# **Mercury Worksheet Notes**

#### **Data Sources**

Sources of data for the mercury worksheet are the mineral statistics publications of the U.S. Bureau of Mines and the U.S. Geological Survey—Minerals Yearbook (MYB) and its predecessor, Mineral Resources of the United States (MR); Mineral Commodity Summaries (MCS) and its predecessor, Commodity Data Summaries (CDS); and Mineral Facts and Problems (MFP). Historical data on government stockpile of mercury are from personal communications with the Defense Logistics Agency (DLA). Metal price data are from Metal Prices in the United States through 1998 (MP98) with prices for 1998–2002 from the 2002 MYB and 2003 to the most recent year from the MCS.

# **Primary Production**

Primary U.S. mercury production data are for domestic mercury mine and byproduct production associated with gold, copper, and zinc mining and mercury produced from old surface ores and mine waste dumps. Data are reported in the MR and the MYB series in the "Salient mercury statistics" table. Primary mercury production data are reported in the MR and the MYB for 1900–89 in the unit measure of the flask. Production data are converted to metric tons using the following definitions for the flask. From 1900 through May 31, 1904, the flask was defined as 76.5 pounds of mercury. From June 1, 1904, through 1926, the flask was defined as 75 pounds. The definition for the flask was changed to 76 pounds of mercury in 1927 and remains unchanged today. The McDermitt Mine in Nevada, the last producing primary mercury mine in the United States, closed in late 1990. Since 1992, there has been no primary mercury production.

#### **Secondary Production**

Secondary production of mercury includes production from industry sources and the General Services Administration (GSA) release of secondary mercury obtained from the U.S. Department of Energy. Secondary production data of mercury from industry sources are reported for 1946–97. GSA releases of secondary mercury were reported for 1963–92. Secondary production data were reported in the MYB as not available for 1998 to the most recent year. All secondary mercury data are from the MR and the MYB.

## **Imports**

Mercury import data for metallic mercury are for domestic consumption only. Mercury compounds and oxides are excluded from apparent consumption estimates, as well as the portion of the general imports not for consumption (re-exports). All mercury import data are reported in the MR and the MYB.

## **Exports**

Mercury export data are for metallic mercury and consist of exports and re-exports of mercury. Export data were not separately classified for 1927–30 and for 1933–35. Export data were not available for 1979–88. Re-export data were reported for 1940–60. All mercury export data are reported in the MR and the MYB.

### **Government Stocks**

Government stocks are in the form of refined mercury managed by the DLA. Acquisitions and releases from government stocks are described under Government shipments. Mercury stocks were held by the Metals Reserve Company during 1941–46 and later transferred to the permanent strategic stockpile. Another major repository for mercury is the U.S. Department of Energy, formerly the U.S. Atomic Energy Commission (AEC). Data prior to 1945 are assumed to be zero.

## **Government Shipments**

Stockpile shipment data were obtained from the DLA for 1945–99 (Cornel Holder, Defense Logistics Agency, written commun., 2002). Negative data indicate acquisitions by the DLA. The major shipments of mercury in 1956 were transfers to another Government agency, possibly the AEC, which was formed during this time. Data prior to 1945 are assumed to be zero.

#### Stocks

Data on mercury stocks at mines were reported in the MYB for 1940–85 and withheld for 1986–2001. Data on mercury stocks at consumers and dealers were reported in the MYB for 1939–97 and were reported in the MYB as not available for 1998 to the most recent year.

# **Apparent Consumption**

Data on consumption of mercury in the United States, by end use, are reported for most years in the MR and the MYB. Apparent consumption is assumed to be the same as reported consumption, unless otherwise noted. Consumption data were not available for 1900–06 in the MR and were estimated for these years using the following equation:

APPARENT CONSUMPTION = PRIMARY PRODUCTION + SECONDARY PRODUCTION + IMPORTS – EXPORTS.

For 1998 and 1999, apparent consumption has been estimated using the fill series, linear type function in Excel. For 2000, apparent consumption was derived using several assumptions described in Brooks and Matos (2005). Apparent consumption data were reported as not available in the MYB and MCS for 2001 to the most recent year.

#### Unit Value (\$/t)

Unit value is the value in current U.S. dollars of 1 metric ton (t) of mercury apparent consumption. Unit value is estimated from the average market price of mercury in U.S. dollars per flask as reported in MP98. For 1999 to the most recent year, unit value is estimated from the average market price of mercury in U.S. dollars per flask as reported in MCS, converted to U.S. dollars per metric ton of mercury. All mercury prices are based on the 76-pound mercury flask.

### Unit Value (98\$/t)

The Consumer Price Index conversion factor, with 1998 as the base year, is used to adjust unit value in current U.S. dollars to the unit value in constant 1998 U.S. dollars.

#### **World Production**

World mine production data are from the MR and the MYB. Mercury production data for the United States, primarily as a byproduct of gold, copper, and zinc mining, were withheld from world mine production data for 1993–97 and were not available for 1998 to the most recent year.
