Bauxite and Alumina Worksheet Notes

Data Sources

Sources of data for the alumina and bauxite worksheets are the mineral statistics publications of the U.S. Bureau of Mines and the U.S. Geological Survey—Minerals Yearbook (MYB) and its predecessor, Mineral Resources of the United States (MR). The years of publication and corresponding years of data coverage are listed in the References section below.

Production

Bauxite data are domestic mine production of ore in terms of “dried bauxite equivalents.” Domestic bauxite production data for 1989–96 are withheld in order to avoid disclosing proprietary data. Data after 1996 are not available.

Alumina production data are in terms of “calcined alumina equivalents.” Calcined alumina production data were not available prior to 1955. For 1950–54, data are reported as “Alumina Production.” All data are from the MR and MYB.

Shipments

Bauxite data are reported as “quantity as shipped.” For 1900–18, shipments are bauxite shipped from domestic producers to the U.S. industry. For 1919–33, shipments are sales of bauxite by domestic producers to the U.S. industry. For 1934–88, shipments are domestic “dried bauxite equivalents” shipments from mines and processing plants to the U.S. industry. Shipments data for 1989–96 are withheld in order to avoid disclosing proprietary data. Data after 1996 are not available.

Alumina shipments data for 1956–69 are “quantity as shipped.” The exceptions are for 1958 and 1966 when no data were reported. After 1969, shipments data are reported in “calcined alumina equivalents.” All data are from the MR and MYB.

Imports

Bauxite imports into the United States for 1900–49 are crude and dried bauxite only. After 1949, imports include crude and dried bauxite, plus calcined bauxite; data are reported as “quantity as shipped.”

For 1935–52, alumina imports into the United States consist of alumina. Data for after 1969 consist of alumina plus the “calcined alumina equivalents” of aluminum hydroxide imports. Alumina datum for 1944 is reported as “less than ½ unit.” All data are from the MR and MYB.

Exports

Bauxite data includes bauxite and calcined bauxite, reported as “quantity as shipped” exported from the United States. Data are not available for 1902–13.

Alumina export data prior to 1965 included other aluminum compounds and are not considered here. Alumina exports include aluminum oxide for 1965–69 and aluminum oxide plus the calcined equivalent of aluminum hydroxide for after 1969. All data are from the MR and MYB.

Stocks

Stock levels at the end of year, December 31. Bauxite industry stocks include both producers and consumers. For 1942–63 and 1969 onward, stocks are reported as “dried bauxite equivalents”; for 1964–68 stocks are as reported. Bauxite government stocks are the strategic stockpile stocks reported in dry equivalents. Bauxite stock data are not available prior to 1942. Bauxite stocks data for 2005–08 are withheld in order to avoid disclosing proprietary data.

Alumina industry stocks for 1969 onward are reported in “calcined alumina equivalents.” Data prior to 1969 are not available. All data are from the MR and MYB.

Bauxite Apparent Consumption

Bauxite consumption data for 1900–40 are published apparent consumption data. Because published apparent consumption data are unavailable after 1940, published consumption data are used. Data for 1900–33 are reported as “quantity as shipped,” and for after 1933, data are reported as “dried bauxite equivalents.” Bauxite consumption data are from the MR and MYB.

Alumina Apparent Consumption

Alumina consumption data are not published and therefore were calculated from data published in the MR and MYB. Data for 1900–54 were insufficient for this calculation. Data for 1955–69 are calculated using the following equation:

$$\text{ALUMINA APPARENT CONSUMPTION} = \text{PRODUCTION} + \text{IMPORTS} - \text{EXPORTS.}$$

Data for after 1969 are calculated using the following equation:

ALUMINA APPARENT CONSUMPTION = PRODUCTION + IMPORTS – EXPORTS ± ADJUSTMENTS FOR INDUSTRY STOCK CHANGES.

All data are expressed as “calcined alumina equivalents.”

Unit Value (\$/t)

Bauxite unit value data in dollars per metric ton (t) are the average U.S. import price of bauxite, port of shipment, free alongside ship (FAS).

Alumina unit value data are the average U.S. import price of calcined alumina, port of shipment, FAS. All data are from the MR and MYB.

Unit Value (98\$/t)

The Consumer Price Index conversion factor, with 1998 as the base year, is used to adjust unit value in current U.S. dollars to the unit value in constant 1998 U.S. dollars.

World Production

World mine production of bauxite is reported on a “dried bauxite equivalents” basis. U.S. bauxite production data are withheld from the total for 1989 to the most recent year.

Alumina world production data is reported as “quantity produced” (alumina), for 1968–71, and as “calcined alumina equivalents” for after 1971. All data are from the MR and MYB.
