

MISSION

Compliance, Safety, Accountability (CSA) is the Federal Motor Carrier Safety Administration's (FMCSA) enforcement and compliance program for preventing bus and truck crashes on our roads. CSA enables FMCSA and its State Partners to effectively identify the safety problems of motor carriers and their drivers. CSA also offers a methodology that enhances the measurement of a motor carrier's safety performance and adds innovative tools designed to correct safety problems.

MEASUREMENT

CSA offers a comprehensive measurement system by including all safety-based violations found during roadside inspections. In addition, when used to assess performance, these violations are weighted by their relationship to crash risk. The system assesses the safety performance of both carriers and drivers. As a result, it provides a thorough evaluation of safety performance.

METHODS OF INTERVENTION

The goal of CSA is to help FMCSA in its mission of preventing crashes, so it broadens interventions and reaches more carriers. The program is designed to draw carriers' attention to safety problems early so that they may correct them before crashes occur. Based on the risk posed by the carrier, the interventions may increase in severity and degree of interaction. This approach allows FMCSA and its State Partners to reach more carriers sooner, using less resource-intensive means while maintaining a strong enforcement presence.

FIELD-TESTED

CSA was designed, field-tested, and refined over five years prior to national launch in December 2010.

Throughout the test, FMCSA solicited feedback and listened carefully to enforcement staff, test participants, and industry safety experts. In response to input and test results, the agency continues to fine-tune the program as it progresses upon a phased national rollout.

ON AMERICA'S HIGHWAYS TODAY

As CSA rolls out, a concerted effort will continue to inform carriers and drivers of the changes, and to encourage all stakeholders to become more involved in their own safety management practices by understanding how CSA impacts them.

SAFETY AND CSA

CSA covers the full spectrum of safety issues: from how data are collected, evaluated, and shared to how enforcement officials can intervene most effectively and efficiently to improve safety on our roads. CSA's data analysis covers behavioral areas specifically linked to crash risk.

THE BASICS

CSA captures all on-road safety performance data (all safety-based roadside violations and crash data) and classifies it into seven specific categories of carrier/driver behavior, called **Behavior Analysis and Safety Improvement Categories (BASICS)**:

- | | |
|--------------------------------|-----------------------------------|
| Unsafe Driving | Hours-of-Service (HOS) Compliance |
| Driver Fitness | Controlled Substances/Alcohol |
| Crash Indicator | Vehicle Maintenance |
| Hazardous Materials Compliance | |

CSA'S INTERVENTION PROCESS

CSA's intervention process is designed to reach more carriers and drivers sooner, so that problems can be identified and corrected before a crash occurs. The interventions promote safety through several proactive tools designed specifically to compel safety compliance. These tools are:

Early Contacts:

- Warning Letter
- Carrier Access to Safety Data & Measurement
- Targeted Roadside Inspections

Investigations:

- Offsite Investigation
- Onsite Focused Investigation
- Onsite Comprehensive Investigation

Follow-on Corrective Actions:

- Cooperative Safety Plan
- Notice of Violation
- Notice of Claim
- Operations Out-of-Service Order

CSA'S FOCUS ON SAFETY

CSA includes making carriers' BASIC results available to Roadside Inspectors for use in inspection selection and to enable them to conduct a more effective and focused inspection.

CSA also expands FMCSA's current carrier-based safety programs to address individual problem drivers who elude such safety programs by moving from one employer to another. Under CSA, FMCSA identifies and addresses drivers with poor safety histories during interventions with motor carriers. For now, the focus is on driver enforcement for serious rule violations such as driving while disqualified or committing numerous HOS violations. Enforcement action may be taken directly against the driver for these violations.

A revised, more comprehensive Safety Fitness Determination (SFD) process is also a feature of CSA. As proposed, carrier safety fitness would be updated monthly based on roadside safety data along with the results of CSA investigations.

Together, these actions mean that everyone can be assured that their vigilance and hard work will bring the results we all want: safer highways for carriers, their drivers, and the entire motoring public.

A CHANGE THAT WILL BE NOTICED

CSA is a proactive, data-driven, performance-based national traffic safety program that transforms the way carriers, drivers, and compliance and enforcement personnel approach their jobs. It is critical that all stakeholders understand its impacts. To accomplish this, a dynamic, educationally based outreach effort has been ongoing. We hope you'll be part of it so that we can spread the word about CSA. The more enthusiasm we can build, the more effective CSA is.
