [Section 4.2.2.2](#), deeper soil excavation in IR-02 or IR-03 would be performed, if necessary, to verify that the residual radiological risk at the final ground surface (following backfilling of the excavation to the existing ground surface and installation of a demarcation layer and soil cover) would be within the risk management range specified in the NCP (10^{-6} to 10^{-4}).

5.2.3.1. Overall Protection of Human Health and the Environment

Alternative R-3 would protect human health and the environment by preventing exposure to ROCs exceeding the RGs through a combination of removal, containment, and institutional controls. As shown on [Figure 8](#), radioactive contamination would be removed at most radiologically impacted sites and buildings at Parcel E prior to final status survey. Surface soil, sediment, and debris would be removed at IR-02 and IR-03 prior to placement of a 3-foot-thick soil cover underlain by a demarcation layer and at least 1 foot of on-site soil that would be free of radioactive contamination exceeding the RGs. The

protectiveness of Alternative R-3 is demonstrated through the post-remediation risk analysis (summarized in [Section 5.2.3.3](#) and detailed in Section B6.1 of [Appendix B](#)). This alternative is also protective of human health and the environment through the use of institutional controls that restrict the reuse of the redevelopment blocks to those activities that would not present a potential unacceptable risk. Therefore, the rating for Alternative R-3 for the overall protection of human health and the environment is protective.

5.2.3.2. Compliance with Applicable or Relevant and Appropriate Requirements

Alternative R-3 would meet all chemical-, location-, and action-specific ARARs that come into effect during remedy implementation, including those radiological-related ARARs identified in [Appendix C](#). The overall rating for Alternative R-3 for compliance with ARARs is meets ARARs.

5.2.3.3. Long-Term Effectiveness and Permanence

The factors evaluated under long-term effectiveness and permanence are the magnitude of residual risks and adequacy and reliability of controls. Under Alternative R-3, the combination of removal, containment, and institutional controls would prevent exposure to ROCs exceeding the RGs. This remediation approach would be effective in the long-term, but would require ongoing inspections to enforce institutional controls and maintain the soil cover at IR-02 and IR-03. The effectiveness of Alternative R-3 is demonstrated through the post-remediation risk analysis (Section B6.1 of [Appendix B](#)). RESRAD modeling using the residential RGs as surrogate concentrations, combined with a clean soil cover of 3 feet, results in an incremental cancer risk of $7E-09$ for the future residential receptor and $5E-10$ for the future recreational receptor. The overall rating for Alternative R-3 for long-term effectiveness and permanence is very good.

5.2.3.4. Reduction of Toxicity, Mobility, or Volume through Treatment

As discussed in [Section 3](#), radionuclides generally cannot be altered or destroyed through treatment. As a result, Alternative R-3 does not contemplate any actions that would reduce the toxicity, mobility, or volume of radioactive contamination through treatment. Therefore, the overall rating for Alternative R-3 for the reduction of toxicity, mobility, or volume through treatment is poor.

5.2.3.5. Short-Term Effectiveness

Under Alternative R-3, the surrounding community and site workers could be exposed to dust, noise, and increased construction traffic during the estimated 2 years required to construct the cap and associated control systems. The risk of exposure to ROCs and other nonradioactive contaminants would be minimized through the use of institutional controls to ensure the proper training of site workers, engineering controls to minimize airborne dust, and site monitoring to track potential contaminant migration during construction. In addition, the risk of contaminant release into San Francisco Bay during construction in the adjacent areas would be alleviated through engineering controls (such as silt curtains

and stormwater best management practices) to restrict sediment transport. The overall rating for Alternative R-3 for the short-term effectiveness is good.

5.2.3.6. Implementability

Excavation and placement of a soil cover are established technologies that can be readily implemented using widely available commercial services, materials, and equipment. In addition, the institutional controls are administratively easy to implement. The most significant implementation challenge would be to locate an adequate volume of soil that meets the stringent acceptance criteria for radioactive and nonradioactive chemicals. Over 215,000 cubic yards of soil is estimated to be needed for a 3-foot-thick soil cover across the 44.6 acres comprising IR-02 and IR-03. This volume is extremely large and generally exceeds the volume of soil imported for large civil construction projects (such as, covers at moderate-sized landfills). Although the required volume and quality of import soil may not be readily available from local borrow sources, the project requirements can be met by using borrow sources from a wider geographic area. The overall rating for Alternative R-3 for implementability is good.

5.2.3.7. Cost

The total capital and O&M costs and parameters used to derive present worth costs for Alternative R-3 are presented in [Table 10](#) and detailed in [Appendix D](#). The overall rating for Alternative R-3 for cost is good. Alternative R-2 would incur present worth costs of a projected \$36.1 million. The costs presented in [Table 10](#) and detailed in [Appendix D](#) are in addition to costs for the remedial alternatives for nonradioactive chemicals, as presented in the Final FS Report ([ERRG, 2012](#)). As discussed in [Section 4.2](#), the soil cover costs for Alternative R-3 are limited to the additional 1 foot of soil cover because the cost for a 2-foot-thick soil cover is already included in the cost estimates for Alternatives S-2, S-3, and S-4.

5.2.3.8. Summary of Detailed Analysis for Remedial Alternative R-3

The overall rating for Alternative R-3 is good. Although long-term exposure to ROCs would be reduced through excavation and off-site disposal, soil covers, and institutional controls, the 3-foot-thick soil cover at IR-02 and IR-03 poses substantial implementation challenges.

5.3. COMPARATIVE EVALUATION OF RADIOLOGICAL REMEDIAL ALTERNATIVES

The comparative analysis of alternatives constitutes evaluation of alternatives in relation to one another for each of the seven NCP evaluation criteria. The purpose of this analysis is to identify the relative advantages and disadvantages of each alternative. The following sections present the comparative analysis of the three remedial alternatives developed for Parcel E. [Table 10](#) summarizes the comparative analysis.

5.3.1. Overall Protection of Human Health and the Environment

Overall protection of human health and the environment is a threshold criterion. Protection is not measured by degree; rather, each alternative is considered as either protective or not protective. Alternatives R-2 and R-3 are protective of human health and the environment because they prevent exposure to ROCs through a combination of removal, containment, and institutional controls. The protectiveness of Alternatives R-2 and R-3 is demonstrated through the post-remediation risk analysis (summarized in [Section 5.3.3](#) and detailed in Section B6.1 of [Appendix B](#)). Alternative R-1 is not protective of human health and the environment because it does not include any action to prevent exposure to ROCs at Parcel E.

5.3.2. Compliance with Applicable or Relevant and Appropriate Requirements

Compliance with ARARs is a threshold evaluation criterion. An alternative must either comply with ARARs or provide grounds for a waiver. Alternatives R-2 and R-3 will comply with the ARARs identified in [Appendix C](#). An evaluation of ARARs for Alternative R-1 is not applicable.

5.3.3. Long-Term Effectiveness and Permanence

Alternative R-1 provides no long-term effectiveness or permanence because potential exposures to ROCs at activity levels exceeding the RGs would not be controlled. Alternatives R-2 and R-3 would provide a comparable degree of long-term effectiveness because both alternatives prevent exposure to ROCs through a combination of removal, containment, and institutional controls. For Alternative R-2, RESRAD modeling using the residential RGs as surrogate concentrations, combined with a clean soil cover of 2 feet, results in an incremental cancer risk of 2E-07 for the future residential receptor and 2E-08 for the future recreational receptor. For Alternative R-3, similar RESRAD modeling, combined with a clean soil cover of 3 feet, results in an incremental cancer risk of 7E-09 for the future residential receptor and 5E-10 for the future recreational receptor.

5.3.4. Reduction of Toxicity, Mobility, or Volume through Treatment

Because radionuclides generally cannot be altered or destroyed through treatment, none of the proposed alternatives contemplate any actions that would reduce the toxicity, mobility, or volume of radioactive contamination through treatment.

5.3.5. Short-Term Effectiveness

Alternative R-1 has the least effect on the community, workers, or the environment during implementation because it includes no actions, so it was rated highest for short-term effectiveness. Alternatives R-2 and R-3 include removing radiologically impacted soil and importing large volumes of soil for the cover at IR-02 and IR-03, which would pose a potential risk to site workers, the community, and the environment. However, this risk is considered low because mitigation measures would be implemented to protect human

health and the environment. Therefore, Alternatives R-2 and R-3 were rated equally as good with respect to short-term effectiveness.

5.3.6. Implementability

Alternatives R-2 and R-3 would require implementation of institutional controls and active remediation. Installing covers and excavating soil (Alternatives R-2 and R-3) are standard technologies that are relatively easy to implement and have been successfully implemented in the past at HPS. However, the extremely large volume of import soil required for Alternative R-3 decreases its implementability relative to Alternative R-2. Alternative R-1 does not involve remedial technologies or institutional controls and is the easiest to implement.

5.3.7. Cost

Alternative R-1 requires no action; therefore, no costs are associated with this alternative. Alternative R-2 would incur moderate costs (\$47.9 million) because it includes removal at each radiologically impacted site and involves a 2-foot-thick soil cover at IR-02 and IR-03. Alternative R-3 would incur slightly higher costs (\$49.1 million) because of the increased thickness of the soil cover at IR-02 and IR-03. The estimated costs to perform the radiological-specific alternatives are presented in [Appendix D](#). As detailed in Table D-15 in [Appendix D](#), the cost to install an additional 1 foot of soil cover at IR-02 and IR-03, which is included in Alternative R-3, is estimated at about \$1.1 million.

5.3.8. Overall Rating of Radiological Remedial Alternatives

An overall rating was assigned to each alternative (see [Table 10](#)). Alternatives R-2 and R-3 meet the two threshold criteria and are similarly rated for the first three balancing criteria. Alternative R-3 is rated lower for the last two balancing criteria (implementability and cost) because of the substantial increase in the amount of import soil volume required to construct a 3-foot-thick cover across all of IR-02 and IR-03 (44.6 acres). Relative to Alternative R-2, Alternative R-3 is more difficult and slightly more expensive to implement, and these relative disadvantages are not offset by a corresponding improvement in long-term effectiveness. As a result, Alternative R-2 was rated very good overall, while Alternative R-3 was rated good overall. The no-action alternative (Alternative R-1) was deemed not acceptable overall because it does not satisfy the two threshold criteria.

Notes:

^a Proposed roadway identified in 2010 Redevelopment Plan for Hunters Point Shipyard. Based on Revised RI Report, this area does not contain chemicals in soil or groundwater at concentrations requiring evaluation in FS report.

^b Railroad right-of-way is part of the 2010 Redevelopment Plan for Bayview Hunters Point, and is proposed for predominantly light industrial reuse.

^c Piers and berths are considered part of offshore Parcel F but are identified in this document for completeness (because they were not discussed in FS report for Parcel F).

HPS = Hunters Point Shipyard
 IR = Installation Restoration
 RI = Remedial Investigation

Notes:
HPS Hunters Point Shipyard
IR installation restoration

Impacted Sites are individual sites or buildings that have known contamination or where site history indicates that radiological contamination may be present. Impacted Sites with Designation refer to an entire geographic unit that has been radiologically impacted, such as an IR site.

For planning purposes, all storm drains and sanitary sewers should be considered impacted. Storm drain and sanitary sewer line locations are based on data from the Navy's Caretaker Site Office and the Historical Radiological Assessment; locations will be verified in the field. Construction documentation for septic sewer lines does not exist. Potential septic sewer lines, if found to originate from radiologically impacted buildings in Parcel E, would be considered impacted.

Buildings 505, 515, 600, and 606 are non-impacted buildings within an impacted site; radiological precautions may be required.

^a Piers and berths are considered part of offshore Parcel F but are identified in this document for completeness (because they were not discussed in FS report for Parcel F).

Tables

Table 1. Parcel E Impacted Sites, Radionuclides of Concern, Historical Uses, and Planned Reuse

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
406	MU-2	¹³⁷ Cs, ²²⁶ Ra	Shipping, packing, and preserving	Mixed Use
414	MU-2	²²⁶ Ra	LLRW storage area for RI IDW, Public Works/Supply storehouse	Mixed Use
500	MU-2	¹³⁷ Cs, ²²⁶ Ra	NRDL storage, barracks, bachelor officers' quarters, and NRDL administrative offices	Mixed Use
500 Building Series	Various	²⁴¹ Am, ¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Original RADLAB/NRDL administrative and laboratory facilities and outdoor storage	Various
503 Site (Demolished)	MU-2	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Ships Galley and Military Support Services and NRDL contaminated laundry facility	Mixed Use
506 Site (Demolished)	MU-2 / EOS-4	²⁴¹ Am, ¹³⁷ Cs, ³ H, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Radioactive waste containers stored on pad behind building; NRDL biology and health physics laboratories; animal, nuclear, and physical chemistry laboratories; radioactive waste storage tank located behind building; NRDL chemistry laboratories; radiochemistry laboratory; NRDL instrument repair, darkroom, and densitometer for film badges; counting rooms; electro-physical and surface chemistry laboratories; administrative offices; storerooms; duty watch berthing; personnel decontamination; and RADLAB/NRDL Headquarters and main facility prior to move to Building 815 in 1955	Mixed Use / Open Space
507 Site (Demolished)	MU-2 / EOS-4	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	NRDL biology laboratories, NRDL change house and animal quarters; Radiological Decontamination Center, Biochemistry Branch, Physiology-Psychology Branch, and Experimental Pathology Branch	Mixed Use / Open Space

Table 1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
508 Site (Demolished)	MU-2 / EOS-4	^{137}Cs , ^{226}Ra , ^{90}Sr	NRDL chemistry branch, library, personnel branch, photographic section of publications branch, radiological safety branch, barracks, health services division, chemical technology and nucleonics division, security division, health physics division, employee relations branch, and pathology laboratory	Mixed Use
509 Site (Demolished)	EOS-4	^{137}Cs , ^{90}Sr	Library	Open Space
510 Site (Demolished)	EOS-4	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Weapons test sample storage, non-NRDL training facility, NRDL radiation facility, glassblowing, woodworking, and machine shops; physics branch; nuclear radiation branch; and research engineering section physics branch	Open Space
510A Site (Demolished)	EOS-4	^{137}Cs , ^{90}Sr	NRDL kevatron facility, NRDL x-ray facility, SUPSHIPS record storage, and fire research facility	Open Space
517 Site (Demolished)	EOS-4	^{137}Cs , ^{60}Co , ^{90}Sr	Former brig and NRDL cobalt animal irradiation facility	Open Space
520 Site (Demolished)	MU-2 / EOS-3	^{137}Cs , ^{226}Ra , ^{90}Sr	Shipyard dental clinic and NRDL administrative offices	Mixed Use / Open Space
521 Site	EOS-4	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Power plant; also one of two suspected sites of fuel oil burning from three OPERATION CROSSROADS target ships	Open Space
527	N/A	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Motor generator building (located on offshore pier that is not planned to be reused)	N/A

Table 1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
529 Site (Demolished)	MU-2	^{137}Cs , ^3H , ^{226}Ra , ^{90}Sr	NRDL isotope storage facility (vault) and neutron generator	Mixed Use
701 Site	MU-3	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Storage building that NRDL requested for "temporary" (120 days) storage of samples in 1947	Mixed Use
704 Area Animal Pens	MU-1	^{137}Cs , ^{226}Ra , ^{90}Sr	Animal pens for NRDL	Mixed Use
704 Radioactive Material Storage Area	MU-1	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Radioactive material storage area	Mixed Use
707 and Kennels	MU-1	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Research animal facility used by NRDL for animal breeding and housing; waste processing and storage facility, formerly leased to Pet Express as an animal clinic	Mixed Use
707B Site (Demolished)	MU-1	^{137}Cs , ^{226}Ra , ^{90}Sr	NRDL animal colony	Mixed Use
707C Site (Demolished)	MU-1	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr	Nuclear weapons test support and experimentation and equipment issue and receiving area	Mixed Use
707 Triangle Area	MU-1	^{137}Cs , ^{239}Pu , ^{226}Ra , ^{90}Sr , ^{235}U	NRDL radioactive waste receiving, packaging, and storage area and suspected septic tank and leach field from early operations	Mixed Use
708	MU-1	^{137}Cs , ^{90}Sr	Research animal facility, bio-medical facility and animal psychology facility	Mixed Use
807 Site (Demolished)	MU-13	^{137}Cs , ^{226}Ra , ^{90}Sr	Scrap yard processing shed	Mixed Use

Table 1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
810	MU-3 / EOS-5B	^{137}Cs , ^{226}Ra , ^{90}Sr	LLRW and IDW storage location; storehouse, paint shop, and paint and oil storage	Mixed Use / Open Space
S-719 Site (Demolished)	EOS-1	^{137}Cs , ^{226}Ra , ^{90}Sr	Incinerator; potentially used by NRD L animal facility at Building 707	Open Space
Shack 79 Site (Demolished)	MU-2	^{137}Cs , ^{226}Ra , ^{90}Sr	NRDL support for radioactive material	Mixed Use
Shack 80 Site (Demolished)	MU-2	^{137}Cs , ^{226}Ra , ^{90}Sr	NRDL support; shack reported to have been moved from behind Building 506 to Building 704 area for "lab operations"	Mixed Use
IR-02 (Bay Fill Area)	EOS-1 / EOS-2 / EOS-3 / EOS-4	^{137}Cs , ^{226}Ra , ^{90}Sr	Bay Fill Area was used for disposal of assorted shipyard wastes, which included ^{90}Sr and ^{226}Ra devices. The area known as IR-02 Northwest and Central contains a suspected concentration of these devices. Potentially used for disposal of wastes from decontamination of OPERATION CROSSROADS ships.	Open Space
IR-03 (Former Oil Reclamation Ponds Area)	EOS-3	^{137}Cs , ^{226}Ra , ^{90}Sr	HPS fuel oil reclaiming plant; possible area for disposal of assorted shipyard wastes, which may have included ^{90}Sr and ^{226}Ra devices and oil	Open Space
IR-04 (Former Scrap Yard)	MU-3	^{137}Cs , ^{226}Ra , ^{90}Sr	Post-disassembly area for metals, equipment, and other unusable items from the salvage yard that could have contained ^{226}Ra devices and other contaminants	Mixed Use
Former Salvage Yard	MU-3 / MU-1	^{137}Cs , ^{226}Ra , ^{90}Sr	Predisposal disassembly area for metals, equipment, and other reusable items that could have contained ^{226}Ra devices and other contaminants	Mixed Use

Table 1. Parcel E Impacted Sites, Radionuclides of Concern Historical Uses, and Planned Reuse (continued)

Building/ Site Number	Impacted Redevelopment Block	Radionuclides of Interest	Historic Use	Redevelopment Block Planned Reuse
Parcel E Shoreline	EOS-1 / EOS-2 / EOS-3 / EOS-4	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Debris disposal	Open Space
Piers and Berths	N/A	¹³⁷ Cs, ²³⁹ Pu, ²²⁶ Ra, ⁹⁰ Sr	Berthing of OPERATION CROSSROADS ships, berthing of the YGN-73 (radioactive waste disposal barge), and NRDL usage (berthing of experimental barges YAG-39 and YAG-40)	N/A
Sanitary Sewer System	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Sanitary sewer system	Various
Storm Drain Lines	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Combined storm and sanitary sewer drains	Various
Septic Sewer Lines	Various	¹³⁷ Cs, ²²⁶ Ra, ⁹⁰ Sr	Septic sewage system (predating sanitary sewer system; potentially associated with impacted Building 810)	Various

Notes:

²⁴¹Am = americium-241

⁶⁰Co = cobalt-60

¹³⁷Cs = cesium-137

³H = hydrogen-3

IDW = investigation-derived waste

IR = Installation Restoration

LLRW = low-level radioactive waste

N/A = not applicable (offshore piers and berths are considered part of the offshore Parcel F but are included in this document for completeness; these structures are not planned for reuse)

NRDL = Naval Radiological Defense Laboratory

²³⁹Pu = plutonium-239

²²⁶Ra = radium-226

RADLAB = radiation laboratory

RI = remedial investigation

⁹⁰Sr = strontium-90

SUPSHIPS = Superintendent of Shipbuilding

²³⁵U = uranium-235

Notes: Information from Table 8-2 of the Historical Radiological Assessment (Naval Sea Systems Command, 2004)

1 Ratings provided for potential migration pathways reflect the likelihood of contamination within that medium, and do not directly correlate to the exposure pathways that are considered complete in the risk screening analysis. Refer to the HRA for additional information on rating assignments.

2 Refer to Table 1 for the status of buildings (existing or demolished).

IR = Installation Restoration

H = High – Evidence of contamination in the medium or migration pathway has been identified.

L = Low – The potential for contamination in the type of medium or migration pathway is remote.

M = Moderate – The potential for contamination in the medium or migration pathway exists, although the extent has not been fully assessed.

N = None – Evidence of contamination in the specific medium or migration pathway has not been found, or known contamination has been removed and surveys indicate that the medium or migration pathway meets today's cleanup goals.

Notes: The various radiological investigations are discussed in detail in [Section 2.2.1](#). Soil and groundwater data collected during the radiological investigations are discussed in [Sections 2.3.1 and 2.3.2](#), respectively.

AEC = U.S. Atomic Energy Commission

EPA = U.S. Environmental Protection Agency

IR = Installation Restoration

NRDL = Naval Radiological Defense Laboratory

RASO = Radiological Affairs Support Office

Table 4. Fate and Transport Properties of Radionuclides of Concern

Radionuclide of Concern	Secondary Media	Migration Potential	Notes
Americium-241	Outdoor air	Low	Potential suspension of soil particles by wind
	Groundwater	Low	Americium forms compounds that do not readily bind to soils, which could be transported by groundwater, typically at the soil and groundwater interface
	Surface water	Moderate	Low mobility except during the limited time that soils are exposed to surface water runoff
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS)
Cesium-137	Outdoor air	Low	Potential suspension of soil particles by wind
	Groundwater	Moderate	Low mobility except at the soil and groundwater interface; mobility is enhanced because of the chemical properties of cesium salts
	Surface water	Moderate	Low mobility except during the limited time that soils are exposed to surface water runoff; mobility is enhanced because of the chemical properties of cesium salts
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS); cesium tends to concentrate in fruit-bearing plants (not present at HPS)
Cobalt-60	Outdoor air	Low	Potential suspension of soil particles by wind; migration potential mitigated because of short half-life
	Groundwater	Low	Low mobility except at the soil and groundwater interface; migration potential mitigated because of short half-life
	Surface water	Low	Low mobility except during the limited time that soils are exposed to surface water runoff; migration potential mitigated because of short half-life
	Plant uptake	Low	Concentration in plants is low; migration potential via plant uptake (or secondary animal transport) are further reduced because of short half-life
Hydrogen-3	Outdoor air	Low	Moderate ability for air transport because of its ability to bind to hydroxyl groups to form tritiated water, which can be entrained in air; however, because of its short biological half-life of 7 to 14 days and the relatively low energy beta particle emission, any effects of inhalation or ingestion are mitigated
	Groundwater	Moderate	High mobility because of its ability to bind to hydroxyl groups to form tritiated waters; effect mitigated because of its short biological half-life of 7 to 14 days and the relatively low energy beta particle emission
	Surface water	Moderate	High mobility because of its ability to bind to hydroxyl groups to form tritiated waters; effect mitigated because of its short biological half-life of 7 to 14 days and the relatively low energy beta particle emission
	Plant uptake	Low	Bioaccumulation in plants possible, but effect mitigated because of its short half-life and low energy of the tritium beta

Table 4. Fate and Transport Properties of Radionuclides of Concern (continued)

Radionuclide of Concern	Secondary Media	Migration Potential	Notes
Plutonium-239	Outdoor air	High	Because of its particle size, plutonium can readily transport in air as plutonium oxides, and because of its chemical toxicity, inhalation of less than 5 milligrams of plutonium per kilogram of body tissue is lethal
	Groundwater	Moderate	Plutonium forms compounds that do not readily bind to soils, which could be transported by groundwater
	Surface water	Moderate	Plutonium forms compounds that do not readily bind to soils, which could be transported by surface water runoff
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS), and leafy vegetable consumption that will not occur after remediation
Radium-226	Subsurface air	Moderate	Decay to radon gas can accumulate in subsurface structures and other areas with limited ventilation
	Outdoor air	Low	Potential suspension of soil particles by wind; radon gas emissions are quickly dissipated in outdoor air
	Groundwater	Low	Low mobility except at the soil and groundwater interface
	Surface water	Low	Low mobility except during the limited time that soils are exposed to surface water runoff
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS)
Strontium-90	Outdoor air	Low	Low air mobility because of the limited extent of strontium-90 present outside sealed sources
	Groundwater	Moderate	Moderate mobility because strontium salt compounds are formed and could be carried by groundwater
	Surface water	Low	Moderate mobility because strontium salt compounds are formed and could be carried by surface water runoff; effect minimized by short duration of surface water runoff events
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS), and leafy vegetable consumption that will not occur after remediation
Uranium-235	Outdoor air	Low	Potential suspension of soil particles by wind
	Groundwater	Moderate	Uranium is naturally occurring and can be found in groundwater due to geological makeup of the land; typically at the soil, rock, and groundwater interface
	Surface water	Low	Low mobility except during the limited time that soils are exposed to surface water runoff
	Plant uptake	Low	Potential for secondary transport by animals (primarily livestock that are not present at HPS)

Notes:

HPS = Hunters Point Shipyard

IR-02 Southeast	9E-02	3E-03	9E-02

Notes:

- a The risk results presented in the table represent the highest risk for an individual exposure area within an impacted site and are based upon anticipated reuse. Chemical risk was derived from the Final Revised Parcel E Remedial Investigation Report, Tables I1-18 and I2-18 (Total and Incremental Risk for the Residential Exposure Scenario) and Tables I1-21 and I2-21 (Total and Incremental Risk for the Recreational Exposure Scenario) (Barajas & Associates, 2008).
- b Total excess lifetime cancer risk.
- c Consistent with EPA HHRA guidance, cancer risk results are presented to one significant figure. Accordingly, the combined risk results presented in the table may not equal the sum of the previous two columns; however, the results presented are an accurate representation of the sum of radiological and chemical risk.
- d Risk results are based on residential exposure scenario.

Table 6. Combined Risk for Parcel E Study Areas (continued)

Notes (continued):

- e Chemical risk is not presented because no soil samples were collected in the vicinity of the site, and chemical risk was subsequently not evaluated.
- f Risk results are based on recreational exposure scenario.
- g Although these areas are planned for open space reuse, risk results are presented for the residential exposure scenario to evaluate unrestricted reuse.

EPA = U.S. Environmental Protection Agency

HHRA = human health risk assessment

IR = Installation Restoration

-- = not applicable

Table 7. Remediation Goals for Radionuclides of Concern

Radionuclide	Soil and Sediment ^{a,b} (pCi/g)		Surfaces	
	Industrial Worker	Residential	Equipment, Waste (dpm/100 cm ²)	Structures (dpm/100 cm ²)
Americium-241	5.67	1.36	100	100
Cesium-137	0.113	0.113	5,000	5,000
Cobalt-60	0.252 ^c	0.252 ^c	5,000	5,000
Plutonium-239	14.0	2.59	100	100
Radium-226	1.0 ^d	1.0 ^d	100	100
Strontium-90	10.8	0.331	1,000	1,000
Uranium-235	0.398	0.195	5,000	488

Notes:

- a RGs for two future use scenarios; however, the residential RGs will apply in all Parcel E areas. These more conservative RGs will enhance the protectiveness of the remedial action for Parcel E, particularly as it relates to future property transfer and the potential need to apply institutional controls for radionuclides (discussed in Section 3.3.1.3).
- b RGs are consistent with the radiological-related remedies selected in the records of decision for Parcels B, G, and D-1 and UC-1 (Department of the Navy, 2009a, 2009b, and 2009c, respectively), and are consistent with U.S. Environmental Protection Agency preliminary remediation goals (unless otherwise noted).
- c RG for Cobalt-60 was revised to support efficient laboratory gamma spectroscopy analysis of soil samples. This revised RG maintains morbidity risks within the EPA defined acceptable range and permits an exposure level that does not increase the risk of cancer from a potential exposure to Cobalt-60 (Department of the Navy, 2012).
- d Objective is 1 pCi/g above background per agreement with U.S. Environmental Protection Agency (established in Final Basewide Radiological Removal Action, Action Memorandum – Revision 2006, Hunters Point Shipyard, San Francisco, California, dated April 21, 2006). The Radium-226 background level for surface soil is 0.633 pCi/g (TtECI, 2011a). The Radium-226 background level for storm drain and sewer lines is 0.485 pCi/g (TtECI, 2010b).

dpm/100 cm² = disintegrations per minute per 100 square centimeters

pCi/g = picocurie per gram

pCi/L = picocurie per liter

RG = remedial goal

TtECI = Tetra Tech EC, Inc.

Table 8. Identification and Screening of Technology Types and Process Options

General Response Action	Remedial Technology Type	Remedial Technology Process Option	Technology Process Option Description	Effectiveness ^a	Implementability ^b	Cost ^c	Screening Evaluation Comments
No Action	None	None Available	No Action	Does not reduce risk associated with exposure to ROC-contaminated soil and materials.	Easy to implement because no action taken.	No Cost	Selected as a standalone alternative in compliance with the NCP
Institutional Controls	Legal Mechanisms	Covenants to Restrict Use of Property and Deed Restrictions	Restricts use of parcel through environmental restrictive covenants that will run with the land; allows only designated land use in accordance with the proposed redevelopment plan (EPA, 2000b); includes criteria during and after future development to ensure mitigated exposure conditions are maintained, such as covers, barriers, or other engineering controls (Navy and DTSC, 2000).	Does not reduce the volume, radiotoxicity, and mobility of ROCs that present unacceptable risks to human health. Usually reliable if used in conjunction with other GRAs, including containment and partial removal of contaminated soil and materials. No adverse impacts occur during the implementation phase because no construction activities are associated with this process option.	Relatively easy to implement.	Low	Selected for alternative development
Containment	Capping	Soil Cap	Covering contaminated soil and material with natural low-permeability soils to minimize exposure and migration of ROCs. Layers of synthetic membrane liners such as geomembranes may be installed during cap construction to minimize infiltration and provide shielding against radiation.	Does not reduce the volume or radiotoxicity of ROCs and provides shielding against radiation effects. Fairly reliable and well-demonstrated technology if properly maintained. Site workers may be exposed to contaminated soil, fugitive dust, and radon gas emissions during construction.	Mature, well-known technology that is relatively easy to implement. Materials and equipment usually readily available. Moderate level of site knowledge is required for implementation.	Low	Selected for alternative development

Table 8. Identification and Screening of Technology Types and Process Options (continued)

General Response Action	Remedial Technology Type	Remedial Technology Process Option	Technology Process Option Description	Effectiveness ^a	Implementability ^b	Cost ^c	Screening Evaluation Comments
Containment (cont.)	Capping (cont.)	Asphalt and Concrete Cap	Containing contaminated soil and materials by providing crushed aggregate base and asphalt and concrete pavement. This cap will prevent contaminant migration and provide shielding against radiation.	Does not reduce the volume or radiotoxicity of contaminated soil and materials. Effective in reducing the mobility of ROCs and provides shielding against radiation effects. Asphalt and concrete cap is expected to be more reliable and durable and need fewer repairs in the long-term compared with a clay cap. Site workers may be exposed to contaminated soil, fugitive dust, and gas emissions during construction.	Mature, well-known technology that is relatively easy to implement. Implementation is expected to be easier than a clay cap because an asphalt and concrete cap is more compatible with existing conditions at the site and the surrounding areas. Materials and equipment usually readily available. Moderate level of site knowledge is required for implementation.	Low	Not selected for alternative development
		Excavation	Excavation of soil and materials with ROCs posing unacceptable risk to human health using appropriate equipment.	Effective in reducing volume of contaminated soil on site. When used with other technologies (such as physical and chemical separation technologies and off-site disposal into licensed disposal facilities) the technology can reduce toxicity to on-site receptors and mobility of ROCs. Fugitive dust, VOCs, and fuel combustion byproducts generated during excavation and processing may pose health and safety risks to workers and the local community. Dust suppression will be a necessary option component.	Easy to implement. Equipment and materials are readily available.	Low	Selected for alternative development

Table 8. Identification and Screening of Technology Types and Process Options (continued)

General Response Action	Remedial Technology Type	Remedial Technology Process Option	Technology Process Option Description	Effectiveness ^a	Implementability ^b	Cost ^c	Screening Evaluation Comments
Removal and Disposal (continued)	Excavation (continued)	Manual Screening	Manual screening of excavated soil and material to separate soil and material exceeding the remedial goals from soil below the remedial goals. This may be accomplished by soil sampling and analyses in the field.	Separates excavated radioactive soil particles from clean soil particles, thus reducing the volume of soil requiring further treatment or disposal. Effectiveness and reliability of manual screening for separating and segregating ROC-contaminated soil above and below the remedial goals for Parcel E are not fully demonstrated. Reduction in toxicity and mobility of radionuclides is not addressed by this technology. Fugitive dust and fuel combustion byproducts generated during excavation and processing may pose health and safety risks to workers and the local community. Dust suppression will be a necessary option component.	High degree of specialization and equipment calibration needed for desired segregation.	Low	Selected for alternative development
Removal and Disposal	Disposal	Disposal	Disposal of excavated radioactively contaminated soil and material into a facility licensed to receive low-level radioactive waste.	Effective in reducing volume of contaminated soil on site by transferring contaminated soil and material to an off-site disposal facility. Mobility of ROCs is also reduced if the selected facility is sufficiently encapsulated. However, there is no change in radiotoxicity of the ROCs. Excavation and transportation of the waste may pose health and safety risks to workers and local community.	Easy to implement.	High	Selected for alternative development

Notes:

- a Evaluation factors included ability of the process option to reduce volume, radiotoxicity, and mobility of the ROCs and attain the RAO; potential impacts to human health and the environment during implementation of the process option; and whether the process is reliable and proven for remediation of radionuclides.
- b Evaluation factors included ability to obtain regulatory agency approval; availability of equipment and skilled workers; extensiveness of knowledge required to implement the process option; and need for treatment or disposal of process waste.
- c Each process option was rated (high, medium, or low) based on cost relative to other process options in the same technology type based on judgment and unit costs presented in "Technology Screening Guide for Radioactively Contaminated Sites" (EPA, 1996).

DTSC = Department of Toxic Substances Control

EPA = U.S. Environmental Protection Agency

GRAs = general response actions

Navy = Department of the Navy

NCP = National Oil and Hazardous Substances Pollution Contingency Plan

RAO = remedial action objective

ROCs = radionuclides of concern

VOCs = volatile organic compounds

Table 9. Components of Alternatives R-2 and R-3 (continued)

Notes:

- 1 Costs for radiological surveys, remediation and removal, and soil cover and institutional controls for IR-02, IR-03, and the Parcel E shoreline were included in the Final FS Report for Parcel E (ERRG, 2012); the FS Report also includes costs for installing shoreline protection throughout Parcel E.
- 2 Alternatives R-2 and R-3 are identical except for the thickness of the proposed soil cover. Alternative R-2 includes a 2-foot-thick soil cover, while Alternative R-3 includes a 3-foot-thick soil cover.
- 3 Remedial action at the south piers will be implemented as part of the Parcel F response; however, costs for these remedial efforts were not included in the Parcel F FS Report and are included as part of this radiological addendum for completeness.
- 4 The specific type of shoreline protection (such as a rock revetment wall or other more natural options) is being evaluated as part of the FS Report.

ARARs = applicable or relevant and appropriate requirements

ERRG = Engineering/Remediation Resources Group, Inc.

FS = feasibility study

Shaw = Shaw Environmental, Inc.

Table 10. Comparative Analysis of Alternatives Summary

Criterion	Alternative R-1 No Action	Alternative R-2 Survey, Removal, and Disposal (with 2-foot-thick soil cover and institutional controls at IR-02 and IR-03)	Alternative R-3 Survey, Removal, and Disposal (with 3-foot-thick soil cover and institutional controls at IR-02 and IR-03)
Overall Protection of Human Health and the Environment	Not Protective	Protective	Protective
Compliance with ARARs	Not Applicable	Meets ARARs	Meets ARARs
Long-term Effectiveness and Permanence	Not Acceptable	Very Good	Very Good
Reduction in Toxicity, Mobility, and Volume Through Treatment	Poor	Poor	Poor
Short-term Effectiveness	Excellent	Good	Good
Implementability	Excellent	Very Good	Good
Present Value Cost (Rating)	Excellent	Very Good	Good
Present Value Cost (\$)	\$0	\$34.9 Million	\$36.1 Million
Overall Rating	Not Acceptable	Very Good	Good

Notes:

ARARs = applicable or relevant and appropriate requirements

IR = installation restoration

Appendix A. Radionuclide Data in Soil and Groundwater

Table A-1. Soil Gamma Spectroscopy Results for Phase I Radiological Investigation at Parcel E-2, Hunters Point Shipyard, San Francisco, California (continued)

All results in picocuries per gram (pCi/g); all samples collected within 6 inches of the ground surface

Notes:

Data compiled from "Surface Confirmation Radiation Survey Draft Report, Naval Station Treasure Island, Hunters Point Annex, San Francisco, California," November 3, 1992.

Only data from Parcel E and reference (background) site are presented in this table.

Data for all radionuclides analyzed are presented for information purposes only; ²²⁶Ra is the only ROC at Parcel E that were analyzed as part of the Phase I investigation.

²⁴¹Am = americium-241

¹³⁷Cs = cesium-137

⁴⁰K = potassium-40

²³⁸Pu = plutonium-238

²³⁹Pu = plutonium-239

²⁴⁰Pu = plutonium-240

²²⁶Ra = radium-226

²²⁸Ra = radium-228

²²⁸Th = thorium-228

< = not detected above MDA

IR = Installation Restoration

pCi/g = picocuries per gram

Std_Dev = standard deviation

Section B1. Purpose

The Department of the Navy (Navy), U.S. Environmental Protection Agency (EPA), and California Department of Toxic Substances Control held a number of focused meetings in 2004 and agreed upon risk assessment methodologies for soil and groundwater that were used for the nonradiological human health risk assessment (HHRA) in the Final Revised Parcel E Remedial Investigation (RI) Report ([Barajas & Associates, Inc., 2008](#)). The methodologies were applied to the analyses discussed in this appendix.

This appendix presents the methodology and evaluations used to estimate the dose and risk to future Parcel E residents and recreational users. The objectives of this appendix are to:

- Identify the critical exposure pathways and radiological contaminants that pose primary health concerns.
- Identify the exposure pathways and radiological contaminants that pose little or no threat to human health.
- Estimate the potential dose and risks to human health from radiological contaminants associated with potential future land-use scenarios.

The remainder of this appendix is organized as follows:

- [Section B2](#) presents an overview of the methodology used for the risk analysis.
- [Section B3](#) discusses the conceptual site model for Parcel E.
- [Section B4](#) presents the data evaluation and identification of radionuclides of concern (ROCs).
- [Section B5](#) presents the exposure assessment.
- [Section B6](#) presents the risk assessment results.
- [Section B7](#) summarizes the uncertainty analysis.
- [Section B8](#) presents the references cited in this appendix.

Figures, tables, and attachments are presented after [Section B8](#).

Section B2. Radiological Risk Assessment Methodology

The computer code Residual Radioactive (RESRAD) Model Version 6.5 (Argonne National Laboratory [ANL], 2009) was used to perform dose and risk modeling of radiologically impacted sites at Parcel E. RESRAD uses the isotopes specified as ROCs and automatically includes the long-lived daughter products of these isotopes, specifically lead-210, which is a daughter product of radium-226 (^{226}Ra).

RESRAD was used to analyze the exposure scenarios that match the planned reuse of Parcel E, based upon the amended redevelopment plan for HPS (San Francisco Redevelopment Agency [SFRA], 2010). The reuses relevant to the Parcel E redevelopment blocks are mixed use and open space, as shown on Figure 2 of the Radiological Addendum. The two exposure scenarios applicable to these planned reuses are residential and recreational. As discussed in Section 2.4.3 of the Radiological Addendum, the residential receptor is evaluated for redevelopment blocks planned for mixed use, which may include residential reuse, and the recreational receptor is evaluated for redevelopment blocks planned for open space reuse. As discussed in Section 2.1.1 of the Radiological Addendum, the redevelopment plan for HPS was amended in 2010, and these receptors are consistent with those evaluated in the Draft Final Parcel E Feasibility Study (FS) Report (Engineering/Remediation Resources Group [ERRG], 2011). To evaluate future unrestricted reuse and to evaluate the highest potential for exposure at the parcel, a residential exposure scenario was also evaluated for each radiologically impacted site. While residential reuse is not anticipated across the entire parcel, the residential exposure scenario presents an upper-bound estimation of risk from exposure to ROCs at the parcel.

The following discussion identifies the best processes to match each of the receptor-specific parameters for nonradiological risk in the RI and RESRAD analyses. Unfortunately, because of the manner in which indoor and outdoor fractions are used in RESRAD and how they relate to exposure time and frequency as used in the Revised Final Parcel E RI Report (Barajas & Associates, Inc., 2008), it is impossible to implement all of the steps necessary to perform a completely matching calculation.

The difficulty arises because the RESRAD indoor and outdoor fractions are pervasive across all calculations. Inhalation, soil ingestion, and exposure calculations all use indoor and outdoor fractions. Inhalation and soil ingestion rates input into RESRAD are total annual rates regardless of location on or off site, whereas rates in the RI Report correspond to rates only for time spent on site. The RI Report

does not account for what a receptor does off site (Barajas & Associates, Inc., 2008). To match the total intake quantities (air or soil), either the intake rates or the total on-site fraction must be modified in RESRAD. To match the exposure period, the only mechanism available for RESRAD is to adjust the total on-site fraction. Therefore, when matching intake quantities, the preferential method is to modify the intake rates because changes to the on-site fraction would prohibit effective matching of the exposure period.

Table B-1 summarizes changes to RESRAD default parameters that are necessary to make the receptor scenarios more closely match the nonradiological RI scenarios. All other RESRAD parameters were left at default values. The approach taken with comparable nonradiological RI parameters is described in the following sections of this appendix.

B2.1. RESRAD

The RESRAD (ANL, 2009) code is used to estimate the potential risk to an individual from exposure to residual radionuclides in soil or soil-like media. It was used to evaluate the risk associated with contaminated soil areas within Parcel E.

The goal of the RESRAD risk modeling approach was to be as consistent as possible with assumptions and inputs used in the nonradiological HHRA in the RI Report (Barajas & Associates, Inc., 2008). To achieve this goal, development of representative parameters for receptor scenarios other than the RESRAD default was required. This development was achieved by following guidance from EPA; specifically, “Exposure Factors Handbook” and the “Risk Assessment Guidance for Superfund (RAGS)” (EPA, 1989 and 1997). The guidance documents were also used to develop input parameters for the nonradiological HHRA in the RI Report. Receptor-specific RESRAD values were selected from the guidance for residents; the RESRAD values for recreational users were based upon site-specific parameters previously developed for HPS (Navy, 2004). To achieve the best correlation with site-specific agreements, it was necessary to adjust each of the parameters based on receptor-specific information.

The differences between the parameters for the various receptors essentially are limited to variation among the following:

- Averaging time for noncarcinogens
- Body weight
- Body surface area
- Soil adherence factor
- Exposure frequency
- Exposure time
- Exposure duration
- Inhalation rate
- Soil ingestion rate

The following subsections provide an evaluation of the sensitivity of each of the parameters when used in performing calculations with RESRAD that directly parallels the exposure scenarios defined in the RI Report. This evaluation presents the chemical analysis parameter(s) and indicates the equivalent RESRAD parameter(s). Where possible, like parameters are grouped together. The resulting exposure parameters used in the RESRAD modeling are presented in [Table B-1](#).

B2.1.1. Averaging Time for Noncarcinogens and Body Weight

From a chemical analysis standpoint, the averaging times for noncarcinogens are used to distribute the harmful effects of exposure for means of common comparison. EPA guidance assumes that all doses are essentially normalized into an average daily dose. By using an averaging time, a long-term low dose is just as unfavorable as a short-term high dose. Body weight is a necessary component to obtain doses in terms of milligrams per kilogram of body weight per day.

When performing radiological calculations, however, neither body weight nor averaging time is included in risk determination. This guidance is given explicitly in Chapter 10 of the RAGS ([EPA, 1997](#)). The rationale is that the determination of dose conversion factors for radionuclide exposure is performed in a different manner than slope factors for chemical exposure. In essence, the body weight and averaging time factors are already included or unnecessary because of the manner in which the calculations are performed. Therefore, consistency between the averaging time and receptor body weight parameters in the nonradiological and radiological HHRA is not necessary.

B2.1.2. Body Surface Area and Soil Adherence Factor

The body surface area parameter is used in chemical analysis for the dermal contact pathway. Because radiological HHRA does not have a direct contact pathway, there is no corresponding body surface area parameter. Any exposure resulting from direct contact with radiologically contaminated material would be accounted for in the external radiation pathway.

B2.1.3. Exposure Frequency and Exposure Time

Exposure frequency and exposure time are used in the nonradiological HHRA to define exposure for the various receptors. The exposure time gives the number of hours per day that a receptor is on site and exposed to harmful substances. Exposure frequency specifies the number of days per year that a receptor is at the site. The product of the exposure time and exposure frequency yields the total number of hours spent on the site in 1 year. For purposes of this discussion, this product shall be referred to as the exposure period.

There are no directly correlated exposure frequency or time parameters in RESRAD. Rather than using these factors explicitly, RESRAD uses parameters for indoor fraction (IF) and outdoor fraction (OF). The

former accounts for time spent inside a building at the site, while the latter accounts for time on site but outside. When added together, these two values give the total on-site fraction. The primary difference between time indoors and time outdoors from a calculational standpoint is that indoor time accounts for additional shielding from direct radiation offered by the building's materials. For recreational users, the total on-site fraction is allocated to the outdoor time fraction because it is not assumed these users will spend any appreciable period of time on site in a building. For residential receptors, the on-site fraction is also allocated entirely to the outdoor time fraction. While this is not a likely scenario, it is a conservative assumption that will result in the highest modeled dose and risk numbers and present an upper-bound estimate of dose and risk.

The indoor and outdoor fractions are unitless parameters, thus they can be applied across any given time period. Using the RESRAD default indoor and outdoor fractions of 0.5 and 0.25, respectively, a default RESRAD receptor spends 18 hours per day on site. RESRAD uses a 365-day year, and there is no means of adjusting the number of days per year. Therefore, the default receptor spends a total time of 6,570 hours on site a year.

To match the exposure frequency in the RI, the total on-site fraction is adjusted such that the exposure period (total number of hours of exposure per year) is consistent with the parameters from the RI. The technique of matching total annual hours on site is consistent with suggestions given in the RESRAD manual for modeling receptors with different exposure scenarios than the default receptor (U.S. Nuclear Regulatory Commission [NRC], 2000). To estimate an OF for a specific receptor, the exposure time is multiplied by the exposure frequency and divided by the total number of hours in a year (8,760). This results in OF values of 0.959 for the adult and child resident receptor, and 0.0713 for the adult and child recreational receptor.

B2.1.4. Exposure Duration

The exposure duration indicates how many total years the receptor will spend on site. By default, RESRAD uses a value of 30 years for exposure duration. This parameter is directly modifiable by the user. The Revised Final Parcel E RI Report uses exposure duration values of 24 years for the adult resident and recreational receptor and 6 years for the child resident and recreational receptor (Barajas & Associates, Inc., 2008); these are the same values used in the RESRAD modeling.

B2.1.5. Inhalation Rate

The RI analysis uses inhalation rates based on the receptor scenario and age. Inhalation rates in the RI are given in terms of cubic meters per hour. RESRAD has a user-defined inhalation rate that by default is 8,400 cubic meters per year (m^3/yr). To best match the RI analysis, the RI-based inhalation rates were converted into annual quantities (m^3/yr) as required for RESRAD inputs. To convert daily inhalation

rates to annual quantities, the daily inhalation rate (derived by multiplying the inhalation rate by the exposure time) was multiplied by the exposure frequency for each receptor.

B2.1.6. Soil Ingestion Rate

Soil ingestion rates in the RI are given in terms of milligrams of soil per day. RESRAD uses soil ingestion rates in terms of grams of soil per year, with a default value of 36.5 grams per year. Similarly to the inhalation rate, the best match is to ensure that the annual soil intake volume is equal for both the RI and RESRAD cases when exposure time and frequency are factored in. To convert daily soil ingestion rates to grams per year, the daily soil ingestion rate was multiplied by the exposure frequency for each receptor.

Section B3. Conceptual Site Model

This section presents the conceptual site model for the radiological risk analysis of Parcel E. The site model summarizes the sources of radionuclide contaminants on site and presents the affected environmental media. Additionally, the potential receptors and pathways through which receptors may receive radiological doses are noted. The conceptual site model for Parcel E is presented on [Figure B-1](#), which indicates exposure pathways evaluated for each receptor. Radiological pathways that are not active for this analysis are excluded from the site model.

B3.1. SOURCES OF SITE CONTAMINANTS

Details on the historical activities at Parcel E that contributed to the existing radiological contamination are presented in [Section 2.1](#) of the Radiological Addendum to the FS Report for Parcel E.

B3.2. AFFECTED ENVIRONMENTAL MEDIA

Previous Parcel E activities have introduced radioactive contaminants to land areas. The primary potential sources of radiological contamination at Parcel E are past shipyard and Naval Radiological Defense Laboratory (NRDL) operations, decontamination of ships that participated in atomic weapons testing, and the disposal of radioluminescent devices.

B3.3. POTENTIALLY EXPOSED RECEPTORS

The 2010 amended redevelopment plan identifies planned reuses for the entire Parcel E area ([SFRA, 2010](#)). [Table B-2](#) shows the impacted areas of Parcel E, the planned reuse, and associated exposure scenario. Only areas for which radionuclide data are available are presented in [Table B-2](#), because they are the only areas quantitatively evaluated in the Radiological Addendum.

The exposure scenario establishes the receptor parameters to be modeled. The potential receptors considered for evaluation were selected to be consistent with the nonradiological HHRA provided in the RI Report (as revised in the Final FS Report) and are as follows:

- Resident (adult and child)
- Recreational user (adult and child)

Most of the radiologically impacted areas at Parcel E fall within the mixed-use land use scenario; for these areas, the resident is evaluated. The Building 509 Site, Building 510/510A Site, Building 517 Site,

and IR Sites 02 and 03 are located within areas designated for open space; the recreational user scenario is evaluated for these areas. As indicated in [Section B2](#), the residential exposure scenario was also evaluated for all radiologically impacted sites to present an upper-bound estimate of dose and risk.

While construction activities are anticipated to occur over various portions of Parcel E, the construction worker scenario is not associated with a planned reuse. Radiological risks to the construction worker would be of a lesser magnitude than for other receptors (industrial workers, residents, and recreational users) because of the shorter exposure duration. Accordingly, the construction worker scenario was not evaluated at Parcel E.

B3.4. EXPOSURE PATHWAYS

As discussed in the nonradiological HHRA in the RI Report ([Barajas & Associates, Inc., 2008](#)), a complete exposure pathway consists of the following four elements:

- A source and mechanism of chemical release
- A retention or transport medium (or media in cases involving transfer of chemicals)
- A point of potential human contact with the contaminated medium (referred to as the exposure point)
- An exposure route (such as ingestion) at the contact point

If any of these elements is missing (except in a case where the source itself is the point of exposure), then the exposure pathway is considered incomplete. For example, if receptor contact with the source or transport medium does not occur, then the exposure pathway is incomplete and is not quantitatively evaluated for risk. Similarly, if human contact with an exposure medium is not possible, the exposure pathway is considered incomplete and is not evaluated.

The exposure pathways for impacted soils at Parcel E present a more complicated analysis. The complete soil pathways, based on the four criteria listed above, are external radiation, soil ingestion, and inhalation.

B3.4.1. External Radiation Pathway

The external radiation pathway is identified as potentially complete for all receptors. Exposure to external radiation is the result of radiation emanating from radionuclides present in soil on other contaminated media.

B3.4.2. Soil Ingestion Pathway

The soil ingestion pathway is identified as potentially complete for all receptors. This pathway corresponds to direct ingestion of soil.

B3.4.3. Inhalation Pathway

The inhalation pathway is identified as potentially complete for all receptors. This pathway corresponds to inhalation of radiologically contaminated dust and soil particles.

B3.4.3. Drinking Water Ingestion Pathway

Ingestion of drinking water is not a complete exposure pathway for anticipated future receptors and is therefore not included in the RESRAD modeling. As discussed in [Section 2.3](#) of the Radiological Addendum, A-aquifer groundwater at Parcel E contains ROCs at low activities that do not exceed drinking water standards at a statistically significant level (95 percent confidence level). In addition, the comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria. This conservative evaluation is not representative of potential exposures to future site users because, as documented in Section 2 and Section 2.2.8 of the FS Report (ERRG, 2012), A-aquifer groundwater is not a potential source of drinking water. Based on the results of the comparison with drinking water standards, groundwater does not appear to have been impacted by radionuclides at concentrations that warrant further evaluation in the FS. This finding is consistent with the Historical Radiological Assessment that determined that a low potential existed for radioactive contamination in Parcel E groundwater based on historical information (Naval Sea Systems Command [\[NAVSEA\], 2004](#)). Accordingly, the drinking water pathway was excluded from the RESRAD modeling.

Section B4. Radionuclides of Concern

The radionuclides identified in [Table B-3](#) are the ROCs at Parcel E. Of the ROCs for Parcel E, only ^{226}Ra and uranium-235 are naturally occurring. Cesium-137 (^{137}Cs), strontium-90 (^{90}Sr), and plutonium-239 may be present in trace quantities because of fallout resulting from nuclear weapons testing. Americium-241 and cobalt-60 may be present at Parcel E because of past shipyard and NRDL operations.

During the Phase V investigation, reference (background) readings were taken from 16 samples collected from various locations within Parcels B, C, D, and E. Readings for samples from the reference areas indicated mean background levels of 0.049 picocuries per gram (pCi/g) for ^{137}Cs and 0.818 pCi/g for ^{226}Ra . A mean background activity of 0.18 pCi/g was calculated for ^{90}Sr based upon the average ratio of ^{90}Sr to ^{137}Cs activities. Background levels for the other ROCs were not calculated.

Section B5. Exposure Assessment

An exposure assessment identified potential human receptors that could come into contact with radiologically impacted areas, as well as the exposure routes, magnitude, frequency, and duration of the potential exposures. The principal objective of this evaluation is to identify reasonable maximum exposures (RMEs). As defined by EPA (1989), the RME is the maximum exposure that is reasonably expected to occur at a site. The potential human receptors and potentially complete exposure pathways for the identified receptors were presented in Section B3, Conceptual Site Model. The remainder of this section describes the process used to estimate exposure point concentrations (EPCs) and to quantify pathway-specific RME radiological exposures for each receptor.

The nonradiological HHRA in the Revised Final Parcel E RI Report provides both total and incremental risk associated with chemical constituents (Barajas & Associates, Inc., 2008). To combine nonradiological risk and radiological risk, the same approach used in the RI Report to calculate chemical risk must be taken; namely, calculating total risk from ROCs inclusive of background and calculating incremental risk from the ROCs present at levels that do not include background. Consistent with EPA and Navy guidance, both total and incremental risk were evaluated.

B5.1. EXPOSURE POINTS AND EXPOSURE POINT CONCENTRATIONS

Similar to the nonradiological HHRA, exposure points are identified based on anticipated population activity patterns and the relationship of the activities to the presence of contaminated media. For this radiological risk evaluation, each of the individual radiologically impacted sites for which data are available was considered a separate exposure point. Soil radiological data from each of the survey units collected during the Phase V investigation, along with data collected during the Phase I investigation, were grouped into individual data sets. The summary statistics for each radiologically impacted site for which data are available are presented in Table B-4.

Sample locations that have been physically removed during the time-critical removal actions at IR-02 Northwest and Central, the IR-02 Southeast Metal Debris Reef Area, and the Polychlorinated Biphenyl Hot Spot Area were removed from each data set.

B5.2. RESRAD

Radiological dose and risk were estimated for each of the radiologically impacted sites for which data are available. Individual RESRAD runs were conducted for each site, using the maximum reported activity of each ROC evaluated during the Phase V and Phase I investigations. [Table B-5](#) presents the modeled dose and risk estimates for the receptors for each site, based upon anticipated reuse. For residential and recreational receptors, the risk values presented in [Table B-5](#) are the sum of the risk for the adult and child receptors, as carcinogenic risk is cumulative. The dose values presented are the higher of the adult and child receptors. The RESRAD modeling runs are presented in [Attachment B1](#). [Table B-6](#) presents the modeled dose and risk estimates for each site, based on residential reuse.

To estimate the incremental risk from impacted soil areas, background concentrations of the ROCs were subtracted from the maximum activity values. As indicated in [Section B4](#), sample results from the reference areas indicated mean background levels of 0.049 pCi/g for ^{137}Cs , 0.818 pCi/g for ^{226}Ra , and 0.18 pCi/g for ^{90}Sr . To estimate the total radiological risk, the maximum activity values were used as the EPC, without subtracting the background values.

Section B6. Risk Assessment Results

Total and incremental dose and risk results are presented in [Table B-5](#). The RESRAD incremental risk estimates are summarized as follows:

- For the residential exposure scenario, incremental radiological risk estimates range from 2E-05 (Building 529 Site) to 7E-03 (Building 707 Triangle Area)
- For the recreational user exposure scenario, incremental radiological risk estimates range from 5E-08 (Building 509 Site) to 7E-03 (IR-02 Southeast)

The RESRAD total risk estimates are summarized as follows:

- For the residential exposure scenario, total radiological risk estimates ranged from 2E-04 (Building 508 Site) to 7E-03 (Building 707 Triangle Area)
- For the recreational user exposure scenario, total radiological risk estimates ranged from 2E-07 (Building 509 Site) to 7E-03 (IR-02 Southeast).

B6.1. COMBINED CHEMICAL AND RADIOLOGICAL RISK

Estimates of the lifetime risk of cancer to exposed individuals resulting from radiological and chemical risk assessments may be summed to determine the overall potential human health hazard associated with a site ([EPA, 1989](#)). To combine the chemical risk and radiological risk, the same approach used in the Revised Final Parcel E RI Report to calculate chemical risk must be taken; namely, calculating total risk from ROCs inclusive of background and calculating incremental risk from the ROCs present at activity levels that do not include background.

Table B-7 presents the combined chemical and radiological risk at the site. To estimate the combined chemical and radiological risk, the incremental risk was derived by reviewing the RI Report, locating grid points close to the impacted soil areas, and adding the points to the estimated risk from the radiological ROCs. In some instances (such as the Building 701 Site), chemical risk is not available because no soil samples were collected in the vicinity and chemical risk was subsequently not assessed. The chemical and radiological risk presented in [Table B-7](#) represents the maximum risk associated with an exposure area within an impacted area. Because the exposure areas and associated grids used in the chemical and radiological risk analyses were different, the grids may not necessarily be collocated. Accordingly, the total risk presented in [Table B-7](#) is an upper-bound estimate of dose and risk.

With some exceptions, such as the Building 707 Triangle Area and IR-02, the estimated risks are of a comparable order of magnitude to incremental risks for nonradioactive chemicals. The results indicate that concentrations of radioactive and nonradioactive chemicals in soil pose a potential unacceptable risk to future site users and remedial alternatives should be evaluated to address the potential risks. Although the extent of radioactive contamination in subsurface soil has not been defined, the Revised Final Parcel E RI Report concluded that subsurface soil throughout Parcel E contains nonradioactive chemicals that require analysis of remedial alternatives (Barajas & Associates, Inc., 2008). As a result, the remedial alternatives evaluated in the FS Report (ERRG, 2012) and this Radiological Addendum address the potential nonradioactive and radioactive chemicals in soil at Parcel E.

B6.2. CRITICAL PATHWAY EVALUATION

An evaluation was performed to identify the critical exposure pathway based on the pathways (external radiation, soil ingestion, and inhalation) identified in Section B3. Evaluation results are shown in Table B-8, which presents the percentage contribution of risk by exposure pathway for each ROC identified at the radiologically impacted sites and evaluated using RESRAD. As indicated in Table B-8, external exposure accounts for a significant majority of all radiological risks, from approximately 98 to 99 percent of all radiological risk. Incidental soil ingestion accounts for 1 to 2 percent of radiological risk, and inhalation accounts for less than one tenth of 1 percent of radiological risk.

B6.3. CRITICAL ISOTOPE EVALUATION

An evaluation was performed to identify the critical isotopes based on the exposure scenarios identified in Section B2. The critical isotope results presented in Table B-8 represent the range of the contribution of each individual isotope to the overall risk for each receptor. As indicated in Table B-8, ^{226}Ra accounts for over 90 percent of all radiological risk, with a few exceptions such as the Shack 80 site, 707 Triangle Area, the Building 517 site, and IR-02 Northwest. At these locations, ^{137}Cs also accounts for a significant portion of the risk.

B6.4. COVER DEPTH

Because the external radiation pathway is the critical pathway, an analysis of the cover depth was performed. The cover depth is the thickness of nonimpacted material (e.g., soil, asphalt, etc.) that is placed over the impacted soil area. The RESRAD default cover depth is zero, meaning the receptor is directly exposed to impacted soil. As the cover depth increases, the resulting risk to the receptor is reduced. For the purpose of this analysis, the cover depth was modeled at thicknesses of 0 feet, 2 feet, and 3 feet in areas where soil cover is evaluated as a remedial alternative. Additionally, the RESRAD default cover erosion rate was set to zero (e.g., cover depth maintained) to account for the institutional

controls proposed in the FS Report (ERRG, 2012). An analysis of the cover depth was only performed for redevelopment blocks EOS-1 through EOS-3, to correspond with remedial alternatives R-2 and R-3.

The modeling results are presented in [Table B-9](#) and show that, at a cover depth of 2 feet, the incremental radiological risks are reduced by approximately two orders of magnitude, and at a cover depth of 3 feet, the incremental radiological risks are reduced by approximately three order of magnitude. For the reasonably anticipated future receptor (recreational user), as well as the resident, the overall radiological risk is reduced to below the 1E-06 level under both scenarios.

The RESRAD modeling output reports are provided in [Attachment B1](#).

Section B7. Uncertainty Analysis

Any comprehensive risk analysis must also consider the effects of uncertainty on input parameters. This analysis is no different; however, rather than perform explicit uncertainty analyses, which would have required countless additional RESRAD runs, an approach was taken that minimized the need for additional modeling computations. Nuclear Regulatory Commission Regulation (NUREG)-6697 (NRC, 2000) was used as the basis for the uncertainty analysis.

One of the primary purposes of NUREG-6697 was to study the effect of various parameter distributions on the final results of RESRAD analyses. RESRAD is a mathematical model that simplifies complex physical, ecological, dosimetric, and human processes. RESRAD requires finite input parameters that represent current and future site conditions. However, most site characteristics (such as hydrogeological and geochemical properties) are not accurately represented by a single input value; most physical characteristics vary across a site. In addition, it is difficult to obtain sufficient data to completely characterize site-specific radionuclide transport and exposure processes and to predict future site conditions and human occupancy factors. Therefore, many of the RESRAD input parameters selected during the modeling process are averages, estimates, or default values.

Because the accuracy of modeled results depends upon the accuracy of the input parameters, risk results derived from RESRAD will contain inherent uncertainties based on the assumptions used in choosing the input parameters. Where default or estimated values are used, the modeled results may not accurately represent the actual physical conditions of the site or the future land use scenarios. To limit this uncertainty and ensure health protective results for the Parcel E radiological risk assessment, input parameters for physical processes and occupancy were chosen based on conservative assumptions; these parameters are discussed in [Section B2.1](#). The uncertainty associated with some of the significant inputs to RESRAD is discussed below.

The RESRAD modeling is based on the radiological data collected during the Phase I and Phase V investigations. The data collected during those investigations were analyzed to meet acceptance criteria (such as minimum detectable activities) that were based on the release criteria current at the time the investigations were performed; however, the current release criteria for certain ROCs are more conservative. The most notable example is ^{226}Ra , for which the release criterion at the time of the Phase V investigation was 5 pCi/g. The current release criterion for ^{226}Ra is 1 pCi/g above background

(the background ^{226}Ra level for the Phase V investigation was 0.82 pCi/g). Because of the differences in release criteria, the accuracy of the data for certain ROCs may not meet current acceptance criteria and results in some degree of uncertainty for the risk screening analysis. However, the degree of uncertainty is acceptable for the risk screening analysis because the analysis was only intended to provide a general estimate of radiological risks for ROCs that, in the case of ^{226}Ra , were known to consistently exceed current release criteria and warrant analysis of remedial alternatives in the FS.

The RESRAD default cover material density was used for all analyses performed. The default was designed to be representative of the body of soil types. In reality, existing asphalt and concrete covers would have a greater density than the default soil value. The specific density is dependent upon the asphalt-laying process. By underestimating the density of asphalt, a certain measure of conservatism has been built into the results presented in this appendix. It is therefore reasonable to assume that any uncertainty associated with the cover material density is minimal and a full uncertainty analysis for a range of cover material densities is not necessary.

Table B-3. Residual Remedial Goals

Radionuclide	Surfaces		Soil and Sediment ^{a,b} (pCi/g)		Groundwater (pCi/L) ^c
	Equipment, Waste (dpm/100 cm ²)	Structures (dpm/100 cm ²)	Industrial Worker	Residential	
Americium-241	100	100	5.67	1.36	15
Cesium-137	5,000	5,000	0.113	0.113	119
Cobalt-60	5,000	5,000	0.252 ^d	0.252 ^d	100
Plutonium-239	100	100	14.0	2.59	15
Radium-226	100	100	1.0 ^d	1.0 ^d	5 ^f
Strontium-90	1,000	1,000	10.8	0.331	8
Uranium-235	5,000	488	0.398	0.195	30

Notes:

- a RGs for two future use scenarios; however, the residential RGs will apply in all Parcel E areas. These more conservative RGs will enhance the protectiveness of the remedial action for Parcel E, particularly as it relates to future property transfer and the potential need to apply institutional controls for radionuclides (discussed in Section 3.3.1.3 of the radiological addendum).
- b RGs are consistent with the radiological-related remedies selected in the records of decision for Parcels B, G, and D-1 and UC-1 ([Department of the Navy, 2009a, 2009b, and 2009c](#), respectively), and are consistent with U.S. Environmental Protection Agency preliminary remediation goals (unless otherwise noted).
- c Groundwater remedial goals are derived from EPA's Radionuclides Notice of Availability Technical Support Document, dated March 2000, as presented in the Final Basewide Radiological Removal Action, Action Memorandum – Revision 2006, Hunters Point Shipyard, San Francisco, California, dated April 21, 2006.
- d RG for Cobalt-60 was revised to support efficient laboratory gamma spectroscopy analysis of soil samples. This revised RG maintains morbidity risks within the EPA defined acceptable range and permits an exposure level that does not increase the risk of cancer from a potential exposure to Cobalt-60 ([Department of the Navy, 2012](#)).
- e Objective is 1 pCi/g above background per agreement with U.S. Environmental Protection Agency (established in Final Basewide Radiological Removal Action, Action Memorandum – Revision 2006, Hunters Point Shipyard, San Francisco, California, dated April 21, 2006). The Radium-226 background level for surface soil is 0.633 pCi/g (TtECI, 2011). The Radium-226 background level for storm drain and sewer lines is 0.485 pCi/g (TtECI, 2010).
- f Limit is for total radium activity.

dpm/100 cm² = disintegrations per minute per 100 square centimeters

pCi/g = picocurie per gram

pCi/L = picocurie per liter

RGs = remedial goals

TtECI = Tetra Tech EC, Inc.

Table B-7. Combined Risk for Parcel E Study Areas *(continued)*

Notes:

- a The risk results presented in the table represent the highest risk for an individual exposure area within an impacted site and are based upon anticipated reuse. Chemical risk was derived from the Final Revised Parcel E Remedial Investigation Report, Tables I1-18 and I2-18 (Total and Incremental Risk for the Residential Exposure Scenario) and Tables I1-21 and I2-21 (Total and Incremental Risk for the Recreational Exposure Scenario) (Barajas & Associates, Inc., 2008).
- b Total excess lifetime cancer risk.
- c Consistent with EPA HHRA guidance, cancer risk results are presented to one significant figure. Accordingly, the combined risk results presented in the table may not equal the sum of the previous two columns; however, the results presented are an accurate representation of the sum of radiological and chemical risk.
- d Risk results are based on residential exposure scenario.
- e Chemical risk is not presented because no soil samples were collected in the vicinity of the site, and chemical risk was subsequently not evaluated.

Notes (continued):

- f Risk results are based on recreational user exposure scenario.
- g Although these areas are planned for open space reuse, risk results are presented for the residential exposure scenario to evaluate unrestricted reuse.

EPA = U.S. Environmental Protection Agency

HHRA = human health risk assessment

IR = Installation Restoration

-- = not applicable

Table B-8. Critical Exposure Scenario and Isotope Evaluation Results

Redevelopment Block and Site	Incremental Risk ^a	Radionuclide of Concern	PATHWAY PERCENTAGE OF INCREMENTAL RISK

File : C:\RESRAD_FAMILY\RESRAD\6.5\USERFILES\PARCEL E BUILDING RES ADULT TOT.RAD

Site-Specific Parameter Summary (continued)

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R014	Well pump intake depth (m below water table)	not used	1.000E+01	---	DWIBWT
R014	Model: Nondispersion (ND) or Mass-Balance (MB)	not used	ND	---	MODEL
R014	Well pumping rate (m**3/yr)	not used	2.500E+02	---	UW
R015	Number of unsaturated zone strata	not used	1	---	NS
R015	Unsat. zone 1, thickness (m)	not used	4.000E+00	---	H(1)
R015	Unsat. zone 1, soil density (g/cm**3)	not used	1.500E+00	---	DENSUZ(1)
R015	Unsat. zone 1, total porosity	not used	4.000E-01	---	TPUZ(1)
R015	Unsat. zone 1, effective porosity	not used	2.000E-01	---	EPUZ(1)
R015	Unsat. zone 1, field capacity	not used	2.000E-01	---	FCUZ(1)
R015	Unsat. zone 1, soil-specific b parameter	not used	5.300E+00	---	BUZ(1)
R015	Unsat. zone 1, hydraulic conductivity (m/yr)	not used	1.000E+01	---	HCUZ(1)
R016	Distribution coefficients for Cs-137				
R016	Contaminated zone (cm**3/g)	4.600E+03	4.600E+03	---	DCNUCC(1)
R016	Unsat. zone 1 (cm**3/g)	not used	4.600E+03	---	DCNUCU(1,1)
R016	Saturated zone (cm**3/g)	not used	4.600E+03	---	DCNUCS(1)
R016	Leach rate (/yr)	0.000E+00	0.000E+00	3.623E-05	ALEACH(1)
R016	Solubility constant	0.000E+00	0.000E+00	not used	SOLUBK(1)
R016	Distribution coefficients for Pb-210				
R016	Contaminated zone (cm**3/g)	1.000E+02	1.000E+02	---	DCNUCC(2)
R016	Unsat. zone 1 (cm**3/g)	not used	1.000E+02	---	DCNUCU(2,1)
R016	Saturated zone (cm**3/g)	not used	1.000E+02	---	DCNUCS(2)
R016	Leach rate (/yr)	0.000E+00	0.000E+00	1.663E-03	ALEACH(2)
R016	Solubility constant	0.000E+00	0.000E+00	not used	SOLUBK(2)
R016	Distribution coefficients for Ra-226				
R016	Contaminated zone (cm**3/g)	7.000E+01	7.000E+01	---	DCNUCC(3)
R016	Unsat. zone 1 (cm**3/g)	not used	7.000E+01	---	DCNUCU(3,1)
R016	Saturated zone (cm**3/g)	not used	7.000E+01	---	DCNUCS(3)
R016	Leach rate (/yr)	0.000E+00	0.000E+00	2.374E-03	ALEACH(3)
R016	Solubility constant	0.000E+00	0.000E+00	not used	SOLUBK(3)
R017	Inhalation rate (m**3/yr)	7.000E+03	8.400E+03	---	INHALR
R017	Mass loading for inhalation (g/m**3)	1.000E-04	1.000E-04	---	MLINH
R017	Exposure duration	2.400E+01	3.000E+01	---	ED
R017	Shielding factor, inhalation	4.000E-01	4.000E-01	---	SHF3
R017	Shielding factor, external gamma	7.000E-01	7.000E-01	---	SHF1
R017	Fraction of time spent indoors	0.000E+00	5.000E-01	---	FIND
R017	Fraction of time spent outdoors (on site)	9.590E-01	2.500E-01	---	FOTD
R017	Shape factor flag, external gamma	1.000E+00	1.000E+00	>0 shows circular AREA.	FS

Site-Specific Parameter Summary (continued)

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R021	Volumetric water content of the cover material	not used	5.000E-02	---	PH2OCV
R021	Volumetric water content of the foundation	not used	3.000E-02	---	PH2OFL
R021	Diffusion coefficient for radon gas (m/sec):				
R021	in cover material	not used	2.000E-06	---	DIFCV
R021	in foundation material	not used	3.000E-07	---	DIFFL
R021	in contaminated zone soil	not used	2.000E-06	---	DIFCZ
R021	Radon vertical dimension of mixing (m)	not used	2.000E+00	---	HMIX
R021	Average building air exchange rate (1/hr)	not used	5.000E-01	---	REXG
R021	Height of the building (room) (m)	not used	2.500E+00	---	HRM
R021	Building interior area factor	not used	0.000E+00	---	FAI
R021	Building depth below ground surface (m)	not used	-1.000E+00	---	DMFL
R021	Emanating power of Rn-222 gas	not used	2.500E-01	---	EMANA (1)
R021	Emanating power of Rn-220 gas	not used	1.500E-01	---	EMANA (2)
TITL	Number of graphical time points	32	---	---	NPTS
TITL	Maximum number of integration points for dose	17	---	---	LYMAX
TITL	Maximum number of integration points for risk	257	---	---	KYMAX

Summary of Pathway Selections

Pathway	User Selection
1 -- external gamma	active
2 -- inhalation (w/o radon)	active
3 -- plant ingestion	suppressed
4 -- meat ingestion	suppressed
5 -- milk ingestion	suppressed
6 -- aquatic foods	suppressed
7 -- drinking water	suppressed
8 -- soil ingestion	active
9 -- radon	suppressed
Find peak pathway doses	suppressed

#For DCF1(xxx) only, factors are for infinite depth & area. See ETFG table in Ground Pathway of Detailed Report.
 *Base Case means Default.Lib w/o Associate Nuclide contributions.

Summary : RESRAD Default Parameters

File : C:\RESRAD_FAMILY\RESRAD\6.5\USERFILES\PARCEL E 506 RES CHILD TOT.RAD

Site-Specific Parameter Summary

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R011	Area of contaminated zone (m**2)	8.170E+02	1.000E+04	---	AREA
R011	Thickness of contaminated zone (m)	2.000E+00	2.000E+00	---	THICK0
R011	Fraction of contamination that is submerged	0.000E+00	0.000E+00	---	SUBMFRACT
R011	Length parallel to aquifer flow (m)	not used	1.000E+02	---	LCZPAQ
R011	Basic radiation dose limit (mrem/yr)	2.500E+01	3.000E+01	---	BRDL
R011	Time since placement of material (yr)	0.000E+00	0.000E+00	---	TI
R011	Times for calculations (yr)	1.000E+00	1.000E+00	---	T(2)
R011	Times for calculations (yr)	3.000E+00	3.000E+00	---	T(3)
R011	Times for calculations (yr)	1.000E+01	1.000E+01	---	T(4)
R011	Times for calculations (yr)	3.000E+01	3.000E+01	---	T(5)
R011	Times for calculations (yr)	1.000E+02	1.000E+02	---	T(6)
R011	Times for calculations (yr)	3.000E+02	3.000E+02	---	T(7)
R011	Times for calculations (yr)	1.000E+03	1.000E+03	---	T(8)
R011	Times for calculations (yr)	not used	0.000E+00	---	T(9)
R011	Times for calculations (yr)	not used	0.000E+00	---	T(10)
R012	Initial principal radionuclide (pCi/g): Am-241	1.970E-01	0.000E+00	---	S1(1)
R012	Initial principal radionuclide (pCi/g): Cs-137	6.900E-02	0.000E+00	---	S1(2)
R012	Initial principal radionuclide (pCi/g): Pb-210	2.175E+00	0.000E+00	---	S1(4)
R012	Initial principal radionuclide (pCi/g): Ra-226	2.175E+00	0.000E+00	---	S1(5)
R012	Concentration in groundwater (pCi/L): Am-241	not used	0.000E+00	---	W1(1)
R012	Concentration in groundwater (pCi/L): Cs-137	not used	0.000E+00	---	W1(2)
R012	Concentration in groundwater (pCi/L): Pb-210	not used	0.000E+00	---	W1(4)
R012	Concentration in groundwater (pCi/L): Ra-226	not used	0.000E+00	---	W1(5)
R013	Cover depth (m)	0.000E+00	0.000E+00	---	COVER0
R013	Density of cover material (g/cm**3)	not used	1.500E+00	---	DENSCV
R013	Cover depth erosion rate (m/yr)	not used	1.000E-03	---	VCV
R013	Density of contaminated zone (g/cm**3)	1.500E+00	1.500E+00	---	DENSCZ
R013	Contaminated zone erosion rate (m/yr)	0.000E+00	1.000E-03	---	VCZ
R013	Contaminated zone total porosity	4.000E-01	4.000E-01	---	TPCZ
R013	Contaminated zone field capacity	2.000E-01	2.000E-01	---	FCCZ
R013	Contaminated zone hydraulic conductivity (m/yr)	1.000E+01	1.000E+01	---	HCCZ
R013	Contaminated zone b parameter	5.300E+00	5.300E+00	---	BCZ
R013	Average annual wind speed (m/sec)	2.000E+00	2.000E+00	---	WIND
R013	Humidity in air (g/m**3)	not used	8.000E+00	---	HUMID
R013	Evapotranspiration coefficient	5.000E-01	5.000E-01	---	EVAPTR
R013	Precipitation (m/yr)	1.000E+00	1.000E+00	---	PRECIP
R013	Irrigation (m/yr)	2.000E-01	2.000E-01	---	RI
R013	Irrigation mode	overhead	overhead	---	IDITCH
R013	Runoff coefficient	2.000E-01	2.000E-01	---	RUNOFF
R013	Watershed area for nearby stream or pond (m**2)	not used	1.000E+06	---	WAREA
R013	Accuracy for water/soil computations	not used	1.000E-03	---	EPS
R014	Density of saturated zone (g/cm**3)	not used	1.500E+00	---	DENSAQ
R014	Saturated zone total porosity	not used	4.000E-01	---	TPSZ
R014	Saturated zone effective porosity	not used	2.000E-01	---	EPSZ
R014	Saturated zone field capacity	not used	2.000E-01	---	FCSZ
R014	Saturated zone hydraulic conductivity (m/yr)	not used	1.000E+02	---	HCSZ
R014	Saturated zone hydraulic gradient	not used	2.000E-02	---	HGWT

Summary : RESRAD Default Parameters

Site-Specific Parameter Summary (continued)

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
C14	Fraction of vegetation carbon from air	not used	9.800E-01	---	CAIR
C14	C-14 evasion layer thickness in soil (m)	not used	3.000E-01	---	DMC
C14	C-14 evasion flux rate from soil (1/sec)	not used	7.000E-07	---	EVSN
C14	C-12 evasion flux rate from soil (1/sec)	not used	1.000E-10	---	REVSN
C14	Fraction of grain in beef cattle feed	not used	8.000E-01	---	AVFG4
C14	Fraction of grain in milk cow feed	not used	2.000E-01	---	AVFG5
STOR	Storage times of contaminated foodstuffs (days):				
STOR	Fruits, non-leafy vegetables, and grain	1.400E+01	1.400E+01	---	STOR_T(1)
STOR	Leafy vegetables	1.000E+00	1.000E+00	---	STOR_T(2)
STOR	Milk	1.000E+00	1.000E+00	---	STOR_T(3)
STOR	Meat and poultry	2.000E+01	2.000E+01	---	STOR_T(4)
STOR	Fish	7.000E+00	7.000E+00	---	STOR_T(5)
STOR	Crustacea and mollusks	7.000E+00	7.000E+00	---	STOR_T(6)
STOR	Well water	1.000E+00	1.000E+00	---	STOR_T(7)
STOR	Surface water	1.000E+00	1.000E+00	---	STOR_T(8)
STOR	Livestock fodder	4.500E+01	4.500E+01	---	STOR_T(9)
R021	Thickness of building foundation (m)	not used	1.500E-01	---	FLOOR1
R021	Bulk density of building foundation (g/cm**3)	not used	2.400E+00	---	DENSFL
R021	Total porosity of the cover material	not used	4.000E-01	---	TPCV
R021	Total porosity of the building foundation	not used	1.000E-01	---	TPFL
R021	Volumetric water content of the cover material	not used	5.000E-02	---	PH2OCV
R021	Volumetric water content of the foundation	not used	3.000E-02	---	PH2OFL
R021	Diffusion coefficient for radon gas (m/sec):				
R021	in cover material	not used	2.000E-06	---	DIFCV
R021	in foundation material	not used	3.000E-07	---	DIFFL
R021	in contaminated zone soil	not used	2.000E-06	---	DIFCZ
R021	Radon vertical dimension of mixing (m)	not used	2.000E+00	---	HMIX
R021	Average building air exchange rate (1/hr)	not used	5.000E-01	---	REXG
R021	Height of the building (room) (m)	not used	2.500E+00	---	HRM
R021	Building interior area factor	not used	0.000E+00	---	FAI
R021	Building depth below ground surface (m)	not used	-1.000E+00	---	DMFL
R021	Emanating power of Rn-222 gas	not used	2.500E-01	---	EMANA (1)
R021	Emanating power of Rn-220 gas	not used	1.500E-01	---	EMANA (2)
TITL	Number of graphical time points	32	---	---	NPTS
TITL	Maximum number of integration points for dose	17	---	---	LYMAX
TITL	Maximum number of integration points for risk	257	---	---	KYMAX

Summary of Pathway Selections

Pathway	User Selection
1 -- external gamma	active
2 -- inhalation (w/o radon)	active
3 -- plant ingestion	suppressed
4 -- meat ingestion	suppressed
5 -- milk ingestion	suppressed
6 -- aquatic foods	suppressed
7 -- drinking water	suppressed
8 -- soil ingestion	active
9 -- radon	suppressed
Find peak pathway doses	suppressed
