

Figure 26. Trajectory in Spawning Stock Biomass (SSB) and Fishing Mortality rate (F, ages 3-7+) for summer flounder, 1997-2011. F35% is the proxy for the fishing mortality threshold Fishing mortality producing Maximum Sustainable Yield (FMSY); SSB 35% is the proxy for the biomass target Spawning Stock Biomass at Maximum Sustainable Yield (SSBMSY); 0.5*SSBMSY is the biomass threshold.
