Camp Lejeune, NC 28542

Dear Sir:

The purpose of this letter is to clarify regulations concerning ground-water quality monitoring at hazardous waste facilities. This is a follow-up to the October 21, 1981, notification of monitoring requirements concerning sample parameters, frequencies and reporting requirements.

The monitoring wells at your facility must be sampled and analyzed each quarter for the parameters listed under I, II and III in Appendix A. For each of the upgradient wells, four replicate measurements are to be taken quarterly for each of the parameters listed under III in Appendix A. Only one measurement of these parameters (III) will be required quarterly for each of the downgradient wells.

For the first year, November, 1981 to November, 1982, the results from analyses of the parameters listed under I in Appendix A must be submitted to this office within fifteen (15) days of the completion of each quarterly analysis. After November, 1982, the parameters listed under I in Appendix A will not be required.

After the first year of sampling has been completed, all monitoring wells, upgradient and downgradient, must be sampled twice per year for the parameters listed under III and once per year for the parameters listed under II in Appendix A.

The results from these analyses must be compared to the background water quality data developed during the first year of monitoring. Information on the determination of background water quality, the arithmetic mean and variance, can be found under Part 265.93(b) in Appendix B.

The outline of your ground-water quality assessment program (Part 265.93(a) Appendix B) should also include any parameter which will be added based on the waste type at your facility. This may be determined by identifying your EPA hazardous waste code numbers in Appendix C. Appendix C contains a list of constituents which are the basis for listing a particular process. In addition to the Appendix C parameters, any constituent(s) used in your process as listed in Appendix D or any other known characteristic parameter(s) of your waste must be included in the ground-water quality assessment program. This will determine whether any hazardous wastes or hazardous waste constituents have entered the ground-water.

A more detailed description of the ground-water quality assessment program along with a sample program is given in Appendix E.

The analyses of all parameters evaluated for the ground-water quality monitoring program as well as information required under Part 265.93(d), concerning contaminant detection, must be submitted to this office annually on or about November 19 of each year.

Should you have any questions concerning this information or wish to submit analytical results, please contact:

Gary D. Babb, Geologist
Solid & Hazardous Waste Management Branch
Division of Health Services
P. O. Box 2091

Enclosures (5)

APPENDIX A

I. EPA Interim Primary Drinking Water Standards*

Arsenic
Barium
Cadmium
Chromium
Fluoride
Lead
Mercury
Nitrite (as N)
Selenium
Silver
Endrin
Lindane
Methoxychlor
Toxaphene
2,4-D
2,4,5-TP Silvex
Radium
Gross Alpha
Gross Beta
Turbidity (Surface Waters)
Coliform Bacteria

*Maximum allowable concentrations can be found in the May 19, 1980 Federal Register, Appendix III, page 33257.

II. Ground-Water Quality Parameters*

Chloride
Iron
Manganese
Phenols
Sodium
Sulfate

*Allowable concentrations based on 1962 Drinking Water Standards and background water quality data.

III. Ground-Water Contamination Indicators*

pH
Specific Conductance
Elevation of Ground-Water Surface
Total Organic Carbon
Total Organic Halogen

*Allowable concentrations determined by background comparison, see Part 265.93(b) Appendix B.

Subpart F—Ground-Water Monitoring

§ 265.90 Applicability.

(a) Within one year after the effective date of these regulations, the owner or operator of a surface impoundment, landfill, or land treatment facility which is used to manage hazardous waste must implement a ground-water monitoring program capable of determining the facility's impact on the quality of ground water in the uppermost aquifer underlying the facility, except as § 265.1 and paragraph (c) of this Section provide otherwise.

(b) Except as paragraphs (c) and (d) of this Section provide otherwise, the owner or operator must install, operate,, and maintain a ground-water monitoring system which meets the requirements of § 265.91, and must comply with §§ 265.92–265.94. This ground-water monitoring program must be carried out during the active life of the facility, and for disposal facilities, during the post-closure care period as well.

(c) All or part of the ground-water monitoring requirements of this Subpart may be waived if the owner or operator can demonstrate that there is a low potential for migration of hazardous waste or hazardous waste constituents from the facility via the uppermost aquifer to water supply wells (domestic, industrial, or agricultural) or to surface water. This demonstration must be in writing, and must be kept at the facility. This demonstration must be certified by a qualified geologist or geotechnical engineer and must establish the following:

(1) The potential for migration of hazardous waste or hazardous waste constituents from the facility to the uppermost aquifer, by an evaluation of:

(i) A water balance of precipitation, evapotranspiration, runoff, and infiltration; and

(ii) Unsaturated zone characteristics (i.e., geologic materials, physical properties, and depth to ground water); and

(2) The potential for hazardous waste or hazardous waste constituents which enter the uppermost aquifer to migrate to a water supply well or surface water, by an evaluation of:

(i) Saturated zone characteristics (i.e., geologic materials, physical properties, and rate of ground-water flow); and

(ii) The proximity of the facility to water supply wells or surface water.

(d) If an owner or operator assumes (or knows) that ground-water monitoring of indicator parameters in accordance with §§265.91 and 265.92 would show statistically significant increases (or decreases in the case of pH) when evaluated under § 265.93(b), he may, install, operate, and maintain an alternate ground-water monitoring system (other than the one described in §§ 265.91 and 265.92). If the owner or operator decides to use an alternate ground-water monitoring system he must:

(1) Within one year after the effective date of these regulations, submit to the Regional Administrator a specific plan, certified by a qualified geologist or geotechnical engineer, which satisfies the requirements of § 265.93(d)(3), for an alternate ground-water monitoring system;

(2) Not later than one year after the effective date of these regulations, initiate the determinations specified in § 265.93(d)(4);

(3) Prepare and submit a written report in accordance with § 265.93(d)(5);

(4) Continue to make the determinations specified in § 265.93(d)(4) on a quarterly basis until final closure of the facility; and

(5) Comply with the recordkeeping and reporting requirements in § 265.94(b).

§ 265.91 Ground-water monitoring system.

(a) A ground-water monitoring system must be capable of yielding ground-water samples for analysis and must consist of:

(1) Monitoring wells (at least one) installed hydraulically upgradient (i.e., in the direction of increasing static head) from the limit of the waste management area. Their number, locations, and depths must be sufficient to yield ground-water samples that are:

(i) Representative of background ground-water quality in the uppermost aquifer near the facility; and

(ii) Not affected by the facility; and

(2) Monitoring wells (at least three) installed hydraulically downgradient (i.e., in the direction of decreasing static head) at the limit of the waste management area. Their number, locations, and depths must ensure that they immediately detect any statistically significant amounts of hazardous waste or hazardous waste constituents that migrate from the waste management area to the uppermost aquifer.

(b) Separate monitoring systems for each waste management component of a facility are not required provided that provisions for sampling upgradient and downgradient water quality will detect any discharge from the waste management area.

(1) In the case of a facility consisting of only one surface impoundment, landfill, or land treatment area, the waste management area is described by the waste boundary (perimeter).

(2) In the case of a facility consisting of more than one surface impoundment, landfill, or land treatment area, the waste management area is described by an imaginary boundary line which circumscribes the several waste management components.

(c) All monitoring wells must be cased in a manner that maintains the integrity of the monitoring well bore hole. This casing must be screened or perforated, and packed with gravel or sand where necessary, to enable sample collection at depths where appropriate aquifer flow zones exist. The annular space (i.e., the space between the bore hole and well casing) above the sampling depth must be sealed with a suitable material (e.g., cement grout or bentonite slurry) to prevent contamination of samples and the ground water.

§ 265.92 Sampling and analysis.

(a) The owner or operator must obtain and analyze samples from the installed ground-water monitoring system. The owner or operator must develop and follow a ground-water sampling and analysis plan. He must keep this plan at the facility. The plan must include procedures and techniques for:

(1) Sample collection;

(2) Sample preservation and shipment;

(3) Analytical procedures; and

(4) Chain of custody control.

[*Comment:* See "Procedures Manual For Ground-water Monitoring At Solid Waste Disposal Facilities," EPA–530/SW–611, August 1977 and "Methods for Chemical Analysis of Water and Wastes," EPA–600/4–79–020, March 1979 for discussions of sampling and analysis procedures.]

(b) The owner or operator must determine the concentration or value of the following parameters in ground-water samples in accordance with paragraphs (c) and (d) of this section:

(1) Parameters characterizing the suitability of the ground water as a drinking water supply, as specified in Appendix III.

(2) Parameters establishing ground-water quality:

(i) Chloride
(ii) Iron
(iii) Manganese
(iv) Phenols
(v) Sodium
(vi) Sulfate

[*Comment:* These parameters are to be used as a basis for comparison in the event a ground-water quality assessment is required under § 265.93(d).]

(3) Parameters used as indicators of ground-water contamination:

(i) pH
(ii) Specific Conductance
(iii) Total Organic Carbon
(iv) Total Organic Halogen

(c)(1) For all monitoring wells, the owner or operator must establish initial

background concentrations or values of all parameters specified in paragraph (b) of this Section. He must do this quarterly for one year.

(2) For each of the indicator parameters specified in paragraph (b)(3) of this Section, at least four replicate measurements must be obtained for each sample and the initial background arithmetic mean and variance must be determined by pooling the replicate measurements for the respective parameter concentrations or values in samples obtained from upgradient wells during the first year.

(d) After the first year, all monitoring wells must be sampled and the samples analyzed with the following frequencies:

(1) Samples collected to establish ground-water quality must be obtained and analyzed for the parameters specified in paragraph (b)(2) of this Section at least annually.

(2) Samples collected to indicate ground-water contamination must be obtained and analyzed for the parameters specified in paragraph (b)(3) of this Section at least semi-annually.

(e) Elevation of the ground-water surface at each monitoring well must be determined each time a sample is obtained.

§ 265.93 Preparation, evaluation, and response.

(a) Within one year after the effective date of these regulations, the owner or operator must prepare an *outline* of a ground-water quality assessment program. The outline must describe a more comprehensive ground-water monitoring program (than that described in §§ 265.91 and 265.92) capable of determining:

(1) Whether hazardous waste or hazardous waste constituents have entered the ground water;

(2) The rate and extent of migration of hazardous waste or hazardous waste constituents in the ground water; and

(3) The concentrations of hazardous waste or hazardous waste constituents in the ground water.

(b) For each indicator parameter specified in § 265.92(b)(3), the owner or operator must calculate the arithmetic mean and variance, based on at least four replicate measurements on each sample, for each well monitored in accordance with § 265.92(d)(2), and compare these results with its initial background arithmetic mean. The comparison must consider individually each of the wells in the monitoring system, and must use the Student's t-test at the 0.01 level of significance (see Appendix IV) to determine statistically significant increases (and decreases, in the case of pH) over initial background.

(c)(1) If the comparisons for the *upgradient* wells made under paragraph (b) of this Section show a significant increase (or pH decrease), the owner or operator must submit this information in accordance with § 265.94(a)(2)(ii).

(2) If the comparisons for *downgradient* wells made under paragraph (b) of this Section show a significant increase (or pH decrease), the owner or operator must then immediately obtain additional ground-water samples from those downgradient wells where a significant difference was detected, split the samples in two, and obtain analyses of all additional samples to determine whether the significant difference was a result of laboratory error.

(d)(1) If the analyses performed under paragraph (c)(2) of this Section confirm the significant increase (or pH decrease), the owner or operator must provide written notice to the Regional Administrator—within seven days of the date of such confirmation—that the facility may be affecting ground-water quality.

(2) Within 15 days after the notification under paragraph (d)(1) of this Section, the owner or operator must develop and submit to the Regional Administrator a specific plan, based on the outline required under paragraph (a) of this Section and certified by a qualified geologist or geotechnical engineer, for a ground-water quality assessment program at the facility.

(3) The plan to be submitted under § 265.90(d)(1) or paragraph (d)(2) of this Section must specify:

(i) The number, location, and depth of wells;

(ii) Sampling and analytical methods for those hazardous wastes or hazardous waste constituents in the facility;

(iii) Evaluation procedures, including any use of previously-gathered ground-water quality information; and

(iv) A schedule of implementation.

(4) The owner or operator must implement the ground-water quality assessment plan which satisfies the requirements of paragraph (d)(3) of this Section, and, at a minimum, determine:

(i) The rate and extent of migration of the hazardous waste or hazardous waste constituents in the ground water; and

(ii) The concentrations of the hazardous waste or hazardous waste constituents in the ground water.

(5) The owner or operator must make his first determination under paragraph (d)(4) of this Section as soon as technically feasible, and, within 15 days after that determination, submit to the Regional Administrator a written report containing an assessment of the ground-water quality.

(6) If the owners or operator determines, based on the results of the first determination under paragraph (d)(4) of this Section, that no hazardous waste or hazardous waste constituents from the facility have entered the ground water, then he may reinstate the indicator evaluation program described in § 265.92 and paragraph (b) of this Section. If the owner or operator reinstates the indicator evaluation program, he must so notify the Regional Administrator in the report submitted under paragraph (d)(5) of this Section.

(7) If the owner or operator determines, based on the first determination under paragraph (d)(4) of this Section, that hazardous waste or hazardous waste constituents from the facility have entered the ground water, then he:

(i) Must continue to make the determinations required under paragraph (d)(4) of this Section on a quarterly basis until final closure of the facility, if the ground-water quality assessment plan was implemented prior to final closure of the facility; or

(ii) May cease to make the determinations required under paragraph (d)(4) of this Section, if the ground-water quality assessment plan was implemented during the post-closure care period.

(e) Notwithstanding any other provision of this Subpart, any ground-water quality assessment to satisfy the requirements of § 265.93(d)(4) which is initiated prior to final closure of the facility must be completed and reported in accordance with § 265.93(d)(5).

(f) Unless the ground water is monitored to satisfy the requirements of § 265.93(d)(4), at least annually the owner or operator must evaluate the data on ground-water surface elevations obtained under § 265.92(e) to determine whether the requirements under § 265.91(a) for locating the monitoring wells continues to be satisfied. If the evaluation shows that § 265.91(a) is no longer satisfied, the owner or operator must immediately modify the number, location, or depth of the monitoring wells to bring the ground-water monitoring system into compliance with this requirement.

§ 265.94 Recordkeeping and reporting.

(a) Unless the ground water is monitored to satisfy the requirements of § 265.93(d)(4), the owner or operator must:

(1) Keep records of the analyses required in § 265.92(c) and (d), the associated ground-water surface elevations required in § 265.92(e), and

the evaluations required in § 265.93(b) throughout the active life of the facility, and, for disposal facilities, throughout the post-closure care period as well; and

(2) Report the following ground-water monitoring information to the Regional Administrator:

(i) During the first year when initial background concentrations are being established for the facility: concentrations or values of the parameters listed in § 265.92(b)(1) for each ground-water monitoring well within 15 days after completing each quarterly analysis. The owner or operator must separately identify for each monitoring well any parameters whose concentration or value has been found to exceed the maximum contaminant levels listed in Appendix III.

(ii) Annually: concentrations or values of the parameters listed in § 265.92(b)(3) for each ground-water monitoring well, along with the required evaluations for these parameters under § 265.93(b). The owner or operator must separately identify any significant differences from initial background found in the upgradient wells, in accordance with § 265.93(c)(1). During the active life of the facility, this information must be submitted as part of the annual report required under § 265.75.

(iii) As a part of the annual report required under § 265.75: results of the evaluation of ground-water surface elevations under § 265.93(f), and a description of the response to that evaluation, where applicable.

(b) If the ground water is monitored to satisfy the requirements of § 265.93(d)(4), the owner or operator must:

(1) Keep records of the analyses and evaluations specified in the plan, which satisfies the requirements of § 265.93(d)(3), throughout the active life of the facility, and, for disposal facilities, throughout the post-closure care period as well; and

(2) Annually, until final closure of the facility, submit to the Regional Administrator a report containing the results of his ground-water quality assessment program which includes, but is not limited to, the calculated (or measured) rate of migration of hazardous waste or hazardous waste constituents in the ground water during the reporting period. This report must be submitted as part of the annual report required under § 265.75.

§§ 265.95–265.109 [Reserved]

Subpart G—Closure and Post-Closure

§ 265.110 Applicability.

Except as § 265.1 provides otherwise:

(a) Sections 265.111–265.115 (which concern closure) apply to the owners and operators of all hazardous waste facilities; and

(b) Sections 265.117–265.120 (which concern post-closure care) apply to the owners and operators of all disposal facilities.

§ 265.111 Closure performance standard.

The owner or operator must close his facility in a manner that: (a) minimizes the need for further maintenance, and (b) controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous waste constituents, leachate, contaminated rainfall, or waste decomposition products to the ground water, or surface waters, or to the atmosphere.

§ 265.112 Closure plan; amendment of plan.

(a) On the effective date of these regulations, the owner or operator must have a written closure plan. He must keep this plan at the facility. This plan must identify the steps necessary to completely close the facility at any point during its intended life and at the end of its intended life. The closure plan must include, at least:

(1) A description of how and when the facility will be partially closed, if applicable, and ultimately closed. The description must identify the maximum extent of the operation which will be be unclosed during the life of the facility, and how the requirements of § 265.111 and the applicable closure requirements of §§ 265.197, 265.228, 265.280, 265.310, 265.351, 265.381, and 265.404 will be met;

(2) An estimate of the maximum inventory of wastes in storage or in treatment at any given time during the life of the facility;

(3) A description of the steps needed to decontaminate facility equipment during closure; and

(4) A schedule for final closure which must include, as a minimum, the anticipated date when wastes will no longer be received, the date when completion of final closure is anticipated, and intervening milestone dates which will allow tracking of the progress of closure. (For example, the expected date for completing treatment or disposal of waste inventory must be included, as must the planned date for removing any residual wastes from storage facilities and treatment processes.)

(b) The owner or operator may amend his closure plan at any time during the active life of the facility. (The active life of the facility is that period during which wastes are periodically received.) The owner or operator must amend his plan any time changes in operating plans or facility design affect the closure plan.

(c) The owner or operator must submit his closure plan to the Regional Administrator at least 180 days before the date he expects to begin closure. The Regional Administrator will modify, approve, or disapprove the plan within 90 days of receipt and after providing the owner or operator and the affected public (through a newspaper notice) the opportunity to submit written comments. If an owner or operator plans to begin closure within 180 days after the effective date of these regulations, he must submit the necessary plans on the effective date of these regulations.

§ 265.113 Time allowed for closure.

(a) Within 90 days after receiving the final volume of hazardous wastes, the owner or operator must treat all hazardous wastes in storage or in treatment, or remove them from the site, or dispose of them on-site, in accordance with the approved closure plan.

(b) The owner or operator must complete closure activities in accordance with the approved closure plan and within six months after receiving the final volume of wastes. The Regional Administrator may approve a longer closure period under § 265.112(c) if the owner or operator can demonstrate that: (1) the required or planned closure activities will, of necessity, take him longer than six months to complete, and (2) that he has taken all steps to eliminate any significant threat to human health and the environment from the unclosed but inactive facility.

§ 265.114 Disposal or decontamination of equipment.

When closure is completed, all facility equipment and structures must have been properly disposed of, or decontaminated by removing all hazardous waste and residues.

§ 265.115 Certification of closure.

When closure is completed, the owner or operator must submit to the Regional Administrator certification both by the owner or operator and by an independent registered professional engineer that the facility has been closed in accordance with the

Part 261, Appendix [Amended]

4. Revise Appendix VII to Part 261 to read as follows:

Appendix VII—Basis for Listing Hazardous Waste

EPA hazardous waste No.	Hazardous constituents for which listed
F001	Tetrachloroethylene, methylene chloride trichloroethylene, 1,1,1-trichloroethane, carbon tetrachloride, chlorinated fluorocarbons.
F002	Tetrachloroethylene, methylene chloride, trichloroethylene, 1,1,1-trichloroethane, chlorobenzene, 1,1,2-trichloro-1,2,2-trifluoroethane, ortho-dichlorobenzene, trichlorofluoromethane.
F003	N.A.
F004	Cresols and cresylic acid, nitrobenzene.
F005	Toluene, methyl ethyl ketone, carbon disulfide, isobutanol, pyridine.
F006	Cadmium, hexavalent chromium, nickel, cyanide (complexed).
F007	Cyanide (salts).
F008	Cyanide (salts).
F009	Cyanide (salts).
F010	Cyanide (salts).
F011	Cyanide (salts).
F012	Cyanide (complexed).
F014	Cyanide (complexed).
F015	Cyanide (salts).
F019	Hexavalent chromium, cyanide (complexed).
K001	Pentachlorophenol, phenol, 2-chlorophenol, p-chloro-m-cresol, 2,4-dimethylphenyl, 2,4-dinitrophenol, trichlorophenols, tetrachlorophenols, 2,4-dinitrophenol, creosote, chrysene, naphthalene, fluoranthene, benzo(b)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, benz(a)anthracene, dibenz(a)anthracene, acenaphthalene.
K002	Hexavalent chromium, lead
K003	Hexavalent chromium, lead.
K004	Hexavalent chromium.
K005	Hexavalent chromium, lead.
K006	Hexavalent chromium.
K007	Cyanide (complexed), hexavalent chromium.
K008	Hexavalent chromium.
K009	Chloroform, formaldehyde, methylene chloride, methyl chloride, paraldehyde, formic acid.
K010	Chloroform, formaldehyde, methylene chloride, methyl chloride, paraldehyde, formic acid, chloroacetaldehyde.
K011	Acrylonitrile, acetonitrile, hydrocyanic acid.
K013	Hydrocyanic acid, acrylonitrile, acetonitrile.
K014	Acetonitrile, acrylamide.
K015	Benzyl chloride, chlorobenzene, toluene, benzotrichloride.
K016	Hexachlorobenzene, hexachlorobutadiene, carbon tetrachloride, hexachloroethane, perchloroethylene.
K017	Epichlorohydrin, chloroethers [bis(chloromethyl) ether and bis (2-chloroethyl) ethers], trichloropropane, dichloropropanols.
K018	1,2-dichloroethane, trichloroethylene, hexachlorobutadiene, hexachlorobenzene.
K019	Ethylene dichloride, 1,1,1-trichloroethane, 1,1,2-trichloroethane, tetrachloroethanes (1,1,2,2-tetrachloroethane and 1,1,1,2-tetrachloroethane), trichloroethylene, tetrachloroethylene, carbon tetrachloride, chloroform, vinyl chloride, vinylidene chloride.
K020	Ethylene dichloride, 1,1,1-trichloroethane, 1,1,2-trichloroethane, tetrachloroethanes (1,1,2,2-tetrachloroethane and 1,1,1,2-tetrachloroethane), trichloroethylene, tetrachloroethylene, carbon tetrachloride, chloroform, vinyl chloride, vinylidene chloride.
K021	Antimony, carbon tetrachloride, chloroform.
K022	Phenol, tars (polycyclic aromatic hydrocarbons).
K023	Phthalic anhydride, maleic anhydride.
K024	Phthalic anhydride, 1,4-naphthoquinone.
K025	Meta-dinitrobenzene, 2,4-dinitrotoluene.
K026	Paraldehyde, pyridines, 2-picoline.
K027	Toluene diisocyanate, toluene-2, 4-diamine.
K028	1,1,1—trichloroethane, vinyl chloride.
K029	1,2-dichloroethane, 1,1,1-trichloroethane, vinyl chloride, vinylidene chloride, chloroform.
K030	Hexachlorobenzene, hexachlorobutadiene, hexachloroethane, 1,1,1,2-tetrachloroethane, 1,1,2,2-tetrachloroethane, ethylene dichloride.
K031	Arsenic.
K032	Hexachlorocyclopentadiene.
K033	Hexachlorocyclopentadiene.
K034	Hexachlorocyclopentadiene.
K035	Creosote, chrysene, naphthalene, fluoranthene benzo(b) fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd) pyrene, benzo(a)anthracene, dibenzo(a)anthracene, acenaphthalene.
K036	Toluene, phosphorodithioic and phosphoro-thioic acid esters.
K037	Toluene, phosphorodithioic and phosphoro-thioic acid esters.
K038	Phorate, formaldehyde, phosphorodithioic and phosphorothioic acid esters.
K039	Phosphorodithioic and phosphorothioic acid esters.
K040	Phorate, formaldehyde, phosphorodithioic and phosphorothioic acid esters.
K041	Toxaphene.
K042	Hexachlorobenzene, ortho-dichlorobenzene.
K043	2,4-dichlorophenol, 2,6-dichlorophenol, 2,4,6-trichlorophenol.
K044	N.A.
K045	N.A.
K046	Lead.
K047	N.A.
K048	Hexavalent chromium, lead.
K049	Hexavalent chromium, lead.
K050	Hexavalent chromium.
K051	Hexavalent chromium, lead.
K052	Lead.
K060	Cyanide, napthalene, phenolic compounds, arsenic.
K061	Hexavalent chromium, lead, cadmium.
K062	Hexavalent chromium, lead.
K064	Lead, cadmium.
K065	Lead, cadmium.
K066	Lead, cadmium.
K067	Lead, cadmium.
K068	Lead, cadmium.
K069	Hexavalent chromium, lead, cadmium.
K071	Mercury.
K073	Chloroform, carbon tetrachloride, hexachloroethane, trichloroethane, tetrachloroethylene, dichloroethylene, 1,1,2,2-tetrachloroethane.
K083	Aniline, diphenylamine, nitrobenzene, phenylenediamine.
K084	Arsenic.
K085	Benzene, dichlorobenzenes, trichlorobenzenes, tetrachlorobenzenes, pentachlorobenzene, hexachlorobenzene, benzyl chloride.
K086	Lead, hexavalent chromium.
K087	Phenol, saphthalene.
K093	Phthalic anhydride, maleic anhydride.
K094	Phthalic anhydride.
K095	1,1,2-trichloroethane, 1,1,1,2-tetrachloroethane, 1,1,2,2-tetrachloroethane.
K096	1,2-dichloroethane, 1,1,1-trichloroethane, 1,1,2-trichloroethane.
K097	Chlordane, heptachlor.
K098	Toxaphene.
K099	2,4-dichlorophenol, 2,4,6-trichlorophenol.
K100	Hexavalent chromium, lead, cadmium.
K101	Arsenic.
K102	Arsenic.
K103	Aniline, nitrobenzene, phenylenediamine.
K104	Aniline, benzene, diphenylamine, nitrobenzene, phenylenediamine.
K105	Benzene, monochloroberzene, dichlorobenzenes, 2,4,6-trichlorophenol.
K106	Mercury.

N.A.—Waste is hazardous because it fails the test for the characteristic of ignitability, corrosivity, or reactivity.

CHAPTER 3--GROUND-WATER ASSESSMENT PLANS

Part 265, Subpart F, §265.93

1.0 INTRODUCTION

Within one year of the effective date of the Interim Status Standards (i.e., by November 18, 1981), owners or operators of a surface impoundment, landfill or land treatment facility must prepare an outline for conduct of a ground-water quality assessment program (40 CFR 265.93; see Appendix B). The measures outlined in the assessment program would be carried out if the basic ground-water monitoring program (basic program), also specified in the standards (40 CFR 265.91; 265.92), indicates that the facility may be affecting ground-water quality. The assessment program can be implemented directly when the owner or operator knows or suspects that the facility is a contamination source. The basic program is designed to detect the appearance of contamination while the assessment program pre-supposes a pollution source and is designed to evaluate the chemical nature, extent and rate of movement of such pollution.

The purpose of this document is to illustrate the tasks which would be likely elements of an outline for an assessment program. These tasks include expanded monitor-well installation, more detailed chemical testing, and possibly surface water sampling and analysis. Specific technical procedures needed to accomplish each task (e.g., well construction techniques, methods for calculating contaminant migration rate, etc.) are not presented here because numerous other documents are available which adequately cover hydrogeological field analysis. The most applicable is the upcoming "Permit Writer's Manual" (Technical Permit Writer's Guidance Manual for Ground-

Water Monitoring Systems at Hazardous Waste Treatment, Storage and Disposal Facilities). Technical personnel should be aware of other EPA reports such as the "Procedures Manual for Ground-Water Monitoring at Solid Waste Disposal Facilities" (U.S. EPA, 1977), the ground-water sampling report by Dunlap et al. (1977), and the General Electric TEMPO series on ground-water monitoring (e.g., Everett et al., 1976). The U.S. Geological Survey has conducted a wide range of studies employing techniques appropriate to hazardous waste investigations (e.g., Zohdy et al., 1974; Wood, 1976; Konikow and Bredehoeft, 1978). Professional journals, such as Groundwater (published by the National Water Well Association) and Environmental Science and Technology (published by the American Chemical Society), and current textbooks, such as those by Bouwer (1978) and Freeze and Cherry (1979), are also excellent sources. See Section 4 for complete references.

2.0 GROUND-WATER QUALITY ASSESSMENT PROGRAM COMPONENTS

The principal goals of a ground-water quality assessment program, based on the interim status standards (Section 265.93 (d) (4); Appendix B), are to establish:

- "The rate and extent of migration of the hazardous waste or hazardous waste constituents in the ground-water; and
- The concentrations of the hazardous waste or hazardous waste constituents in the ground-water."

Each of these major issues can be examined in three phases:

- The treatment of the issue within the basic ground-water monitoring program;
- Areas where the basic program is inadequate;
- Examples of a more comprehensive assessment program.

The differences between a basic program and an assessment program are highlighted in Table 1.

Except for the source of contamination, the assessment program would be, in principal, very similar to most routine hydrogeological impact assessments. These studies are fully discussed in the technical literature (see for example, Todd and McNulty, 1974 and Freeze and Cherry, 1979). Whereas the interim status standards define specific components in the basic program, only overall goals are set for the assessment program. This approach allows maximum flexibility for solving contamination issues. The specific components of the assessment program will be selected, therefore, based on the professional judgement of the geologist or hydrogeologist performing each individual site analysis.

TABLE 1

COMPARISONS BETWEEN A BASIC GROUND-WATER MONITORING PROGRAM AND A GROUND-WATER QUALITY ASSESSMENT PROGRAM

Components of the basic ground-water monitoring program	Limitations of the basic program once contamination is detected	Possible components of a more comprehensive assessment program*
Determine the spread of contamination		
1. install monitoring wells: • at least three, "hydraulically downgradient — at the limit of the waste management area." • at least one, "hydraulically upgradient from the limit of the waste management area."	1.a acts as a warning system only; inadequate for tracing contaminants downgradient	1.a.1 conduct preliminary screening of trend of contaminated ground-water by: • shallow borings; temporary probing of shallow ground-water • electrical resistivity and other geophysical or remote surveys
		1.a.2 expand monitoring network within the facility boundaries and possibly beyond those boundaries
		1.a.3 increase number of well nests (locations with multiple level ground-water monitoring points)
		1.a.4 include sampling of nearby water supplies
		1.a.5 quantify volumes of ground-water flow using field and/or laboratory tests
	1.b no surface water sampling is required	1.b.1 conduct sampling of local surface waters which receive ground-water discharge
Identify the types of contaminants present		
2. analyze samples for three principal groups: • "parameters characterizing the suitability of the ground-water as a drinking water supply" (primary maximum contaminant levels)† • "parameters establishing ground-water quality" (chloride, iron, manganese, phenols, sodium, sulfate) • "parameters used as indicators of ground-water contamination." (pH, specific conductance, total organic carbon, total organic halogen)	2.a many hazardous waste constituents are not directly identified in the basic program	2.a.1 expand analytical scheme to include elements of the EPA list of Priority Pollutants (Finnigan et al., 1979; Keith and Telliard, 1979), e.g., • 31 purgeable organics • 46 base/neutral extractable organic compounds • 11 acid extractable organic compounds • 26 pesticides/PCB's • 13 metals • cyanide, asbestos, phenols
		2.a.2 expand analytical scheme to include those hazardous waste constituents not on the EPA list of Priority Pollutants
		2.a.3 employ advanced analytical techniques for parameter identification/quantification (Finnegan et al., 1979; Keith and Telliard, 1979), e.g., • gas chromatography or gas/liquid chromatography for screening • gas chromatography/mass spectrometry for full spectrum identification and quantification of organic constituents
	2.b sampling frequency may be insufficient for detecting changes in contaminated ground waters	2.b.1 increase sampling frequency based on plume movement, environmental hazard potential and probable timing of pollution abatement measures

*This is a list of some of the major ground-water assessment program components. Not all programs will contain all components; some will include components which are not on this list. The permit-writers manual will contain a more detailed treatment of the technical procedures to be employed in ground-water assessment programs.

†Code of Federal Regulations, Title 40, Part 141

Most of the principal components of a ground-water assessment program are shown in Table 1, though site-specific characteristics may necessitate other technical approaches. Whereas the basic program includes wells at the limit of the waste management area, an assessment program could include a series of wells further downgradient and, possibly, greater numbers of multi-level well "nests." Organic contaminants which are analyzed through gross indicators (e.g., using total organic carbon and total organic halogen tests) in the basic program might be more completely determined for example, through gas chromatography or gas chromatography/mass spectrometry.

3.0 EXAMPLE OF GROUND-WATER ASSESSMENT PROGRAM IMPLEMENTATION

In the hypothetical setting shown in Figure 1, ground-water samples from one downgradient well (number 3) showed a statistically significant increase in organic indicator parameters (total organic carbon and total organic halogen). These results were confirmed by duplicate sampling and testing. To trace the spread of contamination, as the first step in the ground-water quality assessment program, an additional line of downgradient wells was installed (numbers 5 through 10).

Water samples were taken from all new and old wells. A screening for organic constituents was performed using gas chromatography. The work showed that three wells (numbers 3, 7 and 8) contained elevated levels of purgeable (volatile) organics while the others (numbers 1, 2, 4, 5, 6, 9, and 10) were not contaminated. Gas chromatography/mass spectrometry was then used for analysis of samples from the three contaminated wells. Benzene and toluene were identified as the principal pollutants from the wells. Wells number 7 and 8 produced ground-waters of much lower concentrations than the original contaminated well (number 3), suggesting that the edge of the leachate plume was not far from the second line of wells.

To further define the spread of the plume, two additional well sites (numbers 11 and 12) were developed closer to the river. Since the river receives ground-water discharge and the unconsolidated aquifer bordering the river thickens at this point, "nested" wells were drilled. Each

FIGURE 1

HYPOTHETICAL MONITOR WELL CONFIGURATIONS
USED FOR GROUND-WATER CONTAMINATION ANALYSIS

nest contained two wells; one screened near the watertable and one screened at greater depth in the saturated zone. None of the nested wells produced contaminated ground-waters, indicating that the leachate plume had not yet reached the area.

The ground-water assessment program successfully determined the spread of contamination. The decision-making process illustrated in this example is shown schematically in Figure 2.
