APPROVED JURISDICTIONAL DETERMINATION FORM U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): October 1, 2012 DISTRICT OFFICE, FILE NAME, AND NUMBER: JD Form 2 of 50 (Reach A); SAC #1992-24122-4JH, Haile Gold Mine PROJECT LOCATION AND BACKGROUND INFORMATION:

State: South Carolina County/parish/borough: Lancaster City: Kershaw Center coordinates of site (lat/long in degree decimal format): Lat. 34.562341° N, Long. -80.553776° W. Universal Transverse Mercator: Name of nearest waterbody: Little Lynches River Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Lynches River Name of watershed or Hydrologic Unit Code (HUC): Little Lynches River: HUC 03040202-02 Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request. Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form. D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY): Office (Desk) Determination. Date:

SECTION I: BACKGROUND INFORMATION

Field Determination. Date(s): April 26-27, 2012, July 24-25, 2012

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There Are "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.

a.	a. Indicate presence of waters of 0.5. In review area (check all that apply):		
		TNWs, including territorial seas	
		Wetlands adjacent to TNWs	
	\boxtimes	Relatively permanent waters ² (RPWs) that flow directly or indirectly into TNWs	
		Non-RPWs that flow directly or indirectly into TNWs	
	\boxtimes	Wetlands directly abutting RPWs that flow directly or indirectly into TNWs	
	\boxtimes	Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs	
		Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs	
		Impoundments of jurisdictional waters	
		Isolated (interstate or intrastate) waters, including isolated wetlands	

b. Identify (estimate) size of waters of the U.S. in the review area:

Non-wetland waters: 5,712.83 linear feet: 40 width (ft) and/or acres.

Wetlands: 0.48 acres.

c. Limits (boundaries) of jurisdiction based on: 1987 Delineation Manual, Established by OHWM., Pick List Elevation of established OHWM (if known):

Non-regulated waters/wetlands (check if applicable):³

Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional
Explain: Documented on basis form 1 of 50.

Boxes checked below shall be supported by completing the appropriate sections in Section III below.

² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

³ Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

TNW

Identify TNW: .

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed size: 126,832 acres; Little Lynches River, HUC 03040202-02

Drainage area: 500 acres for this particular reach. The reach was determined to be from the downstream confluence of Haile Gold Mine Creek to the upstream confluence with Camp Branch.

Average annual rainfall: **45** inches Average annual snowfall: **<2** inches

(ii) Physical Characteristics:

(a) Relationship with TNW:

Tributary flows directly into TNW.

Tributary flows through 1tributaries before entering TNW.

Project waters are 20-25 river miles from TNW.

Project waters are 1 (or less) river miles from RPW.

Project waters are 20-25 aerial (straight) miles from TNW.

Project waters are 1 (or less) aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW⁵: Little Lynches River flows directly to the into Lynches River, a TNW. Tributary stream order, if known:

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

(b)	General Tributary Characteristics (check all that apply): Tributary is: Natural	:
	Tributary properties with respect to top of bank (estimate): Average width: 40 feet Average depth: 3 feet Average side slopes: Vertical (1:1 or less).	
	Primary tributary substrate composition (check all that apply Silts Sands Cobbles Gravel Bedrock Vegetation. Type/% cover. Other. Explain:	☐ Concrete ☐ Muck
with forested a	Tributary condition/stability [e.g., highly eroding, sloughing areas located on both banks; incised and vertical cut banks observed on the presence of run/riffle/pool complexes. Explain: Tributary geometry: Meandering. Tributary gradient (approximate average slope): 1-5 %	
.,	Flow: Tributary provides for: Perennial flow Estimate average number of flow events in review area/year: Describe flow regime: : Flow regime is at least 90% of Other information on duration and volume: Surface flow is: Discrete and confined. Characteristics: Co Subsurface flow: Yes. Explain findings: Indicators of hydrom, therefore, evidence of subsurface flow was observed in the Dye (or other) test performed:	the year under normal climatic conditions. 	☐ oil or scum line along shore objects ☐ su☐ fine shell or debris deposits (foreshore) ☐ ph	ral extent of CWA jurisdiction (check all that apply): High Water Mark indicated by: rvey to available datum; ysical markings; getation lines/changes in vegetation types.
	nemical Characteristics: naracterize tributary (e.g., water color is clear, discolored, oily f Explain: Little Lynches Watershed is characterized by 55 misc. vegetation communities. Lands immediately surrou fragmented with roads and historic mining operations an site is part of the blackwater system, characterized by na solids (TDS). Surface water composition is dominated by increased turbidity during storm events. The aquatic res	% forested, 30% agricultural, 5% urban land and 10% unding the site have been impacted from timbering and d/or land use practices. The aquatic environment of the turally occurring low pH(4.2-7.4) and low total dissolved calcium and sulfate. Water flows relatively clear with

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

⁷Ibid.

Little Lynches River. Segments of Little Lynches River are listed as impaired (303(d) listed) largely due to biological contaminants.

Identify specific pollutants, if known: See above Statement.

(iii) Biological Characteristics. Wetland supports (check all that apply):

before it enters the tributary.

	cate	and : vide f	logical Characteristics. Channel supports (check all that apply): Riparian corridor. Characteristics (type, average width): Tributary flows through a forested area that aerial photos site evaluation revealed includes wetlands. Both the upland and wetland forest areas shade and buffer the tributary filtering of runoff before it enters the tributary. Wetland fringe. Characteristics: Habitat for: Federally Listed species. Explain findings: Fish/spawn areas. Explain findings: Other environmentally-sensitive species. Explain findings: Aquatic/wildlife diversity. Explain findings: The tributary provides topographic and hydrologic changes in the
-		-	pport a variety of wildlife and species diversity.
2.	Cha	ıract	eristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
	(i)		General Wetland Characteristics: Properties: Wetland size: 0.48 acres Wetland type. Explain: Seasonally saturated, palustrine forested. Wetland quality. Explain: Current wetland condition is forested, fully functional. Project wetlands cross or serve as state boundaries. Explain: No.
reas	sonal		General Flow Relationship with Non-TNW: Flow is: Intermittent flow. Explain: Although no flow patterns were observed on previous site visits, it is assume during wetter months during the dormant season flow can occur in response to large rainfall events. Surface flow is: Not present Characteristics: No surface flow patterns were observed (see above B.2. (b)).
			Subsurface flow: Yes. Explain findings: Hydrology indicators such as saturation, high water table or surface water d in the wetland during the site visits. These indicators coupled with landscape position show the wetland contains e shallow subsurface/groundwater connection to the tributary. Dye (or other) test performed:
		(c)	Wetland Adjacency Determination with Non-TNW: ☐ Directly abutting ☐ Not directly abutting ☐ Discrete wetland hydrologic connection. Explain: A non-jurisdictional natural conveyance connects the 0.10
acre	e wet	land	to the tributary. Ecological connection. Explain: Separated by berm/barrier. Explain: .
		(d)	Proximity (Relationship) to TNW Project wetlands are 20-25 river miles from TNW. Project waters are 20-25 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters. Estimate approximate location of wetland as within the 500-year or greater floodplain.
	(ii)	Cha	emical Characteristics: racterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: Little Lynches Watershed is characterized by 55% forested, 30% agricultural, 5% urban land and 10% misc. vegetation communities. Lands immediately surrounding the site have been impacted from timbering and fragmented with roads and historic mining operations and/or land use practices. The aquatic environment of the site is part of the blackwater system, characterized by naturally occurring low pH(4.2-7.4) and low total dissolved solids (TDS). Surface water composition is dominated by calcium and sulfate. Water flows relatively clear with increased turbidity during storm events. The aquatic resource ultimately flows via direct surface connection to Little Lynches River. Segments of Little Lynches River are listed as impaired (303(d) listed) largely due to biological contaminants. https://dx.doi.org/10.1001/

Riparian buffer. Characteristics (type, average width): While the wetland is not truly riparian, it does act as a buffer

to the adjacent tributary which is a direct conduit to the downstream RPW and TNW. The wetland retains and filters runoff

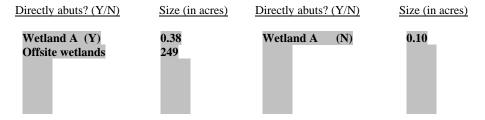

Page 4 of 8

	\boxtimes	Vegetation type/percent cover. Explain: Dominant vegetation is considered hydrophytic with approximately 80%
cover.		
	\boxtimes	Habitat for:
		Federally Listed species. Explain findings:
		Fish/spawn areas. Explain findings:
		Other environmentally-sensitive species. Explain findings:
		Aquatic/wildlife diversity. Explain findings: The wetland provides topographic and hydrologic changes in the
landscape tha	at su	pport a variety of wildlife and species diversity.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: **3** Approximately (250) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

Summarize overall biological, chemical and physical functions being performed: These wetlands contribute vital biological, chemical, and physical functions to the downstream TNW. This wetland system enhances wildlife diversity, acts as catch basins filtering sediment and pollutants from surrounding mining and silvicultural practices, supports the downstream food web, and provides nutrient fixation, flood attenuation and flow maintenance functions. See III.C.2. below for more details.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The wetlands adjacent to this perennial RPW include mixed hardwood/pine palustrine forested depressional wetlands. The wetlands which are similarly situated and adjacent to the RPW are collectively performing functions

consistent with following: Biological- A variety of biological functions are being performed which include providing breeding grounds, shelter, foraging, nesting and travel corridors for aquatic and wetland-dependent species. They enhance wildlife diversity through timber type changes and the transition between upland and aquatic systems. The wetlands are essential in providing collective primary productivity to downstream waters by supplying organic carbon, resulting in the nourishment of the downstream food web. Chemical- The wetlands and tributary within the review area are providing the important collective functions of removal of excess nutrients which are contributed by runoff from surrounding urban and silvicultural areas, reducing nitrogen and phosphorus loading downstream, and effectively preventing oxygen depletion that can result from eutrophication. Physical-The wetlands and tributary in the review area are collectively filtering sediments and pollutants carried by stormwater runoff from roads, urban development and silviculture areas. They are providing flood attenuation and flow maintenance functions by retaining runoff and releasing it slowly, which results in the reduction of downstream peak flows (discharge and volumes) and lower continuous flow volumes. Wetlands such as the ones identified in this reach are actively storing stormwater runoff from adjacent agricultural and silvicultural areas. Based on the collective functions described above and their importance to the biological, chemical, and physical integrity of the traditional navigable waters of Lynches River, it has been determined that there is a significant nexus between the relevant reach of the tributary and adjacent wetlands to the downstream TNW..

- Documentation for the Record only: Significant nexus findings for seasonal RPWs and/or wetlands abutting seasonal RPWs:
- D.

	•
	TERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL AT APPLY):
1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: ☐ TNWs: linear feet width (ft), Or, acres. ☐ Wetlands adjacent to TNWs: acres.
2.	RPWs that flow directly or indirectly into TNWs. Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The flow of onsite tributary was determined to be at least 90% of the year under normal climatic conditions. Stream geomorphic indicators of perennial flow observed were: continuous bed and bank, the channel within bed and banks had a firm sandy bottom clear of vegetation and debris, sediment bars/deposition bars located adjacent to the channel which is evidence of perennial flow. In addition, hydrologic indicators observed were: Leaves within the channel being continuously washed downstream, flowing water at time of site visit under drought conditions, wrack lines consisting of organic debris and misc. trash, and an even distribution of substrates (longitudinally) in the stream channel. The named tributary "Little Lynches River" flows and outfalls directly into Lynches River, a TNW.
	Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: Provide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: 5,712.83 linear feet 40 width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .
3.	Non-RPWs ⁸ that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: Wetland is directly abutting tributary; tributary flows through wetland.
	Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Provide acreage estimates for jurisdictional wetlands in the review area: 0.38 acres.

⁸See Footnote # 3.

	5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
		Provide acreage estimates for jurisdictional wetlands in the review area: 0.10 acres.
	6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
		Provide estimates for jurisdictional wetlands in the review area: acres.
	7.	Impoundments of jurisdictional waters. ⁹ As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below). Explain:
E.	SUC	LATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, GRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY CH WATERS (CHECK ALL THAT APPLY): 10 which are or could be used by interstate or foreign travelers for recreational or other purposes. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce. which are or could be used for industrial purposes by industries in interstate commerce. Interstate isolated waters. Explain: Other factors. Explain:
	Ide	ntify water body and summarize rationale supporting determination:
		vide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: Wetlands: acres.
F.		N-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY): If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements. Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated based solely on the "Migratory Bird Rule" (MBR). Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain: Other: (explain, if not covered above):
	fact	ride acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR ors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional ment (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: . Wetlands: acres.
		vide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such using is required for jurisdiction (check all that apply): Non-wetland waters (i.e., rivers, streams): linear feet, width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: .

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

SECTION IV: DATA SOURCES.
A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):
Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: Maps and report submitted by Ecological Resource Consultants, Inc. (ERC) dated January 6, 2012, Revised August 2012.
Data sheets prepared/submitted by or on behalf of the applicant/consultant.
Office concurs with data sheets/delineation report. The exact location where the data points were collected was not visited;
however, in general the data forms represent the typical soils, vegetation, and indicators of hydrology throughout the tract.
Office does not concur with data sheets/delineation report.

Wetlands:

acres.

B. ADDITIONAL COMMENTS TO SUPPORT JD: This JD form documents the jurisdictional status of the aquatic resources identified as "A". The aquatic resource identified herein is considered a Perennial-RPW; 0.38 acres of wetlands directly abutting the Perennial-RPW; and 0.10 acres of wetland adjacent, non-abutting the Perennial-RPW. The tributary is a named feature on the USGS quad and flows directly into the TNW. From the project site, Little Lynches River (tributary "A") flows approximately 25 miles to its confluence with Lynches River (TNW), which then flows to the Great Pee Dee River. The "recommended and practical limit of navigable waters of the US" is identified at the confluence of Little Lynches River and Lynches River (USACE Charleston District Navigability Study Report No. 10, 1977). The jurisdictional waters documented on this form include a tributary with perennial flow and its adjacent wetlands.
