APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): August 3, 2012

В.	DISTRICT OFFICE	FILE NAME	. AND NUMBER: JD	Form 3 of 3	: SAC 2011-01083-4	E Molltrak Property
ъ.	DISTRICT OFFICE	,	, min distribution of	10111113013	, 5/10 2011 01005 4	L mionician i roperty

ъ.	DISTRICT OFFICE, FILE WAVE, AND TOTAL OF STORMS OF STORM					
С.	PROJECT LOCATION AND BACKGROUND INFORMATION: State: South Carolina County/parish/borough: Sumter City: Center coordinates of site (lat/long in degree decimal format): Lat. 33.930032° N, Long80.317820° W. Universal Transverse Mercator: Name of nearest waterbody: Unnamed tributary of Turkey Creek Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Black River Name of watershed or Hydrologic Unit Code (HUC): 03040205-04 (Pocataligo River Watershed) Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request. Check if other sites (e.g., offsite mitigation sites, disposal sites, etc) are associated with this action and are recorded on a different JD form.					
D.	REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY): Office (Desk) Determination. Date: Field Determination. Date(s): February 22, 2012; May 7, 2012					
	CTION II: SUMMARY OF FINDINGS RHA SECTION 10 DETERMINATION OF JURISDICTION.					
	Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the iew area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain: .					
B.	CWA SECTION 404 DETERMINATION OF JURISDICTION.					
The	ere Are "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]					
	1. Waters of the U.S. a. Indicate presence of waters of U.S. in review area (check all that apply): TNWs, including territorial seas Wetlands adjacent to TNWs Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs Non-RPWs that flow directly or indirectly into TNWs Wetlands directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, including isolated wetlands					
	b. Identify (estimate) size of waters of the U.S. in the review area: Non-wetland waters: 200 linear feet: 11width (ft) and/or acres. Wetlands: 0.29 (W-1) acres.					
	c. Limits (boundaries) of jurisdiction based on: Established by OHWM., 1987 Delineation Manual, Pick List Elevation of established OHWM (if known):					
	 Non-regulated waters/wetlands (check if applicable):³ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional Explain: A linear feature, 1,795 linear feet in length, is located within the review area and determined to be non-jurisdictional. This feature is man-made and was originally constructed prior to 1949, according to aerials submitted 					

by the agent, to support agricultural and recreational land uses on this site. This feature was viewed during the site

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.
² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

³ Supporting documentation is presented in Section III.F.

visits and determined to have no OHWM and terrestrial vegetation growing in the bottom. This feature does provide a hydrological connection for the wetland labeled W-1 in the review area; however, due to the lack of an OHWM or other indicators of flow, this feature was determined to be a non-jurisdictional ditch.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

Identify TNW: .

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed size: 171,667 acres; HUC 03040205-04

Drainage area: 66 acres

Average annual rainfall: **50** inches Average annual snowfall: **0** inches

(ii) Physical Characteristics:

(a) Relationship with TNW:

☐ Tributary flows directly into TNW.

☐ Tributary flows through 2 tributaries before entering TNW.

Project waters are 30 (or more) river miles from TNW.

Project waters are 1 (or less) river miles from RPW.

Project waters are 25-30 aerial (straight) miles from TNW.

Project waters are 1 (or less) aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain: The project waters originate within Sumter County and do not cross or serve as state boundaries.

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

Creek. Turkey Creek flows into the Pocataligo River (pRPW), which flows into the Black River (TNW). Tributary stream order, if known: The pRPW is a 2nd order stream created by the intersection of two 1st order streams previously determined to be jurisdictional in SAC 2010-00396-4E. (b) General Tributary Characteristics (check all that apply): Tributary is: ■ Natural Artificial (man-made). Explain: The pRPW is a man-made tributary that comprises the western property boundary of the site. Manipulated (man-altered). Explain: **Tributary** properties with respect to top of bank (estimate): Average width: 11 feet Average depth: 5 feet Average side slopes: Vertical (1:1 or less). Primary tributary substrate composition (check all that apply): \boxtimes Sands Silts Concrete ☐ Cobbles ☐ Gravel Muck Bedrock ☐ Vegetation. Type/% cover: Other, Explain: Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: The tributary appears relatively stable with no erosion or sloughing banks observed. Presence of run/riffle/pool complexes. Explain: No run/riffle/pool complexes were observed. Tributary geometry: Relatively straight. Tributary gradient (approximate average slope): 0-1 % Flow: Tributary provides for: Perennial flow Estimate average number of flow events in review area/year: 20 (or greater) Describe flow regime: The tributary flows year round during normal climatic conditions.

Other information on duration and volume: The 2nd order stream receives flow from the upsteam pRPW (discussed in JD Form 2 of 3) and the off-site sRPW. This pRPW also receives flow from an adjacent wetland via a non-jurisdictional ditch and overland sheetflow. Further downstream, the pRPW receives flow from off-site adjacent wetlands which are included in the SND. Surface flow is: Discrete and confined. Characteristics: Subsurface flow: Unknown. Explain findings: Dye (or other) test performed: Tributary has (check all that apply): Bed and banks OHWM⁶ (check all indicators that apply): clear, natural line impressed on the bank the presence of litter and debris \times changes in the character of soil \boxtimes destruction of terrestrial vegetation \boxtimes shelving the presence of wrack line vegetation matted down, bent, or absent sediment sorting \boxtimes leaf litter disturbed or washed away scour sediment deposition multiple observed or predicted flow events water staining abrupt change in plant community other (list): Discontinuous OHWM. Explain: If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply): High Tide Line indicated by: Mean High Water Mark indicated by: oil or scum line along shore objects survey to available datum; physical markings; fine shell or debris deposits (foreshore) physical markings/characteristics vegetation lines/changes in vegetation types.

Identify flow route to TNW5: The pRPW on site flows southwest off site into a perennial RPW named Turkey

⁷Ibid.

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

☐ tidal gauges ☐ other (list):
(iii) Chemical Characteristics: Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain: The water in the tributary is consistent with other blackwater systems found in this watershed. The primary land uses in this watershed are agricultural land (43%), forested wetlands (25%), forested lands (23%), and urban land (6%). Other land uses include scrub/shrub land, non-forested wetlands and water. This tributary continues southwest through a portion of the City of Sumter prior to intersecting with Turkey Creek. According to the SCDHEC Watershed report, this area has a moderate to high potential for growth. Identify specific pollutants, if known: This tributary receives overland sheetflow from the adjacent fallow ag. fields and forested uplands and wetlands, which have been previously clear-cut. It is also located within urban land that is highly developed. Potential pollutants include herbicides, pesticides, and pollutants found in stormwater runoff. According to SCDHEC, the downstream monitoring station located on Turkey Creek (PD-098) indicates that aquatic life uses are fully supported; however, recreational uses are not supported due to fecal coliform bacteria excursions. Decreasing trends in turbidity and fecal coliform bacteria concentrations indicate improving conditions at this site. A TMDL developed by SCDHEC for this monitoring site states that a 94% reduction in fecal coliform bacteria is necessary for this stream to meet water quality standards.
(iv) Biological Characteristics. Channel supports (check all that apply): □ Riparian corridor. Characteristics (type, average width): □ Wetland fringe. Characteristics: The pRPW abuts off-site wetlands. □ Habitat for: □ Federally Listed species. Explain findings: □ Fish/spawn areas. Explain findings: □ Other environmentally-sensitive species. Explain findings: □ Aquatic/wildlife diversity. Explain findings: The pRPW provides important aquatic habitat in its drainage area, which consists mostly of uplands, and access by water-dependant species to the downstream TNW.
2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
(i) Physical Characteristics: (a) General Wetland Characteristics: Properties: Wetland size: 0.29 acres Wetland type. Explain: Palustrine scrub/shrub. Wetland quality. Explain: Slightly impaired due to the removal of vegetation within the wetland in the past. Project wetlands cross or serve as state boundaries. Explain: The project wetland originates within the property boundary and does not cross or serve as state boundaries.
(b) General Flow Relationship with Non-TNW: Flow is: Ephemeral flow. Explain: Flow occurs after storm events and during periods of extreme rainfall.
Surface flow is: Overland sheetflow Characteristics: .
Subsurface flow: Unknown. Explain findings:
(c) Wetland Adjacency Determination with Non-TNW: ☐ Directly abutting ☐ Not directly abutting ☐ Discrete wetland hydrologic connection. Explain: Drainage patterns within the uplands between W-1 and the
non-jurisdictional ditch located immediately north of the wetland provide evidence of a direct hydrologic connection which is continued via discrete and confined flow from the non-jurisdictional ditch to the downstream pRPW. Ecological connection. Explain: Separated by berm/barrier. Explain:
(d) Proximity (Relationship) to TNW Project wetlands are 30 (or more) river miles from TNW. Project waters are 25-30 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters. Estimate approximate location of wetland as within the 100 - 500-year floodplain.

(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: Surface water observed within the wetland was clear with no discoloration or oily

film observed. The primary land uses in this watershed are agricultural land (43%), forested wetlands (25%), forested lands (23%), and urban land (6%). Other land uses include scrub/shrub land, non-forested wetlands and water. This site is located east and immediately adjacent to the City of Sumter and the northeastern property borders US Highway 378/76. According to the SCDHEC Watershed report, this area has a moderate to high potential for growth.

Identify specific pollutants, if known: The wetland labeled "W-1" on the plat receives overland sheetflow from the adjacent uplands and is located immediately south of an abandoned racetrack. It is located adjacent to highly developed urban land within the City of Sumter. Potential pollutants include herbicides, pesticides, and pollutants found in stormwater runoff. According to SCDHEC, the downstream monitoring station located on Turkey Creek (PD-098) indicates that aquatic life uses are fully supported; however, recreational uses are not supported due to fecal coliform bacteria excursions. Decreasing trends in turbidity and fecal coliform bacteria concentrations indicate improving conditions at this site. A TMDL developed by SCDHEC for this monitoring site states that a 94% reduction in fecal coliform bacteria is necessary for this stream to meet water quality standards.

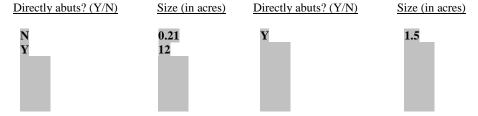

Riparian buffer. Characteristics (type, average width):	
Liparian burier. Characteristics (type, average within).	•
□ Vegetation type/percent cover. Explain: Salix caroliniana (Coastal Plain Willow), Woolgrass (Scirpus cype)	rinus),
and various rushes and grasses.	
☐ Habitat for:	
☐ Federally Listed species. Explain findings: .	
☐ Fish/spawn areas. Explain findings:	
Other environmentally-sensitive species. Explain findings: .	
Aquatic/wildlife diversity. Explain findings: This wetland provides unique habitat on a property predo	minately
consisting of uplands. Because this wetland consists of herbaceous vegetation and is seasonally inundated, it supports differ	ent
wildlife and aquatic species from the remainder of the site .	

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: 3

Approximately (72) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

Summarize overall biological, chemical and physical functions being performed: The wetlands and perennial RPW in the review area are contributing important biological, chemical, and physical functions to the downstream TNW. The wetlands and the pRPW make up an important ecological system with vital aquatic habitat that supports an variety of wildlife in an area that is adjacent to and within the City of Sumter and in a watershed with a moderate to high potential for growth. Due to the prevalence of agriculture land use and urban land use in this watershed and the impacts from pre-CWA manipulation of the site as well as more recent agricultural and silvicultural activities, these waters of the US are acting as a catch basin for the adjacent uplands by filtering sediments, herbicides, and other pollutants and by reducing the amount of flood waters reaching the downstream TNW.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The on-site wetland labeled "W-1" on the plat is providing a unique habitat on property that is predominately uplands. Based on observations of inundation and herbaceous vegetation during the site visit, W-1 is providing seasonally flooded habitat for water-dependent species and acts as a filter for pollutants received via overland sheetflow from the adjacent uplands. W-1 and the off-site adjacent wetlands are serving as catch basins during and after major storm events to reduce the volume and velocity of the downstream flow. Based on the above information, the perennial RPW and its adjacent wetlands have been determined to have a significant nexus to the downstream TNW (Black River).

 $Documentation\ for\ the\ Record\ only:\ Significant\ nexus\ findings\ for\ seasonal\ RPWs\ and/or\ wetlands\ abutting\ seasonal\ RPWs:$

	TERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL AT APPLY):
1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: ☐ TNWs: linear feet width (ft), Or, acres. ☐ Wetlands adjacent to TNWs: acres.
2.	RPWs that flow directly or indirectly into TNWs. Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: Based on a review of the topographic map and aerials, the tributary depicted as "PRPW" on the plat flows year-round. The aerials depict this tributary as a shaded linear feature, and the topographic map depicts a solid blue line that originates from the intersection of two solid blue lines at the western property boundary and continues southwest. This tributary has perennial flow based on the presence of an OHWM, disturbed leaf litter and debris, and two previous determinations. In SAC 2010-00396-4E, this tributary was determined to be a 2 nd order stream that has perennial flow. In SAC 2011-00301-4M, the upstream reach of this tributary was determined to have perennial flow. This PRPW is an unnamed tributary of Turkey Creek, which flows southeast into the Pocataligo River (pRPW). The Pocataligo River flows into the Black River (a TNW).
	☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
	Provide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: 200 linear feet 11 width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .
3.	Non-RPWs ⁸ that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply): Tributary waters: linear feet width (ft).

D.

⁸See Footnote # 3.

	Other non-wetland waters: acres. Identify type(s) of waters: .
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary i seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Provide acreage estimates for jurisdictional wetlands in the review area: acres.
5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
	Provide acreage estimates for jurisdictional wetlands in the review area: 0.29 (W-1) acres.
6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional wetlands in the review area: acres.
7.	Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below). Explain:
SU(DLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, GRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY CH WATERS (CHECK ALL THAT APPLY): 10 which are or could be used by interstate or foreign travelers for recreational or other purposes. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce. which are or could be used for industrial purposes by industries in interstate commerce. Interstate isolated waters. Explain: Other factors. Explain:
Ide	ntify water body and summarize rationale supporting determination:
	vide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: Wetlands: acres.
	N-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY): If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements. Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated based solely on the "Migratory Bird Rule" (MBR). Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain:

E.

F.

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

	Other: (explain, if not covered above):
fac	ovide acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR tors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional gment (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: . Wetlands: acres.
	ovide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such nding is required for jurisdiction (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet, width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: Wetlands: acres.
<u>SECTIO</u>	ON IV: DATA SOURCES.
	PORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked requested, appropriately reference sources below): Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Report by S&ME, Plat by Cox Surveyors. Data sheets prepared/submitted by or on behalf of the applicant/consultant. Office concurs with data sheets/delineation report. Office does not concur with data sheets/delineation report. Data sheets prepared by the Corps: Corps navigable waters' study: U.S. Geological Survey Hydrologic Atlas: USGS NHD data. USGS 8 and 12 digit HUC maps. U.S. Geological Survey map(s). Cite scale & quad name: Sumter East. USDA Natural Resources Conservation Service Soil Survey. Citation: pg. 70. National wetlands inventory map(s). Cite name: U42P, PF01Ad. State/Local wetland inventory map(s): FEMA/FIRM maps: 100-year Floodplain Elevation is: (National Geodectic Vertical Datum of 1929) Photographs: Aerial (Name & Date): 99:11204:98; SC DNR 2006. or Other (Name & Date): Previous determination(s). File no. and date of response letter: Applicable/supporting case law: Applicable/supporting scientific literature: Other information (please specify): Previous determinations on adjacent properties (SAC 2011-00301-4M, letter dated June 2011; SAC 2010-00396-4E, letter dated September 1, 2010).

B. ADDITIONAL COMMENTS TO SUPPORT JD: Based on a review of the topographic map and aerials, the tributary depicted as "PRPW" on the plat flows year-round. The aerials depict this tributary as a shaded linear feature, and the topographic map depicts a solid blue line that originates from the intersection of two solid blue lines at the western property boundary and continues southwest. This tributary has perennial flow based on the presence of an OHWM, disturbed leaf litter and debris, and two previous determinations. In SAC 2010-00396-4E, this tributary was determined to be a 2nd order stream that has perennial flow. In SAC 2011-00301-4M, the upstream reach of this tributary was determined to have perennial flow. This PRPW is an unnamed tributary of Turkey Creek, which flows southeast into the Pocataligo River (pRPW). The Pocataligo River flows into the Black River (a TNW)

The on-site wetland in the review area, labeled W-1 on the plat, was determined to be adjacent, non-abutting, to the PRPW. This wetland has a direct hydrological connection to the downstream RPW via a non-jurisdictional ditch and overland sheetflow, evidence of which was observed during the site visits. The non-jurisdictional ditch located between W-1 and the PRPW is separated from W-1 by uplands and drainage patterns were observed indicating that the inundated wetland provides flow to the non-jurisdictional ditch during and after periods of heavy rainfall. The non-jurisdictional ditch flows directly into the perennial RPW at the southwestern property boundary. The non-abutting wetland and its downstream PRPW were determined to have a significant nexus to the downstream TNW in Section III B&C above.

A linear feature, 1,795 linear feet in length, is located within the review area and determined to be non-jurisdictional. This feature is man-made and was originally constructed prior to 1949, according to aerials submitted by the agent, to support agricultural and recreational land uses on this site. This feature was viewed during the site visits and determined to have no OHWM and terrestrial

vegetation growing in the bottom. This feature does provide a hydrological connection for the wetland labeled W-1 in the review area; however, due to the lack of an OHWM or other indicators of flow, this feature was determined to be a non-jurisdictional ditch.
