Subject: <sup>pc</sup> Results for Sampling and Analysis of Groundwater Wells, Marine Corps Base, Camp Lejeune, NC/Contract No. N62470-96-4889 (MAY '96)

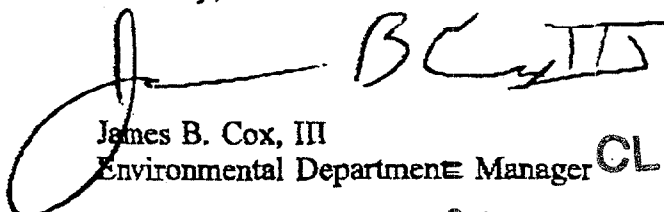

Mr. Ward,

Enclosed are the results of the analyses performed on six groundwater samples collected at Camp Lejeune on 5-28-96. Five copies of the Report of Analysis, Chain-of-Custody, and field notes have been provided as outlined in the contract agreement. Only one value for one well exceeded the North Carolina groundwater standards outlined in 15A NCAC 2L--Chloroform for Well GSR-01 was found to be 38.6 ppb, which is greater than the current standard of 0.19 ppb.

We have consulted with Brent Rouse and are currently formatting the database to contain the well data according to his specifications. This is requiring more time than we originally anticipated because he has asked us to reconstruct the entire database for him rather than simply providing data in an accessible format, as specified in the contract. We expect to complete the database within approximately one week.

If you have any questions about the results, please do not hesitate to contact me at (919) 237-4175.

Sincerely,

  
James B. Cox, III  
Environmental Department Manager
