

# Topics in Forensic DNA Analysis & Interpretation

---

## Indiana DNA Training Workshop

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of  
Standards and Technology

[john.butler@nist.gov](mailto:john.butler@nist.gov)

## **Background on the Presenter**

John M. Butler has a B.S. in chemistry from Brigham Young University and a Ph.D. in analytical chemistry from the University of Virginia. His dissertation research, which was conducted at the FBI Academy in Quantico, VA, involved pioneering work in applying capillary electrophoresis to STR typing. While a postdoc at NIST, he designed and built STRBase, the widely used Short Tandem Repeat Internet Database (<http://www.cstl.nist.gov/biotech/strbase>) that contains a wealth of standardized information on STRs used in human identity applications. He worked for several years as a staff scientist and project leader at a California startup company named GeneTrace System developing rapid DNA analysis technologies involving time-of-flight mass spectrometry. In the fall of 1999, he returned to NIST to lead their efforts in human identity testing with funding from the National Institute of Justice.

Dr. Butler is currently a NIST Fellow and Group Leader of Applied Genetics in the Biochemical Science Division at the National Institute of Standards and Technology. He is a regular invited guest of the FBI's Scientific Working Group on DNA Analysis Methods (SWGDM) and a member of the Department of Defense Quality Assurance Oversight Committee for DNA Analysis. Following the terrorist attacks of 11 September 2001, he aided the DNA identification efforts and served as part of the distinguished World Trade Center Kinship and Data Analysis Panel (WTC KADAP). He is a member of the International Society of Forensic Genetics and serve as an Associate Editor for *Forensic Science International: Genetics*.

Dr. Butler has received numerous awards including the Presidential Early Career Award for Scientists and Engineers (2002), the Department of Commerce Silver Medal (2002) and Gold Medal (2008), the Arthur S. Flemming Award (2007), the Edward Uhler Condon Award (2010), Brigham Young University's College of Physical and Mathematical Sciences Honored Alumnus (2005), and the Scientific Prize of the International Society of Forensic Genetics (2003).

He has more than 100 publications describing aspects of forensic DNA testing and is one of the most prolific active authors in the field with articles appearing regularly in every major forensic science journal. Dr. Butler has been an invited speaker to numerous national and international forensic DNA meetings and in the past few years has spoken in Germany, France, England, Canada, Mexico, Denmark, Belgium, Poland, Portugal, Cyprus, The Netherlands, Argentina, Japan, and Australia. In addition to his busy scientific career, he and his wife serve in their community and church and are the proud parents of six children, all of whom have been proven to be theirs through the power of DNA typing.

For listing of publications, see <http://www.cstl.nist.gov/biotech/strbase/butler.htm>.

## **DNA Workshop for Indiana State Police Laboratory**

Instructor: John M. Butler (NIST)

Indianapolis, IN  
March 28, 2011

### Proposed Agenda (to start at 8:00 a.m.)

Introductions (15 minutes)

CE Fundamentals & Troubleshooting (60 minutes)

ABI 3500 (15 minutes)

- BREAK (15 minutes) -

Low-level DNA Issues (30 minutes)

Validation Discussion (60 minutes) – discuss specific on-going validation studies

Thoughts on the Future Directions of the Field (15 minutes)

- LUNCH (60 minutes) -

Mixtures & SWGDAM Interpretation Guidelines (120 minutes)

- BREAK (15 minutes) -

Y-STRs (30 minutes)

Relationship Testing & Parentage Statistics (30 minutes)

Additional Q & A (15 minutes)

***Please ask questions throughout the presentations!***

**CE Fundamentals and Troubleshooting**

Butler, J.M., et al. (2004) Forensic DNA typing by capillary electrophoresis using the ABI Prism 310 and 3100 genetic analyzers for STR analysis. *Electrophoresis* 25: 1397-1412.

Lazaruk, K., et al. (1998) Genotyping of forensic short tandem repeat (STR) systems based on sizing precision in a capillary electrophoresis instrument. *Electrophoresis* 19: 86-93.

McCord, B.R. (2003) Troubleshooting capillary electrophoresis systems. *Profiles in DNA* 6(2): 10-12. Available at: <http://www.promega.com/profiles/>.

Moretti, T.R., et al. (2001) Validation of short tandem repeats (STRs) for forensic usage: performance testing of fluorescent multiplex STR systems and analysis of authentic and simulated forensic samples. *J. Forensic Sci.* 46: 647-660.

**Low-level DNA Issues** (<http://www.cstl.nist.gov/biotech/strbase/LTDNA.htm>)

Benschop, C.C.G., et al. (2010) Low template STR typing: effect of replicate number and consensus method on genotyping reliability and DNA database search results. *Forensic Sci. Int. Genet. (in press)*. doi:10.1016/j.fsigen.2010.06.006

Butler, J.M., & Hill, C.R. (2010) Scientific issues with analysis of low amounts of DNA. *Profiles in DNA* 13(1). Available at [http://www.promega.com/profiles/1301/1301\\_02.html](http://www.promega.com/profiles/1301/1301_02.html).

Whitaker, J. P., et al. (2001) A comparison of the characteristics of profiles produced with the AMPFISTR SGM Plus multiplex system for both standard and low copy number (LCN) STR DNA analysis. *Forensic Sci. Int.* 123: 215-223.

**Validation** (<http://www.cstl.nist.gov/biotech/strbase/validation.htm>)

Butler, J.M. (2006) Debunking some urban legends surrounding validation within the forensic DNA community. *Profiles in DNA* 9(2): 3-6. Available at <http://www.promega.com/profiles/>.

ENFSI DNA Working Group (2010) Recommended minimum criteria for the validation of various aspects of the DNA profiling process. Available at <http://www.enfsi.eu>.

SWGAM. (2004) Revised validation guidelines. *Forensic Science Communications*, 6(3). Available at [http://www2.fbi.gov/hq/lab/fsc/backissu/july2004/standards/2004\\_03\\_standards02.htm](http://www2.fbi.gov/hq/lab/fsc/backissu/july2004/standards/2004_03_standards02.htm)

**Future Directions of the Field**

Butler, J.M., et al. (2007) STRs vs SNPs: thoughts on the future of forensic DNA testing. *Forensic Sci. Med. Pathol.* 3: 200-205.

Kayser, M., & de Knijff, P. (2011) Improving human forensics through advances in genetics, genomics and molecular biology. *Nature Rev. Genet.* 12: 179-192.

**Mixtures and SWGDAM Interpretation Guidelines** (<http://www.cstl.nist.gov/biotech/strbase/mixture.htm>)

Clayton, T.M., et al. (1998) Analysis and interpretation of mixed forensic stains using DNA STR profiling. *Forensic Sci. Int.* 91: 55-70.

Gill, P., et al. (2006) DNA commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101.

SWGAM. (2010) SWGDAM interpretation guidelines for autosomal STR typing by forensic DNA testing laboratories. Available at <http://www.fbi.gov/about-us/lab/codis/swgdam-interpretation-guidelines>.

**Y-STRs** ([http://www.cstl.nist.gov/biotech/strbase/y\\_str.htm](http://www.cstl.nist.gov/biotech/strbase/y_str.htm))

Brenner, C.H. (2010) Fundamental problem of forensic mathematics—the evidential value of a rare haplotype. *Forensic Sci. Int. Genet.* 4: 281-291.

Buckleton, J.S., et al. (2011) The interpretation of lineage markers in forensic DNA testing. *Forensic Sci. Int. Genet.* 5: 78-83.

Gusmão, L. et al. (2006) DNA Commission of the International Society of Forensic Genetics (ISFG): an update of the recommendations on the use of Y-STRs in forensic analysis. *Forensic Sci. Int.* 157: 187-197.

Krenke, B.E., et al. (2005) Validation of male-specific, 12-locus fluorescent short tandem repeat (STR) multiplex. *Forensic Sci. Int.* 151: 111-124.

**Relationship Testing** (<http://www.cstl.nist.gov/biotech/strbase/kinship.htm>)

Gjertson, D.W. et al. (2007) ISFG: recommendations on biostatistics in paternity testing. *Forensic Sci. Int. Genet.* 1(3-4): 223-231.

# Introductions

---

**Indiana DNA Training Workshop**

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of Standards and Technology  
[john.butler@nist.gov](mailto:john.butler@nist.gov)

**Dr. John M. Butler**  
NIST Fellow & Applied Genetics Group Leader  
<http://www.cstl.nist.gov/biotech/strbase/butler.htm>

Experience

- University of Virginia/FBI Laboratory (1992-1995)
  - Work performed in Bruce McCord's lab
- NIST NRC Postdoc (1995-1997)
- GeneTrace Systems Inc (1997-1999)
- NIST Human Identity Project Leader (1999-present)

Contact Information  
[john.butler@nist.gov](mailto:john.butler@nist.gov)  
301-975-4049

## NIST History and Mission

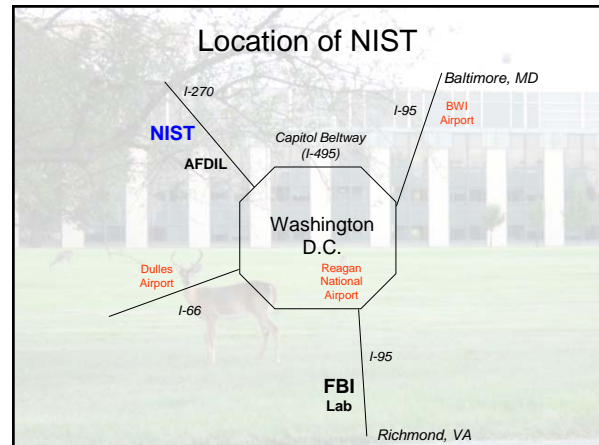

- National Institute of Standards and Technology (NIST) was created in 1901 as the National Bureau of Standards (NBS). The name was changed to NIST in 1988.
- NIST is **part of the U.S. Department of Commerce** with a mission to develop and promote measurement, standards, and technology to enhance productivity, facilitate trade, and improve the quality of life.
- NIST supplies over 1,300 Standard Reference Materials (SRMs) for industry, academia, and government use in calibration of measurements.
- **NIST defines time for the U.S.**

\$686 for 3 jars

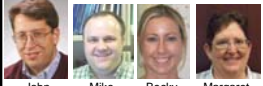

DNA typing standard

## NIST Human Identity Project Teams within the Applied Genetics Group

*Forensic DNA Team*

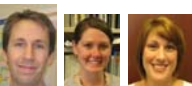

John Butler, Mike Coble, Becky Hill, Margaret Kline

*Data Analysis Support*

Dave Daeuer

*DNA Biometrics Team*

Pete Vallone, Erica Butts, Kristen Lewis O'Connor

Funding from the National Institute of Justice (NIJ) through NIST Office of Law Enforcement Standards

Funding from the FBI S&T Branch through NIST Information Access Division

**National Institute of Justice**  
The Research, Development, and Evaluation Agency of the U.S. Department of Justice

### Current Areas of NIST Effort with Forensic DNA

- **Standards**
  - Standard Reference Materials
  - Standard Information Resources (STRBase website)
  - Interlaboratory Studies
- **Technology**
  - Research programs in SNPs, miniSTRs, Y-STRs, mtDNA, qPCR
  - Assay and software development, expert system review
- **Training Materials**
  - Review articles and workshops on STRs, CE, validation
  - PowerPoint and pdf files available for download

<http://www.cstl.nist.gov/biotech/strbase/NIJprojects.htm>

### Contributors to These Workshop Slides

|   |   |   |   |   |
|---|---|---|---|---|
|  |  |  |  |  |
| Bruce McCord  | Erica Butts   | Becky Hill  | Mike Coble  | Kristen O'Connor  |
| Florida International University  | NIST  | NIST  | NIST  | NIST  |
| CE  | ABI 3500  | low level DNA   | DNA mixtures  | kinship analysis  |

### Forensic Science International: Genetics

<http://www.fsigenetics.com/>

**We need your help as good reviewers and authors**

**Editor-in-Chief:**  
Angel Carracedo (Spain)

**Associate Editors:**  
Peter M. Schneider (Germany)  
John M. Butler (USA)

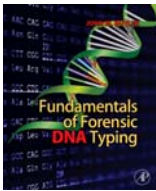

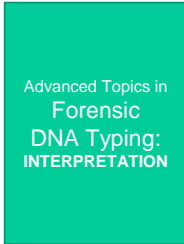

**FSI: Genetics is a new journal dedicated exclusively to the field of forensic genetics.** It has been launched in 2007 by Elsevier Publishers in affiliation with the International Society of Forensic Genetics. **All members of the ISFG receive a free subscription of this journal** (print and online version) as part of their membership benefits.

### Primary Sources for Material Covered in this Workshop

- See [recommended reference list](#)
- Butler, J.M. (2009) *Fundamentals of Forensic DNA Typing*. Elsevier Academic Press
- Butler, J.M. (2011) *Advanced Topics in Forensic DNA Typing: Methodology*. Elsevier Academic Press
- NIST STRBase website: <http://www.cstl.nist.gov/biotech/strbase/>

These workshop materials are available at <http://www.cstl.nist.gov/biotech/strbase/training.htm>

### 3<sup>rd</sup> Edition is Three Volumes

|   |  |  |
|---|--|--|
|  |  |  |
| Sept 2009   | Sept 2011  | Fall 2012  |

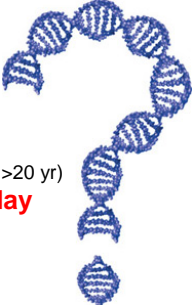

### Participants' Backgrounds

**Your name**

**Your organization/lab**

**Experience level** (e.g., <1 yr, 5 yr, >20 yr)

**What you hope to learn today**

### NIST and NIJ Disclaimer

**Funding:** Interagency Agreement 2008-IJ-R-029 between the [National Institute of Justice](#) and NIST Office of Law Enforcement Standards

**Points of view are mine** and do not necessarily represent the official position or policies of the US Department of Justice or the National Institute of Standards and Technology.

Certain commercial equipment, instruments and materials are identified in order to specify experimental procedures as completely as possible. In no case does such identification imply a recommendation or endorsement by the National Institute of Standards and Technology nor does it imply that any of the materials, instruments or equipment identified are necessarily the best available for the purpose.

**Our publications and presentations are made available at:**  
<http://www.cstl.nist.gov/biotech/strbase/NISTpub.htm>

*Topics in Forensic DNA Analysis & Interpretation*

## Capillary Electrophoresis: Fundamentals & Troubleshooting

---

**Indiana DNA  
Training Workshop**

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of  
Standards and Technology

[john.butler@nist.gov](mailto:john.butler@nist.gov)

### Presentation Outline

- NIST experience with DNA analysis using CE
- CE separation, injection, detection process
- Troubleshooting tips and suggestions

J.M. Butler (2011) Advanced Topics in Forensic DNA Typing: Methodology, Table 6.1

#### Genetic Analyzers from Applied Biosystems

| ABI Genetic Analyzer    | Years Released for Human ID | Number of Capillaries | Laser                   | Polymer delivery | Other features   |
|-------------------------|-----------------------------|-----------------------|-------------------------|------------------|--|
| <b>373</b> (gel system) | 1992-2003                   | --                    | 40 mW Ar+ (488/514 nm)  | --               | PMTs and color filter wheel for detection  |
| <b>377</b> (gel system) | 1995-2006                   | --                    | 40 mW Ar+ (488/514 nm)  | --               | CCD camera   |
| <b>310</b>              | 1995-                       | 1                     | 10 mW Ar+ (488/514 nm)  | syringe          | Mac operating system & Windows NT (later)  |
| <b>3100</b>             | 2000-2005                   | 16                    | 25 mW Ar+ (488/514 nm)  | syringe          |  |
| <b>3100-Avant</b>       | 2002-2007                   | 4                     | 25 mW Ar+ (488/514 nm)  | syringe          |  |
| <b>3130</b>             | 2003-2011                   | 4                     | 25 mW Ar+ (488/514 nm)  | pump             |  |
| <b>3130xl</b>           | 2003-2011                   | 16                    | 25 mW Ar+ (488/514 nm)  | pump             |  |
| <b>3500</b>             | 2010-                       | 8                     | 10-25 mW diode (505 nm) | new pump         | 110V power; RFID-tagged reagents; .hid files; normalization & 6-dye detection possible |
| <b>3500xl</b>           | 2010-                       | 24                    |                         |                  |  |
| <b>3700</b>             | 2002-2003                   | 96                    | 25 mW Ar+ (488/514 nm)  | cuvette-based    | Split beam technology  |
| <b>3730</b>             | 2005-                       | 48                    | 25 mW Ar+ (488/514 nm)  | pump             |  |
| <b>3730xl</b>           | 2005-                       | 96                    | 25 mW Ar+ (488/514 nm)  | pump             |  |

### ABI Genetic Analyzer Usage at NIST

(All instruments were purchased using NIJ funds)

**ABI 310** Single capillary

- 1<sup>st</sup> was purchased in 1996 as Mac (A230, now B233)
- 2<sup>nd</sup> was purchased in June 2002 as NT (B261)

**ABI 3100 → 3130xl** 16 capillaries

- 1<sup>st</sup> purchased in April 2001 as ABI 3100
  - upgraded to 3130xl in Sept 2005
  - Located in a different room (A230, now B219)
- 2<sup>nd</sup> purchased in June 2002 as ABI 3100
  - Original data collection (v1.0.1) software retained
  - updated to 3130xl in Jan 2007 (B219, now B261)

**ABI 3500** 8 capillaries

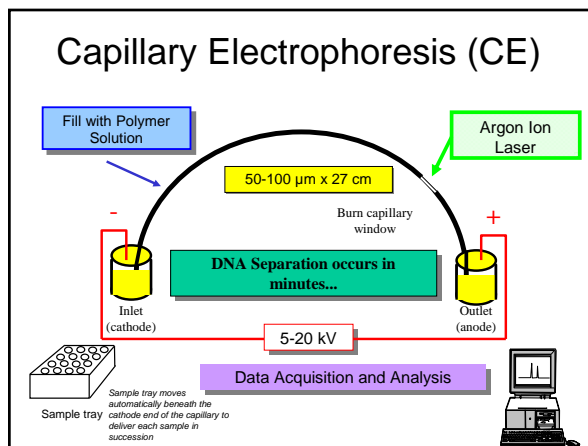

- Purchased Nov 2010 (B233)

### DNA Samples Run at NIST

we have **processed >100,000 samples** (from 1996-present)

- **STR kits**
  - Identifiler, PP16, PP16HS, Identifiler Plus, Identifiler Direct, Profiler Plus, Cofiler, SGM Plus, ESI/ESX 17, SE33 monoplex
- **Research & development on new assays**
  - **STRs:** Y-STR 20plex, MeowPlex, miniSTRs, 26plex
  - **SNPs:** SNaPshot assays: mtDNA (one 10plex), Y-SNPs (four 6plexes), Orchid SNPs (twelve 6plexes), ancestry SNPs (two 12plexes), SNPforID (one 29plex), SNPplex (one 48plex)
- **DNA sequencing**
  - Variant allele sequencing

**We have a unique breadth and depth of experience with these instruments...**

### Review Article on STRs and CE

### Analytical Requirements for STR Typing

Butler et al. (2004) *Electrophoresis* 25: 1397-1412

- Fluorescent dyes must be **spectrally resolved** in order to distinguish different dye labels on PCR products
- PCR products must be **spatially resolved** – desirable to have single base resolution out to >350 bp in order to distinguish variant alleles
- High **run-to-run precision** – an internal sizing standard is used to calibrate each run in order to compare data over time

- ### Process Involved in 310/3100 Analysis
- Separation**
    - Capillary – 50µm fused silica, 43 cm length (36 cm to detector)
    - POP-4 polymer – Polydimethyl acrylamide
    - Buffer - TAPS pH 8.0
    - Denaturants – urea, pyroldinone
  - Injection**
    - electrokinetic injection process (formamide, water)
    - importance of sample stacking
  - Detection**
    - fluorescent dyes with excitation and emission traits
    - CCD with defined virtual filters produced by assigning certain pixels

# Separation

### Ohm's Law

- $V = IR$  (where V is voltage, I is current, and R is resistance)
- Current, or the flow of ions, is what matters most in electrophoresis
- CE currents are much lower than gels because of a higher resistance in the narrow capillary
- CE can run a higher voltage because the capillary offers a higher surface area-to-volume ratio and can thus dissipate heat better from the ion flow (current)

### Separation Issues

- **Electrophoresis buffer** –
  - Urea for denaturing and viscosity
  - Buffer for consistent pH
  - Pyridinone for denaturing DNA
  - EDTA for stability and chelating metals
- **Polymer solution** -- POP-4 (but others work also)
- **Capillary wall coating** -- dynamic coating with polymer
  - Wall charges are masked by methyl acrylamide
- **Run temperature** -- 60 °C helps reduce secondary structure on DNA and improves precision. (Temperature control affects DNA sizing)

### What is in POP-4 and Genetic Analyzer Buffer?

© 1997 Oxford University Press      *Nucleic Acid Research*, 1997, Vol. 25, No. 19    3925-3929

**Improved single-strand DNA sizing accuracy in capillary electrophoresis**

**Barnett B. Rosenblum\*, Frank Oaks, Steve Menchen and Ben Johnson**

PE Applied Biosystems, 850 Lincoln Centre Drive, Foster City, CA 94404, USA

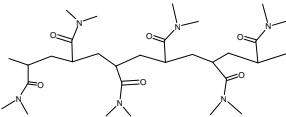

Received May 29, 1997; Revised and Accepted August 6, 1997

See also Wenz *et al.* (1998) *Genome Research* 8: 69-80

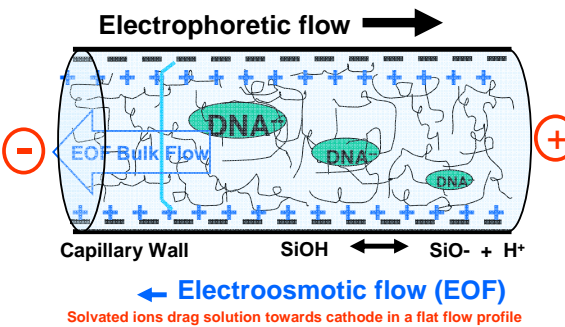

**POP-4** (4% poly-dimethylacrylamide, 8 M urea, 5% 2-pyrrolidinone)

US Patent 5,552,028 covers POP-4 synthesis

**Running buffer** contains 100 mM TAPS and 1 mM EDTA (adjusted to pH 8.0 with NaOH) TAPS = *N-Tris-(hydroxymethyl)methyl-3-aminopropane-sulfonic acid*

### Capillary Wall Coatings Impact DNA Separations

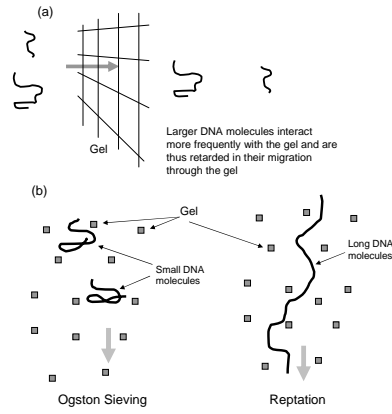

**Electrophoretic flow** →

← **EOF Bulk Flow**

Capillary Wall      SiOH    ↔    SiO<sup>-</sup> + H<sup>+</sup>

← **Electroosmotic flow (EOF)**

Solvated ions drag solution towards cathode in a flat flow profile

(a) Larger DNA molecules interact more frequently with the gel and are thus retarded in their migration through the gel

(b) Ogston Sieving      Reptation

### How to Improve Resolution?

1. Lower Field Strength
2. Increase Capillary Length
3. Increase Polymer Concentration
4. Increase Polymer Length

All of these come at a cost of longer separation run times

# Injection

### Sample Conductivity Impacts Amount Injected

$$[DNA_{inj}] = \frac{Et(\pi r^2)(\mu_{ep} + \mu_{eof})[DNA_{sample}](\lambda_{buffer})}{\lambda_{sample}}$$

$[DNA_{inj}]$  is the amount of sample injected

$[DNA_{sample}]$  is the concentration of DNA in the sample

$E$  is the electric field applied

$t$  is the injection time

$r$  is the radius of the capillary

$\mu_{ep}$  is the mobility of the sample molecules

$\mu_{eof}$  is the electroosmotic mobility

$\lambda_{buffer}$  is the buffer conductivity

$\lambda_{sample}$  is the sample conductivity

Cl<sup>-</sup> ions and other buffer ions present in PCR reaction contribute to the sample conductivity and thus will compete with DNA for injection onto the capillary

Butler et al. (2004) Electrophoresis 25: 1397-1412

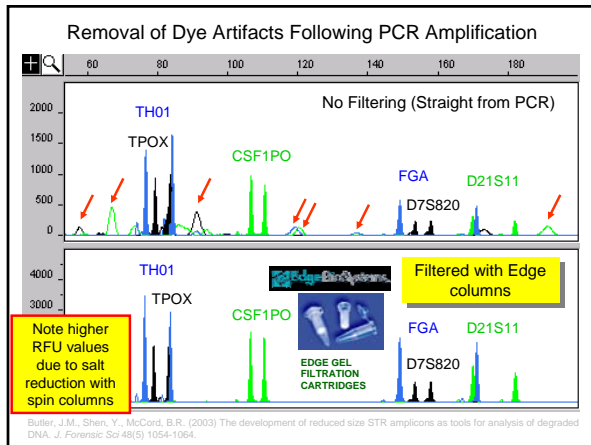

### Steps Performed in Standard Module

See J.M. Butler (2005) *Forensic DNA Typing, 2<sup>nd</sup> Edition*; Chapter 14

- **Capillary fill** – polymer solution is forced into the capillary by applying a force to the syringe
- **Pre-electrophoresis** – the separation voltage is raised to 10,000 volts and run for 5 minutes;
- **Water wash of capillary** – capillary is dipped several times in deionized water to remove buffer salts that would interfere with the injection process
- **Sample injection** – the autosampler moves to position A1 (or the next sample in the sample set) and is moved up onto the capillary to perform the injection; a voltage is applied to the sample and a few nanoliters of sample are pulled onto the end of the capillary; the default injection is 15 kV (kilovolts) for 5 seconds
- **Water wash of capillary** – capillary is dipped several times in waste water to remove any contaminating solution adhering to the outside of the capillary
- **Water dip** – capillary is dipped in clean water (position 2) several times
- **Electrophoresis** – autosampler moves to inlet buffer vial (position 1) and separation voltage is applied across the capillary; the injected DNA molecules begin separating through the POP-4 polymer solution
- **Detection** – data collection begins; raw data is collected with no spectral deconvolution of the different dye colors; the matrix is applied during Genescan analysis

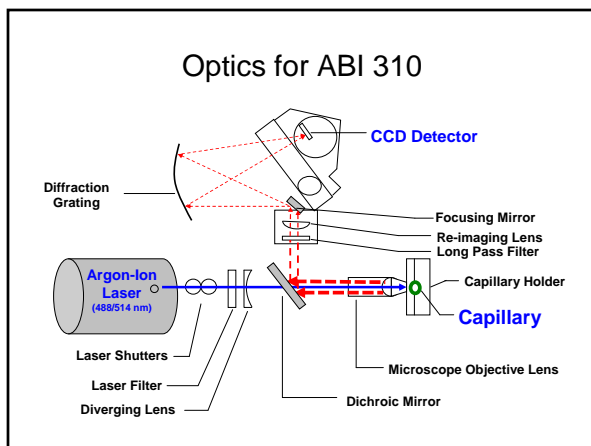

### Comments on Sample Preparation

- Use high quality formamide (<100  $\mu\text{S}/\text{cm}$ )
- Denaturation with heating and snap cooling is not needed (although most labs still do it...)
- Post-PCR purification reduces salt levels and leads to more DNA injected onto the capillary

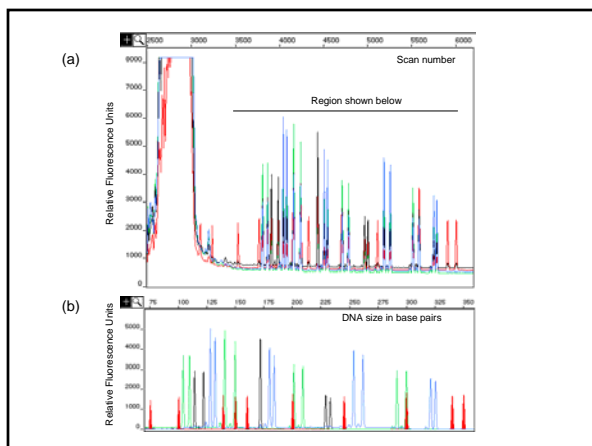

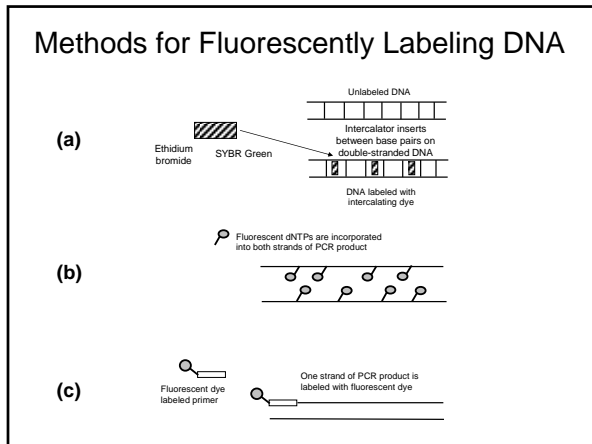

# Detection

### Optics for ABI 310

### Fluorescence

### Matrix with 4 Dyes on ABI 310

$I_{540} = bx_b + gy_b + yz_b + rw_b$  intensity of blue  
 $I_{560} = bx_g + gy_g + yz_g + rw_g$  intensity of green  
 $I_{580} = bx_y + gy_y + yz_y + rw_y$  intensity of yellow  
 $I_{610} = bx_r + gy_r + yz_r + rw_r$  intensity of red

**Where**  
**b** is the %blue labeled DNA  
**g** is the %green labeled DNA, etc.  
**x,y,z,w** are the numbers in the matrix (sensitivity to each color)

| POP4STRMODF |                             |

**Processed Data (matrix applied with baselining)**

### Virtual Filters Used in ABI 310

Visible spectrum range seen in CCD camera: 500 - 700 nm

Filter sets determine what regions of the CCD camera are activated and therefore what portion of the visible light spectrum is collected

| Filter    | Blue | Green | Yellow | Red | Orange | Used with These Kits |
|-----------|------|-------|--------|-----|--------|----------------------|
| Filter A  | FL   | JOE   | TMR    |     |        | PowerPlex 16         |
| Filter C  | 6FAM | TET   | HEX    | ROX |        | in-house assays      |
| Filter F  | 5FAM | JOE   | NED    | ROX |        | Profiler Plus        |
| Filter G5 | 6FAM | VIC   | NED    | PET | LIZ    | Identifier           |

### Variable Binning Increases Red Peaks Comparison of Data Collection Versions

**(a) ABI 3100 Data Collection v1.0.1**  
**(b) ABI 3130x1 Data Collection v3.0**

The same PCR products examined with different data collection versions. In (a) there is an equal number of pixels of light collected from the CCD camera for the blue-labeled and red-labeled peaks. In (b) the signal increase in the red dye-labeled PCR products is accomplished with 'variable binning' where more pixels of light are collected from the CCD camera in the red-channel to help balance the less sensitive red dye with blue dye-labeled amplicons.

### Deciphering Artifacts from the True Alleles

**Biological (PCR) artifacts**

- Stutter products: D3S1358 (6.0%, 7.8%)
- Incomplete adenylation: D8S1179

**STR alleles**

Dye blob  
 stutter  
 spike  
 Pull-up (bleed-through)

Blue channel  
Green channel  
Yellow channel  
Red channel

### NIST ABI 3100 Analysis Using POP-6 Polymer

High Resolution STR Typing

SNaPshot SNP Typing (Coding Region mtSNP 11plex minisequencing assay)

Result from 1 pg (genomic DNA)

mtDNA Sequencing (HV1)

### Maintenance of ABI 310/3100/3130

- Syringe – leaks cause capillary to not fill properly
- Capillary storage & wash – **it dries, it dies!**
- Pump block – cleaning helps insure good fill
- Change the running buffer regularly

**YOU MUST BE CLEAN AROUND A CE!**

### Protocols Used for STR Typing

- Most forensic DNA laboratories follow PCR amplification and CE instrument protocols provided by the manufacturer
- Comments
  - Lower volume reactions may work fine and reduce costs
  - No heat denaturation/snap cooling is required prior to loading samples into ABI 310 or ABI 3100
  - Capillaries do not have to be thrown away after 100 runs
  - POP-4 polymer lasts much longer than 5 days on an ABI 310
  - **Validation does not have to be an overwhelming task**

# Troubleshooting

Bruce McCord's  
*Profiles in DNA* Article

PROFILES IN DNA Volume 6 (2), Sept 2003, pp. 10-12

**TECH TIPS**

**Troubleshooting Capillary Electrophoresis Systems**  
By Bruce McCord  
Associate Professor of Forensic Chemistry, Ohio University, Athens, Ohio

*The key to producing good DNA separations is to understand the principles underlying the injection, separation and detection of each allele.*

**INTRODUCTION**  
The development of capillary electrophoresis (CE) has played a key role in bringing about the modern application of DNA typing. Forensic laboratories are the beneficiaries of this new technology, but many practitioners are not fully aware of the underlying principles of the CE system. This article attempts to address the important issues in CE separations to aid analysts in troubleshooting problematic separations. The key to producing good DNA separations is to understand the principles underlying the injection, separation and detection of each allele. These points are addressed below.

**SEPARATION**  
DNA analysis by CE is performed using entangled polymer buffers (Figure 1). These buffers can be easily pumped into a capillary prior to a separation and pumped out at its conclusion, providing a fresh separation matrix for each run. A typical buffer for forensic DNA separation contains 4% polydimethyl acrylamide (pDMA), buffered to pH 8

### External Factors

- Room temperature
  - Variations in room temperature can cause mobility shifts with band shifts and loss of calibration
  - Temperature is also important due to effects of high humidity on electrical conductance
- Cleanliness
  - Urea left in sample block can crystallize and catalyze further crystal formation causing spikes, clogs and other problems.
  - Best bet is to keep polymer in system and not remove or change block until polymer is used up.

### Effect of temperature on allele size

**Slope is 0.14 bases/degree centigrade  
Therefore a small change in temperature has a big effect  
(A 1-2 degree shift in temperature of the heat plate can produce an OL allele)**

Hartzell, B., et al. (2003). Response of short tandem repeat systems to temperature and sizing methods. *Forensic Science International*, 133, 228-234.

### Temperature Probes

Refrigerator and freezer monitoring

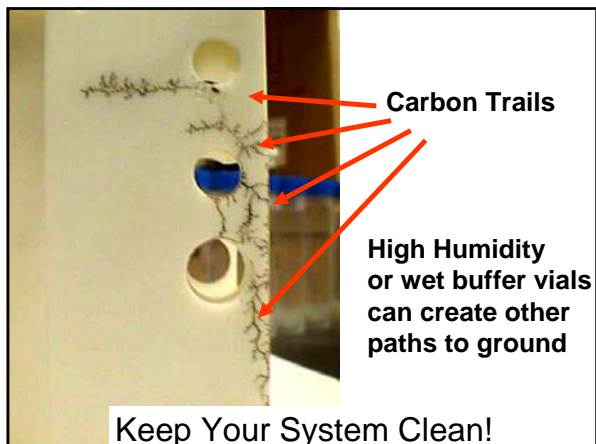

Frig/Freeze Monitors \$240  
 #DT-23-33-80 – USB Temperature Datalogger  
 PLUS Software \$79.00 (#DT-23-33-60)

Room Monitors, # DT-23039-52 – USB Temperature-Humidity Datalogger \$91.00  
 (Cole Parmer, Vernon Hills IL)

Room temperature monitoring

- ### Cleanliness
- Urea sublimates and breaks down to ionic components - these find a path to ground
  - Similarly wet buffer under a vial creates paths to ground
  - Capillary windows must be clear or matrix effects will occur
  - Laser will often assist in this process
  - Vial caps will transfer low levels of DNA to capillary

### Instrumental Factors

- Optical System
  - Sensitivity changes with age, capillary diameter, capillary cleanliness, instrument calibration
- Fluidic System
  - Effects of bubbles, dust, urea crystals, leaks in syringe and capillary ferrule
- Matrix Calculations
  - Changes in buffer, optics, sample dye can alter the software calibrations
- Capillary Problems
  - Chemisorbed materials on capillary surface can produce osmotic flow, DNA band broadening and inconsistent resolution (meltdowns)

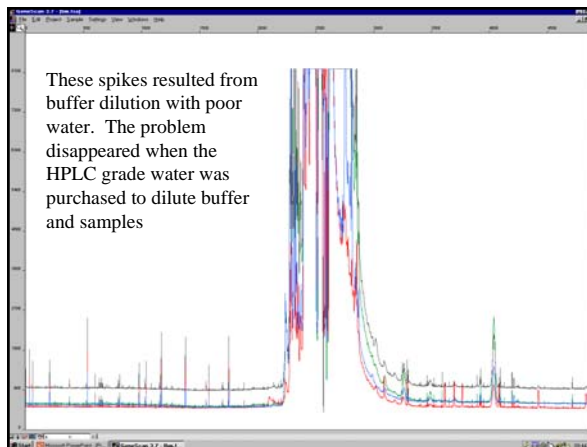

### The Detection Window

Make sure that the capillary window is lined up (if it is not, then no peaks will be seen)

Window may need to be cleaned with ethanol or methanol

**Review Start of Raw Data Collection**

Little spikes indicate need to change buffer... check current

### Beware of Urea Crystals

Urea crystals have formed due to a small leak where the capillary comes into the pump block

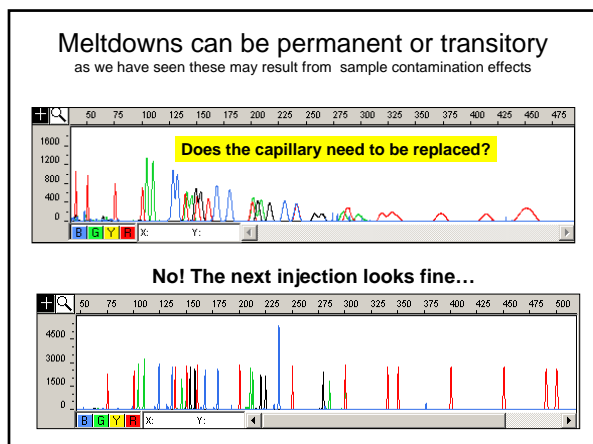

Urea sublimates and can evaporate to appear elsewhere

Use a small balloon to better grip the ferrule and keep it tight

Pump block should be well cleaned to avoid problems with urea crystal formation

### Buffer Issues

- The buffer and polymer affect the background fluorescence- affecting the matrix
- Urea crystals and dust may produce spikes
- High salt concentrations may produce reannealing of DNA
- High salt concentrations affect current
- Low polymer concentrations affect peak resolution

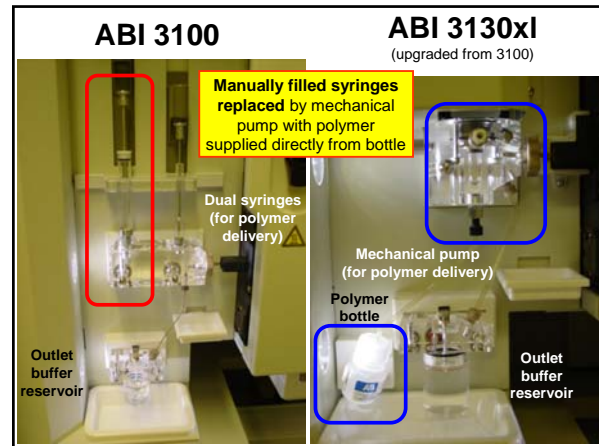

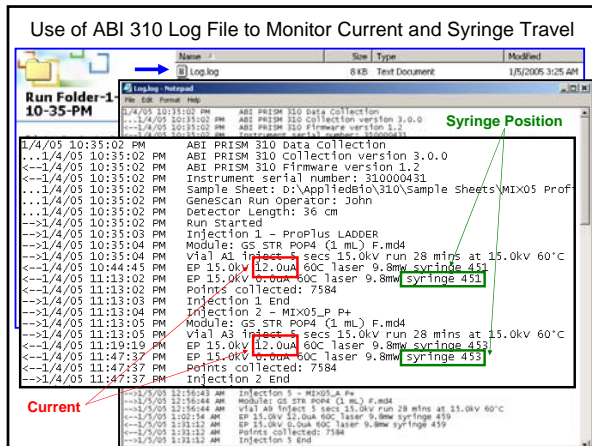

- Meltdowns may be the result of
- Bad formamide
  - Excess salt in sample/renaturation
  - Water in the polymer buffer
  - **Syringe leak** or bottom out
  - Poisoned capillary
  - Conductive polymer buffer due to urea degradation
  - Crack/shift in capillary window
  - Detergents and metal ions

- Troubleshooting benchmarks
- **Monitor run current**
  - Observe syringe position and movement during a batch
  - Examine ILS (ROX) peak height with no sample
  - Observe “250 bp” peak in GS500 size standard
  - Monitor resolution of TH01 9.3/10 in allelic ladder and size standard peak shapes
  - **Keep an eye on the baseline signal/noise**
  - Measure formamide conductivity
  - Reagent blank – **are any dye blobs present?**
  - See if positive control DNA is producing typical peak heights (along with the correct genotype)

- Measurement of Current
- $V/I = R$  where R is a function of capillary diameter, [buffer], and buffer viscosity
  - In a CE system the voltage is fixed, thus changes in resistance in the capillary will be reflected in the current observed
  - Air bubbles, syringe leaks, alternate paths to ground, changes in temperature, changes in zeta potential, and contamination, will be reflected in the current
  - A typical current for a CE system with POP4 buffer is **8-12  $\mu A$**  (microamps)

- Syringe Travel
- The ABI 310 instrument also keeps track of the position of the syringe (in the log file)
  - Depending on the resistance to flow, the syringe will travel different lengths
  - Syringe leaks may be reflected in a longer distance traveled prior to each injection
  - These leaks occur around the barrel of the syringe and at the connection to the capillary block

**Conclusion:**  
**Troubleshooting is more than following the protocols**  
**It means keeping watch on all aspects of the operation**

1. Monitoring conductivity of sample and formamide
2. Keeping track of current and syringe position in log.
3. Watching the laser current
4. Watching and listening for voltage spikes
5. Monitoring room temperature and humidity

# ABI 3500 Genetic Analyzer

---

**Indiana DNA  
Training Workshop**

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of  
Standards and Technology

[john.butler@nist.gov](mailto:john.butler@nist.gov)

## Presentation Outline

- ABI 31xx series retirement
- ABI 3500 features and concerns
- Open letter to Applied Biosystems
- NIST early validation experiments with ABI 3500 instrument

## ABI 31xx Retirement

**Angela Wang**  
Product Manager  
Human Identification  
Instruments

850 Lincoln Centre Drive  
Foster City, CA 94404  
T 650-638-2469  
M 650-478-4817  
F 650-554-2774  
[Angela.Wang@abtech.com](mailto:Angela.Wang@abtech.com)

**No ABI 3100/3100 Avant instruments after Dec 31, 2011**

**No more sales of ABI 3130/3130xl after June 30, 2011**

November 18, 2010

Dear Valued Customer:

We are pleased to be your partner in performing human identification testing with validated, industry-leading Capillary Electrophoresis instrumentation from Applied Biosystems. In order to help plan for your laboratory's future needs, we wish to inform you that Applied Biosystems has planned the retirement of the 3100 Avant and 3100 Capillary Electrophoresis instruments ("3100 System") effective **December 31, 2011**.

Please note that the 3130/3130xl Genetic Analyzers for Human Identification will no longer be available for upgrade or sale by **June 30, 2011**. However, we intend to use commercially reasonable efforts to support current 3130 Genetic Analyzer HID users with related software, reagents and consumables, as well as maintenance and repair service and technical and applications support for a minimum of five years from the date of discontinuance. Please note that the level of support we are able to provide may be limited by circumstances beyond our reasonable control, including but not limited to our inability to source supply. If any changes to the level of support we can offer should be necessary, you will be notified at that time.

## ABI 3500

- With the upcoming retirement of the 31xx series, the entire community will be forced to go to the 3500 series
- How will this impact validation and interpretation guidelines?
- How many labs have experience with the 3500? Are any on-line doing casework?

## Details of the new ABI 3500

**No lower pump block**  
(less polymer waste)

**Improved sealing for better temperature control**  
(improved precision?)

**Reagents prepackaged with RFID tags**

**Better seal around the detector**

### ABI 3500 Evaluation

**New Features of the ABI 3500 CE**

- an improved polymer delivery pump design,
- ready-to-use consumables and containers,
- Radio Frequency Identification (RFID) consumable tracking,
- quality control software features for rapid identification and re-injection of failed samples,
- increased throughput,
- new laser technology,
- reduced power requirements,
- peak height normalization,
- intuitive user software, and integrated primary analysis software,
- improved peak height uniformity across capillaries, runs and instruments
- **6-dye channel capability**

- *NIJ will likely be requested to use federal grants to supply state and local labs with this new instrument*
- *It needs to be assessed for advantages and costs*

### DNA Community Moving to ABI 3500s

|   |  |
|---|--|
| <p><b>Advantages</b></p> <ul style="list-style-type: none"> <li>• Smaller footprint and 110V power requirement</li> <li>• Better polymer delivery and temperature control                     <ul style="list-style-type: none"> <li>– Improved success rates?</li> </ul> </li> <li>• New capabilities                     <ul style="list-style-type: none"> <li>– between instrument normalization</li> <li>– 6-dye detection (bigger kits with more loci)</li> </ul> </li> <li>• Simpler software</li> </ul> | <p><b>Disadvantages</b></p> <ul style="list-style-type: none"> <li>• Up-front cost of new instruments                     <ul style="list-style-type: none"> <li>– Federal government (NIJ) will likely be expected to foot the bill</li> </ul> </li> <li>• Generates .hid files                     <ul style="list-style-type: none"> <li>– Requires new analysis software</li> </ul> </li> <li>• Validation down-time                     <ul style="list-style-type: none"> <li>– New RFU thresholds</li> </ul> </li> <li>• Higher per run cost with RFID tags &amp; limited expiration                     <ul style="list-style-type: none"> <li>– many labs cannot purchase reagents rapidly throughout the year</li> </ul> </li> <li>• Creating technicians not scientists                     <ul style="list-style-type: none"> <li>– Plug and play approach leading to loss of understanding for process</li> <li>– Less flexible (impacts research with it)</li> </ul> </li> </ul> |
|---|--|

### Cost for the Forensic DNA Community to Switch from ABI 3100s to 3500s

- 1. Instrument up-front cost**
  - Will likely be requested from federal grant funds (NIJ)
- 2. New software purchase**
  - Will likely be requested from federal grant funds (NIJ)
  - new .hid file format will not work on current software (GMIDv3.2)
  - 3500 will not create .fsa files with 36cm arrays (HID applications)
- 3. Validation time & expense**
  - Relative fluorescent scales are completely different...
- 4. Operational cost**
  - ABI claims that the running costs are equivalent to 3130s...

### Consumable Costs for the ABI 3500

|  |   |  |
|--|---|--|
| <br><b>POP polymer pack with RFID tag</b><br><b>\$180</b> (384 samples)<br><b>\$455</b> (960 samples) | <br><b>Buffer pack with RFID tag</b><br><b>\$60</b> (\$25+\$35) | <br><b>8-capillary array</b><br><b>\$1200</b> (160 injections) |
|--|---|--|

**“Expires” after 1-week on the instrument**

**Thus, if you run 1 sample or 960 samples (or 384) in that week, the consumable cost will be the same...**

### Likely Cost Increase... and Backlog Increase?

- ABI 3500 reagents are RFID-tagged and made to work under very limited time windows (e.g., 1 week expiration for the polymer)
- If a lab is not running at full capacity, reagents will expire and add to the true cost of performing forensic DNA testing (i.e., can be a similar total cost whether running a few or a few hundred samples)
- Casework **throughput efficiencies are best when small batches are run frequently – to save money, will labs store samples to amass enough for a busy week of running samples through the 3500 instrument?**

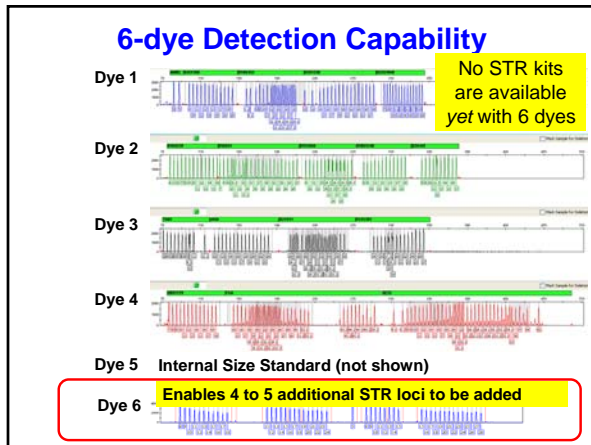

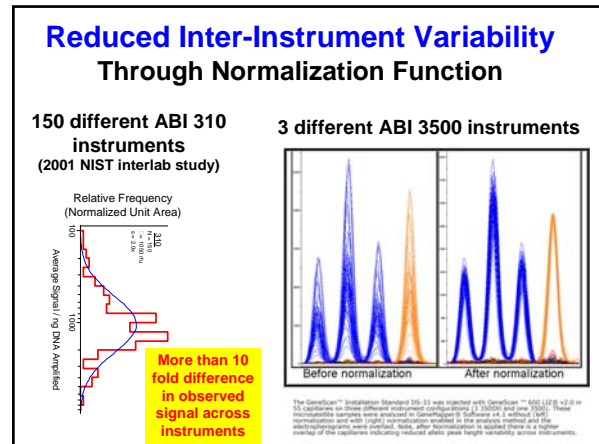

### Cost Comparison

|   |  |
|---|--|
|  <p><b>ABI 3130xl (current)</b></p> <ul style="list-style-type: none"> <li>• <b>16-capillary array</b> <ul style="list-style-type: none"> <li>– \$898 (for 100+ injections)</li> </ul> </li> <li>• <b>POP4 polymer</b> <ul style="list-style-type: none"> <li>– \$468 (1760 samples)</li> <li>– “Expires” after 3 months</li> <li>– <b>\$0.27 per sample</b></li> </ul> </li> <li>• <b>Buffer</b> <ul style="list-style-type: none"> <li>– \$5 (for one week)</li> </ul> </li> </ul> |  <p><b>ABI 3500 (new/future)</b></p> <ul style="list-style-type: none"> <li>• <b>8-capillary array</b> <ul style="list-style-type: none"> <li>– \$1200 (for 160 injections)</li> </ul> </li> <li>• <b>POP4 polymer</b> <ul style="list-style-type: none"> <li>– \$180 (384 samples) or \$455 (960 samples)</li> <li>– “Expires” after 1 week</li> <li>– <b>\$0.47 per sample</b></li> </ul> </li> <li>• <b>Buffer</b> <ul style="list-style-type: none"> <li>– \$60 (25+35) for one week</li> </ul> </li> </ul> |
|---|--|

### ABI 3500 Reagent Costs for 90 samples (90 samples +6 controls: allelic ladders, positive, negative)

|                                    | Quantity Provided                | Total Cost     |                                      |
|------------------------------------|----------------------------------|----------------|--------------------------------------|
| Capillary array                    | 1 array of 8-capillaries (36 cm) | \$90           | 12 injections on array               |
| 3500 POP-4 polymer                 | 384 sample pouch (\$180)         | \$45           | ~4 plates per pouch                  |
| ABC Buffer                         | 4 pack (\$100)                   | \$3            | assume 2 plates/day                  |
| CBC Buffer                         | 4 pack (\$140)                   | \$4            | assume 2 plates/day                  |
| Formamide, Hi-Di                   | 25 mL (for \$25)                 | \$1            | 1 mL used                            |
| Pipet tips                         | 960 tips for \$124               | \$14           | 106 tips used                        |
| 96well plate                       | 10 plates for \$57 (not ABI)     | \$12           | 2 plates                             |
| Septa                              | 20 septum                        | \$16           | 1 septum                             |
| Identifiler matrix standards DS-33 | 6FAM, VIC, NED, PET, LIZ         | \$2            | assume recalibration every 50 plates |
| GS500 LIZ size standard            | 800 tests/pk                     | \$33           | 35 µL each plate                     |
| Identifiler STR kit                | 200 tests/kit                    | \$1,715        |                                      |
|                                    |                                  | <b>\$220</b>   | <b>\$2.44</b> per sample             |
|                                    |                                  | <b>\$1,715</b> | <b>25 µL PCR (full reaction)</b>     |
|                                    |                                  | <b>\$1,935</b> | <b>\$21.50</b> per sample            |

**~90% of cost is the STR kit**

### Open Letter to Applied Biosystems on Concerns with ABI 3500

- **3/14/11 - emailed ~900 forensic DNA scientists** (SWGAM, forens-dna, ENFSI, EDNAP) inviting them to sign onto a letter that will be sent to Applied Biosystems expressing concern with ABI 3500
- **Very positive response and over 50 have already agreed to sign the letter**
- Letter to be sent March 31 to president of ABI and scientists involved with ABI 3500
- **Community will be notified of ABI's response**

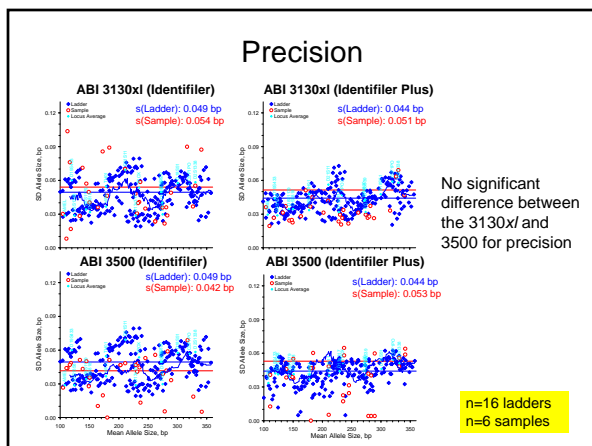

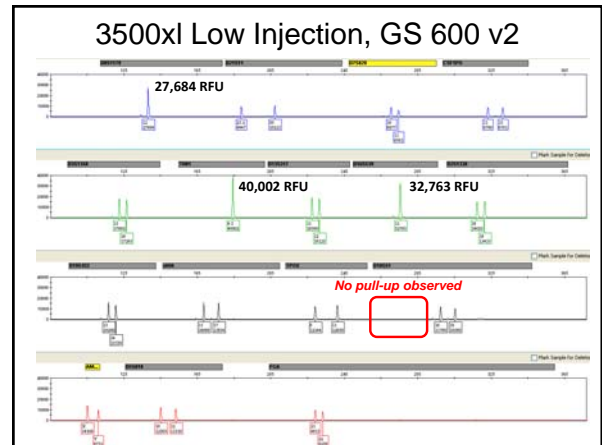

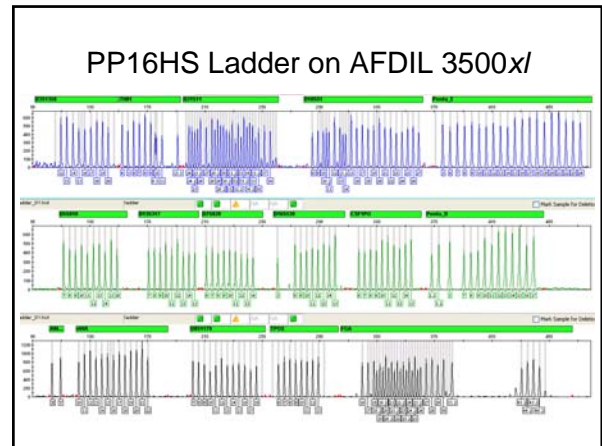

### Concerns Expressed in Open Letter

- RFID tags
- New .hid file structure requires new software
- Short shelf life of reagents

Hopefully a change will result...

Work performed by  
Erica Butts and Becky Hill (NIST)

### Some Data from ABI 3500 (NIST) and ABI 3500xl (AFDIL) Instruments

- ### Summary
- The ABI 3500 and 3500xl instruments work fine for Applied Biosystems and Promega STR kits.
  - The 3500 series instruments offer some improved capabilities for inter-instrument normalization and 6-dye detection. **Only time will tell how helpful these capabilities are...**
  - The cost for the forensic DNA community to switch from ABI 3130xl vs ABI 3500/3500xl instruments will involve more than just the initial purchase price – **reagents are expensive.**

# Low Level DNA Issues

---

**Indiana DNA Training Workshop**

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of Standards and Technology  
[john.butler@nist.gov](mailto:john.butler@nist.gov)

### Some Definitions of Low Template (LT) DNA

- Working with <100-200 pg genomic DNA
- Considered to be data below stochastic threshold level where PCR amplification is not as reliable (determined by each laboratory; typically 150-250 RFUs)
- Enhancing the sensitivity of detection (increasing PCR cycles, PCR product clean-up, increasing CE injection/voltage)
- Having too few copies of DNA template to ensure reliable PCR amplification (allelic or full locus drop-out)
- Can often be the minor component of mixture samples consisting of low level DNA template amounts

### Low Template DNA situations exist in many samples

- In a 1:1 mixture, each DNA source is LT when the total amount of DNA in the amplification reaction is ~ 0.125 ng.
- In a 1:9 mixture, the minor component could be LT **even when the total amount of DNA in the amplification is 1 ng.**

**Two different amplifications would be useful with a 1:9 mixture situation:**  
**Normal level** of total DNA (e.g., 1 ng) so that major component is on-scale  
**High level** of total DNA (e.g., 5 ng) so that minor (e.g., ~500 pg) is out of LT realm – yes, the major component will be off-scale...

Robin Cotton, AAFS 2003 LCN Workshop  
 "Are we already doing low copy number (LCN) DNA analysis?"

### Recent LT-DNA Court Rulings

- "...a challenge to the validity of the method of analysing Low Template DNA by the LCN process should no longer be permitted at trials where the quantity of DNA analysed is above the stochastic threshold of 100-200 picograms..."  
 – United Kingdom: Crown vs. Reed & Reed, Dec. 21, 2009
- LT-DNA testing is "...generally accepted as reliable in the forensic scientific community under the standard enunciated in Frye..."  
 – NYC OCME: People vs. Megnath, Feb. 8, 2010
- "LCN DNA evidence is not inherently unreliable."

### Profiles in DNA (April 2010)

<http://www.promega.com/profiles/>

**Profiles in DNA**  
Each issue provides news and information for researchers and analysts working in the field of genetic identity testing. Topics include forensic research, database samples, paternity analysis, legal issues, technical tips, Promega genetic identity product updates, interesting cases and more.

**POLICE LINE DO NOT CROSS**

VOLUME 13 NO. 1, APRIL 2010  
SUMMARY OF THE LOW COPY NUMBER SESSION AT THE 20TH INTERNATIONAL SYMPOSIUM ON HUMAN IDENTIFICATION

At the 20th International Symposium on Human Identification, prominent figures in the DNA-typing field shared their view of low copy number (LCN) analysis by responding to a subset of LCN-related questions. Charlotte Wood and John Butler provided introductions to the topic. Links to the introductory material and individual responses are provided below. Note: All of the responses are not yet available. The other LCN summaries will be published in *Profiles in DNA* as they become available.

A list of questions can be found [here](#).

**MEETINGS**  
**What is LCN—Definitions and Challenges**  
 Charlotte Wood presents a summary of her presentation during the LCN session. She helps us sort through some of the confusion about what constitutes LCN analysis.

**MEETINGS**  
**Scientific Issues with Analysis of Low Amounts of DNA**  
 John Butler and Carolyn Hill discuss technical issues and challenges that can arise in low template DNA analysis.

**MEETINGS**  
**Low Copy Number Analysis from a Legal Perspective**  
 Brad Lesenthal from the Queens County District Attorney's Office shares his views on the biggest challenges with LCN analysis and his advice for forensic scientists working with attorneys on cases that could be considered LCN.

Article Type: Meetings

**Scientific Issues with Analysis of Low Amounts of DNA**

John M. Butler\* and Carolyn R. Hill  
 National Institute of Standards and Technology, Biochemical Science Division,  
 Gaithersburg, Maryland, USA  
 \*Corresponding author: 301-975-4049; john.butler@nist.gov

---

\*Based on LT-DNA studies performed in Fall 2009

### Summary and Overview of Issues

- Faced with limited evidence that yield low amounts of DNA, forensic analysts will continually have to confront the question of how far to push DNA testing techniques.
- Low level DNA testing, also known as low copy number (LCN) analysis or low template DNA (LT-DNA) testing, involves enhancing detection sensitivity usually through increasing the number of PCR cycles.
- Stochastic effects inherent with analysis of low amounts of DNA yield allele or locus drop-out.
- Additionally, increasing detection sensitivity can result in a greater potential for contamination or allele drop-in.

### Impact of DNA Amount into Multiplex PCR Reaction

We generally aim for 0.5-2 ng

High levels of DNA create interpretation challenges (more artifacts to review)

Too much DNA

- Off-scale peaks
- Split peaks (+/-A)
- Locus-to-locus imbalance

Well-balanced STR multiplex

STR Kits Work Best in This Range

Too little DNA

- Heterozygote peak imbalance
- Allele drop-out
- Locus-to-locus imbalance

Stochastic effects when amplifying low levels of DNA can produce allele dropout

### Potential Results at a Heterozygous STR Locus with Different Levels of Input DNA and Detection Sensitivity

Off-scale data (leads to artifacts)

Optimal data

Allele drop-out

Locus drop-out

Allele imbalance

Allele drop-in

28 cycles    31 cycles    34 cycles

Detection Sensitivity

### Framing the Issues

- Forensic science methods often **must work close to the edge** of a technique due to the limited nature of the evidence
  - perpetrators are usually not willing to go back and add more biological material to a crime scene...
- **Validation studies** are performed in order to **define the limits of a technique**
  - sensitivity studies to determine at what point a lab cannot obtain reliable results anymore

We would always like improved sensitivity to enable results where ever possible

### “Enhanced Interrogation” Techniques to Improve Sensitivity

- **Increased PCR cycle number**
  - With 100% efficiency:
    - 28 cycles = 67 million copies
    - 31 cycles = 1 billion copies (x16)
    - 34 cycles = 4 billion copies (x64)
- Reduced volume PCR
- Sample desalting (e.g., MinElute) prior to CE
- Extended CE injections

Are you “waterboarding” your DNA trying to get more information from the sample?

Requires validation to determine appropriate thresholds for reliability

### Concern with How Methods Are Used...

LCN testing should not be used for exculpatory purposes such as post-conviction testing due to potential of the LCN profile not being relevant to the case due to contamination

“Enhanced Interrogation Techniques” Should Not Be Used for This Purpose

See J.M. Butler (2005) *Forensic DNA Typing, 2nd Edition*, p. 154

### Low Template DNA Testing

- **Every lab faces samples with low template DNA**
  - Do you choose to attempt an “enhanced interrogation technique” such as increasing the cycle number, desalting samples, etc.?
  - **Next generation kits coming from manufacturers are capable of greater sensitivity – will they be misused without appropriate caution and validation?**
- **At what point do you draw a line and not attempt to analyze data below this line?**
  - A certain amount of input DNA (based on what data?)
  - A pre-determined stochastic threshold (based on what data?)

### Comments on DNA Quantitation

- qPCR has enabled lower amounts of DNA to be quantified in recent years – providing in some cases a false sense of confidence in accuracy at these low levels
- Remember that **qPCR is also subject to stochastic effects** and thus DNA quantitation will be less accurate and exhibit more variation at the low end...
- **Next generation STR kits** with their greater sensitivity and ability to overcome inhibition **have the potential to make the current qPCR DNA quantitation kits obsolete as an appropriate gatekeeper** to whether or not to continue with a low level, compromised DNA sample

Stochastic = random selection

### Stochastic Fluctuation Effects

- Unequal sampling of the two alleles present in a heterozygous individual can occur when low levels of input DNA are used (**results in allele drop-out**)
- Walsh *et al.* (1992) – proposed avoiding stochastic effect by adjusting the number of PCR cycles in an assay so that the sensitivity limit is around 20 or more copies of target DNA (i.e., a full profile is obtained with ~125 pg)

Walsh PS, Erlich HA, Higuchi R. Preferential PCR amplification of alleles: Mechanisms and solutions. *PCR Meth Appl* 1992; 1:241-250.

### Stochastic Statistical Sampling

>20 copies per allele      6 copies per allele (LT-DNA)

### Comparison of STR Kit Amplification SOP with LT-DNA Using the Same DNA Donor

Data from Debbie Hobson (FBI) – LCN Workshop AAFS 2003

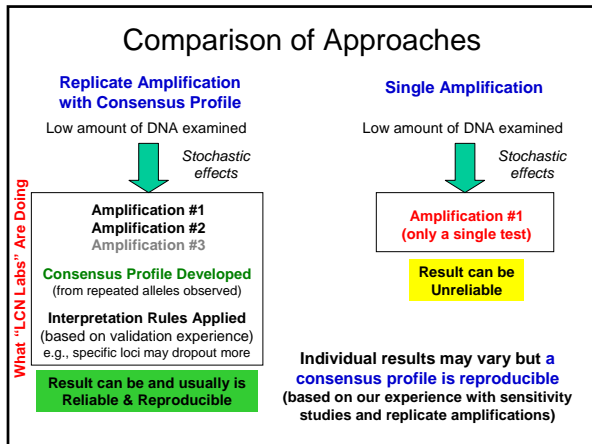

**Allele Drop Out**      **Allele Drop In**      **Heterozygote Allele Imbalance**

### Stochastic (Random) Effects with LT-DNA When Combined with Higher Sensitivity Techniques

Loss of True Signal (False Negative)      Gain of False Signal (False Positive)

| Severe Peak Imbalance                                    | Allelic Drop-out                                      | High Stutter                                   | Allelic Drop-in                                      |
|--|---|--|--|

### Early Work on Replicate Testing with Low Levels of DNA

© 1996 Oxford University Press

Nucleic Acids Research, 1996, Vol. 24, No. 18, 4389-4394

**Reliable genotyping of samples with very low DNA quantities using PCR**

Pierre Taberlet\*, Sally Griffin, Benoit Goossens, Sophie Questiau, Valérie Manceau, Nathalie Escaravage, Lisette P. Waits and Jean Bouvet

Laboratoire de Biologie des Populations d'Aréologie, CNRS UMR 5553, Université Joseph Fourier, BP 53, 38041 Grenoble Cedex 9, France

Received May 1, 1995; Revised and Accepted July 2, 1995

An investigation of the rigor of interpretation rules for STRs derived from less than 100 pg of DNA

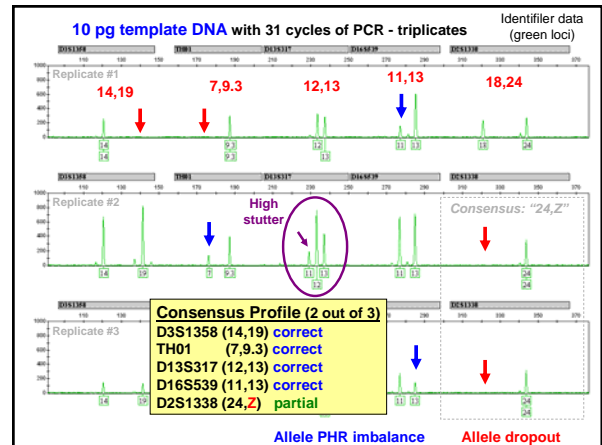

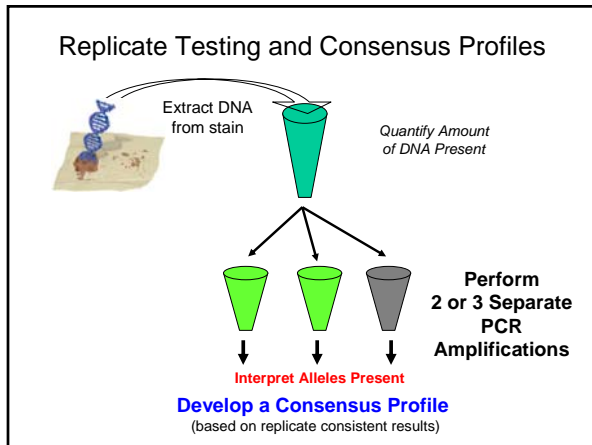

Peter Gill†, Jonathan Whitaker\*, Christine Flamant\*, Nick Brown\*, John Buckleton\*

\*Forensic Science Service, Peterborough, South Street North, Peterborough PE1 1UA, UK  
†FBI, Federal Bureau of Investigation, 4000 University Ave., San Jose, CA 95134, USA

Received 9 December 1995; received in revised form 12 February 1996; accepted 13 February 1996

**Replicate testing introduced (up to 7 times) to account for allele dropout and avoid miscalling allele drop-in**

In conjunction with interpretation rules, duplication of observed alleles in replicates was shown to correctly define the original sample

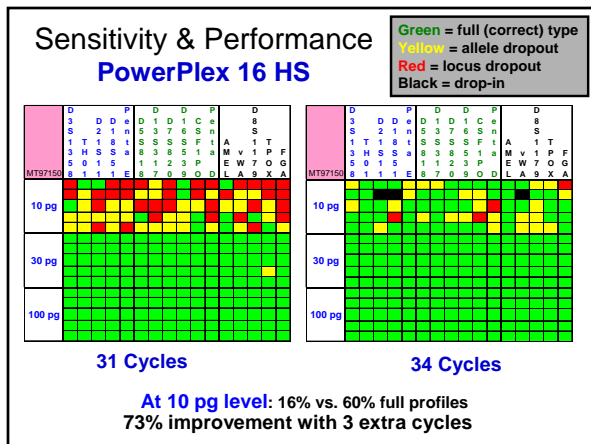

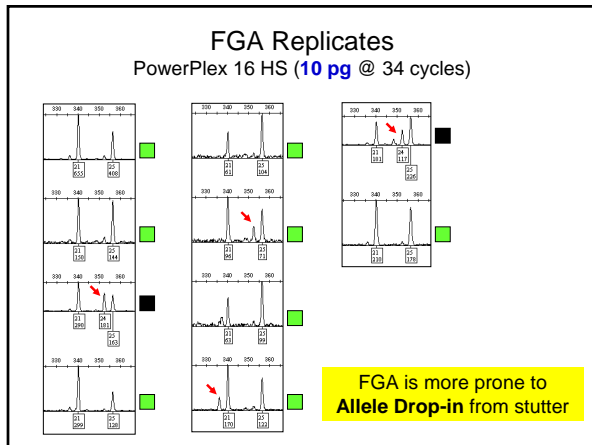

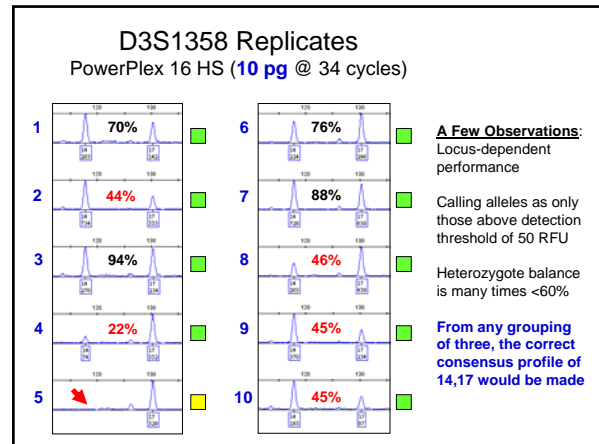

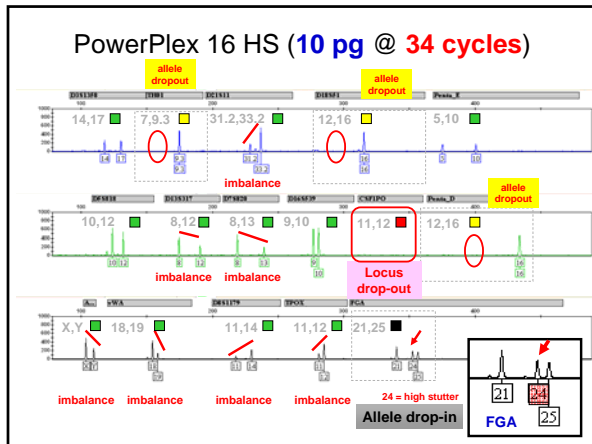

- ### Impact of "Unreliable" Results
- Allele drop-out can be dealt with using moderate stringency searches in CODIS algorithms
    - a homozygote "14" would hit to a heterozygote "11,14"
  - Allele drop-in is most problematic for DNA database searches
    - this can be corrected for with replicate testing and consensus profiles to eliminate incorrect alleles

- ### Experimental Design to Study LT-DNA Issues
- **Pristine DNA Samples**
    - 2 single-source samples (and mixtures created from these)
    - **heterozygous for all loci tested** (permits peak height ratio studies)
  - **Low DNA Temple Amounts**
    - Dilutions made after DNA quantitation against NIST SRM 2372
    - **100 pg, 30 pg, and 10 pg** (1 ng tested for comparison purposes)
  - **Replicates**
    - **10 separate PCR reactions** for each sample
  - **STR Kits**
    - **Identifiler and PowerPlex 16 HS** (half-reactions)
  - **Increased Cycle Number**
    - Identifiler (**31 cycles**; 28 for 1 ng)
    - PowerPlex 16 HS (**31 cycles and 34 cycles**; 30 for 1 ng)

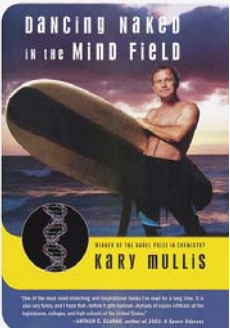

### Summary of Data Observed at NIST

- Increasing the cycle number creates a higher number of full profiles (note: at both 31 and 34 cycles, 100 pg results were all correct with PowerPlex 16 HS)
- Across any grouping of 3 replicates, there was never an instance of an incorrect allele being called when two of three replicates matched
- Certain loci are more prone to allele and locus drop-out (depends on kit and PCR product sizes)

**Discussion of Submitted Questions**

- Submitted Question #5**  
How would you set a cut-off for qPCR kits?
- Submitted Question #6**  
What would you consider as LCN or low template (LT-DNA) analysis?

*Topics in Forensic DNA Analysis & Interpretation*

---

# Validation Discussion

---

**Indiana DNA Training Workshop**  
Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of Standards and Technology  
[john.butler@nist.gov](mailto:john.butler@nist.gov)

## Presentation Outline

- Validation principles
- SWGDAM Revised Validation Guidelines
- Setting thresholds (some ideas)
  - analytical threshold
  - stochastic threshold
- **Topics of interest to your labs**

**Examples from recent ABI 3500 studies at NIST**

**There are no cook books for validation!**

*Topics in Forensic DNA Analysis & Interpretation*

---

# Future Directions of the Field

---

**Indiana DNA  
Training Workshop**

Indianapolis, IN  
March 28, 2011

**Dr. John M. Butler**  
National Institute of  
Standards and Technology

[john.butler@nist.gov](mailto:john.butler@nist.gov)

## Presentation Overview

1. Additional core STR loci
2. Familial searching
3. Rapid DNA testing & portable devices
4. Phenotyping & biogeographical ancestry
5. Other technologies for DNA analysis
  - Mass spectrometry
  - Next-generation DNA sequencing
  - Expert systems for data interpretation

## Additional STR Loci

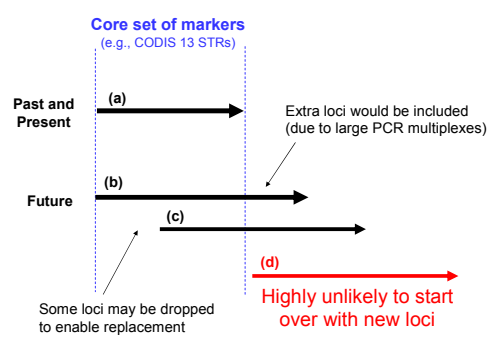

- Will be needed for more complex kinship analyses and extended applications
  - Example: Y-STRs needed for familial searching
- Immigration testing needs more than 13 STRs (a Sept 2007 article called for 25 loci)
- **Larger DNA databases will require more loci to avoid adventitious matches**

## Growth in Numbers of DNA Profiles Present in Various NDIS Indices (cumulative totals by year)

| Year ending Dec 31 | Forensic       | Convicted Offender | Arrestee       | Total Offender*  |
|--------------------|----------------|--------------------|----------------|------------------|
| 2000               | 21,625         | 441,181            | --             | 441,181          |
| 2001               | 27,897         | 750,929            | --             | 750,929          |
| 2002               | 46,177         | 1,247,163          | --             | 1,247,163        |

**23 STR Loci present in STR kits**  
rank ordered by their variability

Better for mixtures (more alleles seen)

There are several loci more polymorphic than the current CODIS 13 STRs

Better for kinship (low mutation rate)

### Random Match Probability for Various Combinations (assuming unrelated individuals)

| STR Marker Combinations               | RMP*    | 1 in ... |
|---------------------------------------|---------|----------|
| 13 CODIS STRs                         | 6.0E-16 | 1.7E+15  |
| 15 STRs (+D2S1338, D19S433)           | 7.3E-19 | 1.4E+18  |
| 18 STRs (+D2S441, D10S1248, D22S1045) | 4.9E-22 | 2.0E+21  |
| 20 STRs (+D1S1656, D12S391)           | 2.8E-25 | 3.6E+24  |
| 23 STRs (+SE33, Penta D, Penta E)     | 1.2E-30 | 8.4E+29  |

\*RMP values calculated by combining Probability of Identity values for each locus

14 orders of magnitude improvement

### Summary: Additional STR Loci

- Additional autosomal STR loci exist in new STR kits and are being studied at NIST in U.S. population sample sets
- To avoid potential adventitious matches with large DNA databases, enable greater international data sharing, and aid missing persons applications, it is highly likely that **additional loci will be added to the U.S. core in the future**

### Familial Searching

- Search unknown evidence profile against offender database to identify a close relative
- No suspect cases, cold cases, violent crimes
- Success in the United Kingdom
  - 2004-2010: 176 submitted, 131 searches, 35 successes
- Recent familial searching programs in the U.S.
  - Colorado (all forensic unknowns, 19 leads, 1 conviction)
  - **California (14 searches, 2 arrests)**
- Combining autosomal STR results with Y-STR information helps

### Why Y-STRs Are Needed for Familial Searching

LOS ANGELES -- A one-time police mechanic was arrested and charged Wednesday in the serial killing of 10 people over 25 years after a DNA sample from his son was found to bear a close resemblance to DNA found on the victims.

Lonnie Franklin Jr., 57, was charged with 10 counts of murder, one count of attempted murder and special circumstance allegations of multiple murders that could make him eligible for the death penalty if convicted, District Attorney Steve Cooley said.

He is charged with 10 counts of murder and one count of attempted murder for a series of killings that date back to 1985.

**Lonnie David Franklin Jr.**

### Victims of the Grim Sleeper

<http://www.laweekly.com/2008-08-28/news/eleven-lives-stolen-and-one-lucky-survivor/>

**The Grim Sleeper's Victims**

- 1) Debra Jackson (age 29) – August 10, 1985
- 2) Henrietta Wright (age 35) – August 12, 1986
- 3) Thomas Steele (age 36) – August 14, 1986
- 4) Barbara Ware (age 23) – January 10, 1987
- 5) Bernita Sparks (age 25) – April 15, 1987
- 6) Mary Lowe (age 26) – October 31, 1987
- 7) Lachrica Jefferson (age 22) – January 30, 1988
- 8) Monique Alexander (age 18) – September 11, 1988
- 9) Enletra Washington (raped but survived) – November 1988

**Ballistics on bullets recovered from the victim's bodies matched**

**DNA evidence recovered**

**Over a 13 year gap in detected crimes, hence the "Sleeper" nickname**

- 10) Princess Berthomieux (age 14) – March 19, 2002
- 11) Valerie McCorvey (age 35) – July 11, 2003
- 12) Janecia Peters (age 25) – January 1, 2007

<http://blogs.laweekly.com/informer/crime/grim-sleeper-son-dna-trail-lead/>

### Putative Relative Is Found

- June 30, 2010: Second familial search of the California database yielded one likely relative
- Database profile belonged to Christopher Franklin (31 years old)
  - Profile added to the database in 2009 after a felony weapons possession charge
- Grim Sleeper profile matched C. Franklin's profile with one allele at all 15 loci
- Both individuals shared the same Y-STR profile, indicating a possible paternal relationship

### Identifying the Grim Sleeper

- Given that the murders spanned at least 25 years, the paternal relationship was likely father-son
- Undercover police shadowed C. Franklin's father, Lonnie David Franklin, Jr., who lived in the vicinity of the murders
- Police collected a DNA sample from Lonnie Franklin
  - **Direct match between L. Franklin and the Grim Sleeper**

### Familial Searching in the U.S.

### Research Underpins Familial Searching

Forensic Sci Int Genet. 2010 Nov 3. [Epub ahead of print]

**Searching for first-degree familial relationships in California's offender DNA database: Validation of a likelihood ratio-based approach.**

Meyers SP, Timman MD, Phozil ML, Sima GA, Greenwald MA, Weigand JJ, Kozlak KC, Buononfantini MR, California Department of Justice Jan Beardsley DNA Laboratory, 1001 West Cutting Blvd., Suite 110, Richmond, CA 94804, United States.

**Abstract**

A validation study was performed to measure the effectiveness of using a likelihood ratio-based approach to search for possible first-degree familial relationships (full-sibling and parent-child) by comparing an evidence autosomal short tandem repeat (STR) profile to California's ~1,000,000-profile State DNA Index System (SDIS) database. Test searches used autosomal STR and Y-STR profiles generated for 100 artificial test families. When the test sample and the first-degree relative in the database were characterized at the 15 Identifier® (Applied Biosystems®), Foster City, CA) STR loci, the search procedure included 90% of the fathers and 72% of the full-siblings. When the relative profile was limited to the 13 Combined DNA Index System (CODIS) core loci, the search procedure included 93% of the fathers and 61% of the full-siblings. These results, combined with those of functional tests using three real families, support the effectiveness of this tool. Based upon these results, the validated approach was implemented as a key, pragmatic and demonstrably practical component of the California Department of Justice's Familial Search Program. An investigative lead created through this process recently led to an arrest in the Los Angeles Grim Sleeper serial murders.

Research is necessary to evaluate the performance of searching algorithms in different state databases

- Size of database
- Number of loci typed
- Types of relationships
- Autosomal vs. lineage markers
- False positives vs. false negatives

### California Familial DNA Search Team

Familial DNA Testing Scores A Win in Serial Killer Case

| Locus   | Crime Scene |    | Convicted Offender |    |
|---------|-------------|----|--------------------|----|
|         | 25          | 31 | 25                 | 27 |
| LOCUS A | 7           | 8  | 8                  | 8  |
| LOCUS B | 17          | 18 | 18                 | 21 |
| LOCUS C | 9           | 9  | 11                 | 12 |
| LOCUS D | 11          | 11 | 11                 | 17 |

http://www.sciencemag.org/cgi/reprint/329/5989/262.pdf

### Rapid DNA Testing

- PCR (~3 hours) is longest step in process
  - NIST studies have shown that equivalent results can be obtained with 20 minute PCR
- U.S. government is putting millions of dollars into efforts to reduce time for **DNA typing process to less than one hour** with full automation (buccal swab in, answer out)

### How Fast Can We Go?

**Better chemistry has potential to lead to ability to routinely obtain results in < 1 hour with commercially available instruments**

Steps Involved

- Collection
- Extraction → Direct PCR (new enzymes & master mix to overcome PCR inhibitors from blood)
- Quantitation
- Amplification → Rapid PCR (new enzymes & thermal cyclers)
- Separation/ Detection → Improved CE systems (ABI 3500?)
- Data Interpretation → Expert system software

### Rapid PCR work published in *FSI Genetics* (Dec 2008)

**Full STR profiles in 36 minutes (instead of 3 hour PCR)**

Forensic Science International: Genetics 3 (2008) 42-45

Short communication

Demonstration of rapid multiplex PCR amplification involving 16 genetic loci<sup>®</sup>

Peter M. Vallone<sup>\*</sup>, Carolyn R. Hill, John M. Butler

National Institute of Standards and Technology, Biomedical Science Division, 100 Bureau Drive, Mail Stop 8211, Gaithersburg, MD 20899-8211, United States

**Complete concordance of STR allele calls (for 60 samples) between the rapid and standard thermal cycling protocols** were observed although there was incomplete adenylation at several of the loci examined and some PCR artifacts were detected. Using less than **750 pg of template DNA and 28 cycles, STR peaks for all loci were above a 150 relative fluorescent unit (RFU) detection threshold** with fully adequate inter-locus balance and heterozygote peak height ratios of greater than 0.84.

### Rapid PCR Work

Rapid PCR Thermal Cycling Profile

**Much shorter hold times at each temperature**

**Faster ramp rates between temperatures**

Maximum heating rate of ~4°C/s on a GeneAmp 9700 (Applied Biosystems)

- **Examination of different enzyme mixes**
  - 0.5 x master mix PyroStart (Fermentas) (\$0.14/rxn)
  - 0.5 x master mix Premix Ex Taq (Takara) (\$0.22/rxn)
  - 0.25 µL = 1.25 units of SpeedStar (Takara) (\$1.09/rxn)
- **Evaluation of additional kits**
  - Identifier, PP16, Yfiler, MiniFiler and Promega S5
- **Testing thermal cyclers with faster ramp rates**

### Four Thermal Cyclers Being Evaluated

**How fast can we run 28 cycles?**

| Thermal Cycler                    | Heating Rate | Heating Mechanism                      | Tube Format             | 28 Cycles Time |
|-----------------------------------|--------------|--|-------------------------|----------------|
| GeneAmp 9700 (Applied Biosystems) | 4°C/s        | Peltier block (AI)                     | 0.2 mL - 96 well plate  | 36 minutes     |
| SmartCycler (Cepheid)             | 10°C/s       | Heating plates and air circulating fan | Proprietary 25 µL tubes | 20 minutes     |
| Mastercycler pro (Eppendorf)      | 8°C/s        | Peltier block (Ag)                     | 0.2 mL - 96 well plate  | 19 minutes     |
| Rotor-Gene Q (Qiagen)             | 15°C/s       | Air chamber (spinning rotor)           | 0.1 mL - 72 tube/rotor  | 36 minutes     |

Phenotype prediction

Biogeographical ancestry

Kayser, M., & de Knijff, P. *Nature Rev. Genet.* 12: 179-192 (March 2011)

Improving human forensics through advances in genetics, genomics and molecular biology

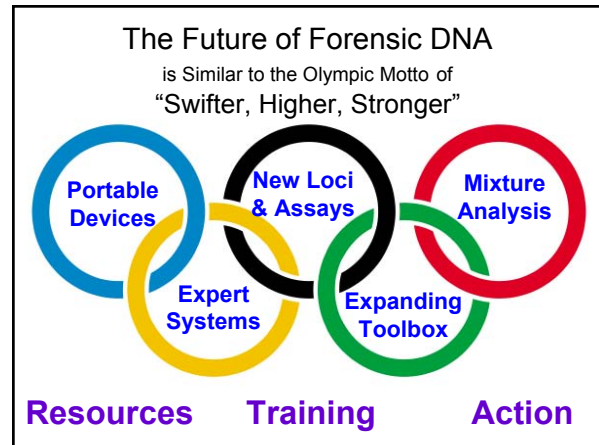

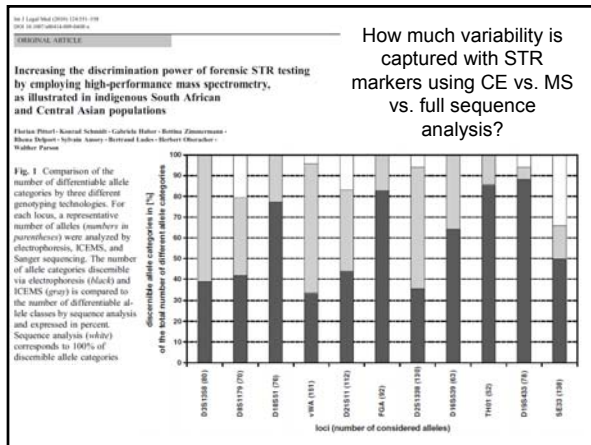

Manfred Kayser<sup>\*</sup> and Peter de Knijff<sup>†</sup>

Abstract | Forensic DNA profiling currently allows the identification of persons already known to investigating authorities. Recent advances have produced new types of genetic markers with the potential to overcome some important limitations of current DNA profiling methods. Moreover, other developments are enabling completely new kinds of forensically relevant information to be generated from biological samples. These include new molecular approaches for finding individuals previously unknown to investigators, and new molecular methods to support links between forensic sample donors and criminal acts. Such advances in genetics, genomics and molecular biology are likely to improve human forensics case work in the near future.

### Other Technologies

- Mass spectrometry
- Next-generation DNA sequencing
  - eventually to gain whole genome information with a reasonable cost and effort
- Expert systems for data interpretation
  - To help solve mixtures

## Presentation Outline

- Why the Y?
- Y-STR Loci & Kits
- Y-STR Databases
- Y-STR Stats

### Scenarios Where Y-STRs Can Aid Forensic Casework

- Sexual assaults by vasectomized or azoospermic males (no sperm left behind for differential extraction)
- Extending length of time after assault for recovery of perpetrator's DNA profile (greater than 48 hours)
- Fingernail scrapings from sexual assault victims
- Male-male mixtures
- Other bodily fluid mixtures (blood-blood, skin-saliva)
- Gang rape situation to include or exclude potential contributors
- Confirmation of amelogenin Y negative males

### Confirmation of Amelogenin Negative Males

- Often due to deletion of that entire region of the Y-chromosome rather than a primer binding site mutation
- Most commonly seen in males of [Indian subcontinent origin](#)
- Y-STRs help demonstrate that the AMEL X sample is really male
- Chang *et al.* (2007) *Forensic Sci. Int.* 166: 115-120 – 12/649 Malaysian males showed no AMEL Y
- Cadenas *et al.* (2007) *Forensic Sci. Int.* 166: 155-163 – 5/77 Nepal males showed no AMEL Y

### Disadvantages of the Y-Chromosome

- Loci are not independent of one another and therefore rare random match probabilities cannot be generated with the product rule; must use haplotypes (combination of alleles observed at all tested loci)
- Paternal lineages possess the same Y-STR haplotype** (barring mutation) and thus fathers, sons, brothers, uncles, and paternal cousins cannot be distinguished from one another
- Not as informative as autosomal STR results**
  - More like addition (10 + 10 + 10 = 30) than multiplication (10 x 10 x 10 = 1,000)

**Scientific Working Group on DNA Analysis Methods Y-STR Subcommittee**

**Introduction**

Detecting DNA from a male perpetrator is the goal in the forensic investigation of most sexual assault cases. Y-chromosome-specific STR typing targets the male DNA and is a useful additional tool in cases that often involve a mixture of male and female DNA. Although many technical aspects of Y-STR testing are parallel to autosomal STR testing, the unilateral (patrilateral) inheritance of the Y-chromosome alleles creates a haplotype of linked loci, and the statistical evaluation and reporting of the results differ significantly. Therefore, the SWGDAM Y-STR Subcommittee was established to deal with all aspects of Y-chromosome-specific testing in forensic casework.

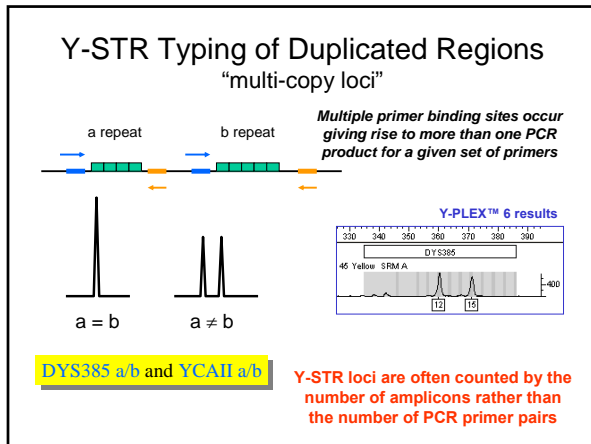

11 PCR products  
 9 primer sets

### Core Y-STR Characteristics

| STR Marker  | Position (Mb) | Repeat Motif  | Allele Range | Mutation Rate |
|-------------|---------------|---------------|--------------|---------------|
| DYS393      | 3.17          | AGAT          | 8-17         | 0.05%         |
| DYS19       | 10.12         | TAGA          | 10-19        | 0.20%         |
| DYS391      | 12.54         | TCTA          | 6-14         | 0.40%         |
| DYS439      | 12.95         | AGAT          | 8-15         | 0.38%         |
| DYS389 I/II | 13.05         | [TCTG] [TCTA] | 9-17 / 24-34 | 0.20%, 0.31%  |
| DYS438      | 13.38         | TTTTTC        | 6-14         | 0.09%         |
| DYS390      | 15.71         | [TCTA] [TCTG] | 17-28        | 0.32%         |
| DYS385 a/b  | 19.19, 19.23  | GAAA          | 7-28         | 0.23%         |
| DYS392      | 20.97         | TAT           | 6-20         | 0.05%         |

Positions in megabases (Mb) along the Y-chromosome were determined with NCBI build 35 (May 2004) using BLAT. Allele ranges represent the full range of alleles reported in the literature. Mutation rates summarized from YHRD (<http://www.yhrd.org>; accessed 6 Apr 2005).

Butler, J.M. (2006) Genetics and genomics of core STR loci used in human identity testing. *J. Forensic Sci.* 51(2): 253-265

**Most current information on Y-STR interpretation**

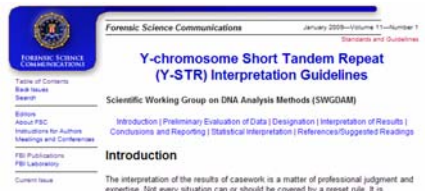

The interpretation of lineage markers in forensic DNA testing  
 J.S. Buckleton<sup>a</sup>, M. Krawczak<sup>b</sup>, B.S. Weir<sup>c,\*</sup>

**This article reviews and discusses a number of highly relevant topics:**

- Normal vs. binomial (Clopper-Pearson) sampling distributions
- Theta corrections
- Handling rare haplotypes (Charles Brenner approach)
- Combination of lineage and autosomal markers

**SWGAM Y-STR Interpretation Guidelines**

- **Approved July 15, 2008 by SWGDAM**
- Published in *Forensic Sci. Comm.* Jan 2009 issue

[http://www.fbi.gov/hq/lab/fsc/backissu/jan2009/standards/2009\\_01\\_standards01.htm](http://www.fbi.gov/hq/lab/fsc/backissu/jan2009/standards/2009_01_standards01.htm)

**SWGAM Y-STR Interpretation Guidelines**  
 Sections 1 – 5

1. Preliminary evaluation of data
2. Allele designation
3. Interpretation of results
4. Conclusions and reporting
5. Statistical interpretation

**SWGAM Y-STR Interpretation Guidelines**  
 Section 5. Statistical Interpretation

(5.1) Population Databases

- Loci on NRY should be considered linked as a single locus
- **Source of population database should be documented**
- Relevant population(s) for which the frequency will be estimated should be identified
- **Consolidated US Y-STR database should be used for population frequency estimation**

<http://www.usystrdatabase.org>

**SWGAM Y-STR Interpretation Guidelines**  
 Section 5. Statistical Interpretation

(5.2) Haplotype Searches

- **Should be conducted using all loci for which results were obtained from the evidentiary sample**
- In cases where less information is obtained from the known sample, only those loci for which results were obtained from both the known and evidentiary sample should be used in the population database search

5.3.1.1. The haplotype has not been previously observed in the database:  
 The formula for calculating the upper 95 percent confidence limit in this case would be:

$$1 - (0.05)^{1/n}$$

where n is the size of the database.

5.3.1.2. The haplotype has been observed in the database:  
 The formula for calculating the upper 95 percent confidence limit in this case would be:

$$p + 1.96 \sqrt{\frac{p(1-p)}{n}}$$

where p is x/n, n = database size, and x = the number of observations of the haplotype in the database.

5.4. For Y-STR mixtures that cannot be deconvoluted, calculations may be performed for the probability of exclusion and likelihood ratios.

5.5. If both autosomal and Y-STR data are collected on a sample, the product rule may be used to combine the autosomal STR genotype match probability and Y-STR haplotype frequency information.

5.6. It is recognized that population substructure exists for Y-STR haplotypes. Studies with current population databases have shown that the FST values are very small for most populations. Thus the use of the counting method that incorporates the upper-bound estimate of the count proportion offers an appropriate and conservative statistical approach to evaluating the probative value of a match.

**Current SWGDAM Y-STR Interpretation Guidelines**

**Replace with Clopper-Pearson calculation**

$$\sum_{k=0}^x \binom{n}{k} p^k (1-p)^{n-k} = 0.05$$

where n = database size, x = the number of observations of the haplotype in the database, k = 0, 1, 2, 3 ... x observations, and p = the haplotype frequency at which x or fewer observations are expected to occur 5% of the time.

Clopper, C.J. & Pearson, E.S. (1934) *Biometrika* 26: 404-413

**SWGAM Y-STR Interpretation Guidelines**  
**Section 5. Statistical Interpretation**

(5.5) Joint Match Probability

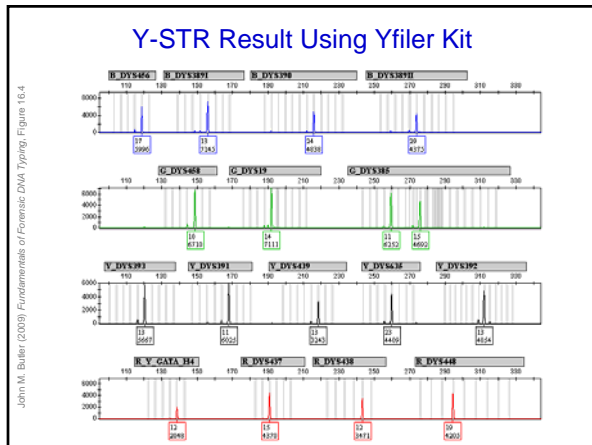

- **The product rule may be utilized** to combine the autosomal STR genotype match probability and Y-STR haplotype frequency information
- Citation to Walsh et al. (2008) Joint match probabilities for Y chromosomal and autosomal markers. *Forensic Sci. Int.* 174: 234-238

**SWGAM Y-STR Interpretation Guidelines**  
**Section 5. Statistical Interpretation**

(5.6) Population Substructure

- Studies have shown that  $F_{st}$  values are very small for most populations
- **Use of the counting method that incorporates the upper bound estimate of the count proportion offers an appropriate and conservative statistical approach to evaluating the probative value of a match**

**No need to use theta correction, but no discussion of partial profiles**

**Results of Y-STR Profile Search**

The following profile was searched on 15 January 2011 against several databases:

DYS19 (14), DYS389I (13), DYS398II (29), DYS390 (24), DYS391 (11), DYS392 (13), DYS393 (13), DYS385 a/b (11,15), DYS438 (12), DYS439 (13), DYS437 (15), DYS448 (19), DYS456 (17), DYS458 (18), DYS635 (23), and GATA-H4 (12).

| Database        | Minimal haplotype (9 loci) | SWGAM (11 loci)       | PowerPlex Y (12 loci) | Yfiler (17 loci)       | 3/N for zero observations |
|-----------------|----------------------------|-----------------------|-----------------------|------------------------|---------------------------|
| YHRD            | 403/89804<br>= 0.45 %      | 29/62548<br>= 0.046 % | 14/42277<br>= 0.033 % | 0/30300<br>= <0.0033 % | 3/30300<br>= 0.0099 %     |
| US Y-STR        | 6/18547<br>= 0.032 %       | 1/18547<br>= 0.0054 % | 1/15223<br>= 0.0066 % | 0/8376<br>= <0.012 %   | 3/8376<br>= 0.036 %       |
| Yfiler database | 64/11393<br>= 0.56 %       | 4/11393<br>= 0.035 %  | 4/11393<br>= 0.035 %  | 0/11393<br>= <0.0088 % | 3/11393<br>= 0.026 %      |

**Normal vs. Clopper-Pearson**

In March 2010 the US Y-STR database changed its 95 % confidence interval calculations to the Clopper-Pearson method.

| Count values                 | Frequency $p = x/N$ | Normal 95 % confidence interval | Clopper-Pearson 95 % confidence interval* |
|------------------------------|---------------------|---------------------------------|---|
| YHRD 9 loci:<br>403/89804    | 0.449 %             | 0.485 %                         | <b>0.487 %</b>                            |
| YHRD 12 loci:<br>14/42277    | 0.0331 %            | 0.0477 %                        | <b>0.0518 %</b>                           |
| US Y-STR 12 loci:<br>1/15223 | 0.0657 %            | 0.0174 %                        | <b>0.0317 %</b>                           |

\* Calculation performed with HaploCALc\_1.0 Excel spreadsheet kindly provided by Steven P. Myers, CA DOJ

Note that with a large number of observations, such as 403 out of a database of 89804, there is almost no difference between the normal and Clopper-Pearson approaches. However, the normal method is less conservative (i.e., provides a more rare frequency) when the haplotype frequency is low, such as 1 out of 15223 or even 14 out of 42277. **Although there are differences in these calculations, re-evaluation by the Clopper-Pearson method will not suddenly change a reported result by orders of magnitude or likely change the outcome of a report significantly.**

The Meaning of a Y-Chromosome Match

Conservative statement for a match report:

The Y-STR profile of the crime sample matches the Y-STR profile of the suspect (at **xxx number of loci examined**). Therefore, **we cannot exclude the suspect** as being the donor of the crime sample. In addition, we cannot exclude all patrilineal related male relatives and an unknown number of unrelated males as being the donor of the crime sample.

### Y-STR Report Conclusions with Statistics

The PowerPlex-Y DNA results are consistent with J. Smith (item #) (or another member of the same paternal lineage) being the source of the Y-DNA profile from item # xx.

The PowerPlex-Y DNA profile detected from item xx has not previously been observed in the National Y-STR population database of 3271 African Americans, 3912 Caucasians, and 1905 Hispanics\*. Therefore, the observed PowerPlex-Y DNA profile is not expected to occur more frequently than approximately 1 in 1090 in the African American male population, 1 in 1300 in the Caucasian male population, and 1 in 635 in the Hispanic male population.

| DYS393    | 3      | 0         |
| DYS385a/b | 17     | 0         |

\*from www.yhrd.org, literature, and our work

**92% have single repeat difference**

Since single-step mutations are most common, then single repeat spacing in duplicated alleles is expected

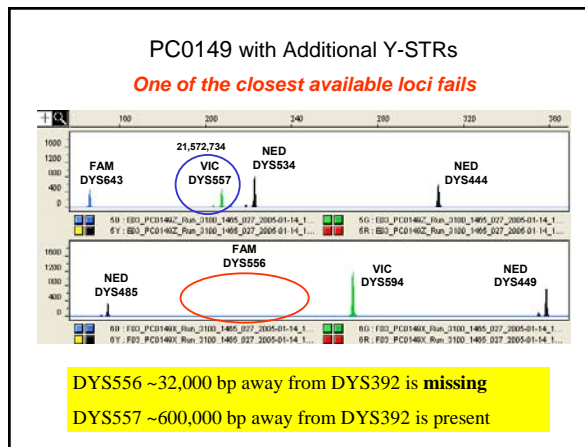

Butler et al. (2005) Chromosomal duplications along the Y-chromosome and their potential impact on Y-STR interpretation J. Forensic Sci. 50(4): 853-859

### Deciphering between a Mixture of Multiple Males and Locus Duplication

- Note the number of loci containing >1 allele (other than multi-copy **DYS385**)
- Consider relative position on the Y-chromosome if multiple loci have two alleles
- See if repeat spread is >1 repeat unit
- Examine **DYS385** for presence of >2 alleles

Locus duplication along the Y-chromosome is in many ways analogous to heteroplasmy in mitochondrial DNA, which depending on the circumstances can provide greater strength to a match between two DNA samples.

Butler et al. (2005) Chromosomal duplications along the Y-chromosome and their potential impact on Y-STR interpretation J. Forensic Sci. 50(4): 853-859

### Practical Information on Y Deletions

- If DYS458 is deleted in Yfiler, then your sample is likely to lack an Amelogenin Y amplicon as DYS458 and AMEL Y are 1.13 Mb apart on the short arm of the human Y-chromosome
  - Chang et al. (2007) Forensic Sci. Int. 166: 115-120
- Many Y-chromosomes are more complicated than originally thought!

### Y-STR Summary

- Mutation rates are similar to autosomal STRs (~0.2%) – based on father-son studies
- Variant alleles are observed as in autosomal STRs due to flanking region mutations, etc.
- Regions of the Y-chromosome can be duplicated or deleted causing Y-STRs to be duplicated or deleted
- Careful primer design is important to avoid X-chromosome homology or Y-chromosome duplications

## Submitted Question #1

What threshold would be recommended for STRs and Y-STRs?

- Whatever YOUR validation data shows!

## Submitted Question #2

What is the best way to calculate those thresholds?

- Evaluate YOUR validation data...
- Will discuss several approaches in the validation portion of workshop

## Submitted Question #3

How would you evaluate thresholds that were first evaluated at a central lab then compared to site specific studies?

- Ideally, each instrument should be evaluated to establish an analytical and stochastic threshold for this instrument

## Submitted Question #4

How would you evaluate a mixture study?

- Think about what questions you are trying to answer by conducting the study (e.g., minor component allele detection and ability to reliably separate a major from a minor)
- Prepare samples with mixtures focusing on the mixture ratio ranges you want to test (consider the allele combinations as well)

## Submitted Question #5

How would you set a cut-off for qPCR kits?

- Remember that qPCR results with low amounts of DNA are subject to stochastic effects
  - thus, you could fail to get a qPCR result yet have sufficient amplifiable DNA to obtain a full STR profile
- Replication of results is ideal
  - Discussed in my forthcoming book *Advanced Topics in Forensic DNA Typing: Methodology*, D.N.A. Box 3.3

### Replicate testing aids confidence in DNA quantitation values of 'zero'

- A study by the Institute of Legal Medicine in Munich, Germany attempted to correlate the DNA quantitation values with STR performance (Kremser et al. 2009). A set of 3,068 casework samples that had been extracted using the Qiagen EZ1 robot was tested twice with the Quantifiler qPCR kit and the results averaged. Based on the internal positive control (IPC) during qPCR showing no increase in cycle threshold values, it was assumed that potential PCR inhibitors had been removed during DNA extraction. STR amplification was then performed with the NanoplexQS kit from Biotype (Dresden, Germany) followed by the SEfiler kit (Applied Biosystems) to confirm allele calls on all positive results. Based on the average of the two Quantifiler results, samples were divided into four groups: Group 1 (0 pg/μL to 5 pg/μL), Group 2 (5 pg/μL to 10 pg/μL), Group 3 (10 pg/μL to 30 pg/μL), and Group 4 (>30 pg/μL).

Kremser, A., et al. (2009). Quantifiler Human DNA Quantification Kit (Applied Biosystems) as a screening kit for DNA profiling. *Forensic Science International: Genetics Supplement Series*, 2, 106-107.

### 3,068 casework samples

↓ EZ1 DNA extraction (no inhibitors seen)

DNA quantitation

↓ **Quantifiler (performed twice and results averaged)**

STR amplification

↓ Nanoplex<sup>QS</sup> and SEfiler (with up to 500 pg DNA added)

|---------------------|--------------------------------------|--------------------------------------|---------------------------------------|-------------------------------------|
| No results          | 96%                                  | 67%                                  | 26%                                   | 3%                                  |
| <b>Full profile</b> | <b>3%</b>                            | 23%                                  | 67%                                   | 96%                                 |
| Partial profile     | 1%                                   | 10%                                  | 7%                                    | 1%                                  |

Kremser, A., et al. (2009). Quantifiler Human DNA Quantification Kit (Applied Biosystems) as a screening kit for DNA profiling. *Forensic Science International: Genetics Supplement Series*, 2, 106-107.

### Summary of Results

- Generally, STR typing results correlated with the amount of DNA.** Full profiles were observed 96% of the time when >30 pg/μL were reported. Likewise, **no STR results were obtained 96 % of the time when DNA quantities in the range of 0 pg/μL to 5 pg/μL were reported.** However, **full or partial DNA profiles were observed 4 % of the time when essentially the DNA quantity was zero** (Group 1, 0 pg/μL to 5 pg/μL obtained). The 1564 samples in Group 1 were explored further by examining the individual Quantifiler results.

Kremser, A., et al. (2009). Quantifiler Human DNA Quantification Kit (Applied Biosystems) as a screening kit for DNA profiling. *Forensic Science International: Genetics Supplement Series*, 2, 106-107.

### Importance of Replicate Testing to Overcome Stochastic Effects

**1564 Samples**  
with 'Zero' Quantifiler Results (pg/μL)  
(Original averaged result was 0-5 pg/μL)

|                   | 0,0  | 0,>0 | >0,>0 |
|-------------------|------|------|-------|
| Number of Samples | 750  | 478  | 336   |
| Positive results  | 0%   | 7%   | 27%   |
| Negative results  | 100% | 93%  | 63%   |

Result 1  
Result 2

**When both Quantifiler results were zero, then all subsequent STR testing failed to obtain a result**

Kremser, A., et al. (2009). Quantifiler Human DNA Quantification Kit (Applied Biosystems) as a screening kit for DNA profiling. *Forensic Science International: Genetics Supplement Series*, 2, 106-107.

### Summary of "0" qPCR Results

- When both Quantifiler replicate results were zero, then 100 % of the time subsequent STR typing failed to obtain results (from 750 tested samples). Thus, **when using DNA quantitation in a gatekeeper function for whether or not to proceed with further testing, replicate zero values were important to guarantee no DNA was present.** This same concept of replicate testing aids reliability with low template DNA

Kremser, A., et al. (2009). Quantifiler Human DNA Quantification Kit (Applied Biosystems) as a screening kit for DNA profiling. *Forensic Science International: Genetics Supplement Series*, 2, 106-107.

### Submitted Question #6

What would you consider as LCN or low template (LT-DNA) analysis?

- low amounts of DNA being tested** often with "enhanced interrogation" techniques (such as higher cycle numbers or sample desalting to boost CE injection)
  - It is not a pre-set DNA quantitation threshold (e.g., 200 pg) because quantitation does not always match PCR amplification performance
  - It is not a pre-set cycle number as each STR kit has a different sensitivity

**Submitted Question #7A**

If you were switching kits, how would you compare the kits?

- **Cost per sample**
- **Customer support**
- **Concordance**
  - What loci are included in the kit to provide overlap with legacy data (largest possible, well-performing multiplex in order to obtain as much information as possible from a tested sample)
  - If different primer positions caused a significant discordance in results, then this could be a problem (but most primer discordances are rare because of careful design & testing)

**Submitted Question #7B**

What criteria would you use (if switching kits)?

- **Performance**
  - How well the kit performs in YOUR hands
  - How robust on challenging samples (can it cope with PCR inhibitors?)
- **Sensitivity**
  - Relative kit sensitivity is not an issue in my opinion as the addition of a PCR cycle (following validation experiments) would address this difference

**Submitted Question #8**

What is your opinion on subtracting out the victim's profile from an intimate sample (e.g., vaginal swab)?  
What statistics would you apply?

- **Fine to do as long as you clearly document what you have done (assumptions made)**
- **Statistics used would depend on the profile and whether the perpetrator portion of the profile is the major or minor component**

**Submitted Question #9**

What are your thoughts on recent discussions regarding CPI stat calculations for DNA mixtures regarding using/omitting loci where a suspect (or victim) is not fully represented?

- **Curran & Buckleton (JFS Sept 2010 article)**
  - If the person is innocent, then CPI is not conservative
- **Charles Brenner (AAFS Feb 2011 talk)**
  - CPI works fine in simple cases but should not be used in more complex (low level DNA) cases because CPI cannot account for the possibility of allele dropout

**Curran and Buckleton**  
(JFS Sept 2010)

**PAPER**  
**CRIMINALISTICS; GENERAL**

James M. Curran,<sup>1</sup> M.Sc.(Hons.), Ph.D. and John Buckleton,<sup>2</sup> Ph.D.

**Inclusion Probabilities and Dropout**

Created 1000 Two-person Mixtures (Budowle *et al.* 1999 AfAm freq.).

Created 10,000 "third person" genotypes.

Compared "third person" to mixture data, calculated PI for included loci, ignored discordant alleles.

**Curran and Buckleton**  
(JFS Sept 2010)

"the risk of producing apparently strong evidence against an innocent suspect by this approach was not negligible."

30% of the cases had a CPI < 0.01  
48% of the cases had a CPI < 0.05

"It is false to think that omitting a locus is conservative as this is only true if the locus does not have some exclusionary weight."
