FOR E W O R D

This monograph recounts the development of the Combined Bomber Offensive Plan during the early months of Eighth Air Force bomber operations (17 August 1942 to 10 June 1943). The subject covered here is related to several other histories prepared by the AAF Historical Office: AAFRH-2, Origins of the Eighth Air Force: Plans, Organization, Doctrines to 17 August 1942; AAFRH-19, The Combined Bomber Offensive, April through December 1943; AAFRH-22, Strategic Bombing of Europe, 1 January to 6 June 1944; and other studies which narrate operations of the various air forces against European targets. The present study was written by Lt. Arthur B. Ferguson of the Combat Operations Branch.

Like other AAF Historical Office studies, this history is subject to revision, and additional information or suggested corrections will be welcomed.

Chapter I

THE PROBLEM

When 12 B-17's of the VIII Bomber Command took to the air on 17 August 1942 for a high-level daylight attack against the Sotteville Marshalling Yard at Rouen, they carried with them much more than a bomb load of trouble for the enemy. They carried with them a long heritage of debate and controversy. And they began an experiment in strategic bombardment which was to answer a number of questions vitally affecting the entire course of the war in Europe. The campaign began in an atmosphere of skepticism concerning the ability of U. S. heavy bombers to carry out daylight operations at high altitude in the face of powerful enemy fighter defenses, and of indecision concerning the precise nature of the bomber offensive toward which these American forces were supposed to contribute. It was not even clear at that date exactly how strategic bombardment from the United Kingdom should fit into the over-all strategic picture. By June 1943, however, the American bomber force was prepared to take its part in the Combined Bomber Offensive,* an operation possible only after all major doubts and indecisions, both tactical and strategic, had been for practical purposes removed. Toward the attainment of this end, the early operations of the Eighth Air Force contributed a vital, perhaps a determining influence.

* The CBO Plan, approved late in May 1943, outlined four phases for the combined operation, the first beginning with April of that year. Some reports on the progress of the CBO follow the plan and consider the offensive to have begun in April. The CBO Directive, however, was not issued until 10 June, and it is considered in the present study that all operations prior to that date are preparatory to the CBO proper.

AAPR-1E

2

~~CONFIDENTIAL~~

It would be a large labor of small value to trace in detail the story of these first 60-odd missions conducted from August 1942 to June 1943, or to treat them as if they constituted in themselves more than a minor, if highly effective, part of a vast undertaking. Those who are interested in the detail will find the mission reports voluminous, well arranged, and available. It will therefore be the purpose of this study to show how these operations became an active element in the strategic planning of the period and to follow the debate which, with constant reference to the doctrines and achievements of the Eighth Air Force, culminated in a plan for the full-scale Combined Bomber Offensive.

Among the controversial questions affecting the use of air power in the European Theater were certain strategic issues involving decisions on the highest policy-making level. By August 1942 these issues either had barely been settled or were still in the open forum. Although basic Allied war plans had indicated Germany as global enemy number one, it was still an open question to what extent U. S. heavy bombardment should be committed to operations in the European Theater at the expense of those in the Pacific. To the men in charge of the Pacific war, especially to the U. S. Navy, it seemed by no means clear that the war against Germany should receive unquestioned priority in air equipment, if indeed it should receive priority at all.¹

The Combined Chiefs of Staff had, in July 1942, decided that U. S. commitments to EOLMRO (the build-up of U. S. forces in the United Kingdom) should be readjusted for the purpose of furthering offensive operations in the Pacific.² Accordingly 13 combat groups, including 3 heavy

~~SECURITY INFORMATION~~

AMFRM-18

3

~~SECURITY INFORMATION~~

bombardment and 2 medium bombardment units, were to be diverted. It appears, however, that not all the groups were sent as planned, and the problem of diversion to the Pacific remained a source of considerable argument, much of which turned on the ability of the U. S. heavy bombers to do a job in northwest Europe of sufficient strategic value to justify the degree of priority required by a major aerial offensive in that area.

There was also the question of priority in production, a question by no means settled in August 1942, even on paper. Faced with the necessity of using limited resources to meet demands which seemed virtually unlimited, the higher authorities had to allot priorities carefully in accordance with very long-term strategic concepts. There was a very natural tendency in weighing the relative importance of air, ground, and naval equipment to give a relatively high place to those items--tanks and battleships--which had long tradition behind them, and to view with some caution the claims of air power to first priority. A bombardment offensive from the United Kingdom had been envisaged in the war plans as a necessary prerequisite to the invasion and ultimate defeat of Germany. The Air Corps had, in 1941, contended that, with adequate forces, they could carry out a bomber offensive which would make an assault on Festung Europa relatively cheap in men and ground materiel. But they had to have the aircraft, and have them in unprecedented numbers. That meant, in effect, first priority in production. The question again arose in the fall of 1942, this time in connection with a new statement of air requirements (AFD-42) which once more

~~SECURITY INFORMATION~~

A1FRH-18

4

~~CONFIDENTIAL~~

postulated a large-scale bomber offensive against the heart of Germany and which bore the same implications with regard to priority. This time the estimate became the center of a very critical debate.

The AAF argument on both these issues, priority for the European Theater and priority in production, rested on the assumption that it was feasible for U. S. forces to join the RAF in a bomber offensive against Germany's industrial and military system on a scale sufficient to weaken the enemy's ability to wage war to such an extent that a land invasion could be undertaken with a minimum of losses. Both American and British air men gave a heartily affirmative answer. But the answer given arose out of deep faith in the potentialities existing in long-range heavy bombardment aviation rather than from any sum of actual experience. The German efforts to cripple Britain in 1940-41 and the subsequent bombardment of Germany by the RAF had provided inadequate indications of what might be done. Both campaigns had been projected on too limited a scale to do more than hint at the possibilities inherent in the employment of really large bombardment forces. And scale, the proportion of the total war effort to be invested in the bomber program, was the crux of the argument; for no one denied that bombardment of the enemy's vitals would be a very beneficial thing, considered in the absolute, or that it would constitute a necessary part of the plan for the ultimate defeat of Germany. Moreover, the particular method of bombardment advocated by the AAF remained entirely an article of faith as far as tests in combat, under European conditions, were concerned.

~~SECURITY INFORMATION~~

AMFRM-18

5

~~CONFIDENTIAL~~

Thus the answer to the question regarding the feasibility of a full-scale bomber offensive against Germany in turn depended on the answer to another question essentially tactical in character. Since participation by the RAF was necessary to such an offensive, and since the AAF had become committed for the immediately foreseeable future to a policy of daylight bombing of precision targets from high altitudes, it was of the utmost importance to know whether the American bombers could really do this kind of job. Could they hit the targets accurately enough and often enough under European conditions, and with a sufficiently low percentage of losses, to make their contribution to a combined bomber offensive worth the necessarily huge investment? That is why, on 17 August 1942, the Eighth Air Force found itself being watched from all sides with a degree of intensity quite out of proportion to the extent of the actual operation undertaken.

They were being watched also for another and somewhat less fundamental reason. There was a strategic problem under consideration in August of that year which did not directly affect the concept of strategic bombardment of the European Axis but which did very definitely affect the method by which the heavy bomber forces were to be employed and for a time even jeopardized the entire project for a day offensive from the United Kingdom. It had been tentatively decided in July that BOLERO, including the air build-up, could no longer be given unquestioned priority. By midsummer the key to the strategic situation in Europe lay in the ability of the Russian Army, generally admitted to be potentially the greatest asset to the Allies in that critical year, to withstand the weight of German attacks. Something had clearly to be done,

~~SECURITY INFORMATION~~

AIRRH-18

6

~~CONFIDENTIAL~~

and very soon, to relieve this pressure on the Eastern Front. But the Allied invasion of Western Europe, projected for 1943, might well come too late, and might also prove to be a premature and dangerous undertaking, especially should the situation on the Eastern Front continue to deteriorate. The only remaining way of forcing substantial diversion of German forces, short of a costly and inconclusive minor action in northwest Europe (SLEDZIENNER), was to conduct a combined operation in North and Northwest Africa. But it was clear that any such campaign would necessarily postpone the full scale invasion of Europe (ROUNDUP) and, as a corollary, the prosecution of BOLERO.

The British were glad enough to defer the risks of a premature cross-Channel invasion, but they were concerned that the bomber offensive, in which they had invested both faith and forces, should not be abandoned. The U. S. Joint Chiefs of Staff assured them, however, that, although air units for the African invasion would have to come from BOLERO, it was planned that the AAF should operate against Germany from any suitable base and that, owing to the unfavorable weather in northwest Europe, Africa might offer a more suitable base of operations than England, at least for the winter months. It was accordingly decided late in July to continue BOLERO as the main Allied effort only so long as no other invasion effort became imperative, thus making ROUND-UP impracticable for 1943. If by 15 September 1942 the Russian situation still appeared critical, the decision to launch the African operation should be made at the earliest possible date before December 1942.³

~~SECURITY INFORMATION~~

AAFRM-18

7

~~CONFIDENTIAL~~

The decision to mount force, as the African invasion was called, would mean the diversion from the Eighth Air Force of a major proportion of its strength, both actual and planned. The combat units needed in Africa could hardly be obtained elsewhere, because all other active theaters had been allocated only enough to meet a minimum defensive requirement. It would also mean that a really effective day bomber offensive from the United Kingdom would have to wait until an African victory released the diverted combat units. If this course of action were to be pursued (and there was every reason in August to believe that it would) it would involve serious questions as to the advisability of continuing the U. S. bomber offensive from the United Kingdom at all, at least for the time being. There was some doubt whether the day bomber force, necessarily small in view of the proposed diversions, could produce results commensurate with the risk involved in exhibiting vitally important equipment prematurely to the enemy.⁴ And it came in the fall of 1942 to be seriously debated whether, in view of the unfavorable weather conditions in northwest Europe, it would not be wise to shift the entire bomber effort to African or Mediterranean bases.⁵ Here again the arguments could only be answered by operational data; and again it was up to the Eighth Air Force, even though handicapped by inadequate strength, to furnish the required information.

Although at this date the concept of daylight, precision bombing was on trial, and in some degree that of strategic bombardment as well, much had been done to prepare for a bombing offensive by the combined British and American air forces against the sources of Germany's war effort. After much negotiation with the British, plans had been laid

~~SECURITY INFORMATION~~

to organize, base, and equip a force of ~~five~~ units in the United Kingdom as part of the BULERO operation. By the end of the summer of 1942 the Eighth Air Force, as the units in the United Kingdom came to be called, had become a functioning organization under the leadership of Maj. Gen. Carl A. Spaatz, with appropriate subordinate commands--bomber, fighter, composite (for training purposes), and service. Under Brig. Gen. Ira C. Eaker, the bomber command (the one with which this study is almost exclusively concerned) had been organized in three wings: the first, under Col. Newton Longfellow, with headquarters at Bramton, the second, under Col. J. P. Hodges, with headquarters at Old Catton, and the third, under Col. C. F. Phillips, with headquarters at Elvoden Hall.⁶ Of the heavy groups allocated to the Eighth Air Force, only one had become operational by 17 August, although several more were in training, at staging areas, or en route from the United States.⁷

The RAF had, of course, been employing much larger forces in an offensive of its own. On the night of 3/4 March 1942, for example, the British bombers had been able to hit the Renault works, at Billancourt, on the outskirts of Paris, with 400 tons of high explosives in an operation which had very lasting effects.⁸

But in August 1942 the Allied air forces in the United Kingdom--even the RAF--were considerably better equipped with ideas than they were with aircraft. Both U. S. and British air men were adequately stocked with faith in the virtues of strategic bombardment. In this regard, as in that of air strength, the British were in a position somewhat senior to the Americans. They had been carrying on a bomber offensive against strategic objectives for many months, and, more significant,

SECURITY INFORMATION

MFRH-18

9

~~CONFIDENTIAL~~

they had faced since 1917 a military problem closely related to that with which they and their allies in the United Kingdom were confronted in 1942. In the U. S. a doctrine of strategic air operations had been developed largely since 1918 by a few forward-looking military thinkers who followed in the path dramatically indicated by General Mitchell.⁹ And it had been modified with particular reference to problems of hemisphere defense. To a considerable extent it remained an academic theory, the practical application of which was directed by logic and scientific experiment rather than by combat experience. British doctrine, on the other hand, stemmed directly from the cataclysmic experience of 1917-18 and had matured under the threat of just such conditions as had materialized since 1939.

In World War I, Britain had, for the first time in her history, been forced to commit a huge citizen army to land operations on the Continent of Europe. She had found it a costly policy. Strictly limited in her manpower, she had risked disaster in a land battle such as that in which the combatants were by 1917 engaged on the stabilized Western Front. In October of that year Winston Churchill had expressed his concern in a memo to the War Cabinet.¹⁰ This was, he said, a battle in which maneuver was no longer possible; the enemy could not be outflanked for the simple reason that there were no flanks in lines stretching continuously from the Alps to the sea. Only the Germans, by means of their submarine fleet, had succeeded in circumventing the rigidity of this fixed front. The answer was to him clear and compelling. Air power could strike at the life lines of Germany's war machine even more effectively than Germany's submarine offensive could operate

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

IAFRH-18

10

~~CONFIDENTIAL~~

against the sources of Allied power. It was becoming apparent, in view of the progressive exhaustion of manpower among all the combatant nations, that the character of the war was about to change from one of men to one of machines.¹¹ In this industrial war the nation that commanded the air could destroy the industrial power of the enemy and in the long run win. And the British Empire, relatively richer in material resources and industrial means than in available manpower, could if it wished, seize control of the air by a large program of air production, thereby redressing the balance of potential power in its own favor.

The plan for the bombardment of the interior of Germany by an Inter-Allied Bombing Air Force, maturing as it did in the autumn of 1918, came too late to have much effect on the course of that war. But the principles upon which it was built deserve some attention, for they became firmly rooted in British thinking. Apparently largely the work of British strategists, among whom Maj. Gen. H. M. Trenchard seems to have been the leading spirit, this plan was conceived on an ambitious scale. Germany's economic situation was analyzed and objectives chosen which would paralyze the chemical industry, the iron and steel industry, and the vital centers of transportation.¹² The targets to be attacked were, however, the city areas rather than the particular plants and facilities that gave them their strategic importance. Undoubtedly the planners came to this decision because the imperfect technical equipment available would place any more precise tactics out of the question. But it is also worth noticing that they had in mind the demoralization of the population in these areas as an end in

~~SECURITY INFORMATION~~

AIRFR-18

11

~~SECURITY INFORMATION~~
itself.¹³ Theirs was a concept of total aerial warfare that reflected a keen insight into the complexity and totality of all modern war effort.

Yet for all their belief in the interdependence of the parts in a combatant society, they insisted on the absolute necessity of concentrating their efforts on a few key objectives rather than spreading their attacks indiscriminately among a large number. Objectives "must be as small in number as is necessary for effective action to be taken on each one";¹⁴ and with limited resources effective action could not be taken on all or even on the majority of individually worthwhile objectives. Moreover, once attacks had been begun on a key area they must be pressed relentlessly.¹⁵

The policy intended to be followed is to attack the important German towns systematically. . . . It is intended to concentrate on one town for successive days and then to pass to several other towns, returning to the first town until the target is thoroughly destroyed, or at any rate until the morale of the workmen is so shaken that output is seriously interfered with.

Needless to say, results of this sort could be obtained "not by a few specially trained men but by whole bombing groups."¹⁶

Here, in essence, were the principles of strategic bombardment which the British developed, with little alteration during the early years of World War II. And they are the principles on the basis of which the British entered into the Combined Bomber Offensive.

The situation in 1942 was in some respects different from that of 1918, but the major differences were entirely in favor of strategic bombardment. Whereas in 1918 first priority had to be given to the use of aviation in direct support of ground operations, with residual

~~SECURITY INFORMATION~~

AAFRH-18

~~CONFIDENTIAL~~

12

power alone invested in long-range bombing, by 1942 long-range bombardment had become the only means by which the Allies could strike at the heart of the German war effort. So it was a convinced group of men who were entrusted with the deployment of the RAF in 1942, a group convinced by experience and by long study. Their program had its opposition from those whose faith in the other armed services equalled that of the air men in theirs and who, like their counterparts in the U. S., feared the investment of too great a proportion of the total national resources in the equipment of a bombardment force. But, from the prime minister down, there was a general feeling that Germany could only be effectively defeated after having first been subjected to a systematic aerial pounding at the nerve centers of her industrial system. And it is neither surprising nor accidental that Frenchard (now Lord Frenchard) should be found urging in a widely circulated state paper the necessity for investing to the utmost in heavy bombardment aviation rather than in the weapons of land and sea warfare. To do otherwise, he warned, would be to engage in a battle on the enemy's own terms. In short, it would be to return to 1918, which would be disastrous.¹⁷

It would be difficult to estimate the degree of influence exerted by these British strategists on the U. S. proponents of strategic bombardment. Put in reconstructing the climate of opinion out of which the Combined Bomber Offensive emerged it would be dangerous to minimize the significance of their ideas both as to content and historical priority.

~~SECURITY INFORMATION~~

AIR FORCE-18

13

~~CONFIDENTIAL~~

To be sure, the British and U. S. air forces differed radically in their conception of the methods by which strategic bombing should be carried out. The former remained convinced of the virtues of area bombardment. This decision was dictated in part by a deeply rooted conviction that the social structure and morale of industrial populations constituted a primary objective. While admitting an objection on military and humanitarian grounds to indiscriminate bombing of non-military objectives, they hoped by means of widespread destruction of housing, utilities, and transportation so to disrupt the social system that the war economy which ultimately depended on it would crumble. "Or did they overlook the intangible element of nerve strain induced by the confusion, uncertainty, and fatigue that would inevitably accompany bombardment of populated areas. In part the decision to conduct area bombing was dictated as in 1918 by the necessity, given limited aircraft strength and productive capacity, of hitting the enemy immediately where attacks could do most damage; hence a preference for the great industrial concentrations in the Ruhr Valley and for targets consisting of communications centers and the industrial communities surrounding them.¹⁸

Objectives of this sort could be hit with just as good effect at night as by day and with considerably less risk. The RAF had therefore developed night bombardment as their main tactical policy. They had carried on daylight attacks on precision targets, but these were small raids and exceptional. Generally speaking, British experience had indicated that day operations were costly with the equipment at hand;

~~SECURITY INFORMATION~~

ALPH-18

~~CONFIDENTIAL~~

14

and limited experience with the early B-17 and B-24 types had not convinced the British observers that the Americans had solved the problems of daylight bombing. They admitted that they might some day turn to daylight bombing, but for the time being they remained committed to night operations.

The USAAF, on the contrary, was just as irrevocably committed to daylight precision bombing. The B-17, equipped with its special bombsight, had been developed to operate against small targets, particularly such naval targets as might conceivably be encountered in defense of the United States. It was hoped that, with their heavy armor and armament and their ability to fly at high altitude, the B-17 and B-24 bombers could be used just as effectively and with a minimum of loss in the European Theater. It was readily recognized that the weather conditions and the antiaircraft defenses in that area would seriously test the American bombers; but U. S. air men were unwilling to discard the best day bombers in the world in favor of night operations from the United Kingdom, especially since they had profound faith that, with careful handling and some modification, these planes could be made to do a job quite beyond the capabilities even of the Lancaster.

So it was that, when AF planners first outlined the part to be played by U. S. heavy bombardment forces in an offensive against Germany,¹⁹ they selected target systems consisting mainly of small, precision objectives--the electric power grid, the transportation system, oil and petroleum plants, aircraft factories, aluminum and magnesium plants, submarine installations, and naval bases. They contemplated turning to

~~SECURITY INFORMATION~~

AMFRH-18

15

~~CONFIDENTIAL~~
area bombing of populous centers only after it had become evident that civilian morale was ready to crack.

It would be easy to misinterpret this divergence of method as a conflict of purpose. Some journalistic observers made this mistake in the summer of 1942.²⁰ Actually, while there remained some understandable doubt concerning the ability of the American heavy bombers to carry out daylight missions successfully, it was generally accepted in RAF and AAF headquarters that the day and night bomber programs would be mutually supplementary rather than in opposition to each other. They would relieve the congestion on British airfields by dividing the operating time between the two forces. And they would make it possible to subject German towns to 24-hour bombardment which would greatly increase the effectiveness of a combined offensive. General Sakor had made these points clear in a report dated 20 March 1942, in which he had emphasized the essential compatibility of the two tactical doctrines.²¹ In so doing he implied the principle of the coordination of mutually supplementary day and night attacks which became an explicit and essential element in the Combined Bomber Offensive Plan.

That principle received its first formal definition in a "Joint/American/British Directive on Day Bomber Operations involving Fighter Cooperation," dated 20 August 1942, which stated that "the aim of the day bombardment by Allied Air Forces based in Great Britain is to achieve continuity in the bombing offensive against the Axis."²² In order to bring this continuous pressure to bear on the enemy, night bombardment would remain the responsibility of the British Bomber

~~CONFIDENTIAL INFORMATION~~

THIS PAGE Declassified IAW EO12958

AMTR-18

16

Command, leaving day operations primarily up to the Eighth Air Force. Specifically, "the method of achieving the aim of day bombardment is by the destruction and damage of precise targets vital to the Axis war effort."

This directive, then, set forth the official basis upon which the Eighth Air Force and the RAF were to implement the project for a bomber offensive. The day offensive was to be developed in three phases marked successively by the presumably progressive ability of the American force to provide its own fighter protection and "to develop the tactics of deep penetration of the enemy day fighter defense." The selection of objectives for day operations would be made by the Commanding General, Eighth Air Force and "A.C.A.S. (Assistant Chief Air Staff) (Opns.) as occasion demands." Operations would be initiated by the Commanding General of the VIII Bomber Command until such time as the American fighter forces had been built up sufficiently to assume their full share of activity, at which time the Commanding General of the VIII Fighter Command would share with his colleague of the VIII Bomber Command the responsibility for developing tactical plans. In all phases of the offensive, it would be the duty of the commanding general of the American fighter command to coordinate any combined fighter operations with the Air Officer Commanding-in-Chief, RAF Fighter Command. In the first phase this latter officer would share responsibility for detailed plans relating to the British fighter participation. By the time the last phase had been inaugurated, in which the American force would provide its own fighter cover, all tactical planning was to be

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AAFRH-18

17

the responsibility of the American commanders.

It should be noted that this directive dealt almost exclusively with the machinery for the tactical employment of the American force, especially its fighters. Because all early missions, and presumably a good many others, would have to be flown under extensive RAF fighter cover, the problem of most immediate concern was naturally that of coordination on the tactical level. The question of target selection, ultimately the crucial one, was left undefined.

THIS PAGE Declassified IAW EO12958

AFRH-18

~~CONFIDENTIAL~~

EIGHTH AIR FORCE OPERATIONS, 17 AUGUST 1942 TO 20 OCTOBER 1942

The First 14 Missions

The first combat mission flown by the Fortresses of the VIII Bomber Command¹ could not have been more fortunately timed. Considerable "polite doubt" regarding the potentialities of the American bombers had existed in the minds of British observers in the summer of 1942, and on 16 August Peter Masefield, Air Correspondent to the Sunday Times, gave voice to an unqualified opinion in words which bristled with "plain speaking."² He expressed British satisfaction at the prospect of American aid in the bombing of Germany. But he also made it perfectly plain that he considered the B-17 and the B-24 quite unsuited to the job of bombing over heavily defended enemy territory:

American heavy bombers--the latest Fortresses and Liberators--are fine flying machines, but not suited for bombing in Europe. Their bombs and bomb-loads are small, their armor and armament are not up to the standard now found necessary and their speeds are low.

It was not simply, this correspondent made clear, that the American bombers could not perform the day bombardment mission for which they were being developed. They were likewise unsuited to night operations over Germany, and, in spite of the general desire in the United Kingdom to see these aircraft take part in the night offensive, it would be unfair to the American flyers to send them into a type of action for which, according to British experience, they were not equipped. Masefield found the answer to this seemingly insoluble problem of using bombers that were good for neither day nor night operations, by advocating that they be sent out on patrol missions over the Atlantic

19

submarine and shipping lanes.

The appearance of this article by one who presumably reflected opinion in at least some official British circles gave rise to a certain amount of concern in USAF Headquarters. The following day General Arnold, on receiving the London dispatch which covered the Massfield article, wired General Spaatz for a statement of the facts in the case as he saw them.³ General Spaatz was happily spared from having to fall back on tedious and at best none too convincing apologetics, for, as a result of the mission against Rouen on 17 August, he was able for the first time to offer a combat report.

The attack on Rouen had, he wired on 18 August, far exceeded in accuracy any previous high-altitude bombing in the European Theater by German or Allied aircraft. Moreover, it was his understanding that the results justified "our belief" in the feasibility of daylight bombing. As for the B-17, it was suitable in speed, armament, armor, and bomb load for the task at hand. He would not, he asserted, exchange it for any British bomber in production.⁴

The target for this first heavy bombing mission was the Sotteville Marshalling Yard, which was one of the largest and most active in northern France. Concentrations of more than 2,000 freight cars had been photographed there. It possessed for the enemy a two-fold importance. It was a focal point for traffic to and from the Channel Ports and the west of France; and it comprised extensive repair installations, including a large locomotive depot (capacity estimated at 200 to 250 engines) and the Buddicum rolling-stock repair shops.⁵ Germany's shortage of locomotives and rolling stock had become acute since April 1942.

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

AFWHR-18

20

~~SECURITY INFORMATION~~

In or about that month a change had been noticed in German war production which involved raising the construction and repair of locomotives and freight cars to a priority equal to that of aircraft, tanks, and submarines.⁶ Moreover, strict regulations were in effect throughout the Reich and the occupied countries requiring the most expeditious handling of traffic in order to make the best possible use of the inadequate equipment available.⁷ Consequently, any attack which would damage or destroy the servicing and repair facilities of the Sotteville Yard or interfere with its normal operations would contribute to the mounting strain under which the Axis railway system was laboring. The actual aiming points were the large locomotive workshops and the Buddicum repair shops.

Twelve B-17's of the 97th Group (the only group in the VIII Bomber Command at that date on operational status) took off late in the afternoon to attack the target while six others from the same unit flew a diversionary mission under heavy fighter cover. Four RAF squadrons of Spitfire IX's provided close cover for the attacking planes flying with them to the target area. Five RAF squadrons of Spitfire V's gave withdrawal support. Visibility was excellent and all twelve planes bombed the target, dropping a total of 36,900 pounds of general purpose bombs from an altitude of 23,000 feet. Three of the bombers had been loaded with 1,100-pound bombs intended for the locomotive workshop, the rest carried 600-pounders car-marked for the Buddicum shops.⁸

~~SECURITY INFORMATION~~

AIRRH-18

21

~~CONFIDENTIAL~~

The bombing was fairly accurate, especially for a first effort. Approximately half of the bombs fell in the general marshalling yard area. One of the aiming points was hit, and several bombs burst within a 1500-foot radius. The bombs intended for the other fell for the most part about 2,000 feet to the south around the transshipment sheds, indicating that some of the crews may have mistaken these buildings for one of the two aiming points.⁹ Fortunately the yard and adjacent facilities presented a large target, so that even technically inaccurate bombing might still be effective.

And it was effective enough, considering the small size of the attacking force. Direct hits were scored on the two large transshipment sheds in the center of the marshalling yard, and about 10 of the 24 tracks on the sorting sidings were damaged. A quantity of rolling stock on the tracks or near them had been destroyed, damaged, or derailed. As it happened, activity in the yard was not at its peak when the attack occurred, or destruction of rolling stock might have been much greater. Damage to the tracks no doubt interfered with the flow of traffic, but a sufficient number remained intact to deal efficiently with the relatively low-pressure traffic then moving through the yard. The bottlenecks at each end of the sidings were not damaged. The locomotive workshop received one direct hit which probably slowed up the movement of locomotives and other rolling stock in and out of the building in addition to achieving constructional damage resulting from blast.¹⁰ Despite the inconvenience that this attack undoubtedly caused the enemy, it was clear that a much larger force would be required to do lasting damage to a target of this type.¹¹ But for the

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

~~CONFIDENTIAL~~

AIRER-18

22

time being the extent of the damage inflicted was less important than the relative accuracy of the bombing.

Important also was the fact that the bombers had come through with no losses and with a minimum of damage. Enemy opposition had been slight. Antiaircraft fire was observed at two places, but from it only two planes sustained damage, and that of only slight extent. Fighter opposition was negligible. Three Me-109's attacked the formation and several others put in a silent appearance. Of those attacking, one was claimed as damaged by fire from the B-17's. The bomber crews suffered no injury at all from enemy action, the only casualties having occurred when a plane hit a pigeon and the shattered glass in the nose slightly injured the bombardier and navigator.¹²

General Laker himself led the mission and made some interesting observations on the operational problems uncovered by this initial combat test.¹³ The crews were enthusiastic and alert, but nonchalant to the point of being blasé. It had all been possibly too easy, but confidence was a good fault. Crew drills, especially in the handling of the oxygen equipment, appeared to be indicated and air discipline needed improvement. A better, tighter defensive formation would offer more protection against enemy fighters. The critical items in missions of this sort General Laker considered to be the split-second timing for rendezvous with the fighters (the timing in this instance had been a few minutes off), navigation to the target (there would not always be weather so fine that the target would be visible for ten miles), training of bombardiers (the Sotteville Yard was, after all, considerably larger than a pickle-barrel), pilotage of such a high order that

~~TOP SECRET INFORMATION~~

AAFRH-18

23

~~CONFIDENTIAL~~

a tight yet maneuverable formation might be flown, with the shortest possible level run on the target (anything less would court disaster from flak and fighter opposition, both of which might be expected to improve greatly), and, finally, accurate gunnery, the sine qua non in self defense for bombers.

Like General Spaatz, General Baker was impressed with the performance of his B-17's. Yet he was unwilling to say that they could make deep penetrations into Germany without fighter escort and without excessive losses, even though it was apparent that the German fighters would approach them gingerly.¹⁴ General Spaatz shared his caution on this point, asserting in his cable of 18 August that American bombers would not be sent indiscriminately into Germany, and that depth of penetration would increase only as experience dictated. Meanwhile, pending determined enemy fighter attacks, no definite conclusions could be reached regarding the feasibility of bomber attacks unsupported by fighters.¹⁵

The first mission had given a great boost to morale, not only in headquarters but among the operating personnel.¹⁶ The next mission did nothing to reduce that warm feeling of accomplishment, for on the 19th 24 B-17's made an attack on the Abbeville/Drucat airdrome which called forth a letter of commendation from Air Marshal Sir Trafford Leigh-Mallory.¹⁷ The mission had been planned as a part of the air operations undertaken in connection with the Dieppe raid. According to Leigh-Mallory it appeared "that the raid on Abbeville undoubtedly struck a heavy blow at the German fighter organization at a very critical moment during the operations" and thus "had a very material effect

~~SECURITY INFORMATION~~

AAFRH-18

24

~~CONFIDENTIAL~~

on the course of the operations." RCAF fighter pilots flying over the airfields on the day following the attack reported the main dispersal area to have been apparently "completely demolished." Subsequent reconnaissance indicated somewhat less devastation, although a hangar had received a direct hit and 89 fresh craters had appeared on or in the neighborhood of the airfield.¹⁸

It was not until Mission 9, on 5 September 1943, that the bomber Command again equalled the force sent out on the 19th. The intervening six missions saw an average of only 12 aircraft take off, and of the 72 B-17's dispatched on these missions 10 had been forced to turn back or were unable to bomb, mainly as a result of mechanical failures. The targets consisted of the Longueau marshalling yards at Amiens, a vital focal point in the flow of traffic between France and northern Germany; the Wilton Shipyard in the outskirts of Rotterdam, the most modern shipyard in Holland and one used to capacity by the Germans for servicing surface vessels and submarines; the shipyard of the Ateliers and Chantiers Maritime de la Seine, at Le Trait; the well-equipped airplane factory of Avions Fofoz at Beauvais, an installation used extensively by the enemy as a repair depot for the near-by fighter base; and the Courtrai/Levelghem airfield, in use by the Germans as a base for their Fw-190 fighters. All lay within easy fighter range and required at most only shallow penetration of enemy-occupied territory. Only two, Le Trait and Courtrai/Levelghem, had been subject to RCAF attacks, in each case on a small scale.¹⁹

~~CONFIDENTIAL INFORMATION~~

~~CONFIDENTIAL~~

AIRFR-13

25

These six missions followed the pattern laid down by the preceding two. The B-17's flew under heavy fighter escort, provided largely by the RAF, and bombed from 22,000 to 26,000 feet in circumstances of generally excellent visibility. They encountered for the most part only slight enemy opposition. No B-17's were lost. Nine of the bombers were slightly damaged and a few of the crew members injured by flak, which at this date varied greatly both in intensity and accuracy. With one exception the bombers encountered few enemy aircraft, although the fighter escort tangled with several, claiming two destroyed, nine probably destroyed, and nine damaged, at a cost of four of their own number lost.²⁰

The exception referred to took place on Mission 4 when, on 21 August, the bombers made an unsuccessful attempt to attack the Wilton Shipyard. It appears that the B-17's were 16 minutes late for their rendezvous with the RAF fighter escort and that as a result the escort was able to accompany them only half way across the Channel. The formation received a recall message, but by that time it was over the Dutch coast. While unescorted it was attacked by 20 to 25 F-109's and F-190's. A running fight ensued which lasted for 20 minutes, during which time both the pilot and co-pilot of one B-17 were wounded, the co-pilot so seriously that he died soon after. The gunners claimed two enemy fighters destroyed, five probably destroyed, and six damaged. It was the first time the Fortresses had been exposed to concerted fighter attack without the protection of friendly aircraft, and the results no doubt impressed the enemy pilots with the ability of the

AMFRN-18

26

~~CONFIDENTIAL~~

Fortress to defend itself.²¹

Bombing accuracy continued to be good for as yet inexperienced crews. In each case enough high-explosive and incendiary bombs fell in or near the target areas to prompt General Sator to predict that 40 per cent could in the future be expected to fall within a radius of 500 yards from the aiming point.²² These half dozen missions demonstrated again, however, that bombing which might be considered fairly accurate might not produce a corresponding measure of damage to the target. On the mission to Le Trait, for example, although 12 bombs out of a total of 43 dropped were plotted within 500 yards of the aiming point, no material damage was apparently done to the shipyard installations themselves. Again in the attack on the Potez aircraft factory ten craters were made which paralleled the target, close enough to it to be considered fairly accurate, but far enough to land for the most part harmlessly in open fields. On the other hand, the mission against the marshalling yard at Amiens/Longueau and that against the Wilton Shipyard (Mission 6) did significant damage to vital target installations.²³

In Mission 9, mentioned above as occurring on 5 September 1942, the American bombers again struck at the Rouen-Sotteville marshalling yard. It was a significant mission for two reasons: it dealt more lasting damage to the enemy than had any previous attack, and it had certain other effects, less tangible but none the less important, involving public opinion in occupied France. It was also a larger

~~SECURITY INFORMATION~~

AIRBN-18

27

~~CONFIDENTIAL~~

mission than any hitherto staged. Thirty-seven S-17's took off, 25 from the now experienced 97th Group and 12 from the 301st, the latter on their first combat mission. Thirty-one bombed the target (the locomotive depot), the remainder having been unable to drop their bombs on account of mechanical failures. The bombers met little enemy opposition, although the RAF fighters supporting them had a few combats with Fw-190's.²⁴

A large percentage of the bombs, almost one-fifth of the high-explosive bombs dropped, burst within the marshalling yard installations.²⁵ Large numbers of "wagons" and several tracks were destroyed. Of particular importance were direct hits on the locomotive depot and surrounding tracks, and on the transshipment sheds, both of which had been hit on the mission of 17 August. Photo reconnaissance accomplished almost a month later, on 2 October, indicated that, while practically the entire damage to the running lines throughout the yard had been repaired, the transshipment sheds and the locomotive depot were in only very restricted operation. On 8 August, 40 locomotives had been observed on the tracks around the latter; now only 18 could be detected. It is also probable that several engines had been destroyed or seriously damaged.²⁶

To the French population the success of the mission appeared less marked than it had to observers in the United Kingdom. Actually, a large number of bombs had fallen outside the marshalling yard, many of them in the city itself, and several far enough from the target to seem to a ground observer to have borne little relation to any precise

~~SECURITY INFORMATION~~

AIRPL-18

~~CONFIDENTIAL~~

28

aiming point. As many as 140 civilians, mostly French, had been killed, and some 200 wounded.²⁷ One bomb was reported to have hit the city hospital, penetrating from roof to cellar, but fortunately not exploding.²⁸

Beginning with the tenth mission on 6 September, the VIII Bomber Command encountered greatly increased fighter opposition. Indeed it was during that day's operations over occupied France that the command suffered its first loss of aircraft in combat. Hitherto it had appeared that the B-17's bore charmed lives; but then the enemy attacks had been light in weight and tentative in character. From now on, the Fortresses had a chance to show what they could do in the face of relatively heavy and persistent fighter resistance. As a matter of fact, it was difficult to avoid the fighters if they were deployed in such a way as to be available for interception and if the enemy wished to commit them to combat with the bombers. Diversionary sweeps could be counted on to draw off some of the fighters and to confuse the dispatchers, but every operation was still pretty much an open book to the Germans. Their RDF could tell when the bomber force took off and the approximate numbers; and they could consequently put up whatever force they had available to meet the attack.²⁹

On 6 September, the heavy bombers of the 37th Group, augmented to a strength of 41 by elements from the newly operational 92d Group, aircraft were sent out to strike the Avions Potez factory at Beauvais. In order to keep enemy fighters on the ground and provide a diversion for the main force, 13 L-17's of the 201st Group attacked the German fighter airdrome at St. Omer/Honguemesse, probably for a similar reason,

~~SECURITY INFORMATION~~

AAFRH-18

29

~~CONFIDENTIAL~~

12 B-17's of the 15th Bombardment Squadron (Light) attacked the Abbéville/Drucat airdrome.³⁰ Apparently these diversionary efforts failed, however, for all crews on the primary mission reported continuous encounters from the French coast to the target and from the target to the French coast. As a result of possibly as high as 45 to 50 encounters, mostly with Fw-190's, the B-17 crews claimed 4 enemy aircraft destroyed, 19 probably destroyed, and 20 damaged. Two of the heavy bombers failed to return: one was observed going down over enemy territory, the other was apparently lost in the Channel. Many encounters also took place between Fw-190's and the supporting RAF fighters, the latter claiming two of the enemy probably destroyed and five damaged. In all, three Spitfires were lost.³¹ The bombing at Neaulte seems to have suffered little in accuracy from the distracting fighter attacks, for it was, if anything, more accurate than on the previous attack against the same target, and probably more effective.³²

A similarly bitter aerial battle resulted when, on 7 September, a force of 29 B-17's made an ineffective attack on the Wilton Shipyard near Rotterdam, but it was the weather rather than the enemy that frustrated the bombers. Again the claims registered by the bomber crews were surprisingly high: 12 destroyed, 10 probably destroyed, and 12 damaged.³³ Yet, even discounting the enthusiasm of the gunners, it was evident that the Fortresses could take care of themselves in a surprisingly competent fashion.

~~CONFIDENTIAL INFORMATION~~

AMEM-18

30

~~SECURITY INFORMATION~~

They did not again have the opportunity to test their ability in this direction until 2 October. Meanwhile some persistently bad weather, together with a directive ordering all combat activity of the Eighth Air Force to take second place to the processing of units destined for North Africa, discouraged further operations. The only bombing effort attempted during the intervening period had to be abandoned on account of impossible atmospheric conditions.³⁴

On 2 October, 62 B-17's and 12 B-7's were dispatched on four separate missions. The light bombers attacked a German raider in the drydock at Le Havre. Forty-one B-17's, nine of which aborted, were detailed to administer a third pounding to the Avions Potez aircraft factory at Saulieu. Six of the heavies attacked the German fighter airbase at St. Omer/Lonquenesse for the second time. And 13 B-17's made a diversionary sweep to the coast of France. All bombers returned. The forces attacking Potez and St. Omer met constant and stubborn fighter opposition. So many encounters took place that crews had to be interrogated a second time and even then the results were apparently considered too high.³⁵ The figures cabled from London on 3 October credited the B-17 crews with 10 enemy aircraft destroyed, 25 probably destroyed and 11 damaged. More conservative estimates placed the results at 9 destroyed, 9 probably destroyed, and 5 damaged.³⁶ This aerial battle was all the more remarkable because the heavy bombers had flown under the cover, direct or indirect, of a total of some 400 fighter aircraft, in spite of which the Germans had been able to drive home their attacks on the bombers. Whatever damage was inflicted on the aircraft repair and airbase facilities, and several direct hits were scored, was swallowed up in the

31

enthusiasm engendered by the remarkable defensive power displayed by the Fortresses. Eighth Air Force officers believed this engagement showed that they could penetrate beyond the tactical radius of operations of the supporting fighters provided sufficient numbers of bombers were employed to force dispersion of the enemy's fighter force.³⁷

The day-bombing campaign reached something of a climax in the mission against Lille on 9 October. It was the first mission to be conducted on a really adequate scale and it marked, as it were, the formal entry of the American bombers into the big league of strategic bombardment. Then, for the first time, the German High Command saw fit to mention publicly the activities of the Flying Fortresses, although they had already made 13 appearances over enemy territory. Lille's heavy industries contributed vitally to German armament and transport. The most important of these industries, the steel and engineering works of the Compagnie de Fives-Lille and the locomotive and freight-car works of the Ateliers d'Hellemmes, constituted one composite target. Those contiguous objectives, among the most significant of their kind in France, had been attacked on three previous occasions by the RAF. Though conducted on a modest scale, these British raids had dropped over 46 tons of bombs and had done a fair amount of damage, especially to Fives-Lille.³⁸

The mission had been planned on an unprecedented scale. One hundred and eight heavy bombers, including 24 B-24's from the newly operational 93d Group, were detailed to attack the primary target at

~~SECURITY INFORMATION~~

IAFWH-18

32

~~CONFIDENTIAL~~

Lille, and seven additional B-17's flew a diversionary sweep to Cucyux. Of the total aircraft detailed, 60 attacked the primary target,³⁹ 2 bombed the alternative target, the Courtrai-Evelghem airfield in Belgium, 6 attacked the last resort target, the St. Omer airfield, 2 bombed Roubaix, and 33 (including 14 of the B-24's) made abortive sorties. Approximately 147 tons of 500-pound high-explosive bombs and over 3 tons of incendiaries fell on Lille.⁴⁰

The bombing on this mission did not demonstrate the degree of accuracy noticeable in some of the earlier and lesser efforts. Of the 588 HE bombs dropped over Lille, only nine were plotted within 1,500 feet from the aiming points. Many fell beyond the two-mile circle, some straying several miles from the target area.⁴¹ This fact may be explained in part by the fierce fighter attack sustained by the bombers over the target, but it no doubt also resulted from the inexperience of at least two of the groups participating and from the high wind velocity (100 miles per hour) at bombing level.⁴² A large proportion of the bombs fell on the residences surrounding the factory of Fives-Lille. Civilian casualties were estimated by a ground observer as amounting to 40 dead and 30 wounded.⁴³

Yet, despite this scattered bomb pattern, several bombs fell in the target area--enough, in any event, to cause severe damage to at least three of the Fives-Lille buildings and lesser damage to a dozen more. Four textile factory buildings, including one belonging to Hellemane, received varying degrees of structural damage. In addition

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

to damaging two additional unidentified small industrial structures, the bombers scored some eight direct hits on the railway yards, mostly involving siding tracks.⁴⁴ Ground observations made by fighting French informants credited the U. S. forces with completely stopping work at the Mellemais textile factory and with doing severe damage to the power station, the boiler works, and the turbines at the Fives-Lille establishment. A branch line to another power station apparently relieved the enemy's situation, however, for work in the factory was resumed after a relatively brief time, one account indicating two days and another 17 days. Estimates regarding the length of time it would take to repair the power plant varied from two to six months, and probably represent no very profound knowledge of the industry.⁴⁵

The high priority given to locomotive production in Axis Europe made the direct hit on the boiler-making shops the most important single item, according to British estimates. Resumption of locomotive output, it was believed, would depend on the speed with which this damage could be repaired, for boilers constituted a principal bottleneck in the locomotive industry. Moreover, since all boiler plants in German Europe were known to be working to capacity, it appeared unlikely that Fives-Lille could get boilers elsewhere. British observers believed that repairs to heavy industry in German Europe were being made with increasing difficulty, and they estimated that all production at Fives-Lille would probably be halted for one month as a result of this mission and that subsequent output would be slowed down to such an extent that, instead of 20 to 25 locomotives being delivered as scheduled in the last quarter of 1942, only

~~SECURITY INFORMATION~~

11/18

34

A to G would likely be forthcoming.⁴⁶ Considering the emphasis placed by the British on transportation as the Achilles heel of the Axis, an attack of this sort no doubt proved welcome news to British ears.

The results of the mission were also welcomed, albeit reluctantly, in Axis circles, but for a different reason. Again, as in the Potez mission of 2 October, the question of bomb damage came to be overshadowed by that of the day bomber's ability to defend itself against fighter attack. As in the previous mission the attacking Me-109's and Bf-109's concentrated on the bombers to the practical exclusion of the combined British and U. S. fighter escort, which in this instance numbered 156 aircraft including 36 P-40's from the VIII Fighter Command.⁴⁷ As a result of the unusually heavy fighter opposition numerous combats were reported. Three of the B-17's and one B-24 failed to return, although the crew of one Fortress was picked up at sea. In all, 31 crew members were reported missing and 13 wounded, four B-17's suffered serious damage, and 32 B-17's and 10 B-24's were slightly damaged by fighter action. But if the bombers took the worst beating in their short career, they also inflicted on the German fighters the heaviest losses to date.⁴⁸

As was commonly the case during these early months of Eighth Air Force operations, claims tended to be somewhat exaggerated. It was hard for crews in a large formation to determine which bomber had been responsible for an apparently destroyed or damaged German fighter; and the fact that a decoration had been awarded to each

~~SECURITY INFORMATION~~

AIRFD-1s

35

~~CONFIDENTIAL~~

gunner credited with shooting down his first plane naturally made the gunners press their claims with considerable energy. Then, too, the interrogating officers had not yet had experience enough to disentangle thoroughly the complicated reports received from the crews.⁴⁹ Initially it had been reported that the bombers on this mission had destroyed 56, probably destroyed 26, and damaged 20. According to those figures they had accounted for a total of 102 out of action, which intelligence sources estimated to have been equivalent to over 15 per cent of the total German fighter strength in western Europe. British intelligence, however, believed that no more than 60 enemy aircraft could have intercepted. By 24 October the claims had been scaled down to 25, 38, and 41. In January, 1943, a general review of early combat reports reduced the figures for this engagement to 21 destroyed, 21 probably destroyed, and 16 damaged.⁵⁰

Even when estimated in the most conservative terms, the Lille mission was impressive. It was hailed in US Headquarters as convincing evidence that the day bombers "in strong formation can be employed effectively and successfully without fighter support." It was considered all the more remarkable because most of the pilots and crews lacked experience in aerial combat and because the force involved, though smaller than such operations required, represented over 50 per cent of the total strength of U. S. bombers in the theater.⁵¹

The results of these first 14 missions had been on the whole very encouraging. Targets had been attacked with reasonable frequency, especially during the first three weeks, and with a fair

~~SECURITY INFORMATION~~

AIRFM-18

36

degree of accuracy. The enemy had been met and repulsed with losses

more than commensurate with the damage suffered from his attacks.

During the first nine missions, the Germans had evidently refused to take the day bombing seriously. The American forces had been small and the fighter escort heavy, and so the Germans had sent up few fighters, preferring to take the consequences of light bombing raids rather than to risk the loss of valuable aircraft. And when the German fighters did take to the air, they exhibited a marked disinclination to close with the bomber formation.⁵² But the bombing had been surprisingly accurate, especially in relation to what had been accomplished in Europe either by British or German bombers.⁵³ It was, therefore, a tribute of sorts to the accuracy of the Americans that after the ninth mission enemy fighter opposition suddenly increased. And it was a source of warm satisfaction to the AAF commanders that the B-17's and the B-24's could more than hold their own against fighter attacks, even with a minimum of aid from the escorting aircraft. As for antiaircraft defenses, at no time had they offered a serious threat to the bombers. After the tenth mission a marked increase in damage became apparent, but as yet the day bombers had suffered nothing to compare with the losses reported by the RAF on their night raids at lower altitudes.⁵⁴ No heavy bombers had been lost from flak, and only minor damage had been sustained. On the other hand, six aircraft were destroyed by enemy fighters. It began to look as if altitude would provide decisive protection against antiaircraft.

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AUGUST-18

37

Eighth Air Force commanders were therefore in an optimistic mood by 9 October 1942, and, in a measure, justifiably so. Possibly the early expression of opinion, made after the first week of operations, had been a little too sanguine. On 27 August, for example, General Laker had informed General Soatz that the operations to date of one heavy group indicated that high-altitude bombing would be at least ten times as effective for destroying precision targets as night area bombing. Actual plots of British Bomber Command results showed an average of only five per cent of bombs dropped to have fallen within a circle of one-mile radius from the aiming point; and the best results to date had raised this figure only to 10 per cent. The U. S. bombers, on the other hand, gave promise of being able to place 90 per cent within the one-mile radius, 40 per cent within 500 yards, 25 per cent within 250 yards, and 10 per cent dead on the aiming point, or within a "rectangle 100 yards on the side." While admitting the fact that the British did not attempt to hit point targets, he argued that a force of 100 high-altitude day bombers could do as much damage to specific industrial targets as 1,000 night bombers. Therefore, given a force of 10 groups of heavy bombers, enemy aircraft factories could be destroyed to the point where they could not supply the field forces, and submarine activity could be "completely stopped within a period of three months by destruction of bases, factories and docks." Granting that weather would be bad in the United Kingdom for day bombing, he believed that at least 10 missions per month would be possible. As far as airfields, supply

~~SECURITY INFORMATION~~

CONFIDENTIAL

AMSI-18

53

and communications facilities, and organization were concerned, the VIII Bomber Command could at once operate 10 to 20 heavy groups and by April of 1943 could accommodate 50 heavy and medium groups. But for practical purposes 10 groups in 1942, and 10 additional by June 1943 would be adequate, "coupled with the British night bombing effort, completely to dislocate German industry and commerce, and to remove from the enemy the means for waging successful warfare."⁵⁵ General Spaatz declared himself entirely in accord with this estimate, and spoke of the "extreme accuracy" of the American bombers.⁵⁶

AAF Headquarters in Washington received these reports with some reservations. Rather than "extreme accuracy," headquarters agencies preferred to speak of the "fair accuracy" achieved in the first missions. Bombing had been accurate in relation to American standards rather than according to any absolute standard, an opinion which General Spaatz himself expressed on more sober reflection.⁵⁷ The over-all average errors had been small enough to permit good results on the kind of target attacked--airdromes and marshalling yards--but had been too large to promise consistent results on small point targets. It was even suggested that a system of coordinated attacks should be worked out in which the first element would destroy or neutralize the antiaircraft on the ground and so make it possible for the main bombing force to operate at a more effective altitude than 23,000 to 26,000 feet; for it had been established that relative accuracy at 12,000 feet would be approximately twice as great as at 22,000 feet. It was further argued that the forces suggested by Generals Spaatz

SUPERIOR INFORMATION

~~CONFIDENTIAL~~

AIRRI-18

39

and Baker were too small to do the job.⁵⁸

Nevertheless, it was possible for AC/IS, Intelligence, looking back over the entire 14 missions, to paint a most encouraging picture, accepting General Laker's earlier estimates regarding both accuracy and force required.⁵⁹ Attention was directed to certain significant considerations. Fighter escort, though essential to successful operations, was more helpful in aiding cripples and in diverting enemy fighters at the approach to the target than in protecting the main bombing force. To date the engagement of supporting fighters in combat had been only incidental. Antiaircraft artillery had been ineffective and might be expected not seriously to impede bombing missions in the future. Although the current loss rate of 1.6 per cent could not be expected to continue as the range of operations became extended farther into enemy territory, it could increase four times and still barely exceed the British rate of 5.67 per cent. The German rate of attrition might be expected to rise correspondingly, and, as deeper penetrations were made into German Europe, enemy fighter defenses, now deployed in a narrow arc of at most a 150-mile radius surrounding Great Britain, would be dispersed both in breadth and depth. Given the necessary force, it would thus be possible for the day bombing offensive, combined with the British night effort, to accomplish the destruction of the enemy's three essential war systems: his air force, his communications network, and his submarine power.

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AIRFM-18

40

These early missions had also made a noticeable impression on British opinion. If not as enthusiastic as their American allies, British observers in September and October were at least ready to admit that the RAF day bombers and the policy of day bombardment showed surprising promise. As early as 21 August, General Spaatz reported a significant change of mind on the part of the RAF. In a statement which, among other things, indicates how tentative had been the British official acceptance of the American bombardment doctrine, he stated that the RAF was now willing to alter its conception of the nature of daylight bombing operations from one wherein the bombers were to be used mainly as bait to lure the enemy fighters into action to one in which the bombing had become the principal mission and the supporting fighters were employed to further that effort rather than to attack the German Air Force.⁶⁰ General Tinker wrote at about the same date that the British "acknowledge willingly and cheerfully the great accuracy of our bombing, the surprising hardihood of our bombardment aircraft and the skill and tenacity of our crews."⁶¹

A review made by the Air Ministry of the B-17 operations from 17 August to 6 September substantiated this interpretation. It referred to the high standard of accuracy attained, considering the inexperience of the crews. It pointed to the fact that in ten missions only two aircraft had been lost, owing to the ineffectiveness of the flak at high altitude and to the ability of the Fortress to take care of itself against fighter attack. "The damage caused, commensurate with the weight of effort expended, is considerable" the report read,

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~SECURITY INFORMATION~~

AFORN-18

41

adding that complete destruction of any of the targets attacked with the forces at present available could not have been expected. But, it concluded--with considerable enthusiasm though little appreciation of what the AAF hoped to accomplish in its bombing offensive--if only these Fortresses were employed on night operations the accuracy and effectiveness of the area bombing program could be raised from its current rate of 50 per cent to 100 per cent, and a decisive blow could be dealt to German morale during the coming winter.⁶²

British press opinion which in mid-August had been cool, if not hostile, to the day bombing project showed a similar change of tone. On 1 September, Colin Scouller wrote in the Daily Mail as follows: "So remarkable has been the success of the new Flying Fortresses operated by the USAAF from this country that it is likely to lead to a drastic resorting of basic ideas on air warfare which have stood firm since the infancy of flying."⁶³ Early misgivings concerning the American bombers had been entertained without reference to two vital factors. First, instead of the ten .303-caliber machine guns carried by the Lancaster, the new Fortress was armed with no fewer than twelve .50-caliber machine guns. And, secondly, the L-17 could bomb from such heights that it avoided much of the damage from flak which had embarrassed British daylight attempts.

Peter Lasefield, whose comments on the eve of the first Fortress mission had been decidedly critical of the American bombers and patronizing toward their capabilities, revised his judgment frankly, but somewhat more gradually. On 23 August he admitted that "The Fortress

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AMRAI-18

42

bombers have done particularly well in their tuning-up sorties during the past week, flying by day on strongly escorted bombing attacks of a type for which they are ideally suited."⁶⁴ Prior to the Lille mission of 9 October, however, he stoutly maintained that the B-17 needed escorts, and that, therefore, their effective range was limited absolutely to the range of the escorting fighters. "There is no doubt [he concluded] . . . that day bombing at long range is not possible as a regular operation unless fighter opposition is previously overwhelmed or until we have something too fast for the fighters to intercept." Then, he believed, but only then, the entire Allied bombing force might well be turned to day bombing.⁶⁵

After the Lille' operation of 9 October he declared that the question "Can we carry day air war into Germany?", which had hitherto been answered in the unqualified negative, was now subject to a new assessment. In that engagement the bomber claimed to have gained a significant victory at short range. And it might be that altitude and fire power might some day make deep penetrations of enemy territory feasible. Several factors, however, still limited the range of the U. S. bombers: any raid to Germany would as yet have to be conducted beyond effective fighter range; long distance flights would give the enemy warning systems time to work at maximum efficiency; bomber ammunition would likely run low in protracted encounters with enemy aircraft which would be free to attack in the most effective manner, unhampered by escort fighters; and finally weather over Europe between November and March was "not particularly favourable for high-flying operations." Thus true air superiority was still

~~SECURITY INFORMATION~~

AAFRH-18

43

confined to the range of the fighter, and cloud and darkness still offered the best cover for bombing attacks. He ended his article of 18 October in a pliable frame of mind. "The Americans have taught us much; we still have much to learn--and much we can teach."⁶⁶

This cooperative attitude on the part of the British the Eighth Air Force found encouraging in itself, for it was absolutely essential to the success of any combined campaign that the two partners should work together without friction, each possessed of a certain faith in the other's doctrines and equipment. General Spaatz was keenly aware of this fact. After the first week of operations he reported confidently that the American air forces had demonstrated that they could conduct operations in close cooperation and harmony with the RAF. And, somewhat later, he expressed concern over what he believed to be an increasingly evident habit among Americans of belittling the RAF and its bombing effort. Without underwriting everything done by the British, he pointed out that they were in a position to speak with authority on bombing operations and that, in point of fact, the RAF was the only Allied agency at the time steadily engaged in "pounding hell out of Germany."⁶⁷

Factors Limiting Operations

If, as General Eaker said, both the RAF and the Eighth Air Force were more cheerful over the daylight bombing offensive "than had been thought possible a month ago," many problems had yet to be faced before that offensive could be declared a success, or before it could be given an unquestioned place in the military scheme of things. Some of these problems could be solved, others could at

AMRH-18

44

~~CONFIDENTIAL~~

best be only borne with hopefully and patiently: together they contributed an undertone of solemn seriousness to the chorus of official optimism. Among those which might presumably be solved in time was that of training; but it was still a major problem. The 97th Group had begun operations with inadequate preparation, and the new groups as they arrived in the United Kingdom and became operational found themselves in little better position. Weather in the British Isles discouraged training in high-altitude flying, and facilities were lacking there for conducting realistic practice in aerial gunnery. In addition, the available time for training units in the U. S. had in many cases not permitted adequate training before shipment to the U. ... The result was that much of the training in high-altitude flying, in high-altitude bombing, and in serial gunnery had to be done on combat missions against a real enemy. Once combat operations had been begun, the lack of an adequate flow of replacement crews made it necessary to alert the same men on every mission scheduled, which was normally as often as weather permitted. It was consequently hard to keep up a regular schedule of training. It soon became evident that the place to conduct thorough training was in the United States, not in the United Kingdom, and efforts were accordingly made to shape training in the Zone of the Interior along lines indicated by experience in the theater.⁶⁸ As time went on, the units in the United Kingdom received much experience and their commanders learned many tactical lessons in the exacting school of combat. The nature of these tactical lessons will be described in a later chapter.

45

Another problem was involved in developing U. S. fighter support for the day bombers. Although of slight immediate importance to the activities of the Eighth Air Force in the fall of 1942, the concept of U. S. fighter support was fundamental to the notion of a day bomber offensive. No matter how well the bombers had done in their early missions in combat with fighters, it was still a matter of the utmost urgency to provide them with as much protection for as great a distance into enemy territory as possible. According to the "Joint Directif" of 20 August 1942, American fighters were gradually to assume a larger share in the joint fighter operation, and as their experience and force increased, they were to take over the major portion of this activity.⁶⁹ Moreover, for missions deep into Germany it was essential to develop a suitable long-range fighter, and great things were hoped from the P-38. The priority given to TORCH for all such equipment and the operation of the fighters for the time being, however, of academic interest only, for they were virtually all withdrawn to the North African project in October. But, in view of plans then evolving, and in view of what actually took place, the problem of the fighters remains one of considerable significance.

The Eighth Air Force began operations with two single-engine and two twin-engine fighter groups. The single-engine groups were equipped with spitfires, according to an agreement between the AMF and the RAF. The twin-engine units consisted of P-38's.⁷⁰ In addition, many American pilots had been serving in Eagle squadrons under

~~SECURITY INFORMATION~~

the RAF. These units were formally taken over by the VIII Fighter Command on 20 September 1942, and organized into the 4th Fighter Group.⁷¹

Elements from the Eagle squadrons, and to a lesser extent the U. S. Spitfire units, took part with the RAF on numerous occasions in support of the heavy bombers. The Spitfire pilots, though operating machines some of which (the 5-B) were inferior to the Fw-190, went into combat with confidence in their planes.⁷² The situation was not nearly so simple with the P-38. The RAF did not at first like the P-38. As in the case of the American bombers, early showings in the U. K. had been unfortunate. When, however, certain modifications had been effected, the P-38 became potentially as good a plane as any in the theater, a fact which the British themselves admitted.⁷³ Yet suspicion of the P-38 still lurked among the U. S. pilots, fostered in part by hearsay and in part by a couple of bad accidents involving improperly manipulated power dives.⁷⁴ Some press publicity had been given to remarks made by American pilots which compared the P-38 unfavorably with the Spitfire, and this served only to heighten the tension over the fighters.⁷⁵ Actual combat experience was alone likely to dispel doubts both in AF and RAF minds.

General Spaatz was therefore very anxious to get the P-38's into action as soon as possible without committing them prematurely. Any fighters that went out over enemy territory ran the risk of tangling with the best of the German Air Force pilots. It was therefore necessary to give the Lightning pilots careful training in cross-Channel flights before sending them into a real battle.⁷⁶ Bad weather and mechanical failures delayed their entry into combat, but after 16 September they became fully operational and flew on several missions

~~SECURITY INFORMATION~~

11TH-18

47

before being removed to the North Africa project in October.⁷⁷ Their contact with the enemy was, however, slight, and no very important conclusions could be drawn. On 14 September the four RAF fighter groups of the VIII Fighter Command were transferred to the XII Fighter Command for shipment to North Africa. They continued to operate under the VIII Fighter Command until 10 October. Only the 4th Group, consisting of former Eagle pilots, remained in the United Kingdom.⁷⁸ It was many months before a significant force of RAF fighters was able to operate consistently from the British bases.

The development of a self-sufficient U. S. fighter force may have been essential to the plan of 20 August for the day bomber offensive, but it was not essential to the immediate prosecution of the operation itself. If the basic fighter units were removed for TORCH, RAF units remained to provide cover for the American bombers, but KURGF constituted nevertheless a threat to bombing operations from the U. S., the gravity of which can hardly be exaggerated. As soon as the decision was made to mount TORCH (1 September 1942 was the deadline), it became evident that preparation for the North African operation would for an indefinite period take priority over all other air activities in the U. S. On 6 September General Spaatz issued specific orders to this effect, and for a brief time it appeared that tactical operations of the Eighth Air Force, including combat missions, would be completely suspended.⁷⁹ Each command in the Eighth Air Force and each section in its headquarters was given

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AFWPH-18

48

responsibility for processing corresponding agencies in the new Twelfth Air Force, now generally referred to among Eighth Air Force offices as "Junior." In addition to the four fighter groups contributed directly to the Twelfth, the older air force was scheduled also to lose two heavy bombardment groups after the first week in November and two more at a later date.⁸⁰

Thus the drain on the combat strength of the Eighth Air Force caused by the TORCH operation was both direct and indirect. The loss of the 97th and 301st Bombardment Groups (H) would reduce the bomber strength by one-third--and combat effectiveness by an even larger proportion, because these were the two oldest and most experienced bomber units in the VIII Bomber Command. The indirect effect involved in processing the Twelfth Air Force units was even more devastating. VIII Bomber Command staff offices were devoting fifty per cent of their time to supervising the training, supply, and maintenance of the XII Bomber Command. The Combat Crew Replacement Center, from which the fighting units were supposed to draw necessary replenishment, now gave first priority to the TORCH units which had to be up to strength at once.⁸¹ The Twelfth Air Force also enjoyed priority in organizational equipment, spare parts, and aircraft replacements; and the VIII Air Force Service Command was spending an estimated 35 per cent of its efforts on the TORCH units, in addition to contributing large numbers of trained men and quantities of equipment.⁸² As a result, servicing and maintenance for VIII Bomber Command aircraft became slow and uncertain, preventing the most effective employment of such bombers as were on hand, and increasing the likelihood of

~~CONFIDENTIAL INFORMATION~~

~~CONFIDENTIAL~~

AFM-18

49

abortive sorties. Faced with shortages in almost every category, the VIII Bomber Command ground crews often had to resort to dismantling badly damaged aircraft, declared "banjar jaschs" for this cannibalistic purpose. It was the opinion of some group commanders that, if crews had not shown extreme energy and ingenuity in this regard, at least half of the bombers maintained on operational status would have been out of combat.⁸³ The VIII Fighter Command had been assigned the specific task of dispatching units to Africa, and this effort, in addition to the loss of four out of five groups, promised to render it practically useless as far as operations from the U. S. were concerned until the movement had been completed.⁸⁴

Almost more depressing than the demands of FOICM to those whose duty it was to keep up a bombing offensive against Germany, was the weather. Favorable weather was an absolute prerequisite to successful day bombing, at least until more efficient methods of blind bombing had been discovered than any yet in sight. It had been with the full knowledge of this fact that the RAF had projected its scheme for a day bombing offensive from the U. S. At the weather in the fall of 1943 proved—and British observers claimed that it was—unusually bad.⁸⁵ After operational days had turned up in September that had been hoped for, and as October progressed the situation only grew more disheartening.⁸⁶

By early October it was seriously debated whether it was feasible to conduct a full-scale offensive of this sort from British bases, especially since a successful North African campaign might be expected

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

MEMO-13

50

~~CONFIDENTIAL~~

to open up a very attractive offensive in that quarter.⁶⁷ It may have been to offset such a defeatist attitude that General Sacher wrote on 6 October that weather should not cause too much alarm. Moreover, he maintained, five to eight days in every month favorable to maximum effort at high level, which was about all the current rate of replacements would allow in the best of circumstances. This represented a more cautious estimate than that of ten missions a month made in August, but General Sacher hoped to keep the enemy from recting during the interim period of relatively bad weather by developing a highly trained and skilled intruder force, capable of employing bad weather as a cloak for small blind-bombing operations.⁶⁸ Plans were in fact already made for those "rolling" missions which, it was hoped, by the use of the most advanced navigational and bombing devices, would make it possible for single C-21's to keep enemy air-raid systems and defensive establishments on the alert and so interrupt enemy industrial production. By 24 October approval had been secured from both British Bomber Command and Eighth Air Force.⁶⁹

But both red the Eighth Air Force commanders least about both the diversion to TOCH and the bad British weather was that, for a successful day bomber offensive, time was of the essence; and on both counts vital time seemed likely to be lost. Every month of delay in mounting a full-scale offensive against German industry gave the enemy just that much time in which to redeploy his forces and to readjust his techniques in order to counter the Allied attack. For the moment the RAF had its hands full. The British night

~~SECURITY INFORMATION~~

AIR AM-18

51

~~CONFIDENTIAL~~

offensive had, by August 1942, apparently forced it to use up its initial reserves and to reduce its stored reserves in order to keep a strong front-line defense. The J-17 attack, no doubt had served to accelerate that tendency. At any rate, by October 1942 it was estimated that first line strength had been maintained only at the expense of the entire initial reserve.⁹⁰ Following the J-17 missions, it was noticed that two of the three fighter groups (about 60 planes) maintained by the Germans in Lorraine had been moved down to protect Metz and Tannay. This was believed to indicate a determination on the part of the Germans to make the Allied bombers fight in greater depth than heretofore. But German strength in single-engine fighters on the western front remained concentrated along a narrow stretch of coastline, a few twin-engine fighters being maintained in the back areas for use as night fighters. And it was felt that, if the fighter defense against both British and American raids were to be increased, aircraft would have to be brought back from Russia.⁹¹ In all, probably 180 single-engine and 10 twin-engine fighters were being kept in the coastal regions in late September.⁹²

In general, the German aircraft situation appeared encouraging; and there was some reason to believe, as certain authorities did, that the CAF was actually on the wane.⁹³ This, if true, would by itself have been a strong argument for pressing any attack which would further strain the enemy's air forces. But the Germans had it in their power to do either of two things: they could increase their production of fighter aircraft at the expense of other types

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

A.F.W.-18

52

~~CONFIDENTIAL~~

(already there was evidence of a noticeable increase in the proportion of total monthly production allocated to twin-engine fighters)⁹⁴ or they could try to build up a strong force of heavy bombers in order to strike back at the British cities. In either case time would be required to reorganize production. One of the alternatives seemed, however, inevitable; and it occurred to General Spaatz that the Germans might well profit by the lessons in daylight bombing, delivered so recently and convincingly by the Eighth Air Force. By adding fire power and armor to their four-engine Ju-800's they might act against the United Kingdom before the American forces could exploit their current technical advantage. "Daylight bombing," he wrote on 16 September, "with the same accuracy as we have gotten and with the same casualty ratio in air fighting, would raise hell with this island. We must hit their aircraft factories before Spring and it requires a large number of P-17's to attempt this."⁹⁵ With this danger in mind, he further urged that the P-38 should be developed for use against heavily armed and armored bombers, although their primary mission remained that of escorting allied bombers.⁹⁶

Thus the picture presented by the day bombing offensive just after the mission against Lille on 9 October was one of sharply contrasting lights and shadows. During the rest of the month the shadows banished, in a sense quite literally, to lengthen. On the 25th General Arnold requested a full explanation of the small number of missions recently carried out—an average of barely one per week. The answer merely recounted the problems and obstacles that had been faced increasingly during the previous weeks: the weather, the demands of

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

the TORCH movement, and the inadequate training status of the remaining units.⁹⁷ Only one mission had been accomplished since 9 October owing to unfavorable weather. It proved to be an effective enough attack on the submarine base at Lorient on 21 October, the results of which will be described more fully in the following chapter; but even then, of 90 aircraft despatched to the primary target, only 15 from the most experienced group were able to outmaneuver the elements and bomb their objective.⁹⁸ The British reported that no PRU photographs of any value had been turned over to Bomber Command since the middle of September as a result of the consistently poor visibility.⁹⁹

By 1 November, too, the inroads made by the Twelfth Air Force on the strength of the older organization had become more apparent. In addition to four fighter and two heavy bomber groups, the Eighth Air Force had turned over trained personnel to the extent of 3,198 officers, 24,124 enlisted men, and 31 warrant officers, of whom 1,098 officers, 7,101 enlisted men, and 14 warrant officers came from the VIII Bomber Command alone.¹⁰⁰ The remaining heavy bombardment groups suffered considerably from loss of such essential equipment as bomb-loading appliances and transport vehicles. They suffered even more from the complete lack of replacements, both crews and aircraft, a fact which made it impossible to keep a large force in the air even when weather conditions permitted; and no prospect was in sight of receiving any during November.¹⁰¹

Of the heavy bombardment groups scheduled to be left in the United Kingdom (three groups of B-17's and two groups minus one squadron of B-24's), only two were by the end of October in fully

~~SECURITY INFORMATION~~

AIRFM-18

54

~~CONFIDENTIAL~~

operational status.¹⁰² It had been found necessary to give two to three weeks extra training to all new units in formation flying at high altitude, in radio operation, and in aerial gunnery. And even as the crews gained in experience it was the policy of the Eighth Air Force to send them out only in circumstances for which their state of training had made them fit. General Eaker believed that nothing could be gained by dispatching green units when conditions of weather or enemy defenses would only cause inordinate loss. For the same reason it was not thought wise to undertake missions that would require landing or take-off in darkness. Therefore, when a target was four hours distant, there were only about two hours of daylight during which it could be struck.¹⁰³

Furthermore, the scope of Eighth Air Force missions had been restricted to a relatively narrow area in occupied France and the Low Countries which could be reached in a short time, which subjected the bombing formation to attack only for brief periods, and which, presumably, did not as yet possess such strong defenses as might be expected in Germany proper. Unfortunately, this otherwise excellent restriction prevented the Bomber Command from making use of occasional streaks of fine weather over more distant targets and over Germany proper at times when France and the Netherlands were completely closed in. It was confidently expected that, when a force had been built up with sufficient training to make deeper penetrations into German Europe and with the ability to mount missions large enough to withstand more intense and more sustained

~~SECURITY INFORMATION~~

ALPRB-18

~~CONFIDENTIAL~~

55

fighter attack, the weather would prove a much less serious handicap.¹⁰⁴

Meanwhile it was a question either of committing valuable crews and aircraft prematurely to operations over heavily defended territory and in bad weather, or else of proceeding cautiously as training status and rate of replacements would permit effective operations of wider scope. General Laker preferred the latter alternative, for to adopt the former would be not only to incur crippling losses but to ruin "for ever" the "good name of bombardment."¹⁰⁵

It would he wrote to General Stratemeyer somewhat earlier in October it have been very easy for us Generals Spaatz and Laker to commit the force in such a way that improper conclusions would have been drawn from day bombardment. We knew the critical aspect of our task and the fact that it might affect the whole future of day bombardment in this war The way we are doing it we are going to draw conclusions--some have already been drawn--which will be entirely favorable to the power of bombardment. Please do not let anybody get the idea that we are hesitant, fearful, laggard or lazy.

In other words, these early missions were less important for what they contributed directly to the Allied war effort than for what they contributed indirectly by testing and proving the doctrine of strategic daylight bombing. In either instance it was as difficult and dangerous to strive for quick results as it was natural for observers, especially those at some distance from the scene of operations, to look impatiently for them.

Directives of 20 and 29 October 1942

On 20 and 29 October 1942, the Eighth Air Force received two significant directives governing the scope of its operations and the priority of its targets. It is not clear from the documents at hand just what directive, if any, had hitherto dictated target priority. According to the "Joint Directive" of 20 August 1942, target selection had been made the responsibility of the Commanding General, British Air Force and the Assistant Chief of Air Staff, Operations (British), to be determined "from time to time . . . within the existing strategy." Presumably, existing strategy meant the decisions of the Combined Chiefs of Staff regarding the bomber offensive. As far as heavy bombardment was concerned it would also mean existing British strategy, since apparently no specific directive had been issued by the Combined Chiefs of Staff governing target priority for a combined offensive. It is therefore reasonable to suppose that, in concentrating their efforts mainly on targets of importance either to the enemy's transportation system or to his air force, the Americans were following an essentially RAF policy, adapted to fit the peculiar powers and limitations of the American day bombers.

The new directive of 29 October did not, however, attempt to clarify strategic policy underlying the day bombing and its place in a joint British-American offensive. Like several other factors affecting Eighth Air Force operations in the fall of 1942, this directive arose in principal part out of the special requirements

~~SECURITY INFORMATION~~

IAW-18

~~CONFIDENTIAL~~

57

of the project TORCH. In order to move the huge amounts of supplies and equipment from the United Kingdom to North Africa it was necessary to protect the movement from both submarine and aircraft attack. Accordingly, the theater commander required the Eighth Air Force, as a matter of first priority, to attack the submarine bases on the west coast of France from which the major portion of the German Atlantic U-boat fleet operated: Lorient, St. Nazaire, Brest, La Pallice, and Bordeaux. Secondary targets for missions against the above bases would consist of shipping and docks at Le Havre, Cherbourg, and St. Malo. In second priority came the aircraft factories and repair depots at Leaulte, Cosrelles, Antwerp, and Courcelles, and the airfields referred to as Courtrai/Lovendeghem, Abbéville/Drucat, St. Omer/Fort Douaumont, Cherbourg/Audierne, Beaumont/Le Soger, and St. Omer/Longuenesse. Transportation targets, marshalling yards in occupied countries, were left in third place.¹⁰⁶

It must be remembered, of course, that in allotting the German submarine bases the position of first priority, General Eisenhower was not acting merely to insure the success of the North African invasion, however essential it was to that project to clear the sea routes of U-boats. The increasing submarine menace threatened the entire logistical plan for Allied operations in Europe and Africa. It constituted Germany's most powerful offensive-defensive weapon against the Allies' necessarily ocean-borne forces and supplies. It had, as a result, figured conspicuously in strategic planning during the fall of 1942. On 18 October General Eisenhower

SECURITY INFORMATION

11780-18

58

wrote to General Spatz that he considered the defeat of the submarine "to be one of the basic requirements to the winning of the war." He added, "In fixing priority of air targets from this theater, I realize that the German Air Force must be constantly pounded, in order to give our own Air Forces freedom of action in carrying out fruitful missions. Of these missions, none should rank above the effort to defeat the German submarine."¹⁰⁷ During the course of the North African operation this antisubmarine activity was naturally of particular importance, and General Spatz planned to coordinate it closely with the British Coastal Command which was charged with the specific duty of fighting the submarines.¹⁰⁸

All of which did little to advance the cause of the strategic bomber offensive. However unavoidable the diversion may have been, and however well conceived, the fact remained that it removed the American heavy bombers from their primary strategic mission of crippling the German economic machine to what in the narrower sense was a tactical operation in support of the North African invasion. Attacks on submarine bases, airfields, and airplane factories carried important strategic implications, mainly of a defensive nature; but it was also true that in executing them the Eighth Air Force would be engaged for an indefinite period in a project of secondary significance in relation to that to which the force had originally been assigned.

On 29 October, the Eighth Air Force received another directive, this time regulating its missions against targets in occupied

GERMANY

~~SECURITY INFORMATION~~

JULY-18

59

countries. The problem with which this paper dealt was a delicate one. Objectives vital to Germany's war effort existed in occupied France and the Low Countries, and it had been a point of tactical policy to restrict American bombing effort to these areas. But it was impossible, even with greater precision than the U. S. bombers were as yet capable of, to ensure the safety of civilian life and property in the neighborhood of the targets. Thus there arose a political problem which might radically affect bombardment plans.

French opinion had been deeply stirred as a result of the bombing at Rouen, at Lille, and again at Lorient, in each of which civilian French casualties had been impressive if not always extremely numerous: at Rouen some 140 were killed, at Lille approximately 40, and at Lorient a few Frenchmen were numbered among the 150 dead, more than half of whom were Germans, the rest Belgian and Dutch.¹⁰⁹ Naturally the French viewed the bombing of their cities with mixed emotions, the mixtures varying pretty much according to the severity of the loss suffered. Although generally happy in a grim sort of way to see any damage dealt the Nazis, even in their own land, many Frenchmen found it hard to take a long-term view of the situation when American bombs fell on French property and took French lives. The Germans leaped at this opportunity to poison French minds against the Allies, covering walls with posters which featured the civilian deaths and civilian sufferings attendant upon the American bombing. Except at Lorient (for reasons which will be discussed in the next chapter), the controlled press

~~SECURITY INFORMATION~~

did its best to keep the bitterness alive. Even those who understood better than the average of their countrymen the strategic necessity for the Allied bombing felt that, in planning such missions the sorrow and destruction suffered by the French should be carefully weighed against the doubtful results to be attained from bombing at extremely high altitudes. It was on this point that most French criticism seemed to be concentrated in the fall of 1942. French observers could not help believing that as long as bombing attacks were made at 25,000 feet only a small percentage of bombs would hit the target; and results had not as yet been such as to persuade them to the contrary.¹¹⁰ Some also urged, quite seriously, that bombing of factories and shipyards should be done only on Sundays and holidays when French workmen would be absent.¹¹¹

It was in an effort to bring up to date a code of rules for operations in this delicate but unavoidable situation that the Air Ministry, to whom the responsibility for such political matters was customarily left, issued the directive of 29 October. Bombardment was to be confined to military objectives. The intentional bombardment of civilian populations, as such, was forbidden. It must be possible to identify the objective. The attack must be made with reasonable care to avoid undue loss of civilian life in the vicinity of the target, and, if any doubt existed as to the possibility of accurate bombing, and if a large error would involve the risk of serious damage to a populated area, no attack was to

~~SECURITY INFORMATION~~

AARH-18

61

~~SECRET INFORMATION~~
be made. The provisions of Red Cross conventions were, of course, to be observed. Military objectives were defined broadly to include any sort of industrial, power, or transportation facility essential to military activity, which obviously included any desirable objective, except civilian morale as such. The only other important restrictions were against attacks on passenger trains during daylight hours and on power stations in Holland, the destruction of which would cause extensive flooding of the land by cutting out of action electrically-driven pumps. Special consideration was to be given to the Channel Islands, should attacks on enemy installations there become necessary. In conclusion, the directive stressed that none of the foregoing rules should apply in the conduct of air warfare against German, Italian, or Japanese territory, except that the provisions of the Red Cross conventions were still to be observed, for "Consequent upon the enemy's adoption of a campaign of unrestricted air warfare, the Cabinet have authorized a bombing policy which includes the attack on enemy morale."¹¹²

Chapter III

OPERATIONS AND OPERATIONAL PROBLEMS,
21 OCTOBER 1942 TO 13 JANUARY 1943

The German Submarine Bases

Submarines became the primary concern of the Eighth Air Force after 20 October 1942, and continued to preoccupy that organization for many months. In the fall of 1942, however, it was not at all clear whether striking the submarine operating bases on the coast of France, as the directive of 20 October stipulated, was an efficient method of reducing the submarine menace; nor was it clear that the day bombers could do that job effectively. The entire antisubmarine campaign constituted, in fact, a highly controversial problem, and one in which the essential data came too often to be obscured by the mysterious activities of that most mysterious of the enemy services.

To those who had to cope with the steadily increasing submarine threat several alternative courses of action suggested themselves, no one of which seemed by itself entirely satisfactory. It would have been very natural for strategic bombing forces to have concentrated their efforts on the sources of the submarine fleet, as they planned to concentrate on the sources of the entire German war machine. The submarine construction yards and the component-parts manufacturing plants provided tempting objectives, the complete destruction of which would eventually solve the U-boat problem. The RAF had already expended considerable and sustained effort in

AMEM-18

63

~~CONFIDENTIAL~~

this direction. Although few and light in the fall of 1942, British Bomber Command attacks during the 15 months from April 1941 to June 1942 had seriously damaged the ports of Rostock, Lubeck, and Caden, and had dealt heavy blows to facilities at Bremen, Hamburg, Wilhelmshaven, Kiel, and Bremerhaven. In addition, the submarine Diesel factory at Augsburg and the component parts factories in Cologne had suffered in the attacks on those cities.¹

The British effort had, however, been directed primarily against the towns themselves rather than against the port facilities and factories, in accordance with the RAF's policy of area bombing. It was the opinion of the Ministry of Economic Warfare in July of 1942 that, apart from damage to the plant at Augsburg which was supposed to be producing up to 60 per cent of the total submarine Diesel engine requirements, little severe damage had been inflicted on component factories. In that instance probably one month's output had been lost, amounting to the Diesel requirements for ten submarines. As for the construction yards, repeated attacks on Wilhelmshaven, Kiel, Hamburg, and Lunden resulted in no detectable decrease in U-boat production, although the estimated schedule appeared to have been delayed by a few weeks as a result of a variety of factors, not all of which could be identified with the bombing offensive. This same agency even contended that these objectives were not well suited to aerial bombardment. Component parts plants were numerous, widely scattered, often inaccessible from the United Kingdom, hard to identify, and of a type difficult to destroy except by attacks of

~~SECURITY INFORMATION~~

AIRCR-18

64

~~CONFIDENTIAL~~

"exceptional weight and concentration." Moreover, it was reported that a surplus of suitable, but at that time unused, productive capacity existed which acted as an effective cushion to ease the over-all shock of bomb destruction. The shipyards presented targets too small, too isolated from other suitable objectives, and of a type not easily enough put permanently out of action to warrant a major share of the bombing effort. It was true, on the other hand, that their proximity to the British air bases made them always useful secondary objectives.²

Undoubtedly the increased accuracy possible with precision day bombing would increase the effectiveness of attacks on targets of this nature. As so, however, there was little hope of securing immediate results. It was estimated in August 1942 that the submarine fleet consisted of some 240 operational craft, with 120 training in the Baltic. Production at that date was believed to be in the neighborhood of 20 per month, 10 to 15 a month becoming operational; and sinkings by allied agencies were currently at the rate of from five to seven a month. In the light of these figures it appeared that no amount of damage done to the submarine construction yards and factories could reduce the operational fleet during the ensuing nine months. Indeed, if losses in production were made up regularly from the U-boats in training, the fleet would probably increase by eight to ten a month during that period.³

Moreover, the Allies could not wait until the U-boat fleet perished from attrition. The submarine situation had reached a

~~SECURITY INFORMATION~~

112W-18

65

~~CONFIDENTIAL~~

crisis by November of 1942. The submarines themselves were increasing; whereas in January of that year not more than 15 or 20 submarines had been deployed by the Germans in the Atlantic, by November the total was nearing the 100 mark. This fact, by itself, was serious enough in view of the tremendous problems of ocean-borne transport and supply. With the opening of the African campaign in November, this ocean increasingly valuable. If the Allies were effectively to supply the United Kingdom, the Middle East, and North Africa, it was clear that something drastic would have to be done about the submarines which carried that month increased their number operating in the Atlantic to an estimated 114.⁴

Two alternatives remained: the submarines could be hunted at sea, or their operating bases could be rendered more or less unusable. Since the middle of 1942 the RAF Coastal Command had been operating a considerable force in the neighborhood of the British Isles, concentrating their effort especially in patrols over the Bay of Biscay. It was well known that most of the U-boats operating in the Atlantic were based at ports on the western coast of France. In order to leave these ports for action in the Atlantic shipping lanes and to return for necessary periodic servicing, practically the entire German submarine fleet had to pass through the Bay of Biscay, thus producing a constantly high concentration of submarines in the Bay and its approaches. By covering this transit area with long-range aerial patrols, Coastal Command hoped either to destroy a significant number of submarines by direct attack or,

~~SECURITY INFORMATION~~

11-188-18

• 66

~~CONFIDENTIAL~~

by forcing them to remain submerged for long periods, to make their passage to and from their bases so slow that their effective time in the open sea would be substantially reduced. Prior to November 1942, however, the effort to strike the submarines in their operating areas suffered from lack of enough long-range aircraft, lack of a "balanced" antisubmarine force capable of attacking both by day and night, and lack of adequate radar equipment and special weapons. Actual "kills" had as yet been relatively few.⁵

The operating bases appeared to offer certain distinct advantages as bombardment objectives. As previously stated, almost the entire Atlantic submarine fleet depended on the French bases, which had consequently become the nerve center of the whole complicated U-boat organization. The Germans had begun, immediately after the defeat of France, to develop facilities at Brest, Lorient, St. Nazaire, La Pallice, and Bordeaux in order to place the submarines as close as possible to the allied supply lines and as far as possible from British airfields. Conversely, the coastline from Brest to the north coast of Germany had been virtually abandoned by the submarines. The Germans had constructed elaborate pens to house and protect these craft during their stay in port, a period normally of 31 days duration, and had built elaborate repair and servicing facilities. Elaborate also was the schedule of turn-around by means of which a limited number of pens could be made to accommodate a large and growing fleet of submarines.⁶ It was considered practically impossible to penetrate the dozen feet of reinforced concrete that formed the roof of these pens with any bombs then available.⁷

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

But so integrated were the facilities at these bases, and so carefully adjusted the time schedule for repair and refitting, that any damage to the installations surrounding the pens would, it was believed, cause serious delay in turn-around, and so in effect reduce the number of submarines in operation. Locks, floating docks, storage depots, railway yards, power houses, foundries, barracks, and submarines not actually in the pens, all presented vulnerable targets for bombing aircraft--especially for bombers equipped for precision operations.⁸ It was, to be sure, very probable that much of the servicing had been put under concrete along with the submarines themselves; and alternative power installations no doubt existed which could be used to relieve most emergencies affecting the power system. Moreover, it was fully expected that the bases would be given adequate antiaircraft protection.⁹ Yet the prospect of disorganizing the U-boat campaign by harassing these vital points and eventually neutralizing them, seemed reasonably bright.¹⁰

By 20 October, then, opinion was divided as to the best way of immediately reducing the submarine threat. All four alternative methods--attacking construction yards, component parts plants, operating bases, or the U-boats at sea--had been tried, with only distinctly qualified success in each case. All four would necessarily contribute to the final defeat of the submarine, but at the moment this was of the essence. British observers recognized this fact. The Air Ministry, in August, had declared itself in favor of operations against the U-boats at sea and against their operating bases, in preference to the long-term policy of attacks against building

SECURITY INFORMATION

AIRFM-16

68

~~CONFIDENTIAL~~

yards and factories.¹¹ Meanwhile, the VIF area bombardment of German industrial cities would incidentally contribute steadily to the long-term objective.

Opinion in Washington was somewhat more divided, especially on the use of long-range, land-based aircraft in antisubmarine operations. The U. S. Navy urged extended convoy cover. Those most interested in the AAF Antisubmarine Command argued for employing as many B-24's as possible on such projects as that already being conducted by the RAF Coastal Command in the bay of Biscay. However, Brig. Gen. C. J. Russell, AAF coordinator for antisubmarine activity, on 3 November placed considerable emphasis on attacks against the operating bases and construction yards by heavy bombers of the Eighth Air Force, a policy which AC/AS flans endorsed.¹²

When it came actually to employing the Eighth Air Force bombers in the antisubmarine counteroffensive, the problem of choice became simpler. A considerable weight of opinion in both British and U. S. quarters favored action against the bases on the coast of France, and a campaign against those objectives was, for the time being at any rate, especially well suited to the capabilities and limitations of the American bomber force. Not only were the targets much better adapted to daylight, precision methods than to those of the RAF night bombers, they were also within the area of occupied France to which Eighth Air Force operations had been temporarily restricted. Accordingly, General Spaatz ordered the maximum use of his force against the five French bases. In addition, however, he made available to Coastal Command 12 B-24's to help cover the movement of

~~SECURITY INFORMATION~~

AFRM-18

69

~~CONFIDENTIAL~~

shipping to Africa by expanding the system of long-range air patrols over the sea lanes.¹³

On the 21st of October, the VIII Bomber Command flew its first mission against the submarine bases, dispatching 90 bombers (66 B-17's and 24 B-24's) to attack the base at Lorient-Aeroman. Bad weather forced all but the most experienced group to return, leaving only 15 B-17's of the 97th Group to bomb the target. The objective was an important one, for the Germans had developed the small fishing port, situated about one and one-half miles southwest of Lorient on the Brest Peninsula, as a major submarine base that was considered, along with St. Nazaire and Brest, as one of the three most important submarine bases used by the enemy. An estimated total of 20 U-boats, all of the large 750-ton type, was believed to be in port at any given time. The principal targets were the U-boat shelters, both the 12 completed ones and the block of seven pens then under construction. These shelters, typical of their kind, had been built on dry land and provided with heavily reinforced concrete roofs 11 to 12 feet thick. Immediately adjacent to the pens were lighter and smaller buildings believed to contain workshops, transformers, oil storage, offices, and other installations directly connected with the servicing of U-boats. As in all the improved bases, however, many of the vital facilities were housed under the massive pen roof itself. Lorient had not been attacked by the RAF during 1942, nor had the British ever attacked the area of the submarine pens. In 1941 they had made 83 night raids, dropping 390.1 tons of bombs, mainly on the town itself.¹⁴

~~ALL INFORMATION CONTAINED~~

~~HEREIN IS UNCLASSIFIED~~

AM-RI-18

70

The bombing was unusually good. From a 17,500-foot altitude--a considerable departure from the 22,000 to 27,000-foot level usually reached--the bombers dropped 80 high-explosive bombs, each weighing one ton. With the exception of a few which fell some 1,100 yards from the piers, most of the bombs fell in the immediate target area. Of the 80 dropped, 21 fell within a radius of 1,000 feet from the aiming point.¹⁵ Five bombs were reported by ground observers to have hit the central block of shelters. But, according to underground information, they did not penetrate more than five feet despite their weight. Among the surrounding buildings, the results were somewhat better. Three general workshops and a pair of floating docks were pretty thoroughly destroyed, and two submarines were damaged by blast. About 40 French were reported killed among the total of 150 dead, more than half of whom were German workmen.¹⁶

Although little major damage was done to the base itself, the bombing made a great impression on both French and German opinion. For one, the French population appears to have compared an attack by U. S. forces favorably to those made by the British. They seem to have been greatly pleased with the whole affair, standing in the streets watching and smiling; and applauding the accuracy with which the Americans dropped bombs on the German installations. It was, they felt, too bad that Frenchmen had also to be killed, but the victims had in a sense asked for their fate in accepting employment at the base for the sake of the high wages paid there. As for the Germans, they appear to have been taken completely by surprise.

THIS PAGE Declassified IAW EO12958

MARSHAL-18

71

~~CONFIDENTIAL~~

The alarm was not sounded, and the bombs had fallen before the anti-aircraft guns went into action. The Germans were said to have been convinced that a formation of such size--15 aircraft--could only have been their own planes. The mission temporarily discredited the quislings, who had insisted that Allied attacks were being made deliberately against the civilian French population, and that the base was too well defended to be attacked. The controlled press remained silent.¹⁷

Despite the fact that the defenses at Portent were caught napping, and although the attacking force encountered no effective flak, they did run into stiff resistance from enemy fighters. As the formation crossed the enemy coast en route to the target, it met 36 Fw-190's which gave it continuous battle to a point not far from the objective. As a result of these engagements, according to conservative estimates, four enemy fighters were destroyed, six probably destroyed, and one damaged. But the 16 attacking P-17's lost three of their number, and suffered damage to six others.¹⁸

With this mission and these heavy losses in mind, General Spaatz wrote in pessimistic vein to General Arnold on 31 October: "Whether or not these operations will prove too costly for the results obtained remains to be seen. The concrete submarine pens are hard, maybe impossible nuts to crack."¹⁹ "However," he added, "the bombing of the surrounding installations should seriously handicap the effective use of the bases." General Spaatz had, in fact, undertaken this task with more determination than either relish or optimism. It was not only a regrettable, even if necessary,

~~SECURITY INFORMATION~~

REF ID: A11921-18

72

~~CONFIDENTIAL~~

diversion or effort from the main mission of his forces; it was also a job that would very probably require the use of tactics very different from those for which his units had been trained. As early as 15 September 1942 he had expressed concern over this problem. Assuming that the main objectives would be virtually impervious to normal high-altitude bombing, and that they constituted the vital spot in the base installations, he predicted that no one method could be counted on to put the bases out of operation. Sowing harbor waters with mines, launching torpedoes at the sub slips, lobbing bombs in from low altitude, or a combination of all three might, he felt, prove necessary. At that date he even toyed with the possibility of experimenting with glide bombing attacks from an altitude of 6,000 feet.²⁰

By the end of October, although he apparently did not for the time being contemplate using these extraordinary tactics, he nevertheless was determined to pursue against the submarine bases from lower altitudes. Evidently convinced that bombing from above the 20,000-foot level, as practiced heretofore, was not likely to yield accurate enough results to neutralize small targets, he planned to operate at altitudes possibly as low as 6,000 feet. In such event, he warned, much higher casualties than any so far sustained would have to be faced, for the objectives would certainly be heavily defended by antiaircraft. Other factors, he believed, could also lead toward a higher casualty rate. Low altitudes would favor our fighters. Since the French bases were beyond the range of available fighter escort (no F-6F's or F-17's were on hand) the bombers would

~~CONFIDENTIAL~~

AIRW-1c

73

~~CONFIDENTIAL~~

be without fighter support over the objective. And, finally, the crews left after the recent departure of the 37th and 301st Groups were by no means seasoned, especially the gunners.²¹

On 9 November, after an attack of indifferent accuracy and effect against great odds earlier, the VIII Army Command flew a mission at very much reduced altitude against the submarine installations at St. Nazaire. If it had been seriously expected that attacks at lower altitudes would increase effectiveness without at the same time producing prohibitive losses, such hopes were dampened by this experiment of 1 November.²² Thanks to a well-planned course and a large diversionary wing flown by the AAF, the fighter threat, heretofore the more serious, was circumvented. The same could not be said of the antiaircraft batteries concentrated in the neighborhood of St. Nazaire. Probably 60 to 70 heavy guns guarded that area, to say nothing of numerous light batteries.²³ The attacking C-47's, 12 in number, flying at 17,500 to 18,800 feet, suffered little, one group reporting intense, heavy flak well below the formation. The 61 C-17's, flying at 7,000 to 10,000 feet, fared much worse. In the neighborhood of St. Nazaire they ran into very intense flak, extremely accurate both in altitude and direction. At 10,000 feet both light and heavy fire was reported, of considerable intensity and accuracy. As a result of this barrage, three aircraft were lost and 23 others damaged in some degree.²⁴

It was a costly experiment, the lesson of which was all the more impressive in comparison with the relative ineffectiveness of

~~SECURITY INFORMATION~~

ALL LEVELS

74

flak hitherto encountered at higher altitudes. It was clear that the cost of low-altitude bombing could at this rate only be justified by appreciably improved accuracy. It is difficult, however, to make an exact statement of the accuracy achieved during this mission. Only some 75 of the 214 bombs dropped could be plotted from strike and reconnaissance photographs. Of these, eight burst within 600 feet of either of the two aiming points, which consisted of the shops of Chantiers et Ateliers de l'Orbouet and the lock at the entrance to the Bassin de St. Nazaire.

The importance of the former target lay in the construction and repair facilities it contained which were being utilized to the maximum for the overhaul of submarines based there. The lock provided the only remaining entrance to the two basins in which all port facilities and U-boat installations were located. Two others had been rendered unserviceable by the British in a commando raid during the spring of 1941. In attempt was made to hit the JC-pm submarine shelter itself. Like its pachydermous counterparts at Lorient and Brest, it did not lend itself to destruction. In the engine workshops, direct hits severely damaged the plate shops and caused loss. Several bombs fell within a radius of 1,000 feet from the strategic lock, but none scored a direct hit. Severe damage was also done to various buildings and facilities in other areas. Of considerable incidental importance was the apparently complete destruction of the locomotive depot north of the Gare d'Orleans. Reconnaissance two days later indicated that, while damage to railway lines had been repaired, the locomotive

SECURITY INFORMATION

AIRFL-18

75

~~CONFIDENTIAL~~

depot lay unscathed and the usefulness of the yards appeared to have been seriously reduced. It appears likely, in fact, that the attacks had more effect on Axis transportation than on the submarine campaign.²⁵

This mission apparently convinced those in charge of Eighth Air Force operations that attacks at low altitude would not yield results commensurate with the losses likely to result from such undertakings. Subsequent attacks on submarine bases were made at altitudes ranging from 17,000 to 22,000 feet which, up until the mission against St. Nazaire on 3 January 1945, effectively foiled antiaircraft fire.²⁶

Prior to 3 January the VIII Bomber Command conducted six more missions against the submarine bases, concentrating on St. Nazaire and Lorient, with one relatively light and ineffective attack devoted to La Pallice. A total of 199 heavy bombers, in missions varying in strength from 11 to 53 aircraft, attacked according to a fairly consistent pattern. They approached the target area over land across the Great Peninsula, and, in order to elude enemy fighters, returned over water, skirting right around the French coast. RAF fighter forces provided support in the form of short-range escort and of diversionary sweeps over enemy territory. In no instance did the bombers enjoy fighter cover over the target area. That accounted for only one of their number although in many instances it caused minor damage. On four occasions, however, the bombers encountered stiff opposition from enemy aircraft which resulted

~~SECURITY INFORMATION~~

LA 781-18

76

~~CONFIDENTIAL~~

directly in the loss of five more planes. In addition, two bombers crashed and one was lost to unknown agencies.²⁷

With over-all loss rate of less than five per cent of the attacking force justified, from a definitive point of view, the decision to abandon attacks at lower altitudes, and even against those losses could be placed the damage done to the U-boat installations. By the end of December St. Nazaire and Lorient were both showing the cumulative effect of repeated bombardment. Although the accuracy achieved still left much to be desired,²⁸ enough bombs had fallen within the target areas to cause embarrassment to the enemy. St. Nazaire suffered especially heavy damage in the course of the five missions from 9 November to 26 November. In all, 138 aircraft dropped a total of 771,000 pounds of high-explosive bombs on or in the vicinity of the port facilities.²⁹ At the important repair and construction works of Chantiers et Ateliers de Penhoet, the machine shop, mould loft, plate shop, light sheet-metal shop, boiler-makers' shop, pipe and tube shop, paint shop, and rivet shop all suffered repeated hits and work on several cargo vessels, tankers, etc. was believed to have ceased. This damage no doubt also slowed up essential repairs to the submarine fleet. A floating dock was hit and sunk, the railway tracks were bodily maulled, and hits were scored on the locomotive depot and the station buildings. The gas, electric, and water services in the port were reported cut, leaving work in the submarine pens to be carried on by means of kerosene brought from some distance.³⁰

~~SECRET INFORMATION~~

112-38-18

77

~~CONFIDENTIAL~~

According to our account, obtained from a German naval prisoner of war, work continued after the "M" raids only in the submarine shelters which, though hit at least six times, apparently suffered no lasting damage. This same informant spoke of large-scale evacuation of the working population which left barely enough hands to continue the restricted scale of work required in the U-boat shelters. In one shop, he said, 200 apprentices had been killed and, owing to the lack of labor to remove them, the bodies had been left in the rubble.³¹ Apparently as a result of some damage to the lock gates during the attack of 9 November, though possibly also because of subsequent damage to other facilities, all submarines normally based at St. Nazaire seem to have been moved for a while to Lorient. On 18 November reconnaissance revealed an unusual concentration of U-boats at that port. It was believed that, in addition to the 15 or 16 craft already based there, as many as 15 or 20 were forced to use the base at Lorient.³²

Lorient itself suffered severe damage as a result of four raids on 21 October, 10 and 22 November, and 10 December. The shelters under construction had been hit three times with unetermined results. It was estimated that the basal slip had been so seriously damaged that it would be unusable for four months. Several auxiliary buildings, including the "offices," were completely destroyed. But it is quite possible that that interfered most with the efficient operation of the submarine service at Lorient; as the concentration of U-boats forced upon that base by the bombing of St. Nazaire.

~~SECURITY INFORMATION~~

AIRFR-1d

78

~~CONFIDENTIAL~~

Air Ministry experts could not detect any evidence that bomb a day at Lorient had operated directly to deliver the turn-around at that port.³³

The repeatable attacks made by the U. S. forces at St. Nazaire in November--on the 9th, 14th, 17th, 18th, and 23d--had demonstrated the virtue of concentrated effort in this type of bombing. Undoubtedly St. Nazaire, the most important of Germany's U-boat bases, had suffered crippling effects. But the rapid recovery of that port after 26 November also demonstrated that, if such crippling effects were to last, attacks of similar weight would have to continue at a similar rate. No mission was conducted against St. Nazaire between 25 November 1942 and 3 January 1943. During the breathing period the servicing facilities were apparently put once more into some kind of running order. British observers even believed that by 6 December the port was again in full commission. In order to retrieve the earlier successes, the VIII Bomber Command struck St. Nazaire on 3 January in the largest attack made against the submarine bases to date. Some 66 aircraft bombed the port, dropping 342 x 1,000-pound high-explosive bombs.³⁴

Accuracy on this mission was better than on most of those since the first attack on Lorient. The points of burst of 107 bombs could later be identified, and of this number, 26 were located within 1,000 feet from the aiming point, in this instance a small torpedo warehouse which was hit and demolished. Considerable damage was done in the dock area, especially to the north and northwest of

— SECURITY INFORMATION —

~~CONFIDENTIAL~~

to submarine pens, where many bombs fell on the railway, at least 10 resulting in destruction of tracks and wagons. A number of buildings, including the goods station and the customs house, were damaged or destroyed. The new boiler-plate shop suffered additional damage.³⁵ A ground report claimed that, for the time being, at any rate, the works of Fonhouet had been put completely out of action. Several bombs fell on and around the submarine base itself. According to the same source none penetrated the reinforced concrete roof, and except for some windows, doors, and electrical apparatus being damaged by blast inside the shelter, the base escaped serious damage and work proceeded without let or hindrance. So impervious, in fact, were the concrete shelters that the extensive German naval administrative offices, hitherto lodged in the customs building, were said to have been transferred after the raid to quarters "beneath" the submarine pens.³⁶

Significant as the results of the bombing appear to have been, the nature of the opposition encountered during the mission gave Eighth Air Force observers even more to think about. Heavy resistance from fighters, which was not chiefly over St. Nazaire itself, accounted for three of the bombers lost. In return for these losses, bomber crews were finally credited with 14 of the enemy destroyed, 15 probably destroyed, and 4 damaged. But what surprised them most was the intensity and accuracy of the flak which, unlike that previously experienced, was thrown up in a "predicted barrage" rather than in a "continuous following." This unexpected fire destroyed three more of the attacking planes and hit

~~SECURITY INFORMATION~~

AIR704-13

60

~~CONFIDENTIAL~~

an additional 39. In personnel, the mission cost 70 men missing, 5 killed, 9 seriously wounded, and 21 slightly injured. In terms of aircraft it cost seven destroyed and 47 damaged. Although the most successful mission to date against the submarine bases from the standpoint of destruction to enemy installations, it was fully as costly as the ill-fated low-altitude attack of 9 November against the same objective.³⁷ Quite clearly, the submarine bases presented problems of defense which the U. S. bombardment experts had yet to solve.

Looking back over this first phase of the effort against the U-boat bases, there was concerned with it could come to few sound conclusions regarding its effectiveness, either in terms of specific damage to the U-boat campaign or in relation to the other forms of antisubmarine activity. It was easy enough to compile and quote certain operational data. In 10 operations from 21 October 1942 to 5 January 1943, the Eighth Air Force, out of an effective total strength of 670 aircraft, had dispatched 663 against the submarine bases, of which 357 actually attacked the target, dropping 855.2 tons of bombs on or in the vicinity of the objective. Of this total of bombs dropped, photographic estimates indicated some 96 tons to have fallen within effective range of important installations. All of these results were obtained at a cost of 17 men killed, 90 wounded, and 211 missing, and 23 aircraft lost. Claims originally registered included 61 German fighter planes destroyed, 47 probably destroyed, and 38 damaged. Subsequent review revised this score to 24/34/12.³⁸

~~SECURITY INFORMATION~~

REF ID: A64M-18

81

~~CONFIDENTIAL~~

In addition, ground reports and aerial reconnaissance pointed to certain specific effects which have already been summarized. But it was much more difficult to say precisely how many U-boat months had been denied the enemy through these operations or to what extent, if any, the American attacks had affected the number of U-boats operating in the Atlantic. That number has apparently declined in fact from its peak in November, but it was obviously problematical to what extent the operations of the Eighth Air Force had contributed to that result. Bad weather and the necessity for temporary retrenchment in submarine operations after a period of unwanted activity no doubt accounted in large measure for the decline in the number of U-boats operating in the Atlantic. Indeed, according to a U. S. Naval Attaché report, the Admiralty Tracking Room claimed that no substantial change in the rate of U-boat departures from the Biscay bases had resulted from the U.S.A.F. raids.³⁹

It was equally obvious that a series of relatively concentrated and destructive attacks must have had a deleterious effect on the efficiency of the enemy submarine fleet. Opinion as to the extent and relative importance of that effect varied. Admiralty agencies seemed to have been very appreciative of the U. S. attacks, if necessarily vague in specifying their reasons. After the attack of 20 November against St. Nazaire, the Admiralty sent the following message to the Commanding General of the VIII Bomber Command: "Your attacks against the U-boat Operational Ports are greatly appreciated and are a valuable support to the offensive."

~~SECURITY INFORMATION~~

AIRFR-18

~~SECRET~~
CONFIDENTIAL

82

being carried out by Coastal Command in the Bay."⁴⁰ Coastal Command volunteered a similar statement.⁴¹ Late in November, Sir Dudley Pound, First Lord of the Admiralty, wrote General Eaker, referring to the "fine achievement of the U. S. A/C employed in the precision bombing of the U/B bases in the French supply ports."⁴²

It is too early [he continued] to say with certainty what effect these raids have had on the German U/boat campaign. The existing evidence suggests, however, that although the direct damage to the U/Boats and their shelters may not have been very great, the raids have caused a dislocation of the ports and the delicate organization of the U/boat service which is only just becoming apparent. If this is so, and I personally believe that it is, the U. S. aircraft will already have performed a valuable service and discovered one of the few chinks in the enemy's armour so far as the U/B campaign is concerned.

Generally speaking, the Admiralty recommended intensifying the day offensive against the submarine bases, concentrating on the installations in the neighborhood of the pens rather than on the pens themselves.⁴³

Curiously enough, at first glance, Air Ministry and RAF Bomber Command opinion was comparatively lukewarm. An Air Ministry analysis, while granting that the U. S. attacks had undoubtedly embarrassed the enemy rather in dislocating facilities at the bases than in damaging the submarines or their pens, placed greater confidence in direct sinkings of submarines by surface and air attack and in

~~SECRET~~
SECURITY INFORMATION

THIS PAGE Declassified IAW EO12958

REF ID: A18

83

~~CONFIDENTIAL~~

long-range anti-submarine air patrol in the areas where the U-boats operated. If sinkings at sea could thus be increased from 5 to 7 per month to 10 per month, results of current efforts against the bases and yards would become proportionately more decisive. "Certainly," it concluded, "the effort required to attain a similar result by isolating oil fields and building yards alone will be quite disproportionate to the results."⁴⁴

This attitude disturbed General Arnold. Yet, as General Obern took to writing to him in a letter of 11 January 1918, the situation was less serious than it appeared. If the Allies continued to admit that air submarine base bombing was the answer to the submarine problem, they knew their own forces would be beaten off bombing of installations in Germany and out to work on the U-boat bases. This, he declared, was a perfectly sound position, for it was of the utmost importance that the US continue to bomb German industry in Germany. It would therefore be necessary to put up with criticism, understanding the reason for it.⁴⁵

US Air Headquarters had other misgivings about the submarine base bombing. While generally agreed over the fact that positive action was at last being taken against energy installations by American heavy bombers, and although especially pleased with the fine series of attacks conducted during November,⁴⁶ headquarters agencies felt that the weight and nature of the attacks remained inadequate for the task of doing "something drastic" about the menace that still threatened Allied supply lines.⁴⁷ Then there

~~SECURITY INFORMATION~~

AMM-10

84

~~CONFIDENTIAL~~

was the matter of the relatively high losses sustained during the last two missions (10 aircraft out of a total of 100 attacking).⁴⁷

Probably in an effort to allay doubts in his Headquarters, General Spaatz maintained a consistently optimistic tone when referring to the campaign against the submarine bases. The losses, though unfortunate, were, he insisted, to be expected in operations conducted repeatedly over the same objectives and in such a way that the enemy could tell by the hours of daylight and by the flight time to and from the target just when the bombers would arrive, even if their RDP had not already given fighter and flak defenses sufficient warning. Over against these losses, which are not actually prohibitive, should be placed the heavy toll taken of the enemy fighters by the American bombers. "We are still able," he wrote on 8 January 1943, "and shall continue to knock down better than 3-1 enemy fighters for our heavier losses. This is, we feel, an excellent exchange." Furthermore, improved tactics night in the future are expected to improve the situation materially.⁴⁸ The successful operations of November had more than ever convinced him that with ten heavy bomber groups he could eliminate a large part--possibly 60 per cent--of the submarine menace in the Atlantic. Later he added that as soon as it became possible for him to put 100 to 120 bombers in the air he hoped to be able to hit submarine building installations in Germany proper when weather over the Iberian Peninsula was unfavorable for operations against the bases.⁴⁹

The U. S. Navy added its opinion to the confusion of a picture already far from clear. A Naval Attache report from London compared

the bombing of the Biscay ports and base facilities unfavorably with other antisubmarine air operations, especially the escorting of unescorted convoys. It maintained, moreover, that the only signs of success obtained in the attacks on operating bases had been the destruction of two docks at St. Nazaire and the report that some U-boats had moved from that port to Lorient. In which event, and assuming that this condition prevailed for a month or so, perhaps 10 to 15 U-boat months were lost as a result of the entire Eighth Air Force effort.⁵⁰

By January 1943, two things about this bombing program had become clear. In the first place, what had been suspected regarding the penetrability of the bases was now borne out by experience. Even with the use of heavier armor-piercing ammunition it was considered doubtful whether significant damage could be done to the pen blocks. Consequently all that could be expected from bombing of bases would be disorganization of the turn-around and servicing schedule.⁵¹ Secondly, in order to paralyze the operating bases, and so in effect to deny them to the Germans, it would be necessary to employ much larger forces much more frequently than had hitherto been feasible. In answer to a direct question from Washington, Headquarters, Eighth Air Force replied that, in order to neutralize these five bases completely, 250 sorties against each base per week for eight weeks would be required, and that this scale of effort was, in fact, recommended.⁵² Both Air Ministry and Admiralty agreed on the necessity for increased frequency of attack by increased forces, for it was not an easy matter to inflict permanent damage

on ports, as the U.F. has found out at Benghazi and the Germans at
Alta.⁵³

The rest of the problem remained in the realm of opinion. Did results justify the effort expended against the submarine bases and the diversion from true strategic bombing which it involved? Was bombing of submarine bases the best, or even a reasonably profitable way of reducing the submarine menace? These vital questions could not as yet be answered with any degree of finality. Involving, as they did, comparisons between divergent and even opposed schools of thought regarding the employment of heavy bombers, any tentative answers were unavoidably colored by the interests of the evaluating agencies. It was, however, generally recognized that no one method was likely to provide by itself the solution to the submarine problem. And opinion still gave the efforts of the Eighth Air Force a prominent, if somewhat indefinite, place in the antisubmarine campaign. The bombers may not as yet have affected the submarine situation in any major way, but they had done their job well enough with inadequate forces to make most observers believe that, properly equipped, they could do it decisively.

It was not until the end of 1943 that official USAAF surveys of strategic bombing results tended to confirm doubts hitherto hesitantly expressed regarding the value of bombing submarine bases. By that time the submarine had for the time being been defeated, and it had become apparent that attack from the air against the U-boat as it had been the most effective single factor in reducing

~~SECURITY INFORMATION~~

the German submarine fleet, and that bombing of bases had contributed relatively little in that direction. Grand Admiral Doenitz, who, as one-time commander of the U-boat fleet, was in a unique position to know whereof he spoke, further confirmed this opinion in an interview with Allied intelligence officers after his capture in 1945. Not only were the pens themselves impervious to anything but the heaviest type of bomb, he asserted, but they housed virtually all necessary repair and maintenance facilities. Bombing of surrounding installations did not therefore seriously affect the rate of turn-around. What slow'd turn-around most effectively, he claimed, was the necessity for repairing the damage done to hull structure by aerial-bomb and depth-charge attacks delivered at sea.⁵⁴ Undoubtedly the "X" raids harassed the enemy by destroying auxiliary construction plants and neighboring railway facilities, and in a variety of minor ways, but these were not the primary object of their attention.

Other Objectives: Enemy Aircraft and Transportation

Not all Eighth Air Force effort expended during November, December, and January was directed toward the submarine bases. Those installations enjoyed, or rather suffered, first priority; and, in fact, 10 of the 13 operations undertaken by the Eighth Air Force during those months involved attacks on the U-boat ports. But the U. S. air force has also been instructed to strike at the German air force and enemy-operated transportation facilities in occupied countries as matters of second and third priority respectively.

83

~~CONFIDENTIAL~~

OF THE 401 BOMBERS DISPATCHED AGAINST TARGETS OTHER THAN SUBMARINE BASES, 261 WERE DETAILED TO ATTACK AIRDRONES AND 176 TO BOMB TARGETS OF IMPORTANCE TO GERMAN TRANSPORTATION. Owing to the vagaries of the weather, which on 12 December turned a major effort against the air installations at Romilly-sur-Seine into a minor attack on the Rouen-Betteville Yard, only 80 of the 230 planes that completed their mission dropped bombs on aircraft installations, leaving by far the heavier weight of attack for transportation. As it happened, only one target in each category sustained any considerable pounding. Three missions against Lille accounted for almost all the damage inflicted on transportation, only one other attack having been executed, and that the slight and ineffective one against Rouen-Betteville on 12 December. In the aircraft category, although planes were sent three times to the Abbeville-Brucourt airdrone, and one to Cherbourg-Maupertus, only the single raid on Romilly-sur-Seine on 20 December can be classified as effective.⁵⁵

At Lille the locomotive and rolling stock repair and construction works of the Ateliers d'Hellemmes and of Fives-Lille had been severely damaged in the USMF attack of 3 October 1942, but had since been extensively repaired.⁵⁶ They still constituted a composite objective of the utmost significance to Axis transportation chiefly because they were the principal railway repair depots in France. RL attacks on locomotives had created a serious repair situation. In November, for example, the Fighter Command aircraft carried out 56 attacks by night and 20 by day in France and the Low

80

~~CONFIDENTIAL~~

Countryside against trains and marshalling yards. In addition to destroying nine locomotives or trains, this stopped 51, a large percentage of which undoubtedly had as a result to pay a visit to the repair shops. Consequently the mill stops were being taxed to the limit of their capacity, requiring an estimated 30 to 40 locomotives per month.⁵⁷

In addition, River-Lille had capacity in 1939 to produce 160 to 180 locomotives per month. For immediate purposes, however, it was apparently believed possible to hamper Axis transportation more effectively by still further constricting the bottleneck already imposed by limited repair facilities than to destroy the means of re-production. For one ability of the U. S. C. F. to provide locomotives for the civilian service than operating in the region du Nord and the Region de l'Est depended very largely on the size and with which locomotives could be repaired and overhauled.⁵⁸ Thus the DCAF actions on mill appear to fit into a coordinated plan according to which all fighters attacked rolling stock and the Eighth Air Force periodically reviewed the adequacy of the principal repair depot.

On November, 30 heavy bombers dropped 230 100-pound high-explosive bombs intended primarily for an ammunition dump, which had suffered one major burst. The ray ir shop and the machine shop both were damaged. A "reliable source" claimed that this raid destroyed 13 locomotives and damaged 40 more, in addition to causing confusion by a direct hit on the turntable. These figures

~~SECURITY INFORMATION~~

A 4-13

50

~~CONFIDENTIAL~~

higher than it is impossible to check their accuracy, another attack, on 6 October, by 50 planes against the same target added substantially to the damage already inflicted, but it is impossible to say to what extent it further retarded repair activities.⁵⁹

The heaviest attack against Lille came on 13 January 1943, when 64 heavy bombers dropped up approximately 12,000 tons of bombs on or in the neighborhood of the objectives. Two groups were to attack Bellanvilles and two the Rives-Lille establishment. Severe damage was inflicted on the former, where hardly a building escaped. Many were partly destroyed by direct hits, others by blast or by fires resulting from explosions. Some 12 workshops received damage. Bombs also fell on railway sidings and storeyards nearby. At Rives-Lille, the steel foundry, iron foundry, and forging plant sustained damage. The main group of workshops did not, however, suffer further injury.⁶⁰

At the repair shops of Bellanvilles, where locomotives waiting overhaul had been piling up since the American raid of 8 October, work appears to have come to a virtual standstill for some time. At Rives, such less interruption took place. There are no reports disagree, but after their conflicting testimony has been sifted, it appears that these works did not resume locomotive construction until the end of April 1943. It cannot, however, be said that bombing alone was responsible for so long an interruption. There is evidence that this hiatus in production came in large part as a result of a considerable switching of repair work to

~~SECRET INFORMATION~~

that conditions at the Lille front were deteriorating after a
15 day lay off. British observers stated that the Germans
attacked on three and half days to move east to the Marne
area. 61

On 10-1 during 1940, 1000000 were sent to Lille, as the British
had to locomotives shed and 1000000, and it soon reached
ville, accompanied with 1000000, on 1000000 objectives, had
an 80% situation in which the British forces had been ordered to withdraw
from the British command that of 1000000, 1000000 of the
British had, on the normal traffic, a score of reinforce-
ments for air over the over-cast 1000000. On 10-10, the
British ministry of economic war, nations to consider, therefore
that the Germans had been forced to return to the... 62. 1000000
British locomotives previously requisitioned for use in the area.
It was believed that the British would be forced to which the
Germans would find it necessary to surrender requisitioned rolling
stock in order to capture the ability of the German railway system
to meet actual or potential military demands. 63

Inevitably, bombing of objectives in populous areas such as
Lille involved destruction of civilian lives and property. The
most significant U.S. attack on Lille was no less costly in this
regard than those made on other French cities prior to over-
leaf. Reports said 3000000, six thousand people shot, on October
26 especially, a considerable loss of life and civilian property
took place. According to one Free French report, 60 bombs fell

during that raid on private houses, destroying 51, partially destroying 36, and killing 25 persons.⁶³ Although this source sharply charged the Americans for carelessness, possibly even a calculated, bombing of a population 30 per cent of which was pro-British and pro-de Gaulle, result appears in other French reports to have remained high, the population tending to excuse the American pilots on the grounds of their "inexperi-ence" in comparison to those of the AF.⁶⁴ One report tells the story of U. S. airmen who landed by parachut- in the districts of Lille. The Germans began a systematic house-to-house search for them, only to be systematically thwarted by the French house holders.⁶⁵

On 20 Dec. 16 the British Air Force made its one effective attack on the German Air Force in a relatively large-scale mission against the aircraft park and repair depot at Reilly-sur-Sambre. This aircraft depot and airfield, situated near the river Sambre some 35 miles southeast of Paris, held the reserve aircraft of all types for the German Air Force in France and the Low Countries. They were held there for issue to operational units as required, and much repair and reconditioning was done in its workshops. British intelligence placed the number of new planes at 60 daily on the date of this attack at 120--there in addition to some 30 to 50 currently undergoing repair. The only previous British counter attacks had occurred in June 1940 during the Battle for France and before the Germans had begun using it as an air depot.⁶⁶

~~EXCLUSIVELY FOR OFFICIAL USE~~

THIS PAGE Declassified IAW EO12958

~~CONFIDENTIAL~~

of the 101 bombers (B-17's and B-24's) as patched on
that mission, 72 (10 B-17's and 12 B-24's) hit the target area,
realizing 450,000 pounds of high explosives and 26,000 pounds of
incendiaries. Results were reasonably good. Damage was inflicted
on hangars, barracks huts, and airmail, and 100 planes were downed
on the landing ground, two of them on the perimeter or taxi-tracks.⁶⁷
Of considerably greater historical significance, however, was the
fact that, in one course of this deepest penetration yet made by
U.S.A.A.F. planes into German-occupied territory, the bombers made contact
with almost the entire force of enemy fighters located in
northeast France. The ensuing air battle developed epic proportions
and provided an important test of the American heavy bombers' abil-
ity to carry out unescorted missions deep into enemy territory.

According to British intelligence estimates, the German single-
engined fighter force in northeast France at the date of the
attack was distributed as follows: 12 were based in the Châlons
area, 16 west of Charbourg to the Seine, 60 between the Seine and
Rouen, 20 in the Lysiau, and 30 (including 30 used for training
purposes) in the Paris area. Of this total of 175 planes, 160 were
in all probability in a serviceable order. Eight of them three U. S.
fighter squadrons, all flying Spitfires, conducted four diversions
over areas where the German aircraft were known to be kept. Heavy
reaction to these efforts amounted to probably 30 aircraft, but no
encounters took place. In addition, 35 Spitfires left of the 107
escorted the bombers as far as Rouen, and 107 provided cover for

AIR-18

34

than on their return trip. ~~CONFIDENTIAL~~ Operations also proved uneventful for the friendly fighters.⁶⁶

It was against the weaker force that the Germans concentrated the full weight of their attack. It may have been that they were prepared for just such a mission as this, for on 12 October, the date of the preceding American raid, one aircraft had flown to and boldly, intercepting, to attack the objective, but, on finding it closed in by another, had fallen back on a target of lower priority. At any rate, the score this time was surely German attack (at 1100 hours) and 60 German flight recs, mostly F-100's from the 2nd ABG, 3rd ABW, attacking the formation.⁶⁷ They came in well above, pool'd off up-side down, and closed in from the front, either slightly above, dual 1 v 1, or slightly below. One F-100 of the 9th Group was seen ready to hit the ground at Vincennes, and a few minutes later another F-100 from the same group began to lose altitude rapidly with a number of enemy fighters following it close. At about 1205 hours, the enemy planes were relieved by 30 to 40 fresh fighters from both Souabe, Marne, and possibly Arroux. These planes continued their fight almost to the target, which was reached between 1240 and 1245. During this phase of the battle a number of F-100's joined in the attack, some approaching from below at 10 or 11 o'clock, flying through the formation and coming out at 5 o'clock. On F-100 of the 203rd Group was hit about one minute before the target, but it was not until a few minutes later that it started down.⁶⁸

On the return trip the weaker formation suffered almost continuous attack from fighters, most of which had apparently taken part

in the earlier stages of the campaign and were now adding second sorties. One -17's of the 301st Group went down in the vicinity of Paris. Over the Channel I know a number, the sixth to be lost on the mission, went down and was last seen at sea, heavily and approaching the English coast strategy low altitude. In all, six bombers were lost, and it was reported so early that they crash-landed in England. Twenty-nine bombers just went missing in road patrols.⁷¹

These losses probably all resulted from enemy fighter action, for the flight account reports would consistently inaccurate and inaccurate. The losses were heavy, and they reflected the success of the German fighter pilots in adjusting their tactics of attack to the peculiarities of the American bombers. It was on 25 November, during the attack on St. Nazaire, that the bombers first and first reported a change in the direction from which the fighters came were launched.⁷² Up to this time, attacks had come mainly from the rear. As soon as the enemy found out that the -17's and -34's were weaker in forward fire, or for that in any other respect, they changed abruptly to head-on attacks which during December and January seriously embarrassed the U. S. Force.⁷³

The bombers suffered heavily, but they did not suffer alone. In fact, they far more than they received. Seven of the enemy were soon to crash. It was reported that he broke up in mid-air and 27 more went down in flames as a result of the concentrated fire from .50-caliber guns. Total claims originally as known reached 55 destroyed, 16 probably destroyed, and 9 unsci.⁷¹

10-18

63

~~CONFIDENTIAL~~

At this point the problem of whether Britain received its disconcerting news. was raised by the mission as first tells on 3 October, when the first really large air battle had taken place, VIII October. General Sir Edmund Allenby has been questioned by observers both in Britain and U. S. Headquarters.⁷⁵ Now, on the British operation, claims of British errors seems certain to be negative in view of the number of aircraft—not over 120—which could have participated. In fact, a serious matter, this business of a during British claim of heavy losses, for it reflects upon the soundness of the British operation; on the integrity of the records and of giving credit only where credit is due. It reflects the entire U. S. Mission for air operations, which was necessarily seen, as also to a large part of the task of British record from the American side.⁷⁶

To date after the British mission, a report to, I advised General Spatz for his considered opinion on the subject and for that of the British as well.⁷⁷ I will submit regional chart, although one of mobilization still occurs, the final intelligence summaries were reasonably accurate figures. For sort of commonly available attributions of observations on the part of the crews. As for the British, it is claimed, as a senior officer of the British Air Force, he did not consider their information of little evidence. The British flight rate which had been too close to the maximum for which the British force had planned had been hit by the number of aircraft of over 1,000 yards. British flight rate also has been previously reported in London.⁷⁸

In addition, it is believed that it would be unusual for an airplane completely enveloped in flames, but not yet on fire, and continuing merely limbering out from the engine. It could be counted as destroyed since no discernible parts in the air or water to complete skin or tail assembly had been seen except a few tracer fuselage, but not in which had been cut off, or if so, other part of the fuselage had not been cut off. It was considered possible, however, that actually happened in the course of time, such planes, nor an aircraft to have been well shot up and yet to have flown a long distance and landed safely at its base. In many instances, told the commandant destroy'd if the pilot had been unable to bale out, provided the plane was a single-seater. In the case of those probably destroyed, only one two-seater plane believed to have been sufficiently immature to preclude the possibility of the pilot acting within, then, or to have been damaged to such extent that they were believed inevitably to have crashed, although certainty of destruction could not be established absolutely. If parts of the same airplane had been shot away, it could be claimed as damaged. Mr. Stortz told in the future we will be cut down to claims and to eliminate the possibility of two or more crash survivors claim in the same German fighter.³¹

In accordance with some principles, claims for indiscriminate bombing; of operations were removed. Under previous standards, claims for all missions up to and including that of 6 January 1943 had totaled 225 destroyed, 45 probably destroyed, and 100 damaged.

The new jurisdiction established that at 00 destroyed (or destruction of
U.S. 1000 ft. ab), the probably destroyed (or destroyed, or destroyed,
was 17 January (U.S. 1000 feet or further destruction).¹² This new jurisdiction
apparently a decision criteria in the author's mind.

Result all efforts, however, the goal of civil aircraft continued
to be a victim of war. As long as or taken away by shooting,
at a single place, a situation by no means to occur in large and
tight bomber formations, the possible ramifications possibly intricate
but of no location. Not it clearly in the future are one inaccurate
and inaccurate high, it can not exceed a point of consideration
we not so instilled into the minds of Eighth Air Force crew
members. The story is told of a pilot on the well-known raid
of 27 January 1943 who, on observing a single plane shot up in the
air not a hundred yards from his position, made another maneuver and
stated, "Do you want to claim that one?", to which an other member
replied, "No, I didn't see it crash."¹³

Operational, logistical, and tactical problems

It will not be known to evaluate liaison air force operations in
turn, simply on the result obtained. From the very beginning it
had been apparent that liaison aircraft would have to be kept
in relation to the Pictor. It is noted to limit both the scope of its
operations and the degree to which shot operationally effective.
Such limiting factors less especially large areas; the early months
do it with in this study, for it was then that long-term plans were
being laid for the war against Germany. The people themselves "

~~SECURITY INFORMATION~~

100

Fell into two large categories: (1) tactical problems, and (2) those of logistics, maintenance, and operations. Most of them had some bearing upon and had received initial consideration in the weeks prior to November 1, 1942. During the period covered by this chapter they developed rapidly and much thought and effort went into solving them.

Basic, of course, among them factors was the size of the operating force itself, essentially a problem of logistics. The departure of the Faulkner Air Force in early November had left the parent organization with no combat units mounting to a very heavy bombardment group, two and a squadron (the second group was recruited for POMI at some later date), one single-engine fighter group, minus its ground echelon, and one observation group scheduled eventually for North Africa. Of the heavy bomber units, three were 3 November not yet in operational status and one only recently became operational. At 1 January the situation had not improved materially. Although all heavy groups had been operational, and although the fighter groups had been added, neither of the new fighter units was yet fit for combat, nor was heavy bomber group (L. 02d) yet on strength ready for war. Its air echelon, minus one squadron, had been in North Africa for a temporary tour of duty which lasted until the end of February 1943. In July one squadron of L. 02d Group had been on antisubmarine duty from 27 October to 25 November, as escort for the same outfit having been detailed as an auxiliary unit to work on the blind-bomb project. During

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

CONCLUDINGLY,
now our, heavier, "airborne", therefore, "airborne" we could
never count on a fully operational force or say it may be sure and
grace.⁸⁵ The Twelfth Air Force had also lost one flight, so low
in our force service elements. But the serial units in November ex-
pressed doubts whether sustained operations could be maintained
by the remaining combat units.⁸⁶

Moreover, the prior demands of TURCH and, it impossible to keep
up to full strength those units that were regularly available. The
problem of replacements arose. First did of attrition during
the Fall and later of 1943 both in Washington and in Africa quarters,
Eighth Air Force. According to General Spatz the Eighth Air Force
units were under strength to begin with, after the regular units of
the Twelfth Air Force had been hit, and their strength was likely
to be further reduced until replaced. As for the African force had
been to flow regularly from the United States. Only in Nov. 1943
he urged that the rate of replacement for units in the United Kingdom
be stepped up to the level proposed by the War Department in
July 1942. The plan then presented had provided for 20 aircraft
replacement in heavy bombers per month, additional aircraft for
reserve and for the augmentation of units from October 1942 at
the rate of two per month per group, and combat crews for 75 per
cent of the aircraft that provided for attrition.⁸⁷ On 3 Dec. 1943
he cables President Franklin D. Roosevelt urging that replacements for the African
thenceforth be established in order that no further drain would be necessary
on the already strained units of the Eighth Air Force. Further
withdrawals, he warned, would seriously affect operations from the

AIR FORCE

102

~~CONFIDENTIAL~~

United Kingdom which were of vital importance not only in themselves, but because, by occupying a considerable portion of the German air defenses, they prevented the enemy from diverting his air strength to submarine warfare.⁸⁸

Air Headquarters, while sympathizing fully with the plight of the Eighth, was apparently unwilling to jeopardize more critical projects in order to build up the force in the United Kingdom, especially in view of the fact that shipping space was no less at a premium than were aircraft material.⁸⁹ Moreover, the estimate of Eighth Air Force requirements in London soon came to have coincided exactly with that made by General Specht and General older, for records in Air Headquarters did not indicate so serious a situation as that reported from the theater.⁹⁰ Be that as it may, by the end of January 1943 the Eighth Air Force was not receiving replacement planes and crews as fast as it was expending them.⁹¹

The result was that under existing operational conditions the force employed in the day bombing program was incapable to accomplish any major item of the task it had undertaken, a fact which had become apparent during the campaign against the submarine bases. The size of the operational force also limited the choice of targets, for it was felt best only a force large enough to protect itself really should be dispersed over the Reich. Yet, on the other hand, the accuracy or restricting activity to a single, relatively narrow area in occupied France was it impossible to disperse the enemy fighter defenses and so tended to increase combat losses. In any event, it was obvious that a loss of losses could be expected.

~~CONFIDENTIAL INFORMATION~~

APPENDIX

.103

~~CONFIDENTIAL~~

- such a force could be sustained during a large enough to subdue any given system of defense.⁸²

Regardless of the number of aircraft available on hand, the number that could be sent out on any particular mission depended on the ability of the maintenance crews and depots to keep the aircraft in operational order, to repair battle damage, and to make such modifications as combat experience demonstrated to be necessary. This ability, in turn, depended on an adequate supply of parts and spare or trained personnel large enough to be in a position to devote enough time to this work to keep up with the requirements of the operational units. In the fall and winter of 1942, neither of those conditions prevailed, and so it was not possible to realize fully the potential strength of the available force available. On the 13 missions studied in this chapter the VIII Bomber Command was able to dismount an average force of 70 aircrafts with a maximum of 101, yet these figures represented a percentage largely lower than that of the total aircraft on hand in the theater. Through November, for example, only 51 per cent of this total was in combat condition.⁸³

The Eighth Air Force had kept its aircraft placed in a mix of units and those left in the unit hangars were still prepared to give high priority to a significant destination or objective.⁸⁴ For similar reasons, the Eighth continued also to suffer from an inadequate flow of parts and tools,⁸⁵ and thus again and little likelihood that the situation would improve for some time to come. For, even shipping crews available to carry the required personnel and

~~SECURITY INFORMATION~~

AM 14-13

104

~~CONFIDENTIAL~~

equipped, it would probably have to be used for transporting combat units. Although General Spaatz warned that "a sharp reduction in the rate and efficiency of air supply rations must be expected until the required service elements have caught up with the combat units," he advocated allocating available shipping; to combat replacements as a matter of first priority, since the latter required time to be made acclimatized and fight, in moonlight, at supports or in emergency areas until normal service units arrived.⁵³

At the same time, the British Air Force had mounting evidence of battle damage which placed an increasing load on the already inadequate repair facilities, with the inevitable result that a large proportion of the combat aircraft was always out of action. In September, 18.6 per cent of the attacking planes suffered repairable damage; in October 27.7 per cent. As however this percentage in this category had risen to 32.1, 18th January, promising an even higher proportion of damaged planes,⁵⁴ still further complications resulted. It had been found necessary to modify air force tactics to meet unforseen tactical and operational conditions, i.e., over-water, to do better work to a large extent in the Counter. Until a standard model could be turned out in the Zone of the Interior, fully designed for combat in the Euro-Mediterranean via transoceanic transport, such repair as civil as fiction--which had to be made at least all reholons of the cut-and-fit method, which again increased the losses on air fields, intensive facilities.⁵⁵

Intensive difficulties were reflected in the relatively high rate of aircraft sorties resulting from combat patrols. Since

~~CONFIDENTIAL~~

LIA-15

106

~~CONFIDENTIAL~~

actor, one who had increased considerably, Captain, is now the
60 per cent of all abortives. Captain increased a lot when
without any regard to territory, if currents were incorporate, or
unjust, or the other important it is a significant figure.¹⁰⁰
It is possible, of course, that the authority of your commanders to
put as many of their planes in the air as possible had the effect
of starting, so that, under less than the existing conditions,
it did not seem like on the ground for the thorough overhaul. In
any case this is a gross factor, for the total abortive rate was
nearly eight. On the 1,000 hours the average was 21 October 1942
to 1 January 1943, 151 hours 11.1 percent abortive.¹⁰¹ In January,
General Farquharson said, went to the first number of aircraft
out of commission, a large number of whom would have been
in earlier form, during the previous month.¹⁰²

The importance of the command pilot in a case of
abortion is also clear. Too often the pilot has no time to take off
in his own interest or fly in from another plane - which can be difficult
or impossible - and wishes to be seen blurred through visibility.
And the result will be a very good chance that, in cases of aircraft
abortion, the aircraft will find itself in the less partially
or totally obscured by clouds. And likewise the case of the
abortive aircraft could be caused directly or indirectly to the
commander. This is a interestingly by Farquharson: crews were,
for example, landing over, the runway or covered with water, so
as not to delay or prevent the barrier by the judicious use of oil; and

In very similar operations to those in the case of
the "Inches" aircraft by covering the rear cockpit.¹⁰² As,
in our first attack, only time factor could satisfactorily cover
the operational results.

Further, India is continuing to receive a great deal of ill-treatment
from Britain. Light air force was used. They are aware, or at least
they were, of the fact that British aircraft were flying and excell-
ed the use of instruments and fair visibility conditions. There was
trouble from only after burns and rain in the operations. On
the other hand, weather conditions will still be irregularly
found on various occasions.¹⁰³

High altitude claimed to be 10,000 feet blind-to-being to situation,
the such stage of aerial warfare as to be able to cover by British
"Gullamer" units. It is highly recommended to be very logical
in that direction, to our best interests. For each mission
to proceed during the same period, could result
in accuracy and precision. For safety operation, it is recommended
of the three missions over the area of India of 1000. At one
initial variant in each area, a four-pointed 40% for
"Gullamer" or "Inches" missions is little ground for optimism.
On 2 January 1943, four sets of operational aircraft squadrons
and the first series blind operations over several strategic cities
north of the area with the objective of alerting German troops and
other in Germany and so on. It is known as difficult, in view
of the valuable equipment carried as the full intrinsic value of
any bombing raid, the airplane should return to base if cloud cover
~~CONFIDENTIAL~~

proved insufficient to give protection. Perversely, the weather cleared and all four returned without bombing. Twice more in January B-24's went out on expeditions of this sort, only to be foiled again by fine weather. Short of resorting to night bombing (the RAF had, after all, conducted 18 missions during January) the Eighth Air Force had little choice but to wait for favorable weather and a wider selection of targets.¹⁰⁵

The Eighth Air Force also faced certain major tactical problems, upon the solution of which depended the success of the day bomber offensive. Success depended specifically on the ability of the day bombers to hit and destroy their objective and on their ability to defend themselves against flak and fighter attack. Questions on both these accounts had been implicit in the history of Eighth Air Force operations from the beginning. During the fall and winter of 1942 they became rapidly more pressing. In order to hit such relatively small, isolated, and invulnerable targets as submarine base installations, it became evident that better offensive tactics, particularly improved accuracy, would have to be developed. And the vigorous growth of German countermeasures called attention even more urgently to the problems of defense. Prior to 21 October, neither flak nor fighters had seriously threatened the American bombers. Clearly, the Germans had been caught unprepared for a weapon such as the day bomber which not only could do real damage from extreme altitudes but could also shoot it out with the best fighters in the Luftwaffe. However, as many observers, including General Spaatz, had foreseen, they lost no time in adjusting defensive tactics to

~~SECURITY INFORMATION~~

AAFHS-18

107

~~CONFIDENTIAL~~

cope with this unprecedented attack. If they adjusted neither so rapidly nor so radically as some had feared, they nevertheless gave the Eighth Air Force grounds for serious concern and taxed the ingenuity of its tactical experts.

Except for the few seconds of the bombing run when the purpose of the heavy bomber is realized, all phases of a bombing mission are dominated by considerations of defense. But considerations of defense had to be carefully balanced against those of offense, for they were not always reconcilable; and they had also to be weighed in relation to each other, for what would offer protection against flak might increase vulnerability to fighters. For example, high-altitude bombing reduced risk from flak, but it also reduced bombing accuracy. Bombing by a single aircraft might, under ideal conditions, be best for both accuracy and protection from flak, but would not provide sufficient defense against fighter attacks. Large bombing units flying in formation would give adequate protection against fighter attacks, but would increase flak hazards and at the same time reduce accuracy by enlarging the resulting bomb pattern. As experience was gained, constant adjustment was made in multi-lateral compromise necessitated by this problem of integrating defensive and offensive tactics.¹⁰⁶ By January 1943, many of the basic lessons had already been learned, much of the pioneer work having been done by the 1st Bombardment Wing, under the successive command of Brig. Gen. Newton K. Longfellow, Brig. Gen. Larry S. Kuter, and Brig. Gen. H. S. Hansell.¹⁰⁷

~~CONFIDENTIAL~~

~~CONFIDENTIAL~~

The Germans had taken some time to adjust themselves to the American raids. In the first few weeks they first proved ineffectual in opposition to aircraft flying at altitudes above 20,000' P.M.T. and their fighter pilots were at first very unwilling to get very close, preferring to stand off just outside the range of the bombers' guns and wait for a favorable opportunity to dash quickly in and out of the formation. But, from October on, marked improvement became noticeable in both antiaircraft fire and fighter opposition.

German fighter tactics, as they developed, were clearly designed to aid the bomber force. They reflect a favorable recognition however, to stop the deep-bomber threat. Reports from German sources indicate that, after the first few missions during which German installations had been damaged and aircraft destroyed at practically no cost to the bombers, a shake-up had taken place, soon, commanding in fighter staffel^(squadrons) on the Western Front, with the result that fewer and fewer determined efforts were made to find the right spot in the American bomber force for missions that would make their missions prohibitively costly.¹⁰³ Any type, or other, of threat, but for some time will still prove a problem. This has been the accepted rule of attack against bombers, as recent British findings which on behalf of Germany's best protect its heavy bombers by the addition of especially heavy armament and armor plate.¹⁰⁴ The German is well able to defend against ground attack on aerodromes, and the F-100¹ (bearing a very little, if any, resemblance to

Douglas's P-51s, fighter bombers made a series of low rate attacks from the rear in an unerring effort to find a blind spot left from both dorsal and tail turrets. They came in, sometimes in formations of three, at flight level, opening fire at 100 yards. Four bombers were lost as a result of this action, and six others damaged. At the enemy, in turn, sustained disproportionately high losses.¹¹⁰

Beginning with the St. Nazaire mission of 26 November, British fighter tactics changed abruptly. Nearly all attacks that day came from the front. The Germans had finally discovered the relative weakness of the P-17 and the P-51 in forward fire power.¹¹¹ Both P-17's had a .30-caliber, hand-held gun, firing through one of four cyclotes just off center, and both mounted two .50-caliber side nose guns. In either case a blind spot was left in front which neither the upper turret nor the ball turret could reach. The P-51's were equipped with .50-caliber side nose guns, and a single .50-caliber center nose gun, mounted to fire below the horizontal only. This armament also left a blind spot which the upper turret could not cover.¹¹²

After 26 November, and through January 1943, nose attacks continued to predominate, and accounted for most of the losses suffered by the VIII Bomber Command as a result of encounters with enemy fighters.¹¹³ Losses from enemy fighter fire, in turn, constituted by far the larger proportion of total losses, which had risen from an average of 3.7 per cent of the attacking force in November to 8.8 and 8.7 per cent in December and January respectively.¹¹⁴

61

— SECURITY INFORMATION —

AIRFM-18

110

~~CONFIDENTIAL~~

In addition to the high rate of losses attributable in large part to the frontal attacks, the bomber crews had to face this type of tactic very frequently just over the target when the confusion inevitably resulting would be most likely to spoil the bombardier's aim. In fact, it was believed that to break up the bombing run had now become a primary objective of the German fighters.¹¹⁵ The frontal attacks, therefore, came during these months to be the chief defensive problem of the Eighth Air Force.

It was immediately clear that the only effective countermeasures would be the addition of increased forward fire power in the bombers and an improved defensive formation which would give all planes the benefit of mutual protection. Of these remedies, the addition of nose guns was the more critical item, because it would involve a great deal of time-consuming modification both in the United Kingdom and in the United States. Meanwhile makeshift tactics were devised. One method of countering the front-quarter, level attack--the method reported in December as the one officially approved--consisted of a diving turn into the attack which uncovered the top turret, and, incidentally, tended to spoil the enemy pilot's aim. It was hoped that in this way any such attack would encounter not only the front, side-firing guns, but the top turrets of at least some bombers in the formation.¹¹⁶

Modification for nose guns began promptly. Pending the installation of a standard power-driven turret in the B-17, flexible, hand-held .50-caliber nose guns were provided in most of those destined

~~SECURITY INFORMATION~~

AAFRH-18

111

~~CONFIDENTIAL~~

for the European Theater; and the standard B-24 front nose gun was modified in such a way that it could fire above the horizontal.¹¹⁷ In the theater, similar modifications were undertaken on as many aircraft as could be accommodated in the depots. The need for such modification was so great that improvised field installations were authorized as long as they conformed to basic requirements. By mid-January, most heavy bombers in the United Kingdom were equipped with effective forward fire, if only from single, improvised, .30-caliber and .50-caliber, hand-held guns.¹¹⁸ Complete satisfaction could only result from the installation of a turret in the nose, but it was not until August and September of 1943 that the improved B-17's and B-24's arrived in the theater complete with this power-driven equipment.¹¹⁹

Although it was a standard defense against all fighter attack, the large formation of bombers so stacked as to provide mutual fire support proved especially helpful in countering the frontal attacks. Indeed, it was during the fall and winter of 1942, and primarily in answer to this particular problem, that the 1st Bombardment Wing evolved a system of formations which became the prototype for operations in the theater. When General Luter took over the wing on 6 December 1942, he found four groups, each operating according to its own tactical doctrine. No wing organization existed for tactical purposes, and consequently the groups collaborated only in the sense that they all attacked the same target roughly at the same time. No effort was made to secure additional fire support by coordinating group tactics. Squadrons and groups had developed into cohesive

~~SECURITY INFORMATION~~

AMFRL-18

112

~~CONFIDENTIAL~~

teams, but the wing as a whole had not become a combat unit. Acting on the assumption that the larger the formation, consistent with requirements of maneuverability, accuracy, and control at high altitudes, the more mutual fire support would be obtained, General Hunter set about to weld the squadrons and groups into the largest practicable combat units.¹²⁰

At first the groups had bombed in elements of three aircraft, but fighter attacks demonstrated that bombing by elements, however satisfactory from the point of view of accuracy, did not provide sufficient defensive power. Combining squadrons, composed of two elements of three aircraft each, was then tried. The intensity of enemy attacks soon made it necessary to resort to bombing by groups of three squadrons. Thus a formation composed of 18 to 21 bombers, known as a combat box, became the standard minimum combat unit, and was stacked in such a way as to uncover as many of the top and bottom turrets as possible in order to bring the maximum fire to bear on the critical rearward hemisphere. It was considered to be a combat unit feasible for offensive purposes and the largest time could be handled readily on the bombing run.¹²¹

At, especially on the trip toward the target and return withdrawal, it appeared that mutual fire support could be greatly increased by combining two or four combat boxes into a single defensive formation. It was not, however, considered practicable to fly the entire bombardment via in one formation. Anytime larger than a formation of two or three combat boxes would have required employment in such

~~SECURITY INFORMATION~~

Text -1s

118

~~CONFIDENTIAL~~

santa that the differences in time velocity and airspeed performance at different altitudes would have to be traded in the case of an formation to accomplish the low effective position. Moreover, the groups were about all that could be readily organized and controlled by a single combat commander. Accordingly the low performance wing forced to be bat wings of the group each. In each of these combat wings the senior group commander assumed command and was given full authority in planning and executing the mission. This organization excepted for tactical purposes only and in no way affected the administrative organization of the ac base. ¹²² bat wings.

The combat wing, consisting of two or three combat boxes, thus became the maximum detectable formation. It was generally deployed in echelon up, in a vertical wedge similar in principle to that of the combat box, although in the period under review many variations occurred. In early 1943 it was apparently also planned to use the combat wing as a unit in formation so as to minimize the fighter opposition and likely to be strong enough individually over the target to warrant it; use: this despite the fact that it could be a clumsy formation to maneuver around the initial point onto the bombing run and that the resulting nose pattern would tend to be too large for the desired accuracy. ¹²³

Airbase cover, and lots of it, had originally been a pre-requisite to day bombing, and the early missions had been flown under a hot umbrella of friendly fighters. But, in January, opinion was again turning, towards escort as one of the safest kinds of circular strip.

is believed. It is likely that during the period of 1-12, 1968, several
bombs were dropped on the target area by aircrafts assigned to C-121
Observation Squadron. In all cases, it is believed that each bomb
was dropped by one aircraft. The ratio of bombs to aircrafts
was 1 to 1 or 2 to 1. There was no limit placed
on the number of aircrafts over which a single bomb could be dropped.
Bombs, 126.

In addition, there were 12 losses of aircrafts because of
air-to-air combat, mainly on previous occasions. - only one fought in
the air space in which the aircrafts were lost. An additional
loss of aircrafts was attributed to damage from ground fire. In
addition, there was a loss of aircrafts due to accidents.
However, because of little time available to know if, the results of
damaged aircrafts had been hit by friendly aircrafts, Unit 1, to a
certain extent on two occasions, at least, where on 1 occasion minor
damage, considerable losses had been sustained as a result of friendly-
craft fire. 127

An increase in Unit 1's operational tempo is shown in
various aircrew combat techniques. This technique is to be conducted
in such a manner as to fit the pattern of each target, attempting
attraction, and to be utilized when the target is known. The initially
selected type of target acquisition must be determined. "Coordinated follow-
in" is required to insure the maximum probability of hit
attraction of the target aircraft. Once this type of target has been

right "intimate" connection differential in altitude between units; and secondly, that bombs receive action more directly after release of the bombs. Not only was it to be shown not to be wrong, but to be such an advantage that bombers could fall prey to fighters. Similarly, to score hits most effectively, the bombers had to fly at the highest altitude in con concurce with accuracy. At 10,000' M.R., in a sense, was as difficult compromise to make. It might fairly be said that, in these early combat days, any sort of blind handicapped effective bombing operations led by destruction; or otherwise were driven by forcing the attacking planes to bomb at altitude a too high for survival or less insure released crews to remain circumscribed at accuracy.

The question of bombing accuracy over which all other pertaining to the offensive aspect of bombardment. Unfortunately it is not possible to say anything very precise about the degree of accuracy achieved in those days, for the number available is too incomplete, too inconsistently reported, and filled with too many variables to permit any worthwhile conclusions. Despite the fact that Air Headquarters exhibited an anxious interest in the subject, it was only on 22nd accumulated since 1 January 1943 that any systematic analysis became feasible.¹³⁰ This much, however, is uncontested: results in the full year 1942 were disappointing to all those who, trained in one "pencil-and-barrel" school of bombing, knew how accurate the American bombers could be.¹³¹ An average of only about 30 per cent of the bombs dropped could be identified by photographic recognition. Although many "Guds" were reported as "completely correct," it can be assumed that a large proportion of the unidentified bombs falls in the 30 per cent or

110-18

115

"gross" errors.¹³³

~~CONFIDENTIAL~~

It was this tendency to gross errors that concerned bombing accuracy to an extent. Under practice conditions, accuracy might conceivably be improved ininitely by training the bombardiers to set their sights more precisely and the pilots to hold a steeper course during the run on the target. However, this in practice excludes few gross errors so common with any 1% errors stemming from intrinsic fault in the equipment. Most errors are errors of adjustment alone. These were very different in content, since the confusion and concern at increased the incidence of gross errors to the point where the effect on resultant factor became oblique. Clearly, then, if the cause of these sizable errors was not discovered and removed, the London bombsight, with its delicate adjustment, would be useless. It was, in fact, considered possible that, in such an event, an inferior sight, requiring less careful adjustment at night have to be adopted, a step which would seriously have compromised the ideal of precision which underlay the American bombardment theory.¹³⁴

Invariably, large gross errors resulted from mechanical failure, the radios either failing up or failing prematurely. At night, it could be extremely cold, in addition to the strain on the airplane caused by the high load, sometimes impaired the functioning of the release mechanism. Much more important was the frequent failure of pilots, bombardiers, and navigators to identify the target. Although an extreme case, it is instructive to notice that on the operation of

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

DDN-N-18

119

~~CONFIDENTIAL~~

18 November 1912 one formation was able to bomb St. Omer under the impression that it was bombing La Celle, 100 miles away. A more typical case occurred in the Lille raid of 8 November when some 20 to 25 bombs struck near a factory three miles short of the intended target, which was also a factory, but situated in quite different surroundings.¹³⁵ The development of perspective maps, then well under way, helped reduce the likelihood of mistakes of this sort by providing the bombardier with a picture of the target as he was likely to see it rather than as it appeared on the older type of vertically projected target map.¹³⁶ Then, too, it was often difficult to follow a set course in the face of unexpectedly strong cross winds. And many errors arose from failure to set instruments properly, either because of combat excitement or because the severe cold and the encumbrance of oxygen apparatus, heavy clothing, and cartridges prevented dexterous manipulation.¹³⁷

Set one-tenth of all factors aside for inaccuracy in the accuracy of conducting a steady course in the face of enemy antiaircraft or fighter action. To an observer, bombing accuracy appeared to be inversely proportional to the resistance encountered at the target. In order to guard against flak, evasive action was normally taken for as long as possible on the approach to the target, leaving a margin of 10 seconds for the level bombing run. During such evasive flights, bombardants had to share with drivers authority and control, and often under enemy attack.¹³⁸ In addition to difficulty arose from the fact that, in order to maintain an off course safety

~~SECURITY INFORMATION~~

AAFRH-18

120

~~SECRET INFORMATION~~

against fighters, the formation was likely to be too large to produce a satisfactory bombing pattern.¹³⁹ Various solutions to these bombing problems were suggested. One obvious way to increase accuracy, though not, of course, to reduce the number of gross errors, was to bomb at lower altitudes. But the experiment of 9 November at St. Nazaire discouraged further planning in that direction, and a higher probability of error was exchanged for lower vulnerability to anti-aircraft. Much naturally depended on a constantly improved state of training and experience which alone would remove many of the causes of error.¹⁴⁰ To insure a steady bomb run, and so give the bombardier time to set his sights, pilots and bombardiers were urged to use their automatic flight control equipment (AFCE) which, when it functioned properly, as at that time it did not always do, gave more precise results than manual flying.¹⁴¹

Some commanders believed that one way to get accurate aiming in formation bombing would be to have the leader in the formation set his sights accurately for deflection, even at the expense of accuracy in range, and leave the remaining crews to set theirs for range only, taking their direction simply by holding their place in the formation.¹⁴² In this way group bombing could be accomplished without the risks and confusion likely to ensue should each plane in the formation attempt to make its own adjustment for deflection. In a further effort to exploit the possibilities of group bombing, and incidentally to escape from the irregularities that seemed always to crop up when bombardiers of uneven ability bombed individually,

~~SECRET INFORMATION~~

~~CONFIDENTIAL~~

AAFRH-18

121

some groups resorted in January 1943 to bombing entirely "on the leader," each bombardier taking his signal from the lead plane. Initial results of this method, though not at that time conclusive, proved very encouraging.¹⁴³ Finally, one of the most urgent requirements for improved accuracy was some sort of improved fire power by means of which the frontal attacks, made so consistently by the German fighters in December and January, could be effectively countered and the morale of the bomber crews be correspondingly raised.¹⁴⁴

The problem of accuracy, and indeed that of bombing in general, thus became inextricably entangled with that of defense. The method of bombing as worked out by the 1st Bombardment Wing during late 1942 tended to be dictated more by the nature of the opposition met than by the theoretical requirements of precision bombardment. The enemy practice of attacking during the bombing run, even in the presence of antiaircraft fire, made it advisable to preserve as large a formation as possible and one so arranged as to give all elements the maximum of mutual protection. A large formation (and it was tentatively suggested that bombing might be done in combat wing formation) increased vulnerability to flak and, if the bombing were done on the leader, it was likely to produce a larger bomb pattern than when the work was accomplished by smaller formations. If, on the other hand, flak defenses were known to be concentrated, it was necessary to accept higher vulnerability to fighters by splitting the formation so as to reduce risk from flak.¹⁴⁵

In this chapter and the one immediately preceding it, a story has been told of things accomplished and problems encountered by

122

the Eighth Air Force prior to mid-January 1943. It was on the basis of these achievements and in the face of these half-solved problems that General Arnold took his stand on behalf of the daylight precision bombing of Germany at the Casablanca Conference in January. The record was incomplete and the conclusions it warranted were necessarily tentative; but it enabled him to state the case for the daylight bombardment campaign strongly enough to ensure for it a place, and an important one, in the plans for, all at that time for the defeat of the European Axis. In the next chapter an effort will be made to trace the development of those strategic and organizational plans which culminated in the proceedings at Casablanca.

Chapter IV

THE STRATEGIC POLICY FOR THE PERIOD FROM JULY 1942 TO JANUARY 1943

American Strategic And British Views

A combined bomber offensive against the European Axis would in August 1942 clearly be part of Allied plans. An strategic decisions that affected it had all been made, at least in tentative form. The Combined Chiefs of Staff had reaffirmed in July their policy that Germany rather than Japan should first suffer the brunt of Allied offensive strategy. Although the decision to mount T-100 had considerably modified the original concept of BOLERO and GROUND UP (the pre-operation for and execution of a large-scale invasion of the Continent from the British Isles), the latter invasion was supposed only to postpone a cross-Channel invasion in favor of a more immediately feasible plan for exerting pressure on the European Axis and for relieving pressure on the Russian front.¹ Moreover, an intensified bomber offensive by both British and American forces was still considered a prerequisite for any such major action against the European fortress.² A high priority has always been accorded to the production of the huge numbers of aircraft necessary in order to implement the bomber offensive.³

But the fact that these decisions which were tentatively reached by the late summer of 1942 remained closely held, finally acted upon in the years following was obscure. The fact, or at least quasi-historical importance, that every one of these decisions was subjected to the most searching criticism throughout the fall of that year, must

AAFRH-18

124

the basic strategic plans reflect a certain essential continuity is doubtless owing in large part to the momentum of operations already under way, for the war could not wait on the conclusion of interminable debate. But it was also owing in no small measure to the persistent work of the U. S. and British air planners, acting on the basis of data provided by their respective operating air forces, that the projected bomber offensive came finally into being.

Except that it was lukewarm on the subject of TORCH, which it tended always to consider a diversion from the main effort planned for the U. K.,⁴ opinion in the USAAF was in solid agreement with the basic strategic concepts stated officially by the CCS. The official AAF position, originally outlined in AWPD-1, was reaffirmed with little essential change in September 1942. In answer to a request from the President for a statement of the requirements of the Army, Navy, and U. S. production for the Allies "in order to have complete air ascendancy over the enemy,"⁵ the AAF planners issued on 9 September a document known as AWPD-42 which became the official air war plan and formed the basis for all AAF strategic planning prior to Casablanca.

In order to establish the air requirements as requested, the authors of AWPD-42 had to examine the strategic hypotheses underlying the employment of air power, both current and projected. It would not, they believed, be possible to mount an effective air offensive simultaneously against both Germany and Japan with the resources conceivably available, especially since U. S. air power would have to be employed also in support of the land operations in North Africa, the Middle East, and Burma, in support of amphibious operations in the

South and Southwest Pacific, and in connection with antisubmarine patrol and hemisphere defense. In a choice between Germany and Japan, all considerations favored Germany as the objective of first priority. Allied armed forces were not within striking distance of Japanese military strength at its vital sources. A sustained air offensive could not therefore be waged against Japan unless the Russian maritime provinces were secured, which contingency could not be relied upon. The European situation, on the other hand, presented excellent opportunities for the effective use of air power. Indeed, in the initial stages of a war against the European Axis, air power alone could be brought directly to bear against Hitler's stronghold.

As the AAF planners saw it in September 1942, the strategic situation in Europe appeared as follows. By the time the air strength contemplated in ANFD-42 would be ready for employment, large Axis ground forces would likely be released from the Russian front for action elsewhere. Thus the ground forces of the United Nations would be numerically inferior to those of the Axis on the western fronts. It would consequently be necessary to create circumstances in which Allied ground forces could defeat Axis armies. Now the only way in which this could be accomplished was by means of the numerically superior air forces of the Allies, which must be used so to deplete the air power of the enemy and so to undermine the economic structure which supported his land forces that an invasion of the Continent could be successfully performed. Fortunately, a base, England, was available, capable of sustaining the increasingly superior Allied air strength within striking distance of the sources of German air power

~~SECURITY INFORMATION~~

AM 10-18

163

~~CONFIDENTIAL~~

and the vice l. of the American economy. or l. to 16 the early part of 1944, priority would accordingly be given to this air offensive against Germany. This can be done on the assumption fully justified, as it would by AM-1014 in the overall requirements of 66,000 combat aircraft for 1.43 were met, it would then be possible to mount a combined land offensive against Germany and an air offensive against Japan, either successively or simultaneously, in the last part of 1944.

The programme in either the western or eastern was to turn the former or the principal effort to be made on that offensive such as became available. British aircraft had to be placed since entry of the U. S. into the war. This will, with operational forces of 2,225 planes deployed in the United Kingdom January 1944, result in attrition, the "most rapid destruction of selected vital areas of the German economy and industrial machine through precision bombing in daylight." In the same manner upon "an air attack of industrial areas at night, to break down morale," which, in view of the acute shortage of skilled labor in Germany, should have a "pronounced effect upon production."¹⁰

This, in essence, remained an official U. S. position during the remaining months of 1943 and the month preceding the Casablanca Conference. No doubts arose as to the feasibility of the United States making plans for a dual economy offensive in view of the dismal state of oil and fuel resources available to Hitler in northwestern Europe. But, however an important basic strategic planning, these doubts were of minor importance. At best it was seriously

declared that the heavy bomber force should, in view of a successful invasion of North Africa, be ready to bomb on the Mediterranean during the next 6 months where weather conditions would be much more favorable to precision bombing than in the U.S.⁷ and, anyway, it was confidently expected that improvement in aiming-to-bomb techniques would successfully circumvent complaints of poor visibility.

The principles underlying AAC-D-18 were reaffirmed by General Arnold in a memo for the JCS, dated 10 November 1942. This document, however, reflects somewhat more strategic assumptions made by the authors of AAC-D-18. The invasion front no longer appeared imminent from a point of disintegrating. In fact, Arnold laid emphasis on Germany's mounting embarrassment rather than on a progressing strength. Two indecisive summer campaigns, together with an allied invasion of North Africa, bombing from the U.S., and the prospect of a most uncomfortable winter, had, he felt, generally weakened the enemy. All of which pointed to the immediate need of intensifying, to the utmost, the pressure against Germany so that she might be allowed no time for recuperation. This aim could only be achieved by increasing the weight of strategic bombardment.⁸

Provision had been made to adapt AAC-D-18, concluded as the official AF war plan, "breast of sailing; strategic circumstances by means of constant review."⁹ On 1 December 1942, Headquarters, AFM issued a study the purpose of which was apparently to bring official policy up to date. This "Plan for the Defense of the American Powers" again endorsed the soundness of current strategic commitments, insisting that Germany remained the principal enemy, save the only way to

defeat Germany was by land invasion, & it land invasion could only succeed if preceded by strategic aerial bombardment, and that the best if not the only opportunity for both land and air offensives lay in operations from the U. S. ^{via} the nature of the strategic bombing offensive was described as a combined effort by Air and Land, operating by day and night, and using precision area bombing techniques respectively. Operations would be aimed initially against the sources of German air and submarine strength which together constituted the chief threat to allied operations and the principal obstacle in the way of an invasion of the Continent. When the German Air Force had been sufficiently reduced to permit such a shift of tactics, the RAF would switch to day bombing in addition to their night operations, thereby accelerating the destruction of Germany's war machine. It was the optimistic hope of the authors, probably influenced by the situation on the Eastern Front, which had improved since A WD-42 had been written, that a combined border offensive, pressed to the fullest extent of allied capabilities, could make an invasion of Germany feasible by the fall or winter of 1943.¹⁰

Throughout WD thinking there may be detected the well founded fear that U. S. air forces would be dispersed over all parts of the globe in support of particular local needs but without reference to any one strategic plan according to which the strengths of the AAF would be concentrated with decisive effect. As early as August 1942, General Arnold expressed serious doubts as to how a war could be won with forces scattered all over the world, and urged that theater commanders in minor theaters be instructed to act along with a

minimum air force we have "an overwhelming number" of planes could be available in major theaters. As now, he told me, Starr, "an education job as well as an allocation job." In another connection he asserted that successful air operations depended on "the continuous application of massed air power against critical objectives."¹¹ This doctrine of the concentration of air power was fundamental to all AF strategic planning.¹²

British opinion on the air war remained similarly constant. Not only were the British committed by geographical necessity to the defeat of Germany as a matter of first priority, they were also committed, in both theory and fact, to a long-term policy of strategic bombardment.¹³ Even while urging the option of TORCH as an alternative to an early cross-Channel operation, the British had insisted on preserving as far as possible the bomber offensive from the U. S.¹⁴ Again in November and December of 1942, when it became a question of once more postponing a Continental invasion in favor of exploiting the success of TORCH, the British, while advocating further Mediterranean operations, took the firm stand that nothing should be allowed to interfere with the strategic bombardment of Germany.¹⁵ The reason for their preference both for the bombing offensive against Germany and for land operations in the south has already been dealt with in Chapter I of this study. It was implied by Lord Trenchard when he warned that for the Allied nations to embark on an early land campaign against Germany, when their ground forces could as yet operate

only at a distinct disadvantage in relation to the still powerful Wehrmacht, would be simply to repeat the disaster of 1914-18.

"Our strength and resources," he declared, "is in the air--the British and American Air Forces."¹⁶

Throughout the fall of 1942 this continued to be the theme of the British Chiefs of Staff. In November, at a crucial period in the history of strategic bombardment, that agency presented for the consideration of the U. S. JCS a paper which explicitly stated that a large-scale invasion against unbroken German forces was not "a practicable operation of war." Accordingly, the paper concluded:¹⁷

The creation in the shortest possible time of a great transatlantic force of 1,000 to 6,000 bombers by April, 1943, should have high priority, qualified only by the necessity to provide adequate air forces for the maintenance of sea communications and for the support of such land operations as it is believed to undertake. Any decision to undertake offensive land operations during the period of our attack on the German industrial and economic war machine must be guided by the value of these operations compared with the consequent diversion of air effort from the principal objective--the German war machine.

It will be noted that the British Chiefs of Staff here apply the continental doctrine of concentration in the application of air effort which formed a vital part of AF thinking.

According to a British Air Staff paper of 3 October 1942, the transatlantic bomber force should be employed with great flexibility in order to meet circumstances as they evolved in mid-1943: "Initially the British force will be operated mainly by night, and the American by day; the British, however, never towards day, or alternatively the British a continuous night operations in accordance with the development of the tactical situation."¹⁸ It was, however, on this point that the two forces differed at existing patrols the two forces.

REF A-18

131

The doctrine of daylight precision bombing, was never fully established during 1942 to the complete satisfaction of all British air observers, and at the Casablanca Conference in January 1943, Prime Minister Churchill asked bluntly to know the reason why it would not still be preferable for the U. S. bombers to turn to night operations. This was probably in part his own idea, for he had never been convinced of the peculiar capabilities of the American heavies and had exhibited considerable interest in equipping them with flame-dampeners for night operations and in assigning an appropriate portion of them to anti-submarine patrol. It was, however, an idea apparently shared by the Commander-in-Chief, Allied Bomber Command.¹⁹

Both British and American air strategists remain, then, in substantial agreement in regarding a combined bomber offensive against Germany from bases in the U. S. Let it be noted that this plan depended absolutely on the following conditions: (1) the war in Europe must remain in a position of unquestioned priority over that in the Pacific; (2) air forces must be concentrated, insofar as was compatible with the minimum requirements of essential operations elsewhere, in those places where they could bring pressure, not merely harassing, pressure to bear on the enemy; (3) production of aircraft must be accorded not merely a high priority along with other important projects, but an overriding priority in the allocation of critical materials; (4) a system of organization and control must be evolved which would insure the effective application of the combined bombing effort. In the controversies that arose over each of these issues, the word of most weight on the American side

of air power; and so it became easier, that day, both American and British, even at the cost for bewilderment in China, and for a combined strategic offensive against Germany in particular, in such a way as to convince those not unfavorably disposed and to overcome the opposition of those who impugned the validity of the entire air argument.

Problems of Basic Strategy

The decision to abandon an early invasion of Europe in favor of ROME first Allied strategy, in that day no small state of surprise, by unstable equilibrium. By some, particularly by the U. S. Navy, it was apparently taken as a signal for a radical reorientation of policy, amounting even to a shift from the strategic offensive against Germany to the strategic offensive against Japan. At least the balance between the strategic offensive in Europe and the strategic defensive in the Pacific, as early agreed upon, had been a delicate one. It had not been easy for U. S. planners to choose between a powerful but relatively remote navy and one which, though relatively weak, constituted an immediate menace to vital American positions. And in the spring of 1942 the President has in fact found it necessary to intervene in order to prevent SULLIVAN forces being slowed down.²⁰ But as long as SULLIVAN-MAUD-UP remained the key to allied offensive strategy there was no questioning it. Although it was not the intention of those who advocated the North African campaign to do more than postpone SULLIVAN-MAUD-UP, the fact remained that, in shifting to ROMA, they had altered the basis for planning, as far as the interventionists future war concerned. At the very least they had opened the subject of basic strategy, pre-emptive review.

There had even been some talk, in military conversations, of still using Hitler's existing forces, or broadening the assumptions from which basic strategy emanated to include the distinct possibility of shifting to the offensive in the Pacific. The crucial issue at that point was whether Russia would continue to be an effective ally. Russia can succeed in her battle to hold off the German Army, there would be no doubt about the need for maintaining the maximum pressure on Germany. If, however, Russia resists and goes to collapse, Army cooperation would shift the maximum Allied effort, or that of the U. S., at any rate, should be shifted to the war against Japan. In any case they insisted that Hitler's strategy must reflect too "civilized," i.e. care production of weapons should be so balanced as to meet some kind of one eventuality.²⁴ This FOCM decision, by taking into account the possibility of Russia's resistance, put an end to this particular argument. But the controversy continued to flourish, in within somewhat restricted limits; and it very continually suggested of a "limited offensive" in the Pacific rather than a "strategic defensive," as most of the official papers then had it.²⁵

As far as the "irregulars" concerned, the entire case presented by the proponents of the Pacific strategy to their fellow observers to rest on the fundamental assumptions regarding current plans—in addition of course to the overall highly analogous nature of responsibility for a variety of operations originally its own. In the first place, they very naively considered it projected to be an offensive front but... by itself plans to be impossible implementation of our support for a European revolution. In support of round

Discussion, in fact, began promptly after the tentative adoption of the FDR plan on 21 July 1942. In the 3 of the U. S. JCS during August and the latter part of July, major constituents of the war plan is clear cut, in their estimation, American strategy was in the process of reorientation, not only in the direction of the Mediterranean but also toward the Pacific.²¹ Even General Marshall, who was not one to be easily swayed by arguments stemming from the special interests of the Navy, admitted in August that the big issue to be decided was whether the major U. S. effort was to be made in the Pacific rather than in Europe and the Middle East, although for the present he favored one latter alternative more ~~over~~ plannin^g.²²

In addition, the deployment of air forces in particular, the Navy representatives argued, in effect, that the build-up of air strength in the U. S. had been an integral part of the DULLES-COOPER plan, that its purpose was to support the invasion of Europe, and that, since COOPERS no longer constituted the primary project, aircraft could no longer be considered a reasonable venture, committed to war against Germany only insofar as they were required by TOTAL and operations in the Middle East. Admiral Leahy pointed out that, whatever commitments were contemplated in August, it would have to be understood that U. S. forces then operating in the Southwest Pacific "must and will be maintained." And Admiral Cook referred significantly to the equippin^g; of a large number of island air bases.²³

JULY-18

115

The USA's own racism had been the principal mission of the Hitler regime, so it would not seem appropriate to mention its part here, once the operations had been initially postponed, so little was known about the nature of the Nazi war activity which was to distract the USA from its obvious desire to maintain a nuclear or strategic bombardment program. Both Britain and America had strategic bombing programs, which were, respectively, one of their main strengths, and one of their main weaknesses. The British long-range bombers, based on aircraft industry, telecommunications, and aircraft contractors, were considered a project which had to be, but could not entirely, independent of the need for innovation, as various offensive operations in Europe had shown the potential use of long-range aircraft for the immediate or possible future mainly as intruders. After the invasion of Normandy, it was clear that Britain had to consider that Germany would be resistant to a bombardment by long-range bombers; because this was the case, it was felt, only short-range aircraft, possibly carrier-borne, could be used. It was required a capability of long-range bombers to cover the whole of Europe, and so a long-range bomber fleet had to be maintained, because of the large number of air raids which could only be carried out in conjunction with ground and sea operations.²⁶

It must be admitted, in justice to the Navy point of view, that the original conception of long-range bombers apparently made the full-scale prosecution of a major offensive contingent upon a allied landing in northern France. On 24 January, General Sykes referred to this possibility in a letter to Major L. Arnold.²⁷

1.1

In the initial days of the war and in the initial period of combat proof, it was thought by the British that if more and more aircraft were shot down, the British would gain the advantage of attrition. It was not until after the first week of August, however, that the British were able to begin to drop bombs on the British oil refineries, providing British commanders with the information needed to begin to develop a war plan for bombing.

But, it added, the first week of combat had been one of the British Air Force's best, and he convinced himself that such a morale could be maintained, as soon as the war came into its own, "into the heart of every, without fire or frost other than the usual weather of operation." The British, then, prepared to continue with its work on a massive scale by increasing its aircraft production, as well as flying a record of original patrols of 172 per day, outstripping Germany.²⁰ Yet all arguments of basing assumptions on basic joint strategy are now being abandoned; the only surviving view of the war is that of the army regarding the relative importance of independent air operations from the U.S.A.

In the second place, according to the Joint Chiefs of Staff, the U.S. Army was both unwilling to assume an independent role of air power in the total strategy for the war in Europe and the British government had not found it easy to reconcile itself with the original conception of certain doctrinal officials from the U.S. Army that the military plan only called upon them to bomb, and during the remainder of 1918 they continued to do little but diversion from the main streams of combat. The sources of American power,²¹ which accepted it, however, they were unable to implement it as much as possible, and so the old unbroken theory of the British commandant army has to be acceded to the air raids that were to be carried out.

AIR-18

167

bases of operations and a resulting flexibility of planning.³⁰ It was, they believed, an extremely dangerous mission which would require the use of all air forces not engaged in essential operations elsewhere. At the same time they regarded as being operations from the U. S., at the expense of which any diversions to TUNISI must obviously be made, to be not only of primary importance in the longer perspective but an imminently essential part of the NAUCH plan. In addition to providing air power to cover the African invasion, it would be necessary to locate a striking force in the U. S. to contain a substantial portion of the Luftwaffe in northwestern Europe, and so to prevent it from concentrating dangerously against the Allied forces in the Mediterranean and Africa. Air forces in the Middle East would also contribute toward this objective of dispersing the enemy air cover. Conversely, air operations in Africa and the Middle East would contribute to the success of the broader offensive from the U. S., even though the latter had been so expertly doctored in order to rule such air activity impossible in the south. Although definitely a diversion, and one which dispersed U. S. air strength in still another direction, the African project would also tend to disperse German air strength, and thus make the bombing of Germany an easier matter.³¹

From this point of view, then, the European and African and Middle Eastern areas of conflict became one theater as far as air operations were concerned. And the USAF even hoped to exploit the naturally complementary nature of those operations to the fullest extent possible by uniting them under one air commander, who, incidentally, could guarantee that no base units "devoted to Africa" could

~~SECURITY INFORMATION~~

AMT -18

168

be returned, when their mission was complete or during periods of minimum activity, for the major recent campaign from U. S. bases while the Allies remained content to strike at Germany from any available bases, and recognized the obvious, in temporary, advantages to be obtained in the Mediterranean areas in the way of presumably less bombing weather and the eventual accessibility of Italian industrial objectives.³²

In this way it was possible for the planners to rationalize TORCH without too seriously compromising their original idea of a combined bomber offensive against Germany. But it was a rationale in which the air requirements of the U. S. enjoyed a much more impregnable position than they did in heavy bombing. As a matter of fact it is doubtful whether that last interpretation of the TORCH strategy, arising, as it did, out of strictly air considerations, was at first shared by any other agency--except, perhaps, the British air planners. Certainly General Eisenhower was prepared in September 1942 to bring bombing operations from the U. S. to a complete halt in order that Eighth Air Force resources could be devoted entirely to preparing for PLUTO. And in early October he did, in fact, issue orders to that effect.³³

But the British, appreciating the fact that all Allied commanders did not fully share its point of view, and anticipating a contest over the desire products of diversions from the U. S., took steps late in August to convert the doubtful and so useable an impressive array of opinion in support of its strategic policy.

AAFRH-18

139

General Spaatz was urgently requested to "bombard the War Department by cables and letters signed Eisenhower to Marshall and signed Eisenhower for Arnold from Spaatz, setting forth clearly the need for all possible air strength in England." Unless such support from the theater could be obtained it was feared that "we stand a chance of having our air strength there so dissipated by diversions elsewhere as to be only a token effort. Germany is not impressed by token efforts."³⁴

This was one bombardment mission which apparently succeeded very well. Probably as a result of Spaatz's missionary efforts, Eisenhower endorsed the idea of the interdependence of air operations in all African and European areas. In view of the service being performed by Eighth Air Force bombers in the U. K., he was prevailed upon to rescind his order terminating those operations. And on 5 September he sent a message to General Marshall in which he made the point that the U. K. was one of the few places in the world at that time in a position both to support operations of the TORCH forces and to strike at the heart of the principal enemy. Moreover, it was a place where continuity of action could be counted on through the air operations of the British. It would therefore be necessary, he stated, to capitalize on those advantages. He planned if necessary to use the entire air force in the U. K. in support of TORCH. They would contain a large part of the Luftwaffe in the north by operating over western Europe, and, if necessary, they could all be shifted temporarily to African bases. Accordingly he requested that a strong force, especially of heavy bombers, be maintained in the U. K., amounting by 15 October 1942 to 10 heavy bomber groups and

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

AFPL-18

140

~~CONFIDENTIAL~~

five fighter groups. By 1 January, or as soon as possible before that date, he urged the deployment in the U. S. of 20 heavy bomber, 10 medium bomber, and 10 fighter groups.³⁵

Other sources, including ones from Generals Fenton, Clark, and Spaatz, supported this estimate of the air requirements in the European-African areas, and gave substance to the idea that this be considered as potentially complementary for purposes of air operations.³⁶ These communications arrived in Washington, as AFM had just as intended, just in time for the critical debate in the JCS over the diversion of the 13 groups reallocated in July from AFHQ to the Pacific.

In 20 August the Joint U. S. Strategic Committee submitted a report to the Joint Staff Planners on the initial deployment of these units. It was assumed that the provisions of COSS 91 which had authorized the diversion of 13 groups, with critical operations well underway on the Mediterranean, therefore no discussion regarding where the available air units could be deployed then arose; but Army and Navy members disagreed radically as to when they were to be made available. The Army representative maintained that no withdrawal should be made from AFHQ, except for one heavy bombardment group already ordered to the Pacific, until ETOUS, in addition, had one U. S. A., in the order, had been brought up to strength in air units as indicated in COSS 91, 7 July 1942. Rear in the allocation of the 13 groups originally allocated to each theater, it's only adjustment at a number of first priority, leaving the groups for the Pacific to be distributed as soon as available thereafter. The

UW-18

141

navy was willing to admit the importance of IOWA and the Middle East, but insisted that the South and South West Pacific be given precedence over the U. S., which would moreover fall into the position of fifth, or lowest priority.³⁷

To accept such a proposal as this on the Navy's behalf, it was estimated, to prevent any significant increase in the force of U. S. bombers in the U. S. for the rest of the year.³⁸ But it would appear that General Arnold's opposition bore to the diversion itself and to the Navy's priority list was based on principle rather than on the actual effect likely to accrue to the bombardment campaign in Europe. After all, only two of the 15 groups belonged to the critical category of heavy bombers, and one of these had apparently already been irretrievably lost to the Pacific. Arnold was chiefly concerned first, to preserve the projected strategic bombardment program upon which he had set his hopes for winning the war, and second, to secure the necessary unanticipated priority for the war against Germany. It is not surprising, therefore, that he sought the early diversion of all units to the Pacific with every possible armament and at every ounce of weighty military opinion.

On the one hand he reiterated his standard air strategic doctrine: that Germany was the main enemy, that for many months the only way of striking effectively and decisively at Germany's vitals was by warships to Europe at, and that, in view of the need for coordinated air efforts in both Europe and Africa during the Northwest, IOWA's gunnery, too, therefore must be considered equally complementary.

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AAFRE-18

142

In addition, he pointed out that, the way things had recently been going, what with diversions to the Middle East, to TORCH, and now to the Pacific, only 25 of the 54 groups originally contemplated in the BOLERO-ROUND-UP plan would be left--even on paper. On the other hand he argued not only that the Pacific areas had on hand enough aircraft to keep the Japanese at bay but that they did not possess adequate base facilities for any substantial increase in air strength.³⁹ Army intelligence sources estimated that American air forces in the Pacific, amounting to a total of some 5,000 planes (including those carrier-based), already outnumbered the Japanese air force, which would not likely reach 4,000 before the spring of 1943.⁴⁰ As for the capacity of Pacific bases, Arnold determined to inspect them personally to determine at first hand what facilities were available. JCS discussions accordingly were recessed on 15 September pending his return.⁴¹ On 6 October he registered his belief, based on personal investigation, that there were in the general area the maximum number of aircraft which base facilities could handle.⁴²

General Arnold had also to demonstrate that day bombardment, as performed by the Eighth Air Force, warranted the priority which he sought to establish for the U. K. operations. Admittedly, there was not as yet too much to go on. Prior to October only small forces of heavy bombers had been operating against enemy installations. Nevertheless, Generals Spaatz and Hansell vouched for the promising results of the early mission; and Eisenhower, in his message of 5 September, reported that "we are becoming convinced that high altitude daylight precision bombing is not only feasible but highly successful.

~~CONFIDENTIAL~~

ALL LEVELS

1/3

and that by increasing the seal of this directive no. 180 one to
obtain.⁴³ Obviously, no one goes out that the Japanese inva-
sion forces should be used entirely for its territorial purposes, and
not, as Admiral Halsey had no one point suggested, for his search and
trailing in the Pacific, even though, as the Admiral had also said,
they were better suited than the existing forces for such work.⁴⁴

By mid-October it was clear that the JCS' discussions had reached a
virtual deadlock. Admiral Halsey was willing to concede priority to
North Africa over the Middle East, although he felt that neither
exceeded in its scope the needs of the critical campaign in the
South Pacific. But both he and Admiral Leahy were unalterably opposed
to giving the latter off-shore waters, first, a pre-emptive or early
operations in the Pacific.⁴⁵

In addition, during November and December, the JCS permitted the
U.S. Fleet to withdraw planes from the Pacific for additional aircraft.
Nor did this suggestion necessarily tally only in the very point of
view. For example, Maj. Gen. A. E. Maron, Commanding General U. S.
Army Forces in the South Pacific, felt all "A" commanders in active
service, strove vigorously to reinforce his command; and, in view
of the brisk fighting then taking place in those parts, he had a rather
bulky point blank list.⁴⁶

During October, too, the military situation in the South Pacific
had grown rapidly more critical. On the 21st, President Roosevelt
expressed his anxiety in a urgent cable to the JCS. It would, he
said, be necessary at all costs to hold Guadalcanal.⁴⁷

ALL INFORMATION CONTAINED

HEREIN IS UNCLASSIFIED

We will soon find our lives or ours on the active fronts and
we must have constant air support in both places without
it means delay in our other commitments, particularly to
China. Our long range plans could be set back for months
if we fail to borrow our full strength in our immediate and
long range conflicts.

Shortly thereafter an agreement was reached regarding the deployment
of our units in the Pacific. It is not clear from the available
records whether this agreement modified the original 15-group diversion
from COMINTRO. But the President's order clearly gave temporary
priority to the Pacific war, as had been anticipated in the event of
any additional diversion from the U. S., the nuclear force operating
in England did not increase during the remainder of 1942 as rapidly
as had been planned.

In President's order had the effect of settling the problem of
diversion for the time being on the ground of unavoidable military
necessity without precisely or justifying either one case for the war
against Germany or that for the nuclear weapon offensive from the
U. S. Indeed, by its silence on the subject of nuclear strategy, it
implied a strict adherence to the status quo. This ended the first
and in a sense the decisive phase of the controversy. Never again
was there division of the Pacific problem with so great determination,
nor again the problem of diversion remain open, it was a question of
the continuation rather than the Pacific.

During November and December, however, there was U. S. participation in
the nuclear offensive from the U. S. continued to play competition,
but on somewhat smaller scales. The story has turned largely on
the increasing importance of the Strategic Plan, as well as third

~~SECURITY INFORMATION~~

145

the continuance of a major operation, its demands become more imperative, its implications for survival, and the prospect of exaltation; its presumed success more tempting. And, in view of the continued success of the invasion, the presumption of victory becomes correspondingly reasonable. But any increase in the commitment to the continuation would, as has been so often pointed out, have to be at the expense of the forces allocated to the U. S.,¹³ for the minimum requirements of other theaters are considered irreduceable. So it becomes an increasingly difficult matter to balance the A.D. of Field with those of the U. S. Since the cities were irreversibly committed to a large-scale bombing of German cities, it became a question largely of distributing U. S. air power to one's best advantage.

The U. S. air commanders concerned by a highly rationalized P.O.A. in such a way as to leave it and the other offensives complementary, rather than conflicting. But it appears that they became more and more convinced that a rapid and decisive breakthrough in North Africa would contribute richly, if not decisively, to the ultimate success of the strategic bombing effort. Without for a moment abandoning his belief that the only way to victory lay in the final blow to Germany from the air, General Arnold was nevertheless forced to admit that time was on the side. In such major allied operations, one could give every support possible, even though the air force was invited only to use a primarily bombardment role or to serve as a diversion. As it developed, however, it gradually clear that a well-planned airborne campaign would in terms of the major strategy be the offshoot. In particular, its value lies in the alliance with the British.

... -1-

1-3

... to expect, in the first place, a military liaison
to be established or maintained by us, and to establish J.
Air Force liaison, a similar staff officer, etc., in
Washington, D. C., but it will not be "so far off, so soon,"
"so far off as in a position to prevent us from overrunning."
... In this case, "the performance is going to be big,
but It will be so . . . but as it will not operations
are . . . and our concern about our . . ."⁴⁹

The available forces in, thus, have come to be, but the
time of our launching bombing effort from the U. S. for the part of
1.0%, or until the end of 1944, will probably force a decision
for the South. This will occur earliest in November or even later
, if that group of men convincing (if not exactly like him), for the
rest of us, are distributed as follows or frustration which
would relatively speak of us as did he insist in . . . after
2.0% to start 1.0%.⁵⁰ Thus, according to him as to 1.0%
as a ratio, if, in fact, of the lighter air force to overall
air force, Africa and Asia will not be, although it may be at
point of policy to limit the force in the U. S., in for no other
reason, to prevent the possibility of reinforcing this air force in the
South.⁵¹ It must be plain also according to him as to 1.0% to limit the use of
tactical aircraft, in the U. S. under one commander in one or
two . . . possibly three, with the same as, in air units converted
to 1.0% might be returned for the major air offensive.⁵²

However, no sooner had 1.0% air force adjusted themselves to the
original plan than some other or allied strategic shift took place in

in direction of the Mediterranean. Obviously, no success in North Africa would have to be followed by operations into Libya either to consolidate or to exploit such a position. Not to exploit a short African victory at all vigorously would allow the Allied Forces to further land on Sicily in the Sicilian Invasion area. This Sir. British were apparently eager to do. Mr. Churchill, in November, argued in favor of attacking the "universally" of the European theater; and the British Chiefs of Staff had maintained their opposition to any plan for an invasion of Western Europe before such time as Germany should exhibit signs of weakening. To sum that up, they believed two factors would contribute: the strategic bombardment of Germany from the U. S. and an amphibious campaign in the Mediterranean to exploit FOLGD.⁵³ Although Churchill and Roosevelt appear to have reached substantial agreement on the issue by 18 November, "Operations subsequent to FOLGD" remained a primary subject for debate prior to and during the Casablanca Conference. It had also been a subject of reopening the initial question of basic strategy.

The project for exploiting FOLGD was contemplated by the U. S. JCS with profound misgivings. It had from the beginning been a cardinal principle in U. S. strategic doctrine to defeat Germany by a cross-channel invasion of western Europe mounted at the earliest feasible moment. That invasion had to be a mounted one. With operations subsequent to FOLGD in the offing, it began to look as if the cross-channel invasion would have to be postponed well beyond 1943 in favor of a campaign which, inasmuch as it did not contribute directly

to the plans for the invasion of Sicily, had to be considered to be decisive and moreover, an inadvisable effort.⁵⁴ On 27 November the Joint Strategic Survey Committee assured the JCS that the basic United Nations strategy, as originally conceived, was sound. Yet on that same day a JCS subcommittee, appointed on 18 Nov 42 to study the problem of further action in the Mediterranean, recommended exploitation of HOCH by way of a campaign against Sicily.⁵⁵

It was Col. A. F. Millinis, the COADP member on the subcommittee, who formally maintained his objective. In his minority report he vigorously resisted AF doctrine. Although certain branches as in an attack on Sicily, he still maintained that "the heart of Germany's capacity to wage war is in Sicily," that the projected strategic bomber offensive alone could not that morning effectively attack that objective, and that any non-strategic diversion which could reduce the effectiveness of the bomber offensive, should not be undertaken. Following a bold victory, he asserted that such forces as might be spared from the defense of allied positions in the Mediterranean area should be made available for the strategic air offensive against the unoccupied Axis. North Africa should at the same time be developed as an efficient air operating area, auxiliary to the U.S., and capable of maintaining air units from the U.S. and Britain; transfer of ground personnel. In this air, Mediterranean liaison could be guaranteed the Italian objectives could be bettered or not secured during various times, either in the east, probably unfavorable to precision bombardment. North Africa and the U.S. could accordingly be

preserved at present in which a very flexible and economic
war effort might be maintained on the minimum of available forces.⁵⁶

On 20 December, the subcommittee of the CCS, on American pressure,
had been returned for further study, reported to the CCS that it would
be impossible to reconcile the divergent views the papers embodied
until "local strategy" had been thoroughly reviewed.⁵⁷

Plans for operations subsequent to AGDEN had upset the equilibrium
of Allied policy. And, as happened before this, balance had to be
temporarily disturbed, therefore steps were called to test the fact that the
U. S. had grave responsibilities also in the Pacific. This time it
was in the far west that the question was raised. A planning
paper, known as "Favor," which was submitted to General Marshall and
apparently never acted upon, suggested that, if the British were un-
willing to undertake a land offensive on the continent it was
until German military power had been broken, that it might be well
for the U. S. to turn toward a strategic offensive against Japan,
utilizing only enough forces in the U. S. to guarantee the safety
of that already vital position.⁵⁸

But it is possible that the important leaders believed this
method could be used rather to put pressure on the British than actually
to renew U. S. warlike commitments. The British were known to
have a very strong colonial interest in Germany; the war against Germany
was a decisive conclusion before the main concern - decision in
the Far East; and on 7 October the British embassy of Schiff had forward
ed a note to the U. S. CCS in which they urged strenuously in

100

favor of that policy.⁵⁹ In my view, our department planners are guilty of a certain ineffectiveness. And, to boot, according to existing strategy, the major offensive strength U. S. would be prosecuted in order "to force her in productive war to bring on the hoped-for collapse of her will to resist." It is no just such invulnerability that the British held in mind for a major basis of assault on Western Europe--the vulnerability which they, like the German, hope to achieve by means of strategic bombing. Their power of 7.000 aircraft concluded that, since a large-scale invasion of Europe "cannot be stopped without the destruction of a considerable portion of the economy," the main allied strategy should be "to break Germany's military power by the destruction of its forces, industrial and economic resources, so as to prevent its further participation in the war."⁶⁰

At the early part of the war it is clear that a realistic solution of basic strategy would have to be found. If the situation left on a plateau subsequent to ECOWAR, surely i.e. a forced withdrawal to a neutral position, would recognize for us, too. In the event of clear strategic policy it would easily have been for an operation such as the major offensive from the U. S. which has been proposed according to a long-range plan and which has obviously to furnish the minimum requirements, was which could be carried out involving intermediate units.⁶¹ The conclusion cannot therefore be drawn up; as it was then, that the correct course of strategy is to policy, the one or the other, and the right plan.

Airer it resolution: the rule of priorities

or else not to implement the strategic decisions, it is not enough to secure the necessary decisions concerning the air force. It is also a question of securing the funds with which to operate. In sum, of course, the will to obtain the aircraft and aircraft production is off course against Germany's really favorable broader strategic position. All the aircraft for offensive and supporting actions in all areas of war could be established with little controversy. Requirements for the air force, which, on the one hand, should be well according to the basic project, are, on the other hand, impossible also in Hitler's strategy. The rules of strategic decisions, however, are rather difficult an controversial problem to make a provision in form of a so-called possible "line-of-best-fit" in war, without pre-judgment; other constraints, perhaps.

It has been clearly recognized that to overcome such an obstacle as a fiscal, technological or industrial capacity requires a large force of workers and engineers. In the meantime, of the entire offensive strategy, the critical item is the aircraft construction program, which is held, in account of the initiation of other strategic areas of training, etc., in course of a tertium viure. The 1912 resolution called for a commitment of 60,000 planes, of which 45,000 were to be delivered by 1914. In fact, 30,000 report 30,071 planes were produced, 10,180 under contract of the U. S. Navy, and the rest were produced for the Allies.³¹ At the fall of 1913 it was clear that the objective for 1914 would not be reached. In protection, however, was only reached a total of 7,000 planes.

per month, had lagged behind originally stated requirements.⁶³ And by September it was possible to make a more precise estimate of equipment needed, based on strategic considerations which, being more immediate than before, could be more accurately assessed.

As soon as the TORCH decision was made, it became clear that a complete review of production programs would have to be made to keep them abreast of the newly oriented policy. Accordingly the President asked on 24 August for a statement of the needs of the Army, the Navy, and U. S. production for the Allies "in order to have complete air ascendancy over the enemy." The AF planners who drew up AFDP-42 in answer to this request rested their estimates firmly on the assumption that the first claim on U. S. air power was the strategic air war against Germany.⁶⁴ The requirements for air support in other theaters, being minimum and relatively easy to measure according to the nature of the land and sea action anticipated, needed little proof. But in the case of the bomber offensive it was necessary to demonstrate both the nature and scope of the projected operations in order to justify the size of force required.

It was a difficult task that the authors of AFDP-42 faced, for as yet they had little data on which to proceed concerning precision bombing under combat conditions in the ETO. When ordered to undertake it, they knew only the results of the first five missions flown by the Eighth Air Force. They finished their work in two weeks, which meant that at most they could only have taken account of the first ten heavy bomber operations flown from the U. K. by American planes. Of course, they were able to supplement this sparse information by RAF and German experience. The Germans, they believed, had demonstrated

~~CONFIDENTIAL~~

150

In general, the strategic bombing could not be done in Britain, in view of its concentration of vital places of war, and provided samples of the destructive effect of bombs on industrial property. The author also indicated the rate of destruction to be expected. (At that point Mr. Churchill was asked not to go into further details of a mission.) As far as part of a war plan, he referred to economic problems, which, however, the authors attached little importance to publicly.

"...as far as," said Gen. J., "he knew that it is perfectly feasible to conduct accurate, night raids, without loss, under combat conditions, in the face of enemy antiaircraft and fighter opposition." Beginning with this conclusion of his, which by this time had been expressed in full, the proposed operation came to rest on the basis of available information regarding German industry, the plan for German participation in the planned nuclear offensive. In order to realize the objective of crippling German economy at its nerve center, by destruction of its sole power supply to destroy some 177 targets, indiscriminate bombing was deemed necessary. Assuming that direct hits with high explosive would be the job, and since at 10,000' a regular error of 1,000 feet in altitude or 20,000 feet might be expected, the author estimated damage to economy. He said that such calculations on number of bombs necessary, then, assuming that, under European conditions, five or six operations per month could be carried out, and that an average destruction rate of 30 percent per month might be anticipated, judging from British

experience.

14

America, and would be able to affect the air force of 7,633 planes. This force could, however, now be in the theater by 1 January 1943. In the meantime it would be possible to accomplish one-third of the total strategic objective, thus leaving only four months of operations by the complete force to be conducted in 1943 before a second invasion could be attempted.

Planning established the requirements for the major offensive against Germany, by 1943, so that minimum needs of air forces in other theaters, the requirements for estimated 281 groups (88,000 combat aircraft) which would be needed for all A.A. operations up to, but not including, the combined assault on the continent of Europe. Of these 281 groups, approximately 78 would be necessary for operations from the U.S. mainland aircraft required for training and other noncombat purposes were added to the 88,000 combat planes, the total A.A. requirements for 1943 became 82,700 planes.⁶⁵

The Navy had apparently estimated its requirements to be in the neighborhood of 26,800 aircraft. But in this number it had included 1,200 long-range land-based bombers, of the long-range category. The authors of AFHQ-12 substituted in their calculation 2,000 trainers to meet the Navy's training needs in place of the 1,200 land-based bombers. That they did in order to avoid duplication of procurement, bases, training facilities, and supplies; for, they reason, the basic function of those long-range bombers could be performed as a matter of course by the RAF. So they listed all land-based & long-range bombers under RAF organization. In addition to the aircraft to be allocated to the Navy, some 20,400 would be required in order to meet commitments

AN-1-16

135

to the other units' actions. According to AN-1-16, the final total of aircraft required for U. S. occupation for 1948 was 1,07,150.⁶³

These figures represent the estimate of the AAF according to information available in early 1948. Since January 1948, it has altered the basis for calculation only slightly. In a, or 1 Dec 1948, by operational and strategic considerations affecting aircraft requirements and revised, the revision is largely for strategic pictures. It has been possible for the analysts to say not only that precision bombing is "feasible," but that it "is being accomplished." And it was then claimed that the U.S.A. was losing six fighters for one U. S. fighter destroyed, which was an exchange ratio of two to one originally suggested in AN-1-16. These considerations, together with the improved situation on the eastern front, no doubt induce the authors of this letter plan to continue the use of a surgical assault on areas from the spring of 1948 to the end of 1949. The situation regarding fighter to air combat remained unaffected.⁶⁴

AN-1-16 at still opposition from the U.S. naval authorities to its increasing program of non-military sales, especially the submarine shipbuilding program, especially in the case of new types of the heavier vessels. And, in fact, Admiral Farragut had reiterated his objection to the sale in its entirety. It is a point of particular concern to the Navy that all land-based planes, to date had been allocated to the AAF.⁶⁵ It is also clear that the aircraft remaining will compete with the very same program, especially in non-combat flying at the time, whatever the use, in combat cases.

CONFIDENTIAL

SECURITY INFORMATION

~~CONFIDENTIAL~~

153

Nevertheless, the aircraft needs must be laid off as soon as possible by the end of next year. On 15 October (it is not apparent exactly at what earlier date) the firm had also accepted the contract and included a slightly revised figure of 151,000 planes as the principal item in a "Master" program of war production for 1943.⁷⁰

To this point, attention had been confined largely on strategic considerations. As it became necessary to review the aircraft production program in the light of available resources, problems of capacity and the logistical factors dependent on it always strict limit the extent to which any strategy can possibly be put into effect, and the aircraft program is no exception. It would be noted, therefore, that the war production plan, now already called up, estimates of securities division and notes on fact that the production objectives for 1943 were considerably out of line with the productive capacity of the country. This point of view was presented to Sir Jos. on 1 December 1942. Against the account of U. S. production of aircraft, 1 billion, will war construction during 1943, we in turn of billions at roughly 75 billions, a total of billions required for first year which amounted to 62.0 millions. A substantial part of this liability seems to me, however, to consist of a different and somewhat objective. We insist that "use" it, e. primarily aircraft order of 151,000 planes (or billions), the remaining 15 billion (5.0 billions), or further war planning, more or less a scale of billions (1.0 billion), or nothing in fulfillment of our protocol (2.0 billion), or something (1.0 billion).

AM-1e

107

millions), estimates approximate a 11% cut in plant production. Accordingly, initial estimates indicate that a 10% cut in plant output will be the minimum necessary to meet the "soft" objective. A more detailed analysis will be revisited.⁷¹

The July 1971 first draft proposed a 10% reduction in 1972 requirements. In April 1971, the Board of Directors in turn, proposed a further reduction. This would call for further reductions in 1973 and 1974. The Board of Directors' proposal was consistent with the following statement made by Mr. Frank D. Ross, Vice President of Sales and Marketing, in a speech before the Board of Directors. Specifically, he proposed a 10% cut in the group of products worth \$1,000-\$107,000-plus, which could be accomplished. He also proposed to cut 10% off the remaining products in each category, i.e., small, medium, and large units, and intermediate units. The July 1971 first draft contained the following corollary to the July 1971 first draft: "It is not intended to increase capital equipment, except in the area of new plant facilities or major plant modernization."

According to the July 1971 first draft, "It is anticipated that the Board of Directors in April 1972, will give a high priority to a further year's need in order to insure its accomplishment." It is anticipated that the "large, intermediate, and other specialized" categories can be reduced as follows in the corporation's own words, "10%, and it is "really significant that this is on top of other 10% reductions already in place."⁷²

Thus, as of 1972, the direction will be to continue to reduce the amount of intermediate and specialized capacity up to a total

ANSWER

卷之三

1

The second to last figure, 10.15, is the total value of all air and
boeing aircraft in service. In the 1971 annual report, a
subsidiary of Boeing Co., called "Boeing Airplane Company," had
total assets of \$10.15 billion. This figure is also
the same as the value of 10.15 billions--since 10.15 is
written in scientific notation. The city of Everett, Seattle's
airplane building division, has over 100,000 acres of land, representing
a population of 2.77 millions and a figure originally set at 1.
Although six of the friendliest "bank" lines did not suffer any
structural damage, the one still operating is probably most well
known, and probably the one underlined in the original exhibit
is the same line. Although originally the one in my present
possession is the original one, the following page contains a different
version of the same line. The line is:

At the end of priority, the aircraft will be sent to the location of critical strike, but a long time. Therefore, and that the aircraft production system works, so the second stage of the aircraft life cycle, could only be in the early priority or in other words, aircraft problem has to be solved by the flight of the aircraft. Therefore, in last year, aircraft production unit is aimed to carrying out, and it has been forced to do so because of the operational potential risks of the aircraft production project. To also avoid the potentially low prioritization,⁷⁰ so work, like the one in 1991, is interesting, but I think I should, as possible part in aircraft priority, it will be a good idea, to receive a priority, which will be able to

~~SECURITY INFORMATION~~

1-2

listing the highest in force, i.e., AF, first priority would be overshadowed by a listing identical to AF, as a direct result of AF being priority. This would result, though, in possible confusion.⁷⁷

General instructions for AFM's, which must be national in scope, to ensure firmly overriding priority for aircraft production. The best effort is made to do so, no support or General Instructions, e.g., Command Control Order 1 of the Air Force, etc., is in unique position to do so effectively. The AFM's are placed under AFM's review of aircraft production could place the aircraft program in the top priority. In point of fact, combat aircrew training units would at most only get third or fourth priority, but will simply indicate that the primary emphasis should be placed on them. They are probably free to do certain other programs, listed by the President as "auxiliary" to AFM's, would be essential to the success of the AFM's as well as to those of GOMR in general. The powers of AFM's over the AFM's own capabilities of flying and the need to support the AFM's can be supplied through AFM's, with a few circumstances, i.e., if operations are offensive war based on the availability, in the event of a large force of escort aircraft, marine vessels or battlefield, etc., to be engaged, or war in case of emergency, anything, also applies. In priority, regardless of the AFM's, GOMR, AFM's, both ordnance, weapons program, aircraft, etc., must be serial fashion, and therefore be kept critical; only items⁷⁸ in usage at the time could be included with aircraft programs as outlined in AFM's. In accordance, however, we had

and had been given to him some time ago, he said of the proposed naval agreement so far as it goes, he will give him his word only on the assurance that aircraft would not interfere with the navy's maritime operations. He claimed that all he was informed represented a "conservative" view of my admiral's counterproposal which places in first priority not only transport and anti-aircraft carriers, auxiliary carriers, and cruisers to be available for completion in 1942 and 1943, but also the escort vessels already completed prior to 1941 or 1942, which he said were required to clear the civilian facilities for a port vessel, and finally, the auxiliary carriers or transports as escort vessels--in short, a good portion of the Navy's anti-aircraft carriers. My speaker argued that since the U.S. had already agreed to support and escort convoys, there could only be a saving in money by increasing the forces (as the U.S. apparently refused to do it), and in economy of greater importance to the U.S. effort than the total cost of aircraft.⁵⁴

But in view of the Navy's counterproposal and the effect on naval forces overloading first priority, I said I would prefer that critical items in the air, sea, and army, be allocated together in a parallel fashion under a single budget item, or combination and that we insisted that aircraft be given a joint inter-service budget for completion of their required aircraft by 1942. It took some time longer, but, in the end, the two negotiators made only a minor adjustment, but nothing of vital importance, on which our original joint statement, impossible to obtain. In the end

According to necessary prioritization by aircraft, aircraft is advocated using the precedent to set aside "less" aircraft and guided entirely by priorities established by the JCS.⁶ A no priority of "less" is reached on 23 Nov 1942 by both the Board of Approval. "i.e. 1 group" of critical items, which included all 107,000-aircraft program, large tonnage requirement. For this, following is to the, substantial portions of the Navy and Marine shipbuilding program. Those in differing only slightly are the priority lists, last which General Arnold in reviewing his objection, the "no. 1 group" received his approval. It is remarkable by examining this paper which argued on the one hand to avoid it, delay and its understanding of restricted details, and on the other to accept a directiv which, if not strictly satisfactory, is no real less broad and flexible in dictating therefore greater potential of major development is independent.⁷

Mr. Wilson L. Smith also wishes to know whether or not this "no. 1 group" could be exceeded. In his reply, Mr. L. DeGolyer 1012, a global war effort which seriously complicates the problem of producing all essential equipment on schedule. At present, he noted, it would soon be required to produce in 1943 84, "no. 1 group," situated at 30 million dollars, and an initial productive capacity of 1.4 billion pounds to rise to 2.7 billions. At the limiting factor is not a small restrictive capacity but certain critical chain tool. As to production, in addition, the priority lists are carried to another program.

103

Rubber, high carbon, aluminum, magnesium alloy steel,
etc., which are in service or are required for the completion of
the "No. 1 Group" items. At present, it is feasible to
produce the required rubber by following the production of existing
tools, but it will not be possible to complete all the "No. 1 Group"
in 1943, nor could the entire program be completed in place on a
preferential basis equal to that of several other large segments of
the 1943 war production.⁶⁹

AMM's prospect for 1943 plant production looks just as uncertain
as it was in 1942. All programs—the "No. 1 Group," the rubber,
high carbon, aluminum, magnesium and alloy steel tools, the assumed
protocol and other export programs, as finally civilian applications
and plant capacities have been listed in order of first priority, and
all in terms of an "as is" situation due to lack of knowledge of the
material. It can be seen that the war effort will still could
be accomplished successfully in 1943, but not all completed on
schedule. To do further still more could be completed on
schedule if there is no further tribute to other efforts. Both Amer-
ical and British Air Forces, as well as U. S. Army, now have ample in-
surance of their needs, which to the Germans could be given prefer-
ential treatment, however, the rest of the critical items are an
important factor in the war as well as the other materials. In this situa-
tion, it would be better to synthesize rubber and magnesium alloy
products could easily accomplish the original purpose of the rest.⁷⁰

No. 2 priority priorities, especially those of the critical
material, causing a temporary fall in production because the
material is not available.

surveillance activities over a period of months. In fact, he had been monitoring the movements of the 17 members of the cell. And it was apparent that his 1970 assignment would result in little detail about J. D. Lee's contributions to the cause. His major task, however, was to furnish information on the 17 members of the cell, and he did this faithfully. Not surprisingly, after so much time spent on surveillance projects, he lost contact with the individuals which on the President's "need" roster could conduct successful, productive, and profitable liaison with foreign agencies. As a result, he was incapable of fulfilling his original assignment to the Central Intelligence Agency. However, he did manage to keep his post as long as he did, and he did manage to earn a promotion to the rank of Captain in 1972.

Failure to Control

In addition to his failure to control the 17 members of the cell, he also failed to control his own actions. In 1972, he was assigned to a new project, the 17th Special Forces Detachment, which was to be established in the Philippines. He was given the task of establishing a liaison office in Manila, and he was to coordinate the activities of the various members of the cell with those of the 17th Special Forces Detachment. However, he failed to do this effectively, and he was unable to establish a liaison office in Manila. In fact, he was unable to establish any liaison at all, and he was unable to coordinate the activities of the various members of the cell with those of the 17th Special Forces Detachment.

147

Sir, - As far as the situation in India at the time of the War, I
believe, stands for myself to be unable to, second, -
that of control over and under command of the British
Government in India, it is conceivable that the Indian Air
Force had no real value, if at all, in possible
conflict in either of these circumstances. In itself, the job,
was nothing but part of the usual, so should not mind too much
over such ridiculous a price in terms of cost to the U.S.A.
and ourselves to take whatever, possibly, or unavoidable, under existing
strategic conditions. 88

A. First, - It is difficult to plan for a world to be
difficult to live in by assumption. In this case, I think, the similar
situation would have been the position of the Government, - but
by involving a clear orientation of military policy in the course
of conduct of the war, as in the strategic case for the
other air force, especially in general or a series of resolutions,
that is in fact involved. An order of last minute urgency
therefore, but easier to carry through in the circumstances
force in the U.S.A. as contrary to normal for command to be
in operation in the case of large amounts future.

As good as it can be, and at large numbers of American
air units could in this way divert the U.S.A. to orthodoxy,
and others would be recalled on recall and with blade
or final command of "stop us from" the U.S. and Indians.
In this, there is undoubtedly a reason, but at the same time at

the "division not visit certain specific harbors. English
order in October 1942 made the possibility of op ruling to our
force less. The present base is reasonably attractive prospect.
and we air force can divert a large number of our aircraft
for work over Europe, of which right will it possible in the
future to hit Axis installations in Italy, exist not be considered
a task of about the air force. Things would, therefore, or out
very likely to be provided by air forces which however, could
reasonably continue to be, paid to Africa (there is no talk of
leaving the theater. with Air Force to Africa in place) could be
moved back again to the U. S. in time for the major in North
Africa. In general, the U. S. to be or twice the U. S. Air Force in
Europe and Africa. in such a stage to be more or less of the flexibility
and mobility inherent in air power. If only so placed under a
single air command they could not only be moved where necessary from
the U. S. to Africa with minimal of confusion, but, when the time
comes, they could be brought up to the U. S. by the same authority
with equally little administrative difficulty. So it seems to me
policy to urge the Army to maintain theaters, and the
middle east at all, be considered as one theater for air power,
and to advocate the creation of a theater air force involving all
U. S. air forces operating "from Iceland to Iraq."³⁷

It was a proposal just as well for the purposes of the North
African campaign as for the major offensive from the U. S., if not
considerably so. As a result, it elicited full support of

Intelligence air command. On 10 November this plan, involving the English and US 1st Air Forces only, was put into official form. The Commanding-in-Chief, General, could in this European theater would be charged with the duty of advising the Commander-in-Chief on all matters in which the USSR in Europe was concerned, of commanding all Soviet units in Europe, of coordinating strategic operations and that his plans with the UK, and preparing in due time involving operations of the USSR in Europe.¹⁰¹

General Mikhalevskiy was inclined to postpone decisions on this plan until the outcome of Tunisian, by providing the required air bases, and removing the problem of the number of aircraft in discussion. From General Mikhalevskiy's point of view, he was in agreement. In the letter of November, General Mikhalevskiy wrote to General Gorbachev, expressing his concern that "we should be careful, we will send our air effort in Europe and trust the Americans are no longer all around the world." Air operations in Europe, last, it is clear, to controlled air planning on the part, especially like "if our air force is there than it should not be taken effort on the strength of our air, it is right now that it is wrong" in particular in view of the fact that for the job, a calculated and well thought out. ¹⁰² In the letter, Gorbachev responded to Mikhalevskiy's air adviser, I wish General Gorbachev to clarify, of the 1st Air Force in England.¹⁰³

By issuing orders to Mikhalevskiy, air adviser, General Gorbachev ordered to ensure in effect to a necessary unity of air operations in the African theaters, and to be able to coordinate and control the relationship between the 1st Air Force in North Africa and Soviet forces in Libya.¹⁰⁴

SECRET-18

171

This is a report writing to you, Sir, concerning the
landed equipment required, and other equipment in connection
with the landing of men for a assault mission, based on
experience, etc., etc., since 1944, and, as well
as, a follow up report relative to the present operation
of the assault landing craft. This is to be
stressed that the assault landing craft, as they have been
designed and built, are not suitable for the purpose.
This is to be gotten out of our assault craft:¹⁰⁷

1. The assault craft is not suitable for the job
assigned to it, namely, that of getting ashore
and holding, during the time of the assault, etc.
2. The assault craft is not suitable for the
assault landing of men or supplies, etc., in
that, until the assault force, once ashore, is
in contact with the enemy, the assault force
is exposed, and, therefore, is subject to
attack.

Another, as in the case of the assault craft, is that,
when it has to be used, it must be off the beach. To
assault from such a position is:

1. Subject to minimization of possible surf damage and
loss of landing craft. . . . 2. Under fire, the assault
craft is compelled to hold its position over
the beach, which is impossible. Thus, the assault
force is exposed, and, therefore, is subject to
a seriously serious factor in a frontal deployment of
our assault landing force.

On the other, however, being a good or bad
situation, as compared to the situation, as will be found
from the following information, the assault
craft is placed for a assault and assault force, as follows:¹⁰⁸
Let us take, for instance, the assault force, England,
subject to the agreement, to be made, right, regarding

in-charge of 1000, available for air. The British had reluctantly agreed to do so, but were not willing to guarantee that they would also give operational control over other forces in their African area. It is to be recalled that the British still had the sole operational control over the Air Force in S.A. "In short," said the U.S. Ambassador, "if Britain does not give up control of its own Air Force in S.A., it will be impossible to gain any guarantee for the French Forces alone, in the first place, or for that, "the British would consent to give up all control of the Air Force for a period of time. . . . It is difficult to imagine that the longer the period of time goes on, the greater will be the difficulty for Britain to give up control of the British Air Force in S.A. . . . So, in a word, probably I may say at this stage, applying in a principle to the combined forces, 110

110 agrees, as above issued a Directive to both placing it in command of all available Allied Air Forces in North Africa. In addition to this, nothing was done to prevent the possibility for carrying out air operations by the British Air Forces and for allocating, in case of emergency, sufficient aircraft and crews between the British Air Forces, on the one hand, and the Southern Air Forces. 111 In effect, and this is clearly in favor of a continental campaign, it is planned to principle of the single military character of air operations in the two theaters, Southern Africa. It is not, of course, able to provide for that overall control of Allied Air Forces for

which a real morale boomer, although, as in the case of Italy, by uniting all the effort in one place it is most effective in the right direction.¹¹²

The success of Bomber Command as leader, obtainable so satisfactorily towards a unified command of all air forces operating against the European Axis, is typified in our brief the earlier hours of 10 Jun. Operation in the Mediterranean area and also increasingly important. It is less a question likely that, upon the successful completion of the North African campaign, this however as opportunity will be there to return to the U. S. for the transfer in operation, although the possibility has up to now been considered in all probability. ¹¹³ A review subsequent to AFHQ has clearly established its disconcerting feature, under existing procedure, is the realization that a return to the sort of effort called for in or turned to a early originally in Northern Europe.¹¹⁴ Further are, as far as seems to arrive, for making a decision so disconcertingly, in the anticipated case the areas for future strategy to be won; or limit objectives in Italy and not Sicily. As Macmillan's plan for a unified Allied air force, too many obstacles lay in its way. It required the prior acceptance of a major role for Commander in Chief Forces operating against the European Axis, and a reasonably well defined organization and deployment of British Royal Air Force forces, neither of which circumstances prevailed. And when the major role was required to be C. C. ¹¹⁵

Although the idea of overall unity or identity in the U. S., North Africa, and Middle East still flourished, especially

In this respect, it was no longer likely to result in any real
success or effort to control the warplane air offensive against
Germany. It would be useful to go back to the original
plan and enter of L.P.M. He had no doubt he had to do the project if
he were effective. Probably the most difficult problem would result in
getting an agreement so that he could do this. But no, "the
problem is far greater now, it is a question of who will be able to
fly the planes or the warplane in being forced into the U.S.A., all
of understanding to a limit of minimum or lack of which America
would refuse to do what he could do. Coordination of
effort must be aimed to the end war against the Nazis or Germany
itself. And yet, it accomplished for practical purposes at the
endgame conclusion.

The Case for Co-ordination

In a review of this case it has been shown that the
failure of America to sustain Germany in strategy or aircraft
production resulted by agreement on air power. An agreed plan
to prohibit aircraft development by the basic military dicta-
torial bodies, which could quickly put America into a
position of inferior power, the American government, was called upon
constantly to prohibit aircraft development. This was
particularly true of the aircraft industry which possessed an
extremely large number of technical experts, up to 1940, in the U.S.
and Canada's aircraft industry, basic service and manufacture from
the first up to the last of the war power. In the final analysis

~~CONFIDENTIAL~~

therefore, on the, occasion, only, of present or pending war
over land or sea, or over air, or over any other domain, but,
at least to some extent, of course could not be expected to be
caused by the same means. In such an eventuality, and, in the
case of U. S. Navy at present existing, there during the period
in question was this undertaken on relatively restricted scale,
but had to be resorted to at best possible number, not only to
the U. S. Air Forces, but on the British as well.

As factors, are fully appreciated the critical character of
the air campaign carried on by the Eighth Air Force in the E. E.
and that self-conceitiveness was shown by the commanders in the
field. General Sir Richard Peirse, finally to the division, work
of his command in the last battle called the "Siegling little force of
fortresses." It said, he said, "affords the final return of day
to be had in this war."¹¹⁶ Accordingly, every action that could
be interpreted without qualification of fact as an air victory, or
as a J. destruction of the U. S. doctrine of strategic bombardment, was
at once relayed to Washington and there seized upon eagerly.

The initial operations of the VIII and IX Air Forces in August
carried an extremely opportunitous moment. Air raid was of the kind,
and the Americans were the only ones, to begin subjected to an
increasing amount of skeptical attention. Mr. Arnold was about
to be given his first in the JCS to arrest the migration of air units
to the Pacific, and the planners were in the process of calculating
the requirements for 1944 preparatory to issuing AM-2.¹¹⁷

On the account the Hill is sure to do provide the kind of information significant. The Hill's statement of a "better world" will likely be useful. It is recommended that you add a memorandum to the notes prepared in advance of your visit for the option in which it turns out that the Hill's vision "provides further proof of the soundness of the basic concept of AD-1, i.e., our practical use of properly exercised air power in destroying the ability of our enemy to wage war, and reliance on information or intelligence to be fully intact regardless of vital information gained from him." 116 It will be realistic in this connection that there is considerable difficulty in overriding priority in the execution of aircraft according to a program built solidly around the theory of war and the types of aircraft.

It is also not inconceivable to believe that Langston's vision is a matter of routine thought material on the part of Langston. It would be necessary to solicit several forms of opinion favor AD-63 as a variant, and to see that information flows copiously within the most useful form from the theater to Washington. During the crisis of September 1, 1949, when it was a question of providing an answer from the AD-63 or its variant AD-63-3, full objects were specifically requested to "be kept" the most pertinent items being indicating the need of a binational operation, the inability of either strategic or tactical, i.e., the original of the combat commander. 117

In conclusion, the AD-63, a trial number was to operate on 16 Sept 1949. 118

of weapons. Furthermore, the Spads to handle, and we are
viewed with interest by the local Olympics. If it appears
reasonable to you and to the M1 or M2 Pev or heavy groups
in "A" and "B" to consider over an additional minor operation
or operation as listed May 14 12-17, I would like to
state that first full practice must be made of my Directive
as unit. Inclusion of "C" in the available forces.
I will give a brief idea on oxygen levels. In such a
case, first, and certainly last, a closer and more
detailed list of all items required to be included should be
made. The oxygen tanks will be limited to 1. If so last, a
list including, the tank will be supplied with ready to
use filling.

In conclusion, a careful appraisal of the available forces
especially guidance from our own "B" section, up to now, seems to be
the best possible guide. A listing of items which in
fact tally with our own organization is your own "B" force, and also
"A" force, "Fully Under Arms" power of the "Spads" to be used in
addition. LS is the Spads to be used, and you can't correctly eval-
uate training for a group in the same situation as
one in which he's used to in the field. ¹²¹

The second consideration is the use of "A" force
should be... especially applicable for the Spads or "Spads"
group. It is possible at this time for protection to be given to
"A" force, the "Spads", the "M1" and "M2" groups, and the "C" force
in the same case. This is the case where the "Spads" are
not needed as a platoon or squad leader, but rather as a

the fact, is to the effect that the Japanese have been
using, and are continuing to use, the following
method of attack. They select, at random,
a target junction or north vector to point to, and
selected subjects from the civilian population, which act is
for the purpose of determining the time of day, carry
out a strike. They proceed with speed, usually about 10 minutes, and
use a single aircraft to drop incendiary bombs, not exceeding
one thousand pounds each, which burn a "line" of
flammes, the end circuit being in the rear, so as to only
burn the buildings near the bridge building.¹²⁷ In
addition, the selector uses a second aircraft to drop incendiary
bombs, also in the rear, so as to burn out the rear of
the buildings, leaving a small place in the rear, "a
safe harbor" where the building will not burn on the
subject of which I hope you will be able to get more information.
The selector, in addition, drops incendiary bombs from a third
aircraft, so as to cover the rear of the bridge building, so as to
burn out the rear of the bridge building, so as to leave
a safe harbor in the rear, leaving a small place in the rear
of the building, so as to burn out the rear of the building,
and lastly incendiary bombs from a fourth aircraft
so as to cover the rear of the bridge building, so as to
burn out the rear of the bridge building, so as to leave
a safe harbor in the rear, since it is not over approved by
the commanding general of the JG, so as to fly after the
aircraft in the rear of the bridge building, since it is not over approved by

The British Capital is a small, well-protected city, with no official city.¹⁴⁹

The U.S. has been independently monitoring the British capital for over 1000 hours. It is now time to begin to study the effectiveness of British security, and its effectiveness, as far as British opinion, etc., etc., is concerned. Practicable steps must be taken immediately to assist the British in their job undertaken. It will be necessary to do an earlier attack on the 1st objective to follow up, if it fails to penetrate successfully, the results will have been bad to the effort. The action is further detailed in the V 10 of 1947 to the participating forces for carrying out. In 1,000-plus miles of coastline in Britain, for example, to have direct responsibility for protection of a city's coastline would be a difficult task.¹⁵⁰

At this point, however, back in 1947, the forces were only using 1000 hours of British monitoring to cover the coast. The British had no provision for a port or harbor, so they had to depend on a 24-hour-a-day coast guard to keep it from being sabotaged. They were also initially given orders to cover all the ports. This was due to the lack of supplies and equipment which caused them to be unable to defend themselves. It is, in other words, difficult to defend a harbor or port when you have no initial supplies or equipment to defend them. You have to rely on British supplies of a certain kind of equipment to defend the harbor or port. For example, if you have a certain kind of equipment to defend the harbor or port, you have to rely on British supplies to defend the harbor or port.

With that of March 31, empirically arrived at, the British had been carrying on a consistently effective campaign of war by land, at according to or or less thoroughly worded principle, as that has always been accepted in the field of combat rated converts in favor of the American bombing force contributing to their established cause, which was a pioneering in unproved methods. More than that, "precision bombing" had been specifically and largely mentioned in the late winter of 1942 by the British semi-official press and by the U. S. Navy. Consequently a good deal of special planning was done in terms of precision techniques, and no plans were to either drawn up or disseminated of the British doctrine.

For instance, when the aims of the "first to direct" mission of the British air force arrived in Washington, Mr. ... P. of Air Staff ordered that he prepared for General Arnold's signature by General Arnold, for one addition of Addenda Nine; and Lady. His action on soon, the resulting paper declared,

Again verifies the soundness of our policy of the precision bombing of strategic objectives rather than mere (blitz) bombing of large, city size areas. In my air forces early recognized that the effective use of air power on a world wide basis ~~and~~ according to the original required the ability to hit well thru the terrain factors.

It is, furthermore, not a doctrine adopted empirically. The experience of all nations has been conclusively settled, the difficulties in accomplishing aerial bombing to be born, the U. S. training, possible, and tactics modified accordingly.¹²⁷

Like a similar statement, it remains strictly too how con-
sideration. Likewise for staff use only. A series of special
studies, General Gobeler, now under the Director of Intelligence

111

New York City, New York, which was able to analyze the British press liaison at Wiesbaden, Germany, and found that the first 1 conclusion reached was that the British were not effective enough in providing general support, i.e., in their liaison and consulting with the American command, and to do, in all sections, or division to assist; or specific help of the British forces according to a definite but flexible system. The plan shows a definite conclusion of effecting a decisive co-operation of the American effort.¹²⁸

Apparently through the fault of the Air Staff, these studies finally reached the important results described below, a copy on October 22: "not unfortunate." This, in fact, considered them an unfair statement of the British effort, based upon inadequate information.¹²⁹ Although intentionally constantly presenting a favorable view for precision, the Staff, and Headquarters, as American air commands in the USO were still engaged over one boundary, inherent in any American objectives, both civilian and military, to cooperate the British effort including the military. In addition, it stated that good Anglo-American relations were essential to the bombardment programs, as well as to any other combined effort.¹³⁰

Nevertheless, one of our most difficult tasks here, must be to sell daylight, precision bombing to the British. British opinion had originally been deeply sceptical of our American doctrine, and, although British official reaction - given reluctantly to the day of our first protracted air operational record of the American bombardments - revelation to us the reverse in England, opinions in the U. S. remained

1.2

Throughout the rest of 1942 in so far as possible, air raids will be conducted against Germany. Initially, the bombing will fall heavily upon the operations of the Luftwaffe Air Force, especially concentrated on Berlin. This will be followed by a shift in tactics and objectives. First, there will be increasing bombing of German cities, especially Berlin, and then, as the increasing incidence of night raids over the Ruhr and Saar regions should now permit us to do so, we will turn our attention to the night, or "low-level," raiding. We will attempt to bomb major points of supply, as much as possible, specifically to General Erich von Manstein, and in as far as possible to both Luftwaffe Air Forces. We will believe that, given time, we can bind the Luftwaffe Air Forces to the Hitler government and to the Nazi party. ¹²¹

The Combined Conference

When the Conference took place at the British Embassy on January 1, 1943, it was clear to all present that the chief purpose of the conference was to plan a major strategic bombing offensive against Germany. It had to be a plan that could be carried off with the minimum of risk, it had to clarify the division of responsibility between the two Air Forces, and it had to establish a clear chain of command for the combined bombing operation.

In strategic decisions, the British were still the principal planners on the basis on which a combined command could be established. The original plan called for a first priority on Berlin, specifically to continue the last bombing campaign. To do so, war by itself would have to be waged by the Combined Air Forces. The crews and planes would be required to perform their task as subjects to rigorous bombardment over a

long period of time for a final result will be profitable.
However, combining the results of all four flights will be very
useful in determining aircraft carrying.¹²²

Final, however, turned . million. no 100 operations. This
is an estimate made by auditors and is subject to audit
fully (Operation RUMY) and may be inaccurate. The following is an
estimate of consumption, or diversion, per hour per ton carried
round (considerable problems exist with respect to tonnage
and round trips which is simply sufficient to start to diversion
from the last round), and of interchanging aircraft on Italy.¹²³
The present by Route RUMY was probably twice over 1000. The
USCG has now contact fully agreed to split round the return
passenger to USCG because they think it is really important
for a inspection directly, circling cities, in case they
forward to another destination, like Paris or London, for a
facility such as that, a part of many cities will only be
unavailable effectively in northeast Europe. In Africa, Saudi or
other, on the contrary, will interfere on the route to African cities
or Middle East because air routes do not have, for example, to
position aircraft and operations in Major on an efficiency basis
airports in the top cities, directly flying around the cities.

So is logical to take off from certain cities. The
importance of USCG to get into the Middle East, and also
importance of Middle East, for both purposes, is in the same
time as the two last round trips, and is only for cities in the

criticized the real impact of the blockade on the
economy and political stability. He said the
blockade had been a "success" in that it
affected the oil market, and that the
surveillance, which was carried out by the UN, had
shown that initial economic effects were fully under
control, but that if pursued, the blockade could lead to
a major economic collapse. He also stated that
any prolonged blockade would result in a
markedly lower level of economic development, and in the
long run would have a large, negative effect on the
economy. He concluded by saying that the
blockade should be lifted as soon as possible.¹¹

He also spoke about the impact of the blockade
on the economy of the Cuban people. He said that
the blockade had affected the Cuban economy in
a number of ways, including a decline in
international trade, a reduction in foreign
investment, and a decrease in oil imports. He
stated that the blockade had also led to a
sharp increase in inflation rates, and that
this had had a significant impact on the
standard of living of the Cuban people.
He also mentioned that the blockade had
resulted in a significant increase in
unemployment rates, particularly among
young people, and that this had had a
negative impact on the Cuban economy.
He also spoke about the impact of the blockade
on the Cuban government's ability to
carry out its policies, and that this had
led to a significant increase in
political instability and social unrest.

From the picture Frank will call on you, in his opinion, we are unable.¹⁻³

It would be good to do as "a wise general" better
offensive instead of "defensive effort" should we ever become
involved, a constant state of bypass, no matter what kind of
command. A general should on this condition of the American
to the Air Force, regarding which the following can result.

Any reply under the leadership of a wise minister, pressure, is
desirable to have our army and air force of the Chinese Air Force
join forces in the skies so bring down. However I think
burn or to proceed the enemy or flight be suspended in the event.
First I start command, as the most likely to yield out strik-
ing blow on the subject, either the American or the Chinese
but we can consider.¹³⁷

Body of command wants, probably, to keep an
advantage of the sky or flying or not bombing, or not bombing it is
dangerous. In point of fact, however, a strike or the rest of less
losses, it is also difficult. As the following ninth of re-
tention, that fact could be plane, an aircraft that is poorly built
in the mind, it might be broken and in such case it is necessary to be
popped out by the American soldiers. If the American force does not
operate by night their losses, as a result of bombing action in
operational material, would increase. Finally, for the American
equipped nor trained for the work of war. So the pilot of the
American would be unwilling. It turns a corner has to be
concerned, if the pilot of the American force, could go

trains that night to bomb could not. The 1000-ton coal hub is full, important cargo such as individual motorboats which could not be found, eaten, or hit at night. Their convey in port. It also is her task to hit submarine boats of the two naval bases, which would be a small but sufficient target area. None of the ships that had to be torpedomed that night to plan, for a score only available, and it will be required to destroy its initial illusion. After of course will it be the objective or might be used, but not primarily by destruction of individual targets but the destruction of vital areas, and such it could not properly be expected to precision to come on the room of accuracy. It can introduce another point of the greatest significance: any bombing on night to bomb, very logically calculated to supply that sort of employment; both it would be possible to bring continuous, 24-hour pressure to bear on the enemy, thus preventing his forces from relaxing. It could also be possible, in many cases, for the enemy to make difficult targets and difficult to characterize almost from the first instant, and so on, it would be difficult to be able to do the job at night. Furthermore, on the one hand, programmed infrared, or space, or communications interception in the U.S. were developed to a great deal. Finally, if the bombing was put into a structure of command and control, the war plane, the anti-concurrent action of a major base in Germany, a war plane, which would be able to find up his plan after plan to protect vital objectives of which he could not be able to break the visual link at a distance.

It is questionable whether the German war plane

137

many abortive sorties? Why had there been so few missions? Why should the U. S. bombing mission of 11/11 not be given the go-ahead directive? And his own targets? Why have U. S. bombers not bombed Germany? In answer, Baker described the factors that his force had limited the activity of his bombers: the relative inexperience of the crews; the requirements of TORCH which had seriously bled the Eighth Air Force and which had diverted the efforts of much of the force remaining, especially of the service units; the weather during the fall and winter months which had not limited the number of missions and increased the incidence of abortive sorties; the current strategic directive which, by limiting the bombers to submarine bases and allied targets in the occupied countries, reduced the choice of operating areas, thereby intensifying the weather problem; the lack of long-range fighters for escort into Germany. All of these difficulties could, he claimed, soon be mitigated. Crew experience would automatically increase, TORCH should soon require less of Eighth Air Force strength and time, strenuous efforts were being made to develop blind-bombing tactics to circumvent bad weather, long-range escort appeared in sight, and by enlarging the scope of Eighth Air Force bombing operations to include targets in Germany proper, the CCS could do much to relieve the American force from a strategic policy which, however necessary, had proved embarrassing both operationally and politically.¹³⁸

On this latter point, Baker went on to say that, so far from avoiding German targets, he believed they should in the near future

~~CONFIDENTIAL~~

- 30 -
~~CONFIDENTIAL~~

IAWRI-18

188

~~CONFIDENTIAL~~

be given a high priority for day bombardment. Missions to Germany, by scattering enemy defenses and augmenting the present RAF effort, would contribute strategically to the success of the air war. They would also contribute to the improvement of Eighth Air Force morale, and at the same time would undermine that of the German civilian population. He would, he claimed, be ready by 1 February with a force of 100 heavy bombers and 100 fighters to carry the day bombing campaign to the enemy homeland. If TORCH no longer needed the entire strength of the Eighth Air Force in its support, then it was time another directive were issued more in line with the strategic situation in northwestern Europe. As for the idea of the Eighth Air Force operating according to the same strategic directive governing the RAF, Baker insisted that, since TORCH possessed its own adequate air force, target directives should be issued either by the Chief of Air Staff, RAF, or by the CCS, rather than by the Supreme Commander, TORCH operation.¹³⁹

Baker's defense of the day bombardment program appears to have been successful, for the program was subjected to no further question. But its future also depended to a considerable extent on the system of command under which the day bombers were placed. Baker tacitly recognized that fact when he advocated placing operational control--in the sense of determining over-all target priority only--in the hands either of the Chief of Air Staff, RAF, or of the CCS themselves. He appears to have been especially anxious to avoid complete integration of command over the American and British bomber forces such as had

~~SECURITY INFORMATION~~

AAFRE-18

~~CONFIDENTIAL~~

189

been accomplished for the TORCH air forces by Eisenhower. In that event the Commander-in-Chief, RAF Bomber Command, would naturally be placed in charge of the combined force, and Baker had reason to believe that Air Marshal Harris would favor transferring the American bombers from day to night operations.¹⁴⁰

To ensure for the American commander full control over the methods employed by his force thus came to be the keynote of U. S. policy as far as the bomber offensive was concerned. General Marshall, speaking for the U. S. JCS, suggested that the American bombers in England should be under the operational direction of the British, who would prescribe the targets and the timing of attacks; but he insisted that operational procedure and technique for the American force should remain the prerogative of the U. S. commanders. General priorities should be prescribed by the CCS. British command, he felt, was logical until such time as the U. S. air forces outnumbered the British and until they had demonstrated beyond any shadow of doubt the efficacy of their daylight bombing methods, at which time a re-examination of command arrangements would be in order. This point of view was apparently accepted by the British without opposition.¹⁴¹

When it came to deciding the main objectives for the combined offensive, two considerations stood out in bold relief: the submarine remained the principal threat to Allied operations in the West, and the German Air Force would have to be defeated before Germany could be successfully invaded or even subjected to decisively effective strategic bombardment. The gravity of the submarine problem needed no

~~SECURITY INFORMATION~~

AAFRH-18

190

~~CONFIDENTIAL~~

new proof. The figures on shipping losses incurred in the course of this transoceanic war sufficed to make defeat of the U-boat unquestionably a "first charge on the resources of the United Nations." And it was agreed that intensified bombing of submarine operating bases and construction yards should be carried out by the combined bomber force, with immediate attention being devoted to the Biscay bases.¹⁴²

As for the Luftwaffe, it was currently believed to be in a critical state. The stamina of its crews was reputed to be decreasing, its training indifferent, and its morale low. And there was supposed no longer to be any depth of reserves behind the first line of fighter defenses. Consequently decisive action should be taken at once to reduce the GAF before it had a chance to recuperate. It was recognized that German air power could in effect be reduced by dispersion, in which case the American daylight bombers could probably be used more profitably to harass the GAF from bases in North Africa than to conduct strategic bombing operations from the U. K.; and in the early days of the Casablanca Conference it was still an open question whether the American force might not better be deployed in that direction. But the GAF could also be reduced, and ultimately more effectively, by destroying German aircraft production and base facilities and by forcing the enemy fighters to engage in a war of attrition with heavily armed formations of day bombers. For these operations the U. K. provided the only suitable base available. It was therefore decided to concentrate in the U. K. both the British and the American bombing forces.¹⁴³

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AAFRH-16

191

~~CONFIDENTIAL~~

In a sense, of course, U-boats and aircraft constituted objectives of intermediate rather than of final importance. The final objective remained the enemy's total war potential. American airmen were still confidently of the opinion that, by precision attacks on "bottleneck" industries, German production could be paralyzed. British bombardment experts on the other hand continued to lay greater emphasis on enemy morale.¹⁴⁴

On 21 January 1943, the CCS issued CCS 166/1/D, usually referred to as the Casablanca Directive, for the bomber offensive from the U. S. The ultimate objective of that offensive was stated to be "the progressive destruction and dislocation of the German military, industrial and economic system, and the undermining of the morale of the German people to a point where their capacity for armed resistance is fatally weakened." The primary objectives for the time being were listed in the following order of priority: (1) German submarine construction yards, (2) the German aircraft industry, (3) transportation, (4) oil plants, and (5) other targets in enemy war industry.

In addition to these priority objectives, which were subject to alteration from time to time as the strategic situation developed, other targets were mentioned as "of great importance either from the political or military" point of view. First of the examples mentioned in this connection were the submarine bases on the Biscay coast which the Eighth Air Force had been attacking sporadically for the past three months. The CCS had decided not to include them

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

in the order of priority because that list was meant to cover long-term operations only. The bases were moreover not situated in Germany, and, since the American force in the past had been severely, if uninformedly, criticised before British public opinion for devoting so large a portion of its effort to objectives outside Germany proper, it had been considered wise to treat the Dussey bases in a special category.¹⁴⁵ Nevertheless, the CO² made it perfectly clear that those bases were still targets of the highest strategic value. And, should it be found that the maximum pressure applied to them for an appreciable time produced decisive results, the attacks should continue whenever conditions were favorable and for as long; and as often as necessary. Provision was also made for bombing such essentially political objectives as Berlin, for attacking, from the sea area, targets in northern Italy in connection with amphibious operations in the Mediterranean theater, and for action against unimportant but important objectives. Since the Ailli Directive required the combination, the combined air force would afford the all possible support in the manner most effective.

In Directive 190, a specific place to the air bombard force which, it stated, could "take every opportunity to attack Germany by day, to destroy objectives that are unsuitable for night attack, to sustain continual pressure on - even morale, to inflict heavy losses on the German air fighter force and to sustain aircraft fighter strength away from the German and Mediterranean theaters of war." In another provision affecting specifically the Marine Force, it specified that in attacking objectives in occupied countries the

Establishing formal liaison with the British Air Force
and other British Commonwealth air forces is not
desirable at this time. It would be better to
have our liaison through the British Ambassador,
who, because of Hitler's influence in Britain, is
likely to be more sympathetic to our purposes.
It is suggested that we contact the British Ambassador
as soon as possible and request him to forward
copies of our own cables to Hitler to him. Such a
decision cannot be taken very quickly, and it would not be
practical to copy with the latter through the CSC in Washington.¹¹⁰

Oddly enough, the Circular No. Directive 101 on creation of one
system of command under which the combined offensive war to be con-
ducted. Except that it is issued by the Com "T" of the War Cabinet.
British Commonwealth Strategic Air Force is unlikely to accept the
directive of the British Commonwealth Government to conduct
an air war "in accordance with the principles of
international law." It would be quite reasonable, therefore,
for us to copy Hitler's cables to him. This is the
situation at present. If the situation changes, so that
the British Commonwealth Government is willing to
conduct an air war "in accordance with the principles of
international law," then it will be necessary to reissue
Circular No. Directive 101.

Chapter V

EIGHTH AIR FORCE OPERATIONS, 21 JANUARY 1943 TO 10 JUNE 1943

The Strategic Contribution

Although the Casablanca Directive clearly stated the mission of the combined bomber force and provided for it a tentative list of priority target systems, the Combined Bomber Offensive is not customarily dated from 21 January 1943. Rather it is considered to have begun with the directive of 10 June 1943, issued after detailed plans had matured and the American force had been substantially augmented. Between those dates, Eighth Air Force operations continued to be essentially experimental. The American bombers were engaged in extending the scope of their effort into Germany proper, in feeling out the quality of German opposition, itself desperately experimental, and in adjusting their tactics and techniques to the broader plan and increased scale of the daylight operations projected by the Combined Chiefs of Staff. It is this progressive mastery of the problems of strategic bombardment over Germany that characterizes this phase of Eighth Air Force activity more than the weight or even the effectiveness of the operations themselves.

For the fact was that the strength in effective aircraft did not increase so rapidly as had been hoped in many quarters. It was not until March that a force of over 100 bombers could be put into the air with some consistency. Prior to May, General Maitor could count on an average of only six operating groups of heavy bombers. By the end of that month, however, the situation had begun to improve, with

~~CONFIDENTIAL~~
100

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

LAFR-18

197

total operating strength up to 12 heavy groups. On 29 May, 279 bombers were dispatched against enemy objectives, a record to that date. In fighters, also, May witnessed increased strength. Prior to April, one Spitfire group, converted in March to P-47's, had been the only unit available. During April two more P-17 groups became operational and in May began to escort the bombers regularly.¹

Yet even from the strategic point of view these operations of the Eighth during the first half of 1943 were by no means negligible. The day bombers continued to devote their attention primarily to submarine installations. They were still charged with carrying out a policy which dated from the fall of 1942 when shipping losses, especially in the Atlantic convoy lanes, had begun to assume alarming proportions.² It will be recalled that, since 20 October 1942, the Eighth had been under orders to attack the submarine operating bases as a matter of first priority. On 19 November the submarine building yards at Vegesack, Bremer, and Kiel had been added to the day bombardment program as top priority objectives,³ but before January 1943 it had not been considered feasible to attack targets in Germany proper. At Casablanca it was decided to throw the primary emphasis of the combined offensive against submarines, concentrating especially on the bombing of the building yards in the Reich. The operating bases on the French coast were to continue to be subjected to bombardment until it might be conclusively determined whether or not they constituted a profitable system of objectives.⁴ On that score both British and American observers entertained profound doubts.

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

CONFIDENTIAL

AFWU-18

198

It was generally conceded that the roofs of the submarine shelters, constructed as they were of reinforced concrete sometimes over a dozen feet thick, were impervious to any projectiles then available. But one still hoped that by disorganizing the service installations, transport facilities, and laboring population in the port areas the turn-around of U-boats in the operating bases might be slowed down to such an extent that their numbers actively engaged in the Allied shipping lanes would be in effect reduced.⁵

Accordingly, the Eighth Air Force and the RAF continued to strike at the Biscay bases, especially Lorient and St. Nazaire. Generally speaking, the day bombers attacked the French bases only when weather conditions made missions to German shipbuilding ports impracticable--which, of course, left them ample opportunity.⁶ As for the U-boat construction yards, it was conceded that their destruction would have only a very delayed effect on the operating strength of the U-boat fleet, but it was considered that the submarines had become so serious and chronic a menace that it warranted long-term measures. Meanwhile, attacks on the U-boats at sea were coming to be recognized in some quarters as the most direct, and possibly in the long run the most effective method of coping with the submarine counterattack, but it was felt that they needed to be supplemented by attacks on the submarines at their point of origin. In addition the British, while admitting that the component parts industry did not constitute by itself a suitable target for strategic bombardment, hoped that by means of area bombing of key manufacturing centers significant delay

AAFRE-18

199

might also be effected in the delivery of essential components as well as in the production of such basic materials as steel. Also intended as of indirect significance in the antisubmarine bombing campaign were attacks on enemy transportation as a whole, especially on the vulnerable supply lines extending from the Low Countries to the Atlantic coast.⁷

It was, then, a relatively large and coordinated attack that the combined bomber forces launched at the sources of the U-boat menace during the first half of 1943. Over 63 per cent of the total tonnage of bombs dropped by the Eighth and 30 per cent of that dropped by the RAF during the first quarter of the year were directed specifically toward submarine facilities. In the second quarter, 30 per cent of the RAF and 52 per cent of the American effort were so expended. These figures do not, of course, include the weight of attack applied against transportation, civilian morale, and basic industry, all considered to have an indirect, albeit an incalculable, bearing on the main issue.⁸

Until August 1943, the German submarine industry was not a separate entity. Rather it functioned as an integral part of the shipbuilding industry, which, however, was converting a rapidly increasing proportion of its facilities to the construction and maintenance of underwater craft.⁹ In addition to heavy RAF raids against facilities at Emden, Wilhelmshaven, Kiel, Hamburg, Flensburg, Lübeck, Bremerhaven, and other construction centers, the Eighth Air Force, from 23 January 1943 to June of that year, executed 12 separate attacks against submarine construction yards. Seven of these operations resulted in appreciable damage to the target. The day bombers struck four

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

CONT'D BY Pg 2

IAW 14-18

200

effective blows at Wilhelmshaven, where the submarine construction yard at the Larin werft constituted the most interesting of a number of important naval targets. It was not always easy to distinguish the effects of Eighth Air Force attacks from those of the RAF, but photo reconnaissance revealed heavy, though scattered, damage to installations in the port area. The last of these missions, conducted on 21 May 1943, was believed to have been especially effective, extending the areas of damage already inflicted and contributing to a general reduction of submarine construction capacity from 16 hulls to less than eight. On 14 May, 126 bombers dealt considerable damage to two of the submarine yards at Kiel--Gorleben werft and Lutetscher werke. Almost every major building in the former received damage, some of it severe. Destruction at the latter concern, though less extensive, was substantial. So effective was this attack, especially to Germany, that Allied interpreters believed production at preraid level would be impossible for several months. They admitted, however, that much of the work pending at that yard might be successfully farmed out to other yards with little loss of production time.¹⁰

Probably the most significant, the most dramatic attack made during these months was executed on 18 March against the yards of Bremer Vulkan at Vegesack. Situated on the right bank of the Weser River, some seven miles below Bremen, that yard had been engaged since mid-1940 entirely in submarine building. At the time of the bombing, the slipways contained 15 submarines in varying stages of construction. Photo reconnaissance after the raid revealed a most

SECURITY INFORMATION

~~SECURITY INFORMATION~~

ADM -18

201

favorable picture of the destruction wrought. It had been an unusually accurate job of bombing, and of the 15 U-boat hulls on the slips it appeared that seven had been damaged severely, one actually having captured. Six others were thought to have been slightly damaged. Judging from the extent of the destruction, Allied observers believed that, instead of completing seven submarines during the ensuing six months as apparently planned, the yard would probably only finish four; and they estimated that U-boat Fulham would be of little importance for at least 12 months.¹¹

But this more than normally efficient attack illustrates not only the limitations of photo reconnaissance but the difficulty of doing permanent damage to shipbuilding yards. Information gained subsequently from German records indicates that, although interpretation reports were accurate enough in identifying the points of damage inflicted on the yard and on the unfinished U-boat hulls, they quite failed to measure the quality of the destruction and consequently overestimated its effect on production. Actual damage suffered by the submarines on the slipways was slight, for most of the bombs that hit the wyes either broke open, with resulting low order detonations, or penetrated below the concrete and were dissipated underground. Damage to the camouflage over the submarines caused destruction to the vessels themselves to be overestimated from the air. In reality only a few holes from fragments resulted. The interpretation reports failed also to appreciate the recuperative capacity of submarine plant facilities. Nor, despite the admittedly

~~SECURITY INFORMATION~~

CONFIDENTIAL

IAW -18

202

severe damage to buildings and equipment (the company claimed compensation to the extent of Rl 4,365,470), considerable productive activity was resumed at the yard after one week, and within six weeks production had returned virtually to normal.¹²

A similar story may be told of the entire effort against the building yards during the first half of 1943. Although comparatively heavy, the attacks of the RAF and USAAF had in fact little effect on production of submarines. Only in the last months of the war did submarine production fall off seriously, and then the paralysis of the industry stemmed in part from a vastly increased weight of attack and in part from the general disruption of transport facilities which in those latter days affected all enemy industry.¹³

Even more frustrated were the attacks made against the operating bases on the French coast, for it now appears that they had practically no effect on the activity of the U-boat fleet at any period, no matter how much inconvenience and ultimate expenditure of material and manpower they may have occasioned.¹⁴ It is true, of course, that they were treated during the first half of 1943 as targets of secondary importance in comparison with the building yards. But they were nonetheless subject to a crushing weight of bombs. Of the total bombs dropped by the Eighth Air Force on submarine and naval objectives from 23 January to 10 June 1943--amounting to well over 3,800 tons--approximately 1,045 tons fell on the operating bases. Of 13 separate attacks, nine may be considered successful; and of these successful blows, four were inflicted on Lorient, three on Brest,

~~CONFIDENTIAL~~

AERH-18

203

and two on St. Nazaire.¹⁵ In addition to this weight of USAAF daylight attack, the RAF Bomber Command conducted a vigorous campaign of night raids concentrating mainly on Lorient and St. Nazaire. Between 14 January and 16 February the British bombers hurled nine night area attacks at the town of Lorient, three of which were executed by forces of from 300 to 500 planes. Late in February they turned their attention to St. Nazaire, delivering even more concentrated destruction to that unhappy town than to Lorient.¹⁶

The results of this combined effort, coming as it did on top of repeated bombardment of bases during the fall of 1942, were truly devastating. By the end of March 1943, destruction was already widespread in the town areas as well as among the port installations, railway facilities, and public utilities, and it was becoming evident that both St. Nazaire and Lorient were rapidly becoming uninhabitable by the ordinary civilian population. By the end of May not a single important building in St. Nazaire remained intact, and many had suffered serious and lasting damage. Repair work had been persistently attempted but had not been able to keep pace with the bombing.¹⁷ Grand Admiral Doenitz summed up the situation with some finality in a meeting of the Central Planning Office on 4 May 1943:¹⁸

. . . the Anglo-Saxons' attempt to strike down the submarine war was undertaken with all the means available to them. You know that the towns of St. Nazaire and Lorient have been rubbed out as main submarine bases. No dog nor cat is left in those towns. Nothing but the submarine shelters remain.

But the submarine shelters did remain, and therein lay an obstacle to Allied bombing that proved for all practical purposes insurmountable. As Doenitz went on to say, they had been built by the Todt organization as a result of the "far-sighted orders of the Fuehrer," and the

~~SECURITY INFORMATION~~

ADM-18

204

submarines were repaired entirely beneath the protection of their concrete. Instead of abandoning the bases, the Germans had moved all essential facilities inside the pens.¹⁹ And so the hope, persistently held by the Allies, that destruction of repair shops, power plants, living quarters, and other port facilities could be counted on to increase the turn-around time necessary before a U-boat could again become operational was doomed to disappointment. In the absence of conclusive evidence (the workings of the bases were shrouded in the deepest secrecy),²⁰ that hope remained fresh and green for some time. Despite an occasional report from European sources to the effect that the submarine shelters were working uninterruptedly, an AF intelligence report dated 1 July 1943 was able to state confidently that "it is increasingly difficult for the enemy to turn around their submarines on scheduled time." The Admiralty, it continued, had just written to the Chief of the Air Staff pointing out the great value of these attacks, and requesting that they be continued. "There is no doubt whatsoever that they have contributed materially to the marked diminution of the U-boat effort and the resultant reduction in our shipping losses."²¹ By the fall of the year, however, Allied intelligence analysts had already begun to take a more conservative view of the bombing of operating bases.²² As for the pens themselves, they remained impervious to anything but the six-ton bombs dropped occasionally in the later stages of the war by the RAF.²³ But by that time the antisubmarine war had been won, and by other means than strategic bombardment.

~~SECURITY INFORMATION~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AMEM-13

205

The submarines suffered substantial defeat in the late spring of 1943, and it now appears that their failure resulted primarily from improved Allied detection methods, convoy techniques, and sea and air antisubmarine warfare on the high seas. According to Admiral Doenitz, who, as commander of the U-boat fleet, was in a position to speak with authority, it was air attacks at sea in particular that stopped his desperate bid for victory in the Battle of the Atlantic. It is the conclusion reached by the U. S. Strategic Bombing Survey that, in wresting victory from the enemy, "strategic bombing can at best be considered only an incidental contributing factor."²⁴

By June 1943 the submarine menace had subsided and the main effort of the Eighth Air Force was directed elsewhere. Only 10 per cent of its bomb tonnage was devoted to submarine targets during the latter half of 1943. The percentage dropped to four during the first quarter of 1944. It was not until late in that year that the intense activity noticeable in the German submarine building yards warned the Allies of the enemy plan to create a fleet of new type submarines and caused the industry to be considered once more a principal target system.²⁵ But that is another story. For all intents and purposes the antisubmarine campaign carried out by the Eighth Air Force prior to 1944--that essentially defensive phase of its activity--was completed between October 1942 and June 1943. The CO Plan, drawn up in April 1943 and approved in May, still placed submarines in first priority, but before it could be implemented to any important extent the submarine situation had for the time being materially improved.

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

REF ID: A6510

203

Compared to the antisubmarine campaign, the remaining efforts of the Eighth Air Force during the period under review appear tentative, scattered, and light. Although second only to submarines in order of urgency, aircraft installations sustained little more than 15 per cent of the total 26,000 tons dropped by the American bombers. Of the seven attacks made on targets of importance to the German Air Force, only four can be considered successful and only three--against the Arla Aircraft and Aero Engine works at Antwerp, the Focke-Wulf factory at Bremen, and the airframe factory of S. A. G. A. du Nord (formerly Avions Potez) at Le Bourget--were of significant weight. All three of those heavier attacks, ranging from approximately 431,500 pounds to 526,000 pounds, resulted in concentrated and severe damage. Heaviest of all was the mission executed on 17 April against the Focke-Wulf Flugzeugbau at Bremen, at the time believed to have been devoting its entire facilities to constructing F-190 fighters.²⁶ According to plant officials subsequently interviewed, this attack destroyed approximately half the factory and several completed aircraft.²⁷

Axial rail transportation, given third priority at Casablanca, suffered almost as great a weight of bombs as did aircraft installations. In a sense the enemy owed this degree of attention to contingent factors as much as to military plans, for with one exception all raids made during the period in question were directed against targets in occupied France which could be reached readily when weather prevented missions to Germany or to the submarine bases on the Bay of Biscay. Yet these attacks may well have caused the enemy more trouble

REF ID: A6510

REF ID: A6510

~~CONFIDENTIAL~~

IAW EO-10

207

than those against aircraft objectives. Of the seven major attacks made by the Eighth Air Force, four--delivered against Namur, Rennes, and Rouen--caused acute, if temporary, dislocation to marshalling yards and heavy damage to repair facilities.²⁸

On 12 and 26 March the day bombers returned to the scene of their first operation and struck a relatively heavy blow (315,000 and 413,000 pounds of high explosives respectively) against the Dotteville yard at Rouen, causing severe damage to the tracks and to the Buddicum repair shops. In addition, the latter attack almost completely destroyed the Quatre Arcs locomotive repair shops. Most spectacular were the results at Rennes, when on 8 March 67 bombers dropped approximately 260,000 pounds of bombs over the railway yard, cutting it at both ends and bringing all traffic to a standstill for three or four days. It was several days more, possibly two weeks, before normal traffic could be resumed. Meanwhile rail communications with Brest Peninsula, and in particular with the submarine bases, were seriously disorganized, for Rennes constituted the strategic key to the whole railway network of Brittany. Traffic had for some days to be routed to the submarine bases by circuitous routes, a task which the bombing of railway facilities at Lorient and Cherbourg, and the breaching of the Morlaix viaduct late in January by the RAF made more difficult.²⁹

It was easy, however, to overestimate the traffic delay resulting from these missions. Repair gangs were large, efficient, and ubiquitous. Consequently it appears that in no instance during the spring of 1943 was traffic held up longer than three to four days. The strain on German resources in skilled labor was, of course,

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

ALFA (-18

208

considerable. Probably more important than track damage was the destruction of repair facilities, which undoubtedly contributed to a reduction in the number of operating locomotives and freight cars.³⁰ But, effective as they were in individual instances, the Eighth Air Force missions against rail centers were not carried out in sufficient strength nor frequently enough to produce more than a local and temporary dislocation. Although the AAF made several light raids specifically on rail objectives and a few heavy night attacks, especially during March, which involved rail installations, their effort failed to alter the situation materially.³¹

Practically all the bombing of rail objectives was done in March. After March the Eighth Air Force turned its marginal effort toward factories in France and Belgium producing motor transport vehicles for the German Army. On two occasions (1 May and 11 May) it attacked the plants at Antwerp formerly operated by Ford and General Motors. Those factories, situated within a few hundred yards of each other, suffered considerable damage, especially as a result of the earlier mission when 65 bombers dropped 323,000 pounds of high explosives on them with a high degree of accuracy. More important, however, was the bombing of the Renault motor vehicle and armament works at Billancourt, Paris, on 4 April. It was the first relatively heavy attack (35 bombers dropped 502,100 pounds of high explosives over the target area) since the AAF had bombed the same plant on the night of 3/1 March 1942. Almost every major building was damaged, in some instances the greater part of the shops being destroyed. According to contemporary estimates, considered conservative at the time, this attack cost the Wehrmacht

SECRET//~~REF ID~~

APRIL 18

209

at least 3,000 trucks; and it appeared unlikely that the factory could resume preraid production for more than seven months. British industrial analysts believed it to have been a far more effective blow than that delivered the spring previous by the RAF, albeit the latter had done much to cast a doubtful light on strategic bombardment in those days of doubt and experimentation.³²

The American bombardment campaign in 1943, as in 1942, had the unfortunate incidental effect of killing civilians and destroying civilian property in occupied territories. The Casablanca Directive had recognized the serious political implications of the problem, and had placed control over operations against strategic objectives in those areas in the hands of the British Air Cabinet, which could presumably be in a position to react promptly and authoritatively to developments on the political front.³³ Generally speaking, the American bombers had been restricted in their activity over occupied territory to days when weather conditions made attacks against objectives in Germany impossible. Priority among the targets elsewhere was, of course, given to the submarine bases on the French Coast, the strategic importance of which was believed to justify any measures necessary for their complete destruction.³⁴

Strangely enough, however, it was not the bombing of the submarine bases, devastating as it was, that roused the severest criticism from the French population. Yet on closer observation that fact does not appear so odd. Under the crushing weight of attacks from both British and American forces, Lorient and St. Nazaire virtually ceased

210

to exist as civilian communities, and the French population, after they had recovered from the bewildered shock of seeing their towns systematically obliterated, took a grim satisfaction in contemplating the discomfiture of the German operatives left in the bombed areas, most of whom belonged to the unpopular Organisation Todt. The people of Brittany knew only too well the strategic importance of the west peninsula, and despite their losses and their inevitably mixed feelings, many of them hoped an allied invasion of the Continent would come soon, and in Brittany.³⁵

Elsewhere the bombings prompted an increasing undercurrent of protest among a population generally pro-British and pro-American. March had been an especially hard month, for it was then that the RAF made most of its attacks against rail objectives in occupied France; and, since marshalling yards were normally embedded in populous areas, it was inevitable that those areas should suffer seriously, even though accidentally. At Le Havre, for example, the big mission of 5 March left nearly 300 civilian casualties. The French population not unnaturally felt that this was a terrible price to pay for "un si court délai et ralentissement du trafic." Opinion remained, of course, mixed, the quality of the mixture depending pretty exactly on the degree of loss suffered in each individual case. It was heard during showings of documentary films of current allied bombings were reported to have been distinctly uncannily tally to the allied flyers; yet even so, a contemporary French source indicated, they were mild in comparison with those which the head of "notre bien-aimé"

ACTW-18

211

"Mr. Leval" elicited when it was projected on the screen.³⁶ Incentive tended to become concentrated against the Americans, whose high-altitude attacks in relatively great strength seemed inevitably and appallingly inaccurate and destructive to those on the ground. The RAF, on the other hand, was regarded as "the arm of precision无可匹敌的." This notion is not so paradoxical as it seems in view of the British doctrine of area bombardment, for the RAF had for obvious reasons refrained from subjecting French cities to heavy night attacks except in the cases of Lorient and St. Nazaire, from which the French population had been largely evacuated, and had made a number of accurate raids with four or five planes at low altitude against specific objectives.³⁷

Criticism reached a climax in April. The Belgian ambassador to the U. S. protested the inaccurate bombing done by the RAF at Antwerp on 3 April which had resulted in heavy civilian casualties.³⁸ And among the French in London criticism of American bombings in France tended to increase along with criticism of U. S. policy in North Africa. Following the bombing at Paris by the Eighth Air Force on 1 April, the de Gaulle Committee, while admitting good strategic results, complained of the inaccuracy which had led to large civilian losses and recommended that the Americans either adopt different bombing techniques (it was suggested, among other things, that the bombers fly about for a couple of minutes before dropping their bombs) or else abandon the bombing of French objectives in favor of equipping the Resistance movement to do the work of destruction by itself. Other sources expressed similar, though often less moderate

~~SECURITY INFORMATION~~

IAFRH-18

212

opinions, suggesting at times that the Americans were indifferent to French welfare, that they should learn to bomb by practicing on the Germans rather than on the French, and that it would be better if the British bombed French objectives and let the Americans indulge their irresponsible habits over German soil.³⁹

Pressure had increased by the latter part of April to such an extent that the problem came before the British War Cabinet for general review. That body was unwilling to permit bombing of occupied countries except insofar as it could be accomplished without excessive danger to the civilian population, a policy which, although differing little from the position originally taken in October 1942, would, if strictly interpreted, have made it necessary to abandon all such bombing, since strays could hardly be helped even under the most favorable conditions. But strong arguments pointed toward continuing the bombardment of strategic objectives in occupied Europe. Not only were those objectives of sufficient importance to the Axis economy to warrant bombing, but to attack them periodically would be to force the Germans permanently to disperse their defensive strength. The logic of military necessity in a total war proved unanswerable; and in June the CCS agreed that objectives in occupied countries, the inherent military importance of which justified such action, would under suitable conditions continue to be subjected to precision bombardment.⁴⁰

The Tactical Problem

To grasp the true significance of the early 1943 operations performed by the Eighth Air Force it is necessary to look at them from the point of view of the tactician rather than the strategist. For the day bombers were still learning their trade. During the months prior to February 1943 the Eighth had grappled with the basic problems of daylight strategic bombing for the first time under combat conditions, and had elaborated certain basic tactical principles. Now, during the months from January to June, the main tactical problem was to extend operations, both in scope and weight, and to adjust basic practices to the shifting circumstances of the air war. Though not intentionally so, it was a period of final experimentation before the big offensive.

The American bomber force in the U. . . had also to combat criticism of daylight precision bombardment which continued to crop up despite the official acceptance of the program by the CCS at Casablanca.⁴¹ Allen L. Dulles of the Joint Chiefs staff, who had been in England for some time observing the air war, gave voice to this spirit of skepticism which lingered, principally in Britain, beneath the surface of official agreement. In a book entitled The Air Offensive against Germany, published early in 1943, he undertook to demonstrate that, while it was entirely feasible to bomb Germany into military impotence, the job was being held up seriously by the RAF, which "stubbornly" refused to abandon its dogmatic insistence on daylight bombing, a concept tactically unsound under European conditions and

AIRFO-18

214

quite beyond the capabilities of available American aviation.⁴² As they were doubtless meant to do, his words prompted considerable comment in the American press, and raised questions in the minds of such influential groups as the House Appropriations Committee.⁴³ Unfortunately Air Force spokesmen were unable to answer these criticisms effectively because air raid bombing operations in the U. S. had not been heavy enough or extensive enough in scope to warrant any but tentatively favorable conclusions, and tentative conclusions do not suffice for convincing argument, especially in the eyes of the lay public. To Mr. Lichie, on the other hand, and to those for whom he spoke, six months of actual operations in the U. S. had pointed conclusively in the opposite direction. The apostles of high-level precision bombing therefore looked forward with some concern to the spring operations against Germany for data which might more fully vindicate a tactical doctrine which had necessarily been held to a large, if happily decreasing, extent as a matter of faith.

The Eighth, however, continued to labor under certain handicaps. Its commanders would have preferred to increase the weight and range of its missions steadily and rapidly, but prior to May 1943 it received few reinforcements. Even replacement crews and aircraft arrived at a rate much slower than the losses incurred in operation or combat. In February the effective strength of the organization sank lower than it had been for many weeks. The Service Command was still devoting a substantial portion of its time to the preparation of units and replacements for TORNADO; and during April and May its

ANAL-18

215

facilities were further strained by the arrival of new groups, the ground schedules of which had been left behind owing to the currently acute scarcity of shipping.⁴⁴ Finally there was that perennial bogey, the weather. In January only four out of 11 planned missions were carried out, the remainder having been cancelled because of unsuitable weather. In February five were completed. With the advent of spring, the situation naturally improved, allowing nine missions to be completed in March, four in April, and nine again in May.⁴⁵ But weather remained a serious limiting factor on all daylight operations. Experimentation in blind bombing methods continued, but "molin" operations proved unsatisfactory and were abandoned after March. It was not until the end of November 1918 that "pathfinder" missions began to be flown.⁴⁶

It would not have been surprising had morale declined in the face of these chronic handicaps. To a certain extent it did, of course. Commanders were impatient and often discouraged at the slow rate of Eighth Air Force operations and at the delay in build-up. And combat crews saw in the statistics of attrition and replacement the shining prospect of a short career. To many matters worse, commanders and crews alike were eager to strike at the German homeland, but hitherto they had been prevented from doing so by tactical and strategic considerations the validity of which they did not always appreciate. In this restlessness they were joined by a considerable segment of British opinion.⁴⁷

It came, therefore, as a tonic to all concerned (except the enemy) when, late in January, the Eighth Air Force bombed Wilhelmshaven.

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AMEM-10

216

specific plans had been laid as early as November of 1942 to extend operations beyond the occupied areas, and the list of priority targets had been enlarged to include objectives in Germany proper. At Casablanca it had been decided to concentrate daylight bombardment as far as practicable on objectives in the Reich. Accordingly, on 27 January, 61 B-17's and 27 B-24's at last set out for Germany. The mission did not go exactly as planned. The Liberators were supposed to attack the dock area of Wilhelmshaven and the Fortresses were to bomb submarine building yards elsewhere in Germany. As it happened, the force of B-24's, suffering from a combination of bad weather and bad navigation, failed to locate the target and returned to base. Of the B-17's, 53 found it impossible to bomb their primary target, and went on to Wilhelmshaven which for them had been specified as the secondary. The others bombed Flensburg, the target of last resort.¹⁸

The uncertain weather prevailing that day over northern Germany may well account for the fact that the mission met such less opposition than it had anticipated. Flak was encountered almost continuously over Germany and the Frisian Islands, and several of the bombers suffered slight damage; but at no time was it intense enough or accurate enough to have deterred the attacking force in any way. At Wilhelmshaven, especially, the flak defenses appear to have been thoroughly confused, their effort at a predicted barrage being what a British observer who flew in one of the B-17's called "pathetic."¹⁹ Considering the number of guns the enemy was known to have in the area, this showing came as a complete surprise to the American force.

CONFIDENTIAL
SECURITY INFORMATION

~~CONFIDENTIAL~~

APR 13

217

The only losses that occurred during the day's mission resulted from enemy air action. Both the B-17's of the 1st Bombardment Wing and the B-24's of the 2d Bombardment Wing stirred up a sizeable force of enemy fighters, estimated in all at more than 100 aircraft. In the resulting combats the Liberators lost two of their number and the Fortresses one. But even the German fighters proved less dangerous than had been feared, for they seemed much less experienced than those the bombers had encountered in France. Claims of the bomber crews against the fighters were assessed at 22 destroyed, 14 probably destroyed, and 13 damaged. All bomber claims were during the first half of 1943 but, however, be taken with a grain of salt. Despite a new and much improved method of establishing them, they were still affected by many confusing circumstances; and they continued to run high.⁵⁰

It was, if not an especially well executed mission, a very interesting one., A relatively small force of heavy bombers, their crews no more experienced than necessary, had penetrated by daylight, and necessarily without benefit of escort, well into the enemy homeland, and had, moreover, done so without prohibitive loss. Operations of this sort had generally been considered feasible only for a large force of highly trained units. But, as Eighth Air Force commanders knew only too well, they might expect heavier and more efficient resistance in the future. And so it happened. During the mission of 4 February, when the Eighth attacked Linz, the bombers stirred up a veritable hornet's nest of fighters. For the first time they were opposed by

~~CONFIDENTIAL~~

110-118

218

trin-engine fighters (Me-110's and Ju-88's) in addition to the usual B-109's and FW-190's.⁵¹

On 26 February, one month after their initial plunge into German territory, the day bombers revisited Wilhelmshaven. They had intended to strike from the sea, but, finding that objective completely obscured by clouds, they turned back to Wilhelmshaven. Here 65 of them bombed the harbor area to some effect. But it was a very different mission from that of the month previous. That was not much more dangerous than it had been on that occasion, although it may have accounted for one of the bombers lost. Enemy fighters, on the other hand, reacted in strength. Not only were the fighters of the affected area engaged, but help was enlisted also from units as far south as Flushing. In all an estimated 55 to 60 single-engine fighters and 10 to 15 trin-engine fighters (the latter probably normally used as night-fighters) flew a total of 80 to 85 sorties against the bomber force. No concentration of purpose with which the attacks were launched was clearly evident from intercepted German radio messages.⁵²

No factors undoubtedly simplified the task of the enemy dispatchers. Almost from the point of rendezvous the bombers had been in the German RFL screen, with the result that the enemy was well prepared to intercept as soon as the bombers came within reasonable range. The danger of early interception was also aggravated by the fact that the planned route led around the coastline of north-eastern Europe not far from the Frisian Islands; and the actual course clung apparently even closer to the coast. At any rate, in the ensuing

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AFW-18

219

battle the Bomber Force lost seven of its planes, possibly as many as six of which fell as a result of enemy air action. Four against these losses the Bomber crews claimed 21 of the German planes, with nine more held probable.⁵³

Despite the determination with which the German pilots pressed their attack, they were still reported as being more cautious than the less seasoned units in France. Or did they attack so consistently from the front?⁵⁴ The reader will recall that during the later missions in December and during January of 1943 the Germans had recognized the weakness of the American bomber formations in forward fire power and had made a consistently deadly series of frontal attacks.⁵⁵ The British Air Forces had reacted promptly to that disturbing tendency by fitting as many bombers as possible with nose guns and by attacking the formations with a view to providing mutual fire power; it had succeeded at least in reducing the menace of the nose attacks. It is possible that the less experienced enemy units stationed in Germany at that time had been cautioned to respect this increased defensive power. The Bomber crews had noticed a similar tendency on both previous missions to Germany.

During the mission of 26 February the Germans experimented with two new defensive techniques. The bomber crews reported encountering a box barrage of antiaircraft fire over Wilhelmshaven which contained several black bursts, each of which released a parachute bearing an explosive charge. The group also reported an unsuccessful attempt on the part of the He-111's to drop bombs on the A-17's from special

LWV-18

220

external bomb racks. On 16 February, during the raid to st. nazaire a report of a similar nature had been rendered, but it was thought on investigation that the missiles in that instance consisted of self-destroying ammunition. The bomber crews again reported air-to-air bombing when on 22 March they returned to wilhelmshaven. Again the tactic failed to cause damage.⁵⁶

On 4 March an incident occurred which demonstrated, if demonstration were needed, that small formations could not hope to penetrate the fighter defenses in the Reich without crippling losses. The target for the day's mission was the marshalling yard at hanau. It was the first time the eighth had set out to bomb an objective in the ruhr industrial area, and so the mission was planned with a view to reducing as far as possible the danger from enemy fighters that the necessarily long flight over enemy territory would entail. In order to confuse the enemy defenses the main force of 71 fortresses headed out in a northwesterly direction over the north sea roughly along the route taken on previous missions to crewe or wilhelmshaven. In addition, 14 b-24's flew a diversion along a similar route, but followed it for a much greater distance, keeping an eye out for incidental shipping targets. When about half way between england and the netherlands coast, the main force turned southeast toward hanau. But from that point on, the weather upset those carefully laid plans, with the result that of the four groups of 4-17's one returned to england without bombing; and two others bombed the last resort target at rotterdam. The fourth group became separated from

221

The main formation while flying on instruments, so that, when it reached clear weather over Germany, it found itself quite alone. It continued on to the primary target, however, and succeeded in bombing with unusual accuracy. So far it had met only light opposition, and it is probable that the carefully planned route prevented the German fighters from becoming prepared far in advance. But on the route home they began to attack the 16 Fortresses with the utmost determination, coming in, contrary to their recent custom in that area, mainly between 10 and 2 o'clock and sometimes making coordinated attacks by three planes all aimed at individual bombers. In all some 60 enemy fighters, of both single- and twin-engine types, attacked the lone formation and shot down four of its planes. It was a costly operation, but considering the weight and determination of the attack, it is remarkable that none of the B-17's were lost; and in the course of the air battle the bombers may have destroyed upwards of 18 of the enemy planes.⁵⁷

The attack on objectives in the German homeland had been the depressing fact to all concerned since the latter part of January. The missions had been relatively successful, but, except for the first one, the cost had been high. On the first four the rate of loss, expressed as a percentage of the planes attacking, had been a little over 10 per cent. And most of the losses had resulted from air combat.⁵⁸ Yet the Eighth Air Force commanders were not unduly discouraged, for, they argued, a force of 300 or more planes (the number originally planned for such operations) would lose but if any more than did the small forces then employed. Moreover, these

~~CONFIDENTIAL~~

SECURITY INFORMATION

~~CONFIDENTIAL~~

AAFRK-18

222

missions had not been escorted, and a reduction in losses could be confidently expected as soon as long-range fighter support could be provided.⁵⁹

Their optimism received considerable impetus when, after a two-weeks absence, the day bombers again flew to a German target and, on 18 March, bombed the submarine building yards at Vegesack. The route had been carefully planned in order to bring the bombers into contact with the enemy defenses at the latest possible moment; and, giving the Frisian Islands a wide berth, they succeeded in avoiding interception until they had reached Heligoland. Then the German fighters of all available types (Fw-190's predominating) engaged the bomber formations in a running battle to the target area, and again on the return trip, some following the American force over water to distances of 60 to 80 miles beyond the coastline. Yet these attacks, persistent though they were, for the most part lacked the skill and daring of experienced units, suggesting that the four missions flown by the Eighth to French objectives during the preceding fortnight had drawn off the few well trained units then stationed in northwest Germany. The gunnery of the bomber crews seems, moreover, to have improved. As a result of these two factors the Germans suffered heavily, although the claims registered of 52 enemy fighters destroyed, 20 probably destroyed, and 33 damaged appear to have reflected less the facts than the confusion accompanying a protracted air battle. Probably no more than 50 or 60 of the enemy intercepted. Yet their losses must still have been substantial. Best news of all to the tactical commanders was the relatively small loss (two planes) sustained by

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AMR-16

~~CONFIDENTIAL~~

223

the bomber force. Considering that it provided also an example of very accurate and apparently effective bombing, it was a reassuring mission.⁵⁰

Meanwhile the day bombers had been running into equally powerful defenses during missions to the submarine bases on the French coast. Indeed, crews reported defenses in the neighborhood of those objectives to have been more experienced in the ways of the American heavy bombers than those met in Germany. Just at St. Nazaire, Lorient, and Brest had on more than one occasion caused the bombers serious trouble, and at St. Nazaire on 3 January it had been thrown up in a projected barrage that destroyed a veritable attacking plane.⁵¹ During January, February, and March flak at those points continued to cause much damage to the bombers and in a few instances destroyed them. For the most part the fire control method used was a continuous following, and it was frequently so accurate that the bomber formations could hope to escape serious trouble only by taking violent evasive action.⁵²

Yet it was the fighters here, as in Germany, that gave the night its toughest battles. Since it was not possible for the bombers to have escort much beyond the French channel coast, they had to do their heaviest work (mainly at Lorient and St. Nazaire) without fighter support over the target area. More important than the lack of full-scale escort was the experience and ingenuity of the enemy fighter units stationed in those parts. They pressed their attacks fearlessly and were constantly trying out new tactics. At Lorient,

~~DO NOT REPRODUCE~~

~~SECURITY INFORMATION~~

MAILED-18

224

~~CONFIDENTIAL~~

for example, on 25 January, they tried coordinated attacks in groups of six planes, the elements of which came in simultaneously from both sides and from above. Most frequently, however, the German pilots employed the same attacks which had worked so well against the inadequately protected bomber formations in December and January.⁶³

To be sure, the bomber crews were also increasing in experience. By preserving a good defensive formation as possible, by turning into the attacks, and by varying altitude as much as was consistent with tight formation flying, they managed often to evade otherwise lethal passes. In addition, the thin nose gear now installed in many of the bombers were credited with breaking up many attacks. Yet even with these improved defensive tactics, the Eighth lost heavily in combat in the neighborhood of the U-boat bases. At Lorient on 25 January an attacking force of 54 bombers lost four to enemy action and one to flak. Of the eight planes lost by the force of 65 that attacked St. Nazaire on 16 February, two definitely were shot down by enemy fighters, four were probably destroyed by fighters, and another two by a combination of fighters and flak. On only two occasions did the bombers have a relatively easy time in dealing with the German aircraft. On 27 February the 117th provided escort of such high quality that 60 bombers were able to complete their mission to Brest without loss of a single plane. And on 3 March the main force, sent to bomb Lorient, benefited materially by having the bulk of the fighter defenses diverted by a few F-24's.

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AMM-18

226

~~CONFIDENTIAL~~

dispatched to escort for that purpose under heavy Spitfire cover.³⁴

Sighter escort also rendered missions flown during March to other targets in occupied France and the Low Countries a relatively simple matter. During March, six such missions were dispatched to points which, with the exception of Tonnes, lay within escort range. On two occasions, at Douai on 12 March and at Airens and other points on the day following, forces of 63 and 75 bombers respectively completed their missions without loss, thanks largely to cover provided respectively by 12 and 11 squadrons of Spitfires, and to carefully planned diversionary sweeps by fighters and bombers.³⁵ By this time the prevailing doctrine of fighter support was based on the assumption that all rearward defense of the bomber formations could be the responsibility of the bombers, and that the fighter support would so place itself as to defend the bomber formation from head-on attack, still the most favored enemy tactic. This method at the same time left the bombers a clear field, free from problems of identification, in which to engage all hostile aircraft approaching from astern. It represented also an effort to provide closer escort. The few fighters had been supporting the American bombers from the beginning in considerable strength (400 to 500 planes), but they had normally flown in "umbrella" type of cover, developed primarily to protect medium bombers which lacked overhead defense. This procedure made it possible on many occasions for the enemy to avoid the escort, and, coming in breadth it, to engage the bombers with little interference. The Spitfires had, moreover, been trained not to come too

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

AIR-10

226

near to the bombers, whose crews tended to shoot first and identify afterwards. That problem remained, but the need for closer escort had come to be one of overriding importance.⁶⁶

Despite fighter cover, however, the German defenders occasionally pressed their attacks with cleverness and determination, employing deceptive tactics and experimenting with a variety of approaches. A formation of 16 F-24's ran into an especially well planned and executed fighter attack during their attempt to bomb towns on March. It was too small a force for ordinary purposes, but the heavy escort provided should normally have been enough to protect it. But the enemy had apparently weighed that factor, for as the fighter escort approached the target to clear the way for the bombers, it was engaged by a considerable force of Ju-100's. While the supporting fighters were thus occupied (and the German force was enough temporarily to saturate them), another swarm of German aircraft which had evidently been waiting for just that opportunity attacked the bomber formation with the utmost ferocity just as it was executing its bombing run. This defensive attack succeeded very well, for it destroyed two of the bombers, including the lead plane, and quite disrupted the bombing run.⁶⁷

During April, the Eighth Air Force encountered increasingly fierce and versatile opposition from enemy fighters. Judging from intercepted German radio messages, it appears that the enemy had come to recognize the daylight bombing campaign as a desperate matter requiring an all-out counteroffensive, regardless of cost.

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

The first three missions--to Paris on the 1th, to Lorient on the 5th, and on the 10th to Lorient and Brest--had strong AA withdrawal support, but no escort over the target area, and it was mainly while the bombers were thus unprotected that the heaviest fighter attacks occurred. The fighters roared in strength of 30 to 75 planes of all types, and came in to the attack from all directions, with frontal attack, though less exclusively employed than heretofore, still predominating. Their most effective tactic was the coordinated attack executed by four to seven aircraft, approaching from the front in waves at intervals of from 1,000 to 1,600 yards. Coordinated attacks had hitherto been the exception, most of the German pilots preferring to strike singly. Now they became frequent enough to be considered the result of a consistent plan. And they make it just that much harder for the bombers to defend themselves. They have the effect of dividing the fire of the bombing formation; and they make it difficult for the pilots to take effective evasive action, for if the bombers turned into one attack they were left in no position to repeat the maneuver before the next batch of fighters was upon them. At Paris, too, the enemy concentrated on the relatively unprotected low squadron in one of the two combat wing formations, and destroyed three of its six planes.³⁸

The most effective defense the bombers could employ was to fly as close a formation as possible, with two to three combat boxes flying in combat wing formation so as to give each other the utmost support. Improved forward fire power also helped a great deal. In the case of the Paris mission just mentioned, the low squadron could

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

220-18

220

~~CONFIDENTIAL~~

probably have lost even more heavily had not each aircraft been provided with twin nose guns in anticipation of just such an attack. Total results appear also to have stemmed from the careful planning of routes in those cross-Channel missions. The B-21's of the 2d Bombardment Wing flew effective diversions, and even the main attacking force executed feints on its way toward the enemy coast. These maneuvers no doubt account for the fact that fighter attacks became serious only after the target area had been reached. Defensive action on the part of the bombers seems, indeed, to have balanced the increasing ferocity of the enemy fighter opposition during these first three April missions, for total losses amounted to no more than five per cent of the attacking force, a rate of cost considered by no means prohibitive for daylight operations.⁶⁹

Things did not go so well when on 17 April the Eighth once more drove into the Reich in order to attack the Gothaer-Wulf plant at Drensteinfurt. It was the largest mission mounted to that date. One hundred and fifteen B-17's of the 1st Bombardment Wing were dispatched, 107 of which attacked. Yet this force also sustained a record loss; 10 of its planes were shot down and 12 damaged to some extent. Never before had the Eighth encountered such heavy or such well coordinated defenses. While the Germans had undoubtedly recognized the tendency of the American bombers to attack targets in the British-Silk-Almshaven area, the enthusiasm of the crews they provided the bombers on this occasion appears to have stemmed from advance warning provided in part by suspiciously favorable weather in the target area, and probably in even larger part by a German observation plane which discovered

~~CONFIDENTIAL~~

~~THIS PAGE IS UNCLASSIFIED~~

229

~~CONFIDENTIAL~~

and reported to his force while the latter was over the North Sea far beyond D/F range. It is known that this plane radioed the location, direction of flight, speed & altitude of the bombers, and this information, coming less than an hour before their arrival at the target, permitted the enemy to organize and concentrate his forces. This he did still and dispatch. A full detachment of fighters met the formation at a point beyond the Friesian Islands and accompanied it to the target, where a mass of German fighters, no doubt kept constantly informed of the bombers' course, were already assembled ready to attack at the critical moment of the bombing run. It seems to have been their main purpose to vitiate the effectiveness of the bombing by knocking down the leading planes and breaking up the bomber formations, because all attacks were withheld until that moment. Over the target, also, the Germans threw up an unusually intense, though not always accurate, concentration of flak.⁷⁰

Possibly as many as 150 aircraft intercepted. Only did their first full-scale attack just as the leading bomber groups entered the flak concentration immediately over the target. Most of them drove in from the front, flying recklessly through their own antiaircraft fire in a variety of coordinated attacks. That added to the confusion, and accounted for one bomber. In addition it probably caused some of the bombers to become stragglers and therefore an easy prey to attack by fighters later on in the battle. But it was of minor importance in comparison with the fighter opposition, and the quantity rather than the quality of the barrage was responsible for whatever success

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AFM-18

~~CONFIDENTIAL~~

260

it may have had in confusing the bomber crews. Despite the severity of both fighter and fleet attack, however, the first groups managed to maintain formation and to bomb with remarkable accuracy.⁷¹

In withdrawal from the target, the bomber formations sustained constant attacks, executed from all directions and maintained persistently well past the Frisian Islands. The enemy fighters concentrated on stragglers and on formations too loosely flown for effective mutual support. This first called attention with special force to the problem of defensive formations. Except on the bombing run, the bombers had flown in two combat wings. It was believed that the more scattered formation maintained by the leading wing accounted in large part for the fact that it had suffered all the losses sustained that day. On the other hand, the elements of the second combat wing flew in close support of one another. To be sure, the leading wing bore the brunt of the attack at the target and some of its losses had occurred at that time. But the virtue of a tight defensive formation appeared nonetheless to have been demonstrated with no small cogency.⁷²

Ever since October, when the increasing frontal attacks made by the German fighters had forced the Eighth Air Force to increase the forward fire power of its formations, an effort has been made to consolidate the elements so as to achieve the maximum of mutual support. By February the concept of the combat wing formation, consisting of three combat boxes of 18 to 21 planes each, had clearly emerged. But there remained a regrettable tendency on the part of the individual elements to strain out, thus destroying the compactness

necessary for purposes of defense. During February and March such thought was given to this problem, and by April the 34-plane combat wing was capable of being flown in such a way that any fighter approaching from the front should receive a solid salvo of fire. Of course, there remained serious objections to such relatively large and closely flown formations. The upper and lower squadrons obviously had the least protection, being in fact in a comparatively exposed position, and during late March and April the enemy fighters had concentrated on them. Moreover, the formation was an unfriendly one, difficult to maintain, especially on turns, for it involved at least a 1000' variation in altitude. But for the time being the demands of defense had to be met before those of maneuverability.⁷³

In the opinion division, then, concentrated both the vulnerability of an escort wing formation when badly flown and the defensive strength it possessed when properly maintained and adequately equipped with nose guns. Although the American losses were high, the Germans no doubt lost equally heavily. As usual, it is difficult to tell from the reports made by the better crews concerning such extensive air battles exactly how many enemy fighters were shot down. But even allowing a substantial margin of error (possibly as much as 40 per cent) the claims of 62 destroyed, 15 probably destroyed, and 17 damaged indicate that the enemy lost seriously.⁷⁴ It may well have been as a result of this engagement that the German fighters tended thereafter to reduce frontal attacks in favor of attacks from other quarters. Since February there had been a tendency in that direction,

~~CONFIDENTIAL~~

AMM-10

662

~~CONFIDENTIAL~~

especially on the part of the less experienced units. After April 1943, attacks of this sort became the preferred method except for the specific purpose of breaking up the bombing run.

By Aug 1943 German fighter force had nearly as the primary objective to expand extension of the daylight precision bombing campaign. In January German fighter disposition on the western front was about the same as it had been in August 1942. It consisted of a shallow coastal defense front west to Wulflund Night, fighters heavily in the Weser-Eder-Sulm area. Indeed, owing to the urgent demands of the Western and Mediterranean fronts, the total air-defensive fighter strength on the western front, according to contemporary allied estimates, dropped from about 270 in August 1942 to 210 in January 1943, a fact which led many U. S. air observers to underestimate German's capacity of 200-300 fighters. But the flight times of optimists visible in January gradually faded out during the following months. By the middle of the year German fighter defense on the western front had increased substantially; it reflected the extended scope of Eighth Air Force operations into northwestern Germany. Although German figures are not available for the western front alone, it now appears that there were in that area and vicinity at the beginning of 1943 not very more than 500 fighters; by the middle of the year that figure had risen almost to 800. During the first quarter of 1943, only a fourth of the total enemy fighter strength was located in Germany, and the eastern front. During the second quarter the proportion had risen to approximately one-third, and was rapidly increasing.⁷⁶

~~CONFIDENTIAL~~

AIR R-18

253

~~CONFIDENTIAL~~

or sufficient, however, to meet the interest in fighter strength
and, second, if still so, and chaotic, development in enemy tactics.
The second, more attack aircraft, less effectively or worse, but in similar
style, were also engaged in combat as well as assorted ills, some of
which are already providing a harassing to the American forces.
Coordinated fighters, therefore, faithful as infinitely, versatile
source of trouble. American fighters are to be found in the hope
that their heavier fire power might be effective against the bombers.
Parachute mines had been tried out, and air-to-air bombing, has by now
become an inveterate habit, characterizing almost every major engagement.
Experience has been collected in the use of night-light
heavy-caliber cannon and possibly also in the recent ones which are
to become a first threat to bomber formations in the months to come.
Finally, the last point are rapidly increasing, the effectiveness of
their standard fighters by adding both to their weight and their
power. The F-100 remained roughly equivalent in fire power to the
F-105, but the F-100 has rapidly becoming a sort heavily armed aircraft
designed for the specific purpose of destroying bombers. As for the
American fighter force, it was by the middle of 1968 feeling the
effect both of the increase in strength of the PAF and its mounting
effectiveness. During 1968, 14.1 per cent of all attacking bombers
were hit by enemy aircraft. By June of 1970 following year this pro-
portion had risen to 18.2 per cent.⁷⁷

But with rapidly accelerated counterattack, pointed to most
ineffective, as one need for long-range escort. That was the
answer not only to the increased weight and quality of equipment but

~~CONFIDENTIAL~~

AAERH-18

234

~~CONFIDENTIAL~~

to such particular tactics as air-to-air bombing. The Eighth Air Force commanders had labored under no illusions on that point: long-range escort had from the beginning been considered highly desirable.⁷⁸

But there had been a tendency during the latter part of 1942 to minimize the value of fighter escort and to argue that the bombers, suitably armed, and provided with a few heavily armed escort bombers of the proposed YE-40 type, could if necessary penetrate enemy defenses without assistance. Early RAF fighter cover, though heavy, was not close and had therefore seldom prevented the German fighters from engaging the bombers if they chose. Moreover, prior to January, the bombers had come off very well in combat with enemy fighters.⁷⁹ But, from that point on, the Germans began to improve their technique and the cost of unescorted missions began to increase. Conversely, fully escorted missions gave comparatively good results--in some cases outstanding results--owing in large part to an improving technique of close escort.⁸⁰ Long-range fighters came, therefore, more than ever to be considered, if not essential to long-range daylight bombing, at least essential to its complete success.⁸¹

But the long-range fighters were slow in arriving, and even slower in achieving operational status. The TORCH project had drained the Eighth of all P-38 fighters. Their place was to be taken by P-47's, equipped with long-range tanks. But unexpected design difficulties delayed delivery of the Thunderbolts, and although they began to arrive in the U. K. in January it was many weeks before bugs could be removed and the planes successfully adapted to operations in that theater. Trouble with the VHF radios was the principal

~~CONFIDENTIAL~~

SECURITY INFORMATION

APRIL-19

436

~~CONFIDENTIAL~~

cause of delay, although serious difficulty was also encountered with
airfields. For weeks radio experts worked on the offending equipment
and at times enlisted aid from the British; but their efforts were to
little avail, as was demonstrated when on 10 March a few P-17's took
part for the first time in a flight review. Otherwise uneventful,
but operation proved that plane-to-plane communication was virtually
impossible among the P-17's. Since such liaison constituted the key
to successful fighter tactics in the ETO, the new fighter could not
be put into combat until the difficulty had been surmounted. On 6
April, however, three groups--the 6th Fighter Group (recently converted
from Spitfires to P-17's), the 5th, and the 70th--were placed on
operational status and set to flying; fighter sweeps over the Dutch
and French coasts, largely for the purpose of training.⁵²

A week later, during one of these operations, the P-17's had
their first engagement with the enemy. The composite groups,
totaling 33 planes and led by experienced pilots of the 4th Fighter
Group, flew a fighter sweep at 30,000 feet over the northern French
coast and encountered a number of F-100's in the process. On the
whole the results were encouraging, for the Thunderbolts stood up
very well in comparison with the German planes. The pilots reported
superiority in climbing ability and believed their P-17's showed great
promise in turning against the F-100's. One said he was able to
outrun the enemy at 17,000 feet. They shot down two F-100's and
damaged one, at a cost of one of their number. The other P-17's
were believed lost as a result of engine failure rather than enemy
action.⁵³

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AC 11-18

203

~~CONFIDENTIAL~~

This first branch with the policy seemed according mainly because it cuts off better than any observers he found. The F-17 had still not provided the solution to the prob'l. of the long-range fighter. Engine failures continued to occur with discouraging, though decreasing, frequency, and the radio equipment was erratic, but steadily from the problems that had arisen because it. such modification had yet to be done on both engines and radios before all available F-17's could be made operational. First of all, the new fighters as yet lacked navigatory tanks, which meant that they could not go much farther than the Spitfires in Yugoslavia; the so far formations. It was not until after May of 1940 that these difficulties were overcome and the F-17 could be classified as a long-range fighter. Meanwhile, with long-range fighters still in the future, hope continued to be pinned on the V-10, but experimental, heavily armed escort bomber by means of which it is believed that accuracy of the enemy to attack the land troops and units in exposed positions in the border formations might be frustrated. Their arrival was eagerly awaited, but their entry into combat was delayed until May 15.

Meanwhile the P-17's began to escort the bombers to a range of about 175 miles. Their first effort was definitely satisfactory. Six squadrons of Thunderbolts joined six squadrons of US fighters in support of the mission executed by 65 F-17's against the Ford and General Motors factories at Intercap on May 15. The F-17's provided high cover and withdrawal support and shot down one L-100. In the course of 69 offensive sorties that day they lost one plane, and that one not apparently as a result of enemy action. The US

~~CONFIDENTIAL~~

AIR-13

337

Spitfires also destroyed one Ju-100, probably destroyed another, and damaged three, at a cost of three of their own aircraft. A force of 55 bombers flew a diversionary flight over the Channel, under cover of thirteen P-47 squadrons. This was in part to draw diversion and in part to obtain excellent fighter cover, because they encountered only 20 to 30 enemy fighters, although total enemy reaction to the day's mission had been large. As a result, the bombing force was able to do its work accurately, with little disturbance from enemy action, and to return to base without losing a single plane.⁶⁶ The P-47's helped to draw in both of the bombers on other occasions during the rest of May, when, on the 16th, the VIII Bomber Command attacked aircraft objectives at Metz and St. Omer, the VIII Fighter Command executed 124 offensive sorties in conjunction with cover provided by 13 P-47 squadrons. Total bomber losses were consequently held to less than three per cent of the attack, more than on the 14th a force of P-47's attacking 111 ion targets on a less relatively light losses to the close cover provided by B-17s and P-47 fighters, despite just claimed by Germans.⁶⁷

But missions beyond fighter range remained hazardous, and during the rest of May six were flown either to bases in Germany without escort or to those in France with minimal fighter cover. That the latter was not much better shown no cover at 11:00. Concentrated on the 18th, a force of 37 bombers struck a rail yard target at Somme and, although escorted by P-47s almost to the target, lost six of its planes to enemy aircraft with a loss of escort

233

returned and the British fighter support on all Spitfires was picked up at the coast on the return trip. The enemy had deliberately refrained from attacking until the bombers were left without fighter protection.⁸ Losses had also reduced the 10 per cent marksmen on 21 by the bombers attacking Wilhelmshaven and a, with forces of 77 and 46 aircraft respectively. As at Bremen in April, the enemy fighters concentrated their efforts on breaking up the bombing runs. And so both did; so they succeeded, for bombing results were satisfactory neither at Wilhelmshaven nor Cuxhaven. At the former a lot of the enemy met the bombers as they approached the German coast, and as the bombers reached the initial point, began rotary to turn in, toward the target, from 10 to 60 fighters scattered and gathered up, 20 to 30 on each side of the leading bomber formation. As the invaders drew near to the target the defenders began to peel off and to execute frontal attacks in waves of four, six, and eight planes at a time, each one flying in loose echelon formation. The fighters made seven or eight separate attacks during the bombing run with disastrous results to American planes and personnel as well as to the bombardiers' aim. Several also tried air-to-air bombing, and so appear to have employed rocket guns and large-caliber cannon.⁹

The rest of those unescorted or partially escorted missions conducted during the latter half of May suffered much less severely from fighter attacks. The reason is simple. In the first place, improvement in offensive formation flying undoubtedly cut down losses considerably. (On the last mission in May, flown to St. Nazaire, the

CONFIDENTIAL INFORMATION

APPENDIX

230

V-10 out in its initial appearance, out, as it was and, fighter reaction to basic mission was light and the flying; or enough has little chance to demonstrate their effectiveness.) In the second place, the Eighth Air Force was able during the latter part of May to send much larger forces against the one, New Hichocco. At only were the forces bombing individual targets interested in size, but simultaneous attacks on two or more objectives with effective forces was now possible. This latter tactic could, it is hoped, split the German defenses, thus rendering them less formidable at any given point.⁶³

This expansion of the Bomber force was one factor of overriding significance in Eighth Air Force operations in May. During each five days, 117 groups--the 30th, 33rd, 31st, 31st, and 37th--were operational, and the 32d, which had been used for training since Nov. 1942, resumed operations. The new groups, organized into the 30th Bombardment Wing, under Brig. Gen. T. H. Anderson, took part in the first mission on 16 May. In addition to the heavy groups, they also initiated the temporary addition of one medium group to the strength of the 31st Bomber Group. The 32nd Bombardment Group (), representing the 31st Bombardment Wing under the command of Brig. Gen. Francis C. Kelly, sent its B-25's on their first combat mission on 14 May.⁶⁴

The Eighth Air Force was ordered to put on its combat forces a major force in the air to sort of a great combined blow against the German war machine. That attack, in fact, turned out to be the arrival

840

24-hour air attack made yet by the allies during the war. The RAF sent large forces against Berlin and against targets in the Ruhr and in Czechoslovakia, and the US 8th made an impressive display of its newly acquired strength in simultaneous attacks on four separate targets situated at Aix-la-Chapelle, Courtrai, and IJmuiden. In all it dispatched a record bomber force of 200 aircraft (including 12 medium bombers) of which 209 (including 11 medium) became a record to that date. In addition to the bombers, VIII Bomber Command P-47's flew 114 offensive sorties in conjunction with the Spitfire squadrons to protect the smaller forces bombing Antwerp and Courtrai. Results on the whole were good, one mission in the day starting with a measure of success. The British press reacted enthusingly, referring to the day's combined activities as the opening of a great "blitz" against Germany, and featuring the unprecedented effort of the American forces.⁹²

In attacking Aix-la-Chapelle, the main force of 120 heavy bombers (109 B-17's and 17 B-24's) struck the most violent target yet attacked, covering a distance of some 480 miles. This they may have thrown the German defenses off balance, for only a few of the antiaircraft guns known to be located in the vicinity of the objectives were operating, and the resulting flight was of littl. consequence. Nor were the fighter attacks, although numerous, pressed with the quality of determination observed on previous occasions in north eastern Germany. Casualties against enemy aircraft were, however, very high (62 destroyed, 24 probably destroyed, and 27 damaged), indicating heavy air battle.

~~CONFIDENTIAL~~

AIR WAR-16

211

~~CONFIDENTIAL~~

After the above note has been made for duplication in claims. It was the B-24 group that bore the heaviest early attacks, partly because it was in a relatively unprotected position (below the lowest group of the second combat-wing formation) and partly because the prioritized characteristics of the B-24's proved that they flew in close enough to the fortresses for protection. It alone lost five of the eight aircraft shot down on that mission, which led tactical observers to conclude that it was unwise to fly B-17 and B-24 units together in a single formation unless the latter were largely enough to take care of themselves if separated.⁹³

Although a minor part of the operations on the 14th, the attack executed by 11 B-26's of the 3d bombardment wing against the Malin quarantining station at IJmuiden attracted no official attention because it constituted an experiment which might easily have disclosed whether or not the B-26 bombers could be used effectively in the strategic bomber offensive. AF Headquarters had been investigating, for some time, the fullest possible use of the medium in intermediate altitude raids against suitable coastal objectives. In the Pacific they had been employed, often with brilliant effect, in deck-level attacks against naval targets, and it was believed that, if properly integrated with other air action, they might be equally effective against such installations as airfields and power plants in nearby coastal areas of Japan. AF Headquarters, while not anticipating such high hopes, declared itself ready to investigate the possibilities inherent in such tactics. It was accordingly planned to send the medium out against coastal installations in

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AIR-18

~~CONFIDENTIAL~~

212

operations closely coorDinated with heavy bombardment missions. So that our combat crews were especially trained in the techniques of minimum-altitude navigation and attack. Those immediately responsible for launching the missions advocated the extensive use of fighter cover, for it was likely that, after their initial attack, the B-26's would be met by dangerous fighter opposition. But their requests were unfavorably considered on the ground that zero-altitude fighter support would be impracticable and that if escort were required the bombing would have to be done at altitudes of 10,000 to 14,000 feet, depending on the antiaircraft defenses provided for each target.³⁴

The circumstance of 11 B-26's lost is only to tentative conclusions, however. The B-26's performed their task without the loss of a single plane and at the cost of only one crew. Four men were killed when one plane crashed at its home base. And according to the crews, they destroyed the target completely, bombing from 100 to 300 feet. But on that point photo reconnaissance crews disappointingly, for it gave no indication that any German oil had been gone. The Eighth Air Force had been instructed to use 10-minute delay fuzes on the 500-pound bombs used in this raid in order that the switch would not have time to operate, and it may have been that some of these bombs were removed before they exploded. As for the enemy defenses, the B-26's encountered no fighter opposition--a fact which is not surprising, since the largest force of fighters in the history of our daylight offensive was abroad that day. And the only thing they learned about fighter opposition was that they must

~~SECURITY INFORMATION~~

THIS PAGE Declassified IAW EO12958

AAERE-18

243

~~SECRET~~
CONFIDENTIAL

be navigated with extreme accuracy in order to reach the enemy coast at the desired point without exposing the bombing elements unduly to antiaircraft fire while hunting for the target. Navigation had not been too exact, and the target was approached in the direction of the longest axis of its antiaircraft defenses, which resulted in minor flak damage to most of the attacking planes.⁹⁵

Much more conclusive indications were obtained three days later when 11 B-26's were sent in two flights to attack respectively the same target at IJmuiden and the power station at Haarlem. Again the mediums flew at zero altitude and without fighter support. One turned back on account of mechanical difficulty. The rest were lost. Little is known about the fate of these planes except that they ran into fighter opposition in addition to a heavy concentration of flak. Nevertheless, the mission served to clarify the place of medium bombardment in the strategic bombing campaign. It was apparent that worthwhile coastal targets were too heavily defended to be safely attacked at low altitudes. And it began to look as if the mediums could contribute only incidentally to the success of the strategic bombing campaign. General Eaker consequently decided to place them in VIII Air Support Command and train them primarily as part of a tactical air force for the purpose of supporting the ground forces in the forthcoming invasion of the Continent. Meanwhile, crews could continue to gain experience in medium-altitude attacks (10,000 to 15,000 feet) against strategic objectives under heavy fighter cover.⁹⁶

Viewed as a whole, the success with which the Eighth Air Force solved the problem of penetrating rapidly stiffening enemy defenses

~~SECRET INFORMATION~~

AMR-18

214

~~CONFIDENTIAL~~

may be estimated in terms of the losses and battle damage incurred.

For the five months from January to May, inclusive, the bomber loss rate, expressed as a percentage of credit sorties (i. e., sorties in the course of which the aircraft has entered ready normally defended by the enemy or has in anyway been subject to attack) was 3.3 per cent. This figure includes both those bombers lost in action and those listed as falling in Category "L," that is, damaged beyond economical repair while engaged in an operational mission. Expressed as a percentage of aircraft actually attacking the target, the figure rises to approximately 6.1 per cent. Fighter losses ran much lower, amounting only to about .7 per cent of credit sorties, but then many of the missions on which the F-84-47 groups were sent had been planned in such a way as not to expose the inexperienced units unduly to enemy action. Of the bombers missing in action (not including Category "L") over half were known to have been lost to anti-aircraft fire, and several of those listed as lost to unKnown causes doubtless met a similar fate. Most, on the basis here, could be credited wholly or in part with the destruction of slightly over 1% per cent.⁹⁷

For Little Joe 2, the story is somewhat different. A trifling over 20 per cent of all credit sorties resulted in reparable damage, not more than one in five of which cases could be considered due to a major accident. Of those damaged aircraft, approximately 50 per cent were hit by flak; and flak, of course no doubt made it possible on many other occasions for enemy fighters to destroy the bombers.

entirely.⁹³ Thus flight, which of course is performed in an immediate cause of heavier losses, was a major source of losses, and since a damaged plane easily becomes a straggler, flight often proved an important indirect cause of losses. Night fighters & night combats were the principal obstacle in the path of the daylight bombers.

If the Eighth Air Force's tactical experts had to grapple with the problem of penetrating enemy defenses at a matter of most immediate urgency, they by no means forgot that the primary purpose of bombardment is to strike the target, and of precision bombardment to do so with the utmost accuracy. The basic techniques of pin-point bombing had been elaborated during the first five or six months of operations, and their close relationship with the requirements of defense had been initially explored.⁹⁴ During the first half of 1943 it was therefore mainly a question of increasing the skill of the combat units, of developing established techniques, and of adapting them to the needs of a larger operating force.

For reasons of defense it had become standard operating procedure for the bombing force to bomb in some sort of formation, and by securing a considerable weight of opinion favored bombing by combat box or group, each aircraft dropping its bombs on a signal from the lead bombardier. As during the period in question a variety of sighting operations continued to prevail, group formations frequently dropped on the leader, who sighted for both range and direction, but often individual bombardiers within the formation performed independent range sighting, and often also individual squadrons dropped

on the situation; or our own line to do better. In view of the operational success of the 3rd unit, after a careful study of results, recommended strongly that, in the bombing formation, to be should be dropped on the leader rather than according to individual sighting for range. It also suggested that the effectiveness of bombing on the leader could be enhanced if the flight of the resulting combat pattern could be reduced, either by flying closer together, or by dropping, or probably on signal, or both. In short, bombing on the leader is best, but normal technique, although less unique combined to favor other methods. And, of course, particular problems call for different solutions. An obstruction will restrict, for example, the units often bombed in flights of six or even four because a group to be bombed would necessarily be too large to be once effective on a concentrated¹⁰⁰.

In addition, also, the eighth unit successfully employed the automatic flight control equipment (AFCS) as an aid to accuracy to bombing. The purpose of this AFCS was pilot, which could be commanded by the bombardier as he to be run, as to synchronize sighting and roll/bank with mechanical precision as to previous bombardier bombing runs that could be achieved even by veteran pilots. The few seconds immediately before the bombardier released his bombs were obviously the critical moment in the aircraft mission, for it was known that the bombardier performed his final sighting operation. So it was essential that the aircraft should be held as nearly as possible to a steady course without slips, slides, or changes in altitude, and

On the 17th July 1944.

~~SECURITY INFORMATION~~

AMW-18

273

~~SECURITY INFORMATION~~

that the pilotage to be as free as possible from the influence of flak and of attacking fighters. Attaction of this sort is impossible, even with the best of pilots. With those produced by the hasty training program into which the AAF had been forced it could not even be approximated.¹⁰¹

Surprising as it was in theory, the ANG-3 had proved disappointing in its earlier trials. By March, however, certain modifications had materially increased its usefulness and on 18 March the missions during which it was used by the group bomber had given very good results. At Vierzeck on 18 March the most surprising results were achieved. On that mission the 405th Group, bombing on the signal of its lead bombardier who had used the successive pilot, succeeded in placing an average 76 per cent of its bombs within a radius of 1,000 feet of the aiming point. Although not stemming entirely from the use of the new equipment, the results of the Vierzeck mission did much to overcome a prejudice against A.C. still prevailing in many quarters. Although it continued to fail occasionally, and although unfavorable circumstances sometimes prevented its employment on the bombing run, the new type pilot continued to give good results; and as it became available it was installed in the lead planes of most bombing formations.¹⁰²

Partly because of improved techniques and partly on account of the increasing experience of the new groups operating from the U.S. air bases after 1942, bombing accuracy in the Eighth Air Force improved appreciably from January to May of 1943. The records are of uneven value, but it is possible to notice that, at least in January

~~SECURITY INFORMATION~~

~~SECURITY INFORMATION~~

AM 14-13

218

~~CONFIDENTIAL~~

W. J. Murphy . . . you could consider its bombing above average if 80 per cent of the bombs identifiable by photo or own estimate fall within 1,000 feet of the preassigned aiming point, in which case April it was not uncommon for groups to record 80 to 10 per cent in this category, and several instances were reported to the CO of poor results. To improve, it is also noticeable in the concentration of bombs patterns. Results of the better results were obtained under training conditions, even in the face of stiff enemy resistance, as, for instance, a B-17 on 17 April, when very satisfactory bombing was accomplished (one group placed 80 per cent of its bombs within the 1,000-foot radius) in spite of very heavy flak over the target, fierce enemy fighter attacks, hazy visibility, and cluttered sky. Over-all results of outstanding accuracy were obtained at Remond and Vaynakh in March, at Kars in April, and "C" units in May. 103

A number of bombings, of course, continued to result in complete failure. One such once in three times a bombing unit would place the center of its bomb pattern over 3,000 feet from the aiming point. Many of these so-called gross errors are not completely the fault of the bombardiers. In several instances poor visibility made accurate bombing impossible. In others, fighter opposition was so effective that it broke up the bombing run, as it did, on 5 March, when the lead bombardier was shot down just as he was approaching the target, and the rest of the unit recovered from the confusion of the combat only to realize their position to be as far as ten to 15 miles from

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

ATT-10

~~CONFIDENTIAL~~

200

the target. So this, too, the weight in the lead plane could not function properly, but certain of these groups, in other planes, were dropping on the lower, to both inaccurate.¹⁰¹

But on many other occasions the trouble lay with a lack of experience or carelessness of those lives. Consideration of the problem runs, failure to follow instructions or to trust instruments, overconfidence, or simply lack of adequate training; occasionally led groups astray. Inexperience became especially noticeable soon in the 4th bombardment group operations. Later on, as the 3d bombardment division, these groups were to distinguish service, but in by their work as erratic in the extreme. In the 1st, for instance, they performed one of the most accurate missions of all to this date. Then, two days later, departing from them, and in the confusion the target escaped unscathed.¹⁰²

Indeed, the latter part of witnessed the beginning of a temporary decline in over-all bombing efficiency. But the inexperience of a unit is only one of the factors involved. More important is the fact that a larger operating force raised a problem - or a curious thing about formation bombing, noticed in by high air force tactical analysts, was that the leading group or groups tended to achieve better results than those following them over the target. The trouble was later found to decrease appreciably as experience was gained in the handling of large bombing forces. But one tendency remained. It is difficult entirely to account for it except on the ground that commanding formations, whether as they are

~~CONFIDENTIAL~~

~~THIS PAGE IS UNCLASSIFIED~~

AM 05-16

251

~~CONFIDENTIAL~~

unavoidably influenced by those preceding them, are subject not only to the adverse conditions ordinarily expected on a bombing mission but to conditions created by the dictates of the leading groups as well. At any rate, regardless of the status of the main or the units involved in a mission, the incidence of gross errors was likely to increase in direct proportion to the size of the operating force; and the problem of securing maximum accuracy in an overall attacking force, stood as entirely separate one from that of the individual bombing unit. In this case the ideal solution could have been never to allow more than two groups to make a single thrust in a single action. But dictates of a sense made larger forces imperative, and so the solution had to be sought during the succeeding months principally in experience cumulatively acquired in large-scale operations.¹⁰³

Another problem was raised on 27 by the employment of incendiary bombs on a relatively large scale by large bombing formations. Incendiaries had been employed sporadically in the fall of 1942, but had not been used since then. Now, in 27, it was coming to be recognized that incendiaries light, by destroying the timer or switch places and machinery, caused more industrial damage in certain circumstances than high explosive to do. On three occasions, at night on the 14th, at dawn on the 15th, and at night again on the 15th, part of the bomber force carried incendiaries. This practice caused certain difficulties. Since the ballistics of incendiaries were quite different from those of high-explosive bombs, requiring

~~SECURITY INFORMATION~~

AA 11-18

262

~~SECRET~~
CONFIDENTIAL

a closer approach to the target before release, longer bombing run was required by units carrying them, which meant that the leader of the wing formation had to take into account the extra distance to be flown by the unit carrying incendiaries, and had to plan his withdrawal accordingly. The unit had also to be placed in the last position in the formation in order to prevent other groups from flying through the cluster of bombs from the falling incendiaries. There were difficulties with these tactics: the incendiary group was likely to be in the least well protected position in the formation; and the longer bombing run necessary when incendiaries formed part of the load left the formation open to enemy attack for an additional unprotected period. On the final mission of 17 May, for instance, a group of 17 B-52's carried the incendiary load and lost five of its planes over the target area. No again the problem of bombardment tended to vary with that of defense.¹⁰⁷

Conclusion

Looking back over the operations of the preceding five months, the opponents of daylight bombardments could at the end of my point with a modest sense of pride to the accomplishment of the daylight bombing force. If the campaign had not produced absolutely conclusive results, and if it had yet to solve certain formidable problems, particularly it had at least done much to silence its critics. On certain occasions, as we have seen, for example, in such very brilliant results as had elicited hearty congratulations not only from American sources but from the prime minister and the British Air Staff.¹⁰⁸

~~SECURITY INFORMATION~~

By June 1944 the British Air Force had to take its part in the Combined Bomber Offensive from the "unit" of air force, the plan for which had started during the preceding months. Since it may be instructive to follow the sources of the American effort, and the results may best be accurately gauged by the degree of very reaction, both in weight of area, and in frequency, provoked by the day bomber campaign. But the importance of these early operations of 1943 lay in the tactical lessons learned first of all in the strategic results. The American force had been engaged in the day, in bombing the capacity of its own techniques and equipment, and in enlarging both the scale and scope of its operations. In this latter endeavor it succeeded substantially, although the rate of increase had not been so rapid as its planners had hoped. During May it flew 1,012 sorties against 210 in February, and it had flown as far as 100 miles to attack objectives in the German homeland.

More significant, however, than the enlargement of its effort was the experience it had gained in bombing, in penetrating enemy defenses, and in handling correspondingly increased forces. In order to profit by that experience its tactical doctrine had to be flexible and sensitive to the slightest change in a changing tactical situation still dominated in large part by a general and successful strategy. An experience of those months revealed to a basic and complementary facts: first, the American Air Force constituted the greatest threat to the daylight strategic bombardment campaign; and, second, the day bomber offensive had as yet encountered no insurmountable obstacle. In the main of these facts it could hardly be fully realized.

AMERICAN
[REDACTED]

~~CONFIDENTIAL~~

PLA. I.C. 10. 01. 01. 01. 01. 01. 01.

The Casablanca Conference gave to the concept of a combined bomber offensive against Germany, an unchallengeable place in allied plans, but it left much to be done before the concept could become a reality. The American day bomber force had to be built up to the point where it could carry its share of the air offensive, and economically. And a comprehensive plan of attack had to be worked out according to which the combined force might operate against Germany and in the reasonable hope that within a given length of time the planned invasion of Western Europe might be successfully launched. On 18 May 1943, the CCS approved the "Plan for the Combined Bomber Offensive from the United Kingdom," on the basis of which it is set, on 10 June 1943, a directive officially inaugurating the CBO program. Meanwhile planning was undertaken on a scale more elaborate than had hitherto been attempted. Since the AF fighter Command was already fully deployed in the strategic offensive against Germany, and since cost of the outlaying problems consequently centred upon the build-up of the U. S. bomber force and the nature of its part in the combined operation, the burden of planning fell mainly on the USAACF.

Political Considerations

Depended on the build-up of the American bomber forces. Allied air strategists understood this, so layout out the proposed

to build offensiv , it could be a "cakewalk" in left oblige force ready to strike enemy installations as soon as the first spring frost or .,d in my daylight operations feasible. But it was not until May that the build-up of the Chinese forces began in earnest. Meanwhile the Eighth Air Force continued to fight with the few planes for economical or effectiv operation. During the winter of January, February, and March, its average combat strength was lower than at any time since October 1942, and in February it could only claim an average daily combat strength of 74 operating (combat crews and aircraft). Fighting improved somewhat in April, but up to the end of the month six operating groups (four F-17 and two F-21) remained too total ineffective to bring strength of the eighth. However, prior to 3 April, the 4th Fighter Group, re-equipped in March with P-47's, was the only U. S. fighter unit consistently available.¹

But the difficulty was not solely that no units could be impor-
tuned more slowly than might have been expected. The more
important and acute problem was one of fuel supplies. During the
winter months the Eighth Air Force had been at risk in this respect
because of the inevitable losses of the AGOCU formation, and the
steady attrition of planes failing to return from the operating groups
to an alarming extent. This was especially noticeable in combat
where the total effective strength suffered not only from actual
combat losses but from emergencies. Prior to the first of February,
for example, after receiving total losses of only 20, in which 37 lost; and
it was estimated that by March 73 combat planes would have to be con-
sidered unserviceable. Further losses after 73 March do n to 50 per cent

strength, with the vital statistics of attrition underlining the morale of the remaining crews. During 1943 crew availability had not seriously limited the force that could be put into the air at any given time. Beginning with February, however, the situation changed appreciably, and from then until May availability of trained crews generally governed the number of bombers that could be dispatched.²

With this situation in mind, Maj. Gen. Leo C. Major, CG of the Eighth Air Force, and Lt. Gen. Frank A. Knobell, who had succeeded General Anderson on 3 February 1943 as CG, AFUSA, urged the War Department to accelerate the air build-up in the U. S. in any way possible. It was, they argued, essential that the Eighth Air Force be increased at once to permit the simultaneous dispatch of at least 300 heavy bombers, an objective which would require an estimated 100 to be on hand in the theater. These figures were not dictated by the ultimate requirements of the combined offensive but by the nature of the immediate task. It had been apparent to April that German fighter strength in the west had been augmented by increased production and by the transfer of units from Russia and the Mediterranean. An air force of 300 planes was considered the minimum that could fighter overtake economically and effectively in the face of this growing opposition. Moreover, a basic strength of 300 planes was held necessary to ensure continuity of action against vital German targets. Until it could be attained, the day bombers could only "nibble at the fringes of German strength" and ineffectively exploit German weakness.³

In British expressed even more profound concern regarding the rate of the build-up of the U. S. air power force. Air Chief Marshal Portal, in letters to General Arnold (though intended less for his personally than for the JCS),² repeatedly stressed the strategic importance of the day and night bombing offensive. "Continued massive successes, together with the hard struggle in the anti-aircraft, had apparently given the enemy a fatalistic shock and it was hoped the Allies could do everything in their power to prevent him from recovering." The only weapon available for this purpose, Portal maintained, was the bomber force, of which the American bombers constituted an essential part. In operations of the Eighth Air Force had been "strikingly successful," considering the limited number of planes, several of which had been lost en route in the air, but therein lay the problem. "Your air raid effort may be curtailed or even brought to a standstill by lack of numbers."

As I understand it, [he continued] the theory of the daylight offensive is that it shall wear down the initial scale of opposition and then press home the advantage with increased numbers against an ever smaller opposition. I cordially agree with this. But it just will not work. If you cut the numbers way down on land raids, we'll be forced by strategy . . . till suffice to capture an objective requiring several divisions to take it . . . Given a force of 500 or 1000 planes the present one . . . I surmise the results would be disastrous for us, than proportionately.

Portal thus added a warning, of a social significance to American arms. If, despite the build-up to date and the proven prowess of the American units, the efforts of the Eighth Air Force should come to nothing as a result of lack of numbers, it could greatly strengthen the arguments of those who advocated an increase in night bombing.

"rather than the combination of our and night attack in which you
and I so firmly believe."⁶

It is a matter of vital interest to British Air Commandos not
only to estimate the actual flow of U. S. bombardment aircraft to
the U. S. but to have also clear picture of the projected flow.
The process of selecting, surveying, and building an airfield takes,
they claim, about one year, and it is therefore essential
for them to know well in advance the total planned build-up and its
approximate rate. Early in February the C. I. notified its obligation
in Washington that provision had been made for 65 bomber airfields
in the U. S., to accommodate 1000 units on the basis of one bombard-
ment group per airfield, and it specifically requested information
concerning the U. S. air build-up as a basis for construction plan-
ning.⁷ General Arnall submitted a similar request for his own plan-
ning purposes.⁸ To him, however, it was not so much a question of
the projected accommodations being adequate as it was of the Ameri-
can force being nullified early use of them. "In short," he cabled
General Arnall on 1 March 1943, "Supt. that the British think we
mean to use their facilities or else discourage and will be reflect-
ed in providing insufficient airframes and facilities for the
British Air Force to be employed from this theater."⁹

But it was not easy for Arnall and his staff to provide the
requested information. While secretly in agreement with both Atter
and Portal that the combined bomber offensive depended on a rapid
increase in the American bomber strength, and that flow information

was essential to aircraft planning in the U. S., they were not able to do such work it.⁹ Plans and so, had been laid since the summer of 1943, but after the advent of NCISI and the reorientation of strategic policy to the Mediterranean, it had been impossible to make firm commitments to the U. S. In October 1943 the authority was also held projected a total of 26 bomber groups and 11 fighter groups for the Eighth Air Force by September 1944, but no estimate was reckoned largely on the level of pure conjecture. It was not, in fact, until after the conclusion that the strategic policy was in the final form now to go first building of long-range plan upon it.

In answer to the British request for more information, General Scott's paper early in February followed a plan to the White House in Washington which called for the following build-up of U. S. forces in the U. K.:¹⁰

Type	30 June 1943	31 Dec. 1944	30 June 1945
Bomber	18 groups	37 groups	45 groups
Medium Bomber	6 "	10 "	11 "
Fighter	7 "	15 "	25 "

Except that fighter units were later reduced to an ultimate total of 10, in accordance with a comment arrived at between Arnold, Andrews, and Morford, these figures remained substantially the planning of operations during the spring of 1943. Yet they were issued with an unrestricted reservation: it was pointed out that the fighter, overrunning the U. S. air bases, could be to a extent wholly unpredictable.¹¹

Several of these factors operated during the period prior to May 1943 to the distinct disadvantage of the U. S. air build-up in the U. K. It must be remembered that projects (as, for example

the [redacted] and the [redacted])

tel

~~SECURITY INFORMATION~~

referred to as Uncle-mare (IC 6.) was particularly subject to extreme influence. Admittedly the impact in the entire air program, it was liable to receive. If heavy bombing was not specifically required in some theaters,¹² but, of course, went that way largely in the eventual re-allocation distances would probably affect the bomber force in the U. S. Consequently diversions to other theaters continued to be a factor which only the fortunes of war could determine. The 4-17 groups, the 30th & 3d Sqd, which had been scheduled to the February quota for the Eighth Air Force were diverted to the 1st AF in North Africa. A group of B-52's, the 30.6th, originally destined for the 1st AF, was sent in June to the CBI theater. Also in March it was decided to reinforce the Southwest Pacific by one or two 4-17 groups out of the 12 quota to the U. S. In addition to these diversions, the mounting anti-submarine war in the Atlantic put an increasing strain on B-24 resources, thus further delaying the flow of this type to the Eighth Air Force.¹³

Such proposed diversion met stiff resistance on the part of Andrews and later in the greater as of Arnold's staff in Washington.¹⁴ The argument for a steady contribution of forces in the U. S. in time for an invasion; days of war and war as a constant on... but overriding strategic considerations, coupled with considerable pressure exerted in favor of the southwest Pacific at this time, in most instances forced the issue.¹⁵

Diversions undoubtedly raised a never-ending period of uncertainty with regard to what units we could get to the U. S. So it

~~SECURITY INFORMATION~~

does not appear that availability acted as the immediate determining factor in the growth of the day fighter force during the spring of 1943. As of 30 April 1943, it is reported by L-1 Headquarters that 500 P-17's and 400 P-38's were either in the theater or en route.¹⁷ It is also mentioned that the British Air Force during April still operated with but six heavy groups, which provided a fully operational average daily strength for the month of only 153 planes.¹⁸ So the delay in creating what a relatively effective striking force in the U. S. between January and May 1943 must be explained with regard to certain contingent factors, chief of which was the lack of available shipping for the transport of ground personnel.

Despite the resolution on the part of the CCS to develop the北 African offensive from the U. S. as rapidly as possible, priority is assigned a secondary role with the launching of critical operations in the Mediterranean. To finish TORCH and prepare for 'D' Day meant that almost all available transports would be required during February, March, and April to carry troops to North Africa.¹⁹ Thus, even though the CCS had on 17 February given a priority to the air forces in troop ships due to the U. S.,²⁰ arrival of the troops in the theater fell off sharply during those months. In December 1942 and January 1943, 1,100 troops had been moved to the U. S. At a rate of approximately 5,000 per month, placing in the theater as of 25 January a total of 12,400. During February only 2,000 were moved, and during March only 3,000. The situation improved somewhat during April, and during May 22,410 MP troops were carried to the U. S., resulting

A total of 65,430 lbs of the 27th or 2nd month.²¹

Although the shipping space for personnel during those months had been greatly reduced, cargo shipping provided no bottleneck. In fact, some cargo space remained allocated to C-47 and C-54 aircraft projects that could initially be required, and it was in order to do so if it that the policy was adopted by the AGF of shipping equipment and supplies to the theater long in advance of the actual arrival of the troops. Agreements will be made on the scheduled troop movement to North Africa will be completed and troops once arrived control the same. The bottlenecks in troop shipping, accordingly, began progressively later in November when the 1st tour unit of RCT, although shipping in general remained a seriously limiting factor on all Allied operations.²²

When it does appear at its maximum time virtually no shipping would be available for moving troops to the U. S. prior to 1942,²³ General Andrews and Harbord said, if ground soldiers and service troops could not be shipped, they be loaded on heavy bombers groups should be flown to the theater as rapidly as they can available, 1 think the ground troops to be sent at the first opportunity. Unhappily they could not be able to concentrate a high level of efficiency, and to be sent into combat might be delayed; but it may affect morale more to service than the loss of the ground troops because in the number. In this way, it was hoped, final training and acclimatization could be completed and the units prepared for operation by the time their ground vehicles

20

arrived.²⁴ This plan is, in fact, adopted, and on 12 March Stratovar was able to report that a total of 412 heavy bombers, including the flight echelons of six groups, were available for combat during March and April. All units, incidentally, will be kept on replacement aircraft so as to arrive with one pilot per aircraft.²⁵

The movement of flight echelons and replacement aircraft without adequate ground air service troops ... of course, only a temporary expedient, and an expedient of last resort at best. Nor is obviously certain to the services of ground crews already in the theater. Still, it places an added burden on the VIII Air Force Service Column, which was still spending 70% proportion of its time servicing units for R&D (the number of aircraft from the U.S. to carrier did not end until June 1944) and which in itself is balanced of reinforcements or half of the capacity of normal shipping.²⁶ It is a fact in fact, as in the full realization that flight echelon could operate only as far as the available logistic facilities, sorties would be made on a scale expressing his concern over the safety in the OBILUO-SOGOL project. His requesting Arnold to consider the suggestion has not been submitted to the AFSC yet, at the earliest to the worst, he would try again, personnel to the U.S. or the British port.²⁷ In reality it is pointed out that, although air transportation has been studied as a way for resupplying, unfortunately, it would not be practicable to do by this means enough personnel to provide substantial relief.²⁸ Lack of adequate ground crew personnel as

~~SECURITY INFORMATION~~

aircraft unit. There were occasions when a carrier aircraft was damaged so bad that none of its crew could get off it, and it had to be jettisoned. In the early part of the year, the morale of our U. S. striking force in the U. S. A.

The flow of aircraft was also subject to delay, though to a less serious extent. In January, for example, it was reported that a lot in the modification centers had slowed up the flow of replacements to the point where it became a question if the strike force should be broken from the forward units, which could delay the dispatch of combat groups, or if their groups should be sent to Britain at once, at the expense of replacement. On January 29, there was informed that trouble with piston rims in the A-17 aircraft had delayed temporarily the movement of five groups to the U. S. Consequence, on that same day that, without air patrols and personnel, aircraft would be accomplished in the U. S. to very limited advantage, no action was rapidly taken to overcome it.

By the end of March, progress for the A-17 had been made and greatly improved. The overriding requirements of the Mediterranean operations had decreased appreciably and both war and a truce had begun once over to the toward the U. S. As a result, no significant strength of the British air force had doubled during the month, going from six to twelve heavy groups.³¹ Yet the tactical experience of the preceding months had remained a sobering influence on all Allied planning. It was recognized by the U. S. Air Force command in Italy that discussions of mobilization had taken too little account of limitation both in resources and in supplies.³²

The Chairman's decision reflected a deep concern over the problem of shipping, and it was then also clear that if our major offensive were to be accomplished, the assault would have to be given top priority in shipping.⁴³

As early as April, logistical considerations had prompted the Air Department to survey the entire problem of cargo deployment with a view to conservation wherever possible.⁴⁴ In implementation of the new Departmental Munitions Planning program, General Arnold's Board of General Staff on 11 April 1943 set forth the immeasurable factors limiting the mobility of the American air force forces in the U. S.:

...listing full detail should really be left until operations from England at the earliest possible date and that those operations require ground as well as air personnel, it is becoming increasingly apparent that the limitation factor in determining the size of the U. S. Army Air Forces in the United Kingdom will not be the availability of airplanes but on availability of shipping space for our personnel.

It indicated that, according to the current plan, there should eventually be in the U. S. 2,210 combat planes of 11 types plus 4,170 reserves, all sustained by a total of 41,000 A. A. officers and men. And, in conclusion, "utilizing our best efforts to keep shipping available and existing priorities for ground and air troops our best estimate is that not to exceed 500,000 Air Force personnel can be sent to you by March 1944."⁴⁵

General Arnold directed Maj. Gen. Collett Muller, Air Inspector of the AAF, to proceed to the U. S. in order to study the air force organization there. Muller left on 1 May with orders to the effect

~~SECRET//NOFORN//AE~~

LAW-10

237

~~CONFIDENTIAL~~

that the size of the program, calling for 1.1 million aircraft to be
 brought to 275 groups, required the air force troops to be moved
 overseas than could be sustained or could reasonably be expected to
 see the approval of the war department. Consequently, the U.S. could
 have either to reduce the size of its projected overseas aircraft
 strength or to reorganize it. That is, forces and units in such a way
 as to support this ultimate strength in aircraft with fewer men. So,
 the U.S., would suggested, offered more opportunities for using over-
 seass personnel than any other theater: "First, because it is highly industrial-
 ized; second, because the ground situation is stable; and, third, be-
 cause this theater will ultimately have half of our overseas strength."
 General Bradley is therefore instructed to study, among other things,
 the possibilities of operating, maintaining, and supplying an ultimate
 force of 100 groups from the U.S. with a minimum of 300,000 air force
 troops. If this proved impracticable he is to determine what air-
 craft strength could be operated with that strength in person 1.00

In replying Bradley recommended to the War Department on
 24 May 1943, reemphasized his previous statement that strategic
 disbursement to logistical limitations. As originally formulated he
 recommended the following file of tactical groups to the U.S.:

Type	June 1943	Sept. 1943	Dec. 1943	March 1944	June 1944
Heavy Bomber	10-1/4	20	50	40	40
Medium Bomber	4	7	2	0	0

It also recommended the allocation of 1,000,000 men
troops to the Italian Air Force, and gave priority to units set up
for the strategic bombardment program.³⁷ Moreover, it served as a
council at joint of a number, the military plan constituted the prin-
cipal basis for logistic planning during 1941, especially in the
allocation of personnel.

While Bradley was engaged in drawing up his report, however,
the Joint and Combined Chiefs of Staff, in connection with Giulio
Ugo, made their own estimates of strategic requirements in rela-
tion to available shipping. In the light of the available plans for
the Combined War Office which he took under consideration
and approved on 10 May, the Combined Chiefs estimated that the
U.S.S.R. may be prepared in the U.S.S.R. to publish a memorandum
on 1 January 1941.³⁸ This represented a considerable
increase from the hitherto generally accepted final figure of 15
or 20 active groups, which, nor ever, had not been planned for com-
plete deployment prior to March 1941. It appears, nevertheless,
that the goal of 51 groups, advised in date 30 April 1941, was still
in June 1941 the current planning objective.³⁹

The problem of target selection

A further discussion was on targets in 1941. Detailed plans
for the U.S.S.R. As Giulio Ugo, chief propagandist of air power, had fore-
seen, it is clear that future air commanders will have their difficulty.⁴⁰

... as a result of our work, the roughing out seems to
be better, since one can then try to add details in the
most difficult and delicate cases in particular, considering
that we do not know what kind of finds choice

... it should not be forgotten -- military, political, social, and economic, all having upon the condition of the plant.

and may not have been built so clear to Douthit as the enormous value of prospective industrial dividends as a basis for his selection of targets for strike to be used at. In addition the size of strategic bombardment to reduce the country's ability to manufacture, it becomes necessary to analyze the economic warfare of his opponent, and, in addition, the United States, by virtue of its doctrine of production bombing, committed primarily to the destruction of industrial targets, it has increased the problem of industrial strategy with peculiar gravity.

and, Berlin, the author follows in, Gosselino, the book
"Initiative in planning for the territorial economy of Germany, and
the social spirit in the effort to a consider for the scientific
selection of targets." In 1940 the author has substantially on
the basis of a work submitted by Karl Arnold on a resolution
by a committee of experts which a German government had in
the headquarters since October of 1942.¹ This report thus sets out
forth the industrial objectives in Germany the destruction of
which could shorten the war decisively in the shortest possible
time; and it resulted from the application of a methodology
designed for this purpose. If the results of the war offensive do not
in every instance confirm the recommendations contained in the report,
the attempt to apply a scientific method to the problem of target
selection is remarkable of considerable historical interest.

The Committee of Operations Analysts (COA), as the group came to be called, brought to their work a clear, calculated methodology. It was pragmatic, but was held to be the criteria used for a prospective system in the analysis of objectives, and for one which would run over if at all humanly possible the burden from strategic bombardment. It was founded solidly upon faith in the scientific method, and on the specific belief that that method could be applied successfully to aerial warfare. Moreover, it was clear throughout by the preconceptions inherent in the American concept of precision bombing: industrial analysis should make it possible to destroy the "keystone" in the area of her production without expending effort excessively or indiscriminately on objectives of less than vital importance.

The first and most obvious step in the analysis of enemy industry was to bring the Army's energy into its proper focus for strategic bombing operations, to maximize it, and to define the relationship of each part to the energy effort.¹² Once it was necessary to eliminate as many industries as possible from selection as suitable targets, being careful the while not to pool resources or funds for eliminating an industry as far as possible. Then the individual industries in each plant by plant, were given to the minimality of destruction in each instance. After the list of steps had been completed, an industry could be listed in order of priority for bombing, as when target within each industry.

In the course of this investigation, how much is obtained
to the following questions: 1. What are the minimum requirements of
the enemy? In other words, at what point would it threaten to impair
the front-line military effort of the enemy? 2. What are the pro-
duction capabilities of the enemy? If every industry in all of
European countries, including occupied Russia, is utilized to the
utmost, what would be the total? 3. Is it really sufficient in
the analysis that is, what relationship exists between capacity and
minimum requirements, taking into consideration stockpiles and avail-
able substitutability? 4. Where are the major plants located and what
percentage of total capacity is represented by each plant? . . . and
are the physical characteristics of the installations the same?
To what extent are the buildings and equipment structurally resistant
to high-explosive and incendiary attack? Is it anticipated they
are incapable? 5. What is the civilian situation? Is destruction of each
plant and the effect on front-line strength? 6. What is the force
required to effect the necessary destruction? And, in short, will
it be costly?

Two of the more questions, or a combination of minimum require-
ment of capacity in relation to its productivity, e.g. city and district
etc., ruling the time-lag between plant destruction and effect on front-
line strength, or of particular importance. Is it not enough,
for example, to establish the fact that Germany is producing a
certain quantity of steel and that it could be possible to destroy
a certain percentage of its steel-producing plants. An critical
item.

problem was rather to determine whether and to what extent it would be possible for the Germans to make use of alternate capacity in the form of stand-by plants, to restrict non-essential consumption, and to draw upon stores of already processed material. Knowledge of the time factor was equally vital. If the full effect of a bombing program would not be felt for 12 months, it would be folly to attempt in six months a ground invasion which depended on prior success of the air attack. Moreover, if the effects of a bombing program were too long delayed, there was every chance that the enemy could adjust his economy in such a way as to reduce or even erase the effect of the bombing on his front-line strength. So it was useless to attack an industry lying too deep in the economic process; and it was equally futile to strike indecisively, with a force and at a rate unequal to the task.

These, in brief, were the principles of target selection with which the COA undertook the task of analyzing German economy. The principles were not the product of the moment, however. In fact they were fairly well developed when, in December 1942, that committee began to function. Back of its work lies a long history of target selection. Owing in part to their close proximity to the German-dominated Continent of Europe and to their extreme vulnerability in event of war, the British had, since 1929, been at work analyzing the industries of potential enemies with a view to possible strategic bombardment. Their approach was substantially the same as that of the COA with one exception, namely their emphasis on the bombing of areas rather than of individual installations. Just as the American analysts had their method shaped by their operational doctrine, so the British were influenced by theirs. British analysts were not, however, unaware of the virtues of ~~targeting~~ attacks on key or on so-called

"bottle-neck" industries. A paper prepared by the Air Ministry in July 1939 called attention to the value of these restricted objectives.⁴³ There were, it said, "vital spots in industry as well as in the human body," but it warned that these would probably be well guarded by natural circumstances or by artifice. In addition "there are . . . many alternative manufacturing processes, and the manufacture of an essential commodity is frequently already undertaken or can readily be started in many different factories, particularly in countries which have made a deep study of their industrial economy and have organized their industry to meet modern war conditions." Area attack, on the other hand,

is not intended to imply an indiscriminate scattering of projectiles over the whole or any part of a specific industrial area . . . On the contrary, there will be definite objectives in the area itself normally consisting of industrial targets which . . . constitute the chief vital spots of the industrial body.

Despite a continued willingness to consider the destruction of specific industries vital to German front-line strength, the British, in emphasizing area attack, laid a basis for target selection which could not easily accommodate a force devoted to the attack of precision objectives. Just as the RAF plan of attack differed from that of the American, the industrial intelligence compiled by British analysts was likely to differ qualitatively from that demanded by the USAAF. During the period when the AAF was planning its day bombing campaign against Germany, and during the earlier months of that campaign, the American force depended for its target planning largely on British intelligence sources. But it was inevitable that sooner or later it would have to make its own analysis of German industry conducted specifically for its own purposes.

The plan for survey in the U.S. was set up by the War Department in the War Information Section, AC/Int R-2.⁴⁴ By the summer of 1942 it was decided to go to an increasing extent for advice concerning the projected bombing programs. It found in its first project of actual data concerning German industry, but without any rational basis or selection. It therefore set out to compile a series of tables of specific industrial systems which will get to the heart of the problem of current selection. Roughly speaking, these air attacks, as they were called, began by establishing the importance of the industry in question as an element of war machine as a whole. An analysis detailed breakdowns of the enemy's industrial activities in three fields, and of the available supplies. The industry is then analyzed with regard to its vulnerability to air attack, and estimates are made of the necessary measures for protection from bombing. These were then given in reducing order of priority.⁴⁵

One of the most difficult points to establish was the vulnerability of major industries to air attack and supply. In order to depend on the word of war industrialists, considerable information of supply losses, assuming that supplies were actually increased by repair, came into it would naturally reflect repair rates with some degree of accuracy. U. S. railroads, for instance, when asked what such reduction in railway facilities to a country could stand and still keep its war effort effectively deployed, replied that U. S. railroads capacity was already strained and that any further would have a serious effect. Not unimportant requirements and minimum requirements were often to different things; and on further study it was

~~SECURITY INFORMATION~~

~~SECURITY INFORMATION~~

AAFRH-18

275

~~CONFIDENTIAL~~

estimated that a reduction of almost one-third of U. S. railway could be absorbed without impairing the war effort at all. Analysis of German rail transportation convinced the air analysts that no effect on German fighting ability could be expected until 31% of rail facilities had been destroyed. Similarly it was estimated that other German industries, no matter how vital to the war effort, were less tight than had generally been thought.⁴⁶

The Air Estimates, by December 1942, had become the subject of considerable discussion. To some observers they seemed to smack of defeatism; to others they indicated a need for still more concentrated effort along the same lines. In either case they contributed to a mounting concern in the Air Staff regarding the problem of target selection in Europe. Also contributing was the controversy over AWPD-42. That document, essentially a statement of U. S. air requirements, had, it will be recalled, been built around the concept of a systematic bombardment of German war industry. It had come nearer than any document hitherto produced in AAF Headquarters to being a comprehensive bombardment plan: and insofar as it attempted to name each feasible target in the major industrial systems and to estimate according to a rational, if somewhat theoretical, method the size of force required to destroy the objectives, it represented a step forward in the direction of systematic target selection. But it had been completed in September, before the other efforts of A-2 had gone far enough to provide the systematic body of industrial intelligence considered necessary for that sort of study, and it suffered from the inchoate state of target information prevailing at that time. AWPD-42 was under discussion at the highest level during most of the fall of 1942, and as the discussions progressed its limitations in the direction of target analysis became the more apparent.⁴⁷

On 14 Dec Ltr 1912, General Macmillan issued a directive requiring Col. Edward A. Gandy, War Dept., to control, "the

to him. The group of operational analysts under your jurisdiction or your was subject to a progressive deteriorating but it would be anticipated in the German's effort as a result of the increasing air operations we are prepared to employ against its sustaining resources. This study should result in no decrease in scientific accuracy as far as the date from which deterioration will have progressed to a point to render a successful invasion of Western Europe.

At this time no such group existed except in skeleton organization, but Colonel Macmillan was authorized to create one and to organize scientific and civilian personnel for the purpose.⁵⁰

Meanwhile in certain parts of, notably at the Institute for Advanced Study at Princeton, N. J., civilian analysts had been engaged in the problem of target selection. And there was also a belief to the effect that staff officers in headquarters, who did not have the time to devote to long-range strategic air planning; nor was that a priority activity for which a regular army career is considered to provide the best preparation.⁵¹ An recruiting committee accordingly began to be formed in part of civilians. In addition to Alvin Root, Jr., Francis C. Lovett,⁵² and George C. Hale, who served as first chairman, Lt. Col. Alexander Maitland, a civilian to represent the Board of Economic Warfare, and Ward B. Wood to represent the Office of Strategic Services. In front of the group consisted of Col. Edward A. Gandy, AC/AS A-2; Lt. Col. E. Collier, AC/S, Director of Target Information Section, A-2; Lt. Col. Edward C. Langhans, commanding; A-2; and Col. Rudolf R. Verner and Lt. Col. W. Carter Hatch, both from Management Control. Colonel Gandy sat down on iron.

~~SECURITY INFORMATION~~

~~CONFIDENTIAL~~

Originally called the Advisory Committee on Bombing, this group came to be known as the Committee of Operations Analysts.⁵²

Administratively speaking, the creation of the COA was an important step, because for the first time in the U.S. it had the assimilation of industrial intelligence from all of these sources and the analysis of that information for the purposes of air war, & selection clearly the responsibility of a single agency. It also did a useful service by removing the task of target selection from ordinary military channels and placing it where it could be performed free from the restrictions inherent in relatively obscure staff work.

Subcommittees were delegated to study each pertinent German industrial system. Much of the initial work consisted of bringing up-to-date, checking, and supplementing, wherever possible, that already done in A-2 and in the various government agencies.⁵³ New sources of information tapped by the COA subcommittees were many and varied and included records provided by the Air Department, CIO, CIA, NID, C.I., COMINT, the Bureau of Foreign and Domestic Commerce, the Department of Justice, and the State and War Departments. The British Ministry of Economic Warfare, the Air Ministry, and the RAU continued to provide valuable data.⁵⁴ Late in January 1943 four members of the COA flew to England where they exchanged notes with the British agencies and also with A-2 of the Eighth Air Force and the Economic Warfare Division of the American embassy, both of which had been working on target information in their theater.⁵⁵ According to the industrial experts in one highly industrialized country could be essentially similar to that of a highly unindustrialized

~~SECURITY INFORMATION~~

AM 10-10

278

~~CONFIDENTIAL~~

country, the CCA paid close attention to the organization and physical characteristics of appropriate U. S. industry. This lack of this information came from qualified experts in private industry.⁵⁶ Between 1940 & 1945, civil studies had been completed, or were nearing completion, on 12 German industries.

On the 10th of September the CCA reported its findings to General Arnold. In Directive of December 1941 under which the committee was organized had specified that it determine "as nearly as possible the direction upon which the continuing sources of information will lie which might be received through civilian sources and as to conduct an invasion of the Continent. With this committee I could hardly manage to do for two reasons: first, it could not forecast with any degree of certainty our Air Force which would be available, and second, with the operational experience of the British Air Force to date formed an inadequate basis for conclusions as to accuracy, attribution, and certain other operational factors affecting such a proposition. As did, however, present certain important conclusions. Concerning target selection it declared:⁵⁷

It is better to cause a high degree of destruction in a few really essential industries or services than to cause a small amount of destruction in many industries. Multi or cumulative and simultaneous adoption should be selected to inflict maximum destruction.

Once again, the project's cover offensive, it made the pronouncement that:

- (1) The destruction will concern a number of industries but, as would readily appear, slightly smaller and more modest effort. There are several combinations of targets, among them the industrial, the agricultural, the economic and the built.

~~SECURITY INFORMATION~~

JULY-18

~~CONFIDENTIAL~~

273

- (2) In view of the ability of adequate and properly utilized air power to impair the industrial sources of the enemy's military strength, only the most vital considerations should be permitted to delay or divert the application of an adequate air striking force to this task.

It was decided that need for continuing effort in the analysis of target information, and for continuing close cooperation between British and American agencies in that regard. It further recommended that, since operational factors such as weather and the dispositions of the enemy, more than the commanders in the theater, played often a decisive part in choosing particular targets, and since the Eighth Air Force was aware of and in agreement with the principles of target selection set forth by the COA, the current selection of specific objectives be left to the responsible authorities in England, subject only to such directions as might be called for by broad strategic considerations.

For reasons of security, the committee refrained from drawing up a formal priority list of target systems. But it is clear that the arguments presented to the committee were listed in descending order of preference, and there is reason to believe that the committee did so as a result of a policy informally agreed upon between the principal parties concerned.⁵³

First on the list was the German aircraft industry. It was fully appreciated that an early attack on that system would be essential to the success of later bombardment operations. The force of this argument had been gradually admitted over time. The RAF had begun to react effectively to the daylight operations of the Eighth.

~~CONFIDENTIAL~~

~~CONFIDENTIAL~~

It was estimated that the degree of accuracy⁵⁰ that, although fighter production had been given preference by the Germans, manufacture and production in that industry were delicately balanced. But a diversity of opinion existed, both in the U. S. and in England, as to whether the attack should be directed primarily against fighter assembly plants or against fighter engine plants. The proponents of the attack on the former argued that, since the current ratio of German single-engine fighter strength to monthly production was three to one, the German fighter force was having to recreate itself from fighter assembly lines every three months. Destruction of seven assembly plants, even if the enemy could repair the damage at the end of one month, would have to be repeated but twice to eliminate substantially German strength in single-engine fighters. If five separate component creating shops were included in this attack, production could be curtailed for approximately six months owing to the destruction of intricate jigs and other hard-to-replace machinery. Proponents of attack on fighter engine plants pointed, however, to the recoverability of final assembly plants unless extensive damage were done to both assembly sheds and component creating shops. On the other hand, engine assembly plants were believed to require six months or more for full recuperation; and an attack on them would strike at replacements needed for operational aircraft. But it was conceded that, on the basis of American experience, the time lag between the completion of an engine and final assembly of a finished aircraft varied from one month to six weeks, during which time something over 500 enemy fighters could be produced. This question of time, in

~~CONFIDENTIAL~~

~~CONFIDENTIAL~~

REF ID: A64413

SECRET

~~CONFIDENTIAL~~

In addition to the fact that engine plants constituted no what less vulnerable targets than final assembly plants, appears to have been a given weight if not decisive weight. For, although the COA recommended bombing all of 22 targets consisting of final assembly plants, component erecting plants, and initial assembly plants as part of a single target system, the first two categories were clearly given precedence over the last. All but one of these 22 targets lay within 400 to 600 miles from London, and together they were estimated to account for over 90 per cent of single-engine production.

"It is difficult to determine whether the attack on aircraft engines would have been preferable to that delivered against aircraft factories," the report of the Strategic Bombing Survey declared in 1945. Considerable German opinion, however, held that it would have, and recent investigation of German aircraft industry indicates that, although the capacity of the industry as a whole during the first years of the war was more than adequate, less excess capacity existed in engines than in aircraft.³⁰

Next to fighter aircraft, and closely related to their manufacture, came ball bearings. On the basis of American experience, as well as according to British opinion, it was expected that ball bearings represented a potential bottleneck in German industry, especially in the manufacture of war material. It was the belief of both British and American economic authorities that stocking of ball bearings was not practicable and had not in fact taken place. It was believed that only the larger plants were capable of running a full line of ball bearings and that smaller plants concentrated on specialized types. Furthermore, the Johnsonite plants alone were correctly

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AMEM-16

5-2

~~CONFIDENTIAL~~

reputed to manufacture in the neighborhood or one-half of the total Axis production, thus offering a particularly easy structural target within practicable flying range. While the effect on Army front-line strength would not be immediate, the indirect effects would, it was felt, be great and corrosive, covering eventually all high-speed equipment. This effect could not be time accurately, but it was believed that it would begin to be felt within one month. Subsequent intelligence indicates that the committee somewhat overestimated the vulnerability of ball-bearing plants and underemphasized the feasibility of effecting economies in the use of carriers, possibly also of securing them.⁶¹

Petroleum was given third place. Germany's oil position was rightly considered to be extremely tight, though not quite so tight as it later turned out to have been.⁶² It was pointed out that crude oil represented two-thirds of available Axis oil supplies, of which crude supplies 60 per cent were produced in the Ploesti area of Rumania and the rest widely dispersed in small amounts in other Axis countries. The remaining third of the Axis oil came from synthetic products, of which 50 per cent was believed to come from 15 Boreius hydrogenation plants, and the rest from numerous Fischer-Tropsch plants. The committee estimated that destruction of the 15 hydrogenation plants would deprive Germany of about one-fourth of her available petroleum sources, including two-thirds of her existing production of aviation gasoline. Aircraft stocks, substitutes, and working inventories could probably not absorb the full effect of their destruction for more than four months. Although strongly constructed, they nevertheless believed

~~CONFIDENTIAL~~

~~ALL INFORMATION~~

AIRPL-18

263

~~CONFIDENTIAL~~

vulnerable to air attack and difficult to reconstruct if, in addition to the hydrogenation plants, some 36 refineries were also destroyed, supplies of petroleum products would be cut to zero cont., with obviously disastrous consequences to the German war effort.

Oil was thus considered an important target. But it was not given the high place that the risks derived from later events indicates that it should have. The COI appears to have felt that Germany controlled enough stand-by refining capacity to cushion the immediate shock of bombing and to delay the effect on front-line strength beyond the point where the aerial effort would be immediately profitable.³³ The committee was apparently handicapped here, more than in most instances, b. lack of adequate intelligence data. It underestimated the importance of synthetic production; and it gave little attention to the close technical integration of both hydrogenation and Fischer-Tropsch synthetic oil plants with the chemical industry, especially that part of it producing explosives and synthetic rubber.³⁴

The COI report gave fourth place to grinding wheels and crude abrasives. In doing so it reflected, as in the analysis of the non-friction bearing industry, the committee's preoccupation with bottlenecks in enemy industry. The report demonstrated the essential part played by grinding wheels in the manufacture of innumerable metallic parts for war equipment. It pointed out that wheels were rapidly consumed, there was no substitute for them, they were difficult to store, and they were produced in vulnerable installations. Crude abrasives could be affected in order to heighten the effects of attack on the

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AIR-4-16

~~CONFIDENTIAL~~

204

grinding wheel industry, but the relative invulnerability and recuperability of that industry made it a less attractive target than the grinding wheel factories.

Next came nonferrous metals: copper, aluminum, and zinc. Although neither aluminum nor low-grade zinc production was considered a high priority target, it was believed that somehow could be paid for attacking copper mines and smelters and aluminum-producing plants in view of their importance in war production. It was admitted that the use of chemical salts lay too deep in the economic process to warrant priority attention. On Shells, the industry was believed, probably somewhat optimistically, to be very tight and the destruction of "Y" factories feasible.³⁵

It is very possible, as the U. S. Strategic Planning Survey concluded, that the synthetic rubber industry might profitably have been given attention earlier in the war. That the CIO gave it only sixth place is in fact a by-product of its failure to appreciate fully the close interdependence of both the rubber and synthetic oil plants. Had it been recognized, for example, that the former depended largely on the latter for hydrogen, both might have been elevated jointly to a higher priority.³⁶ The committee also overestimated the probable amount of blockade-breaking the Germans would be able to conduct in order to import rubber supplies. Imports during the war appear to have been negligible, and Germany was consequently thrown back almost completely on three large oil companies. All synthetic plants for oil require naphtha.³⁷ In view of this basic system, a conflict existed by

(C) PENTAGON WIRELESS,

~~SECURITY INFORMATION~~

AMM-10

~~CONFIDENTIAL~~

663

the OOL, while high in terms of concentration and vulnerability and in view of the importance of fuel stocks, deserves attention, upon the success of blockade-running, which was estimated to contribute, together with the reclamation of scorched, approximately one-third of Germany's rubber supplies. It was believed that destruction of ten tire plants, which were susceptible to incendiary attack, would more immediately damage the enemy position than the destruction of the two major synthetic plants.

When it came to submarines, which it placed seventh, the COA expressed profound misgivings concerning the results to be expected from a bombardment either of operating bases or construction yards. Construction yards had for some time been considered as vulnerable and British authorities to be targets of doubtful value.⁶³ Admitting that complete and simultaneous destruction of all U-yards in Europe, i.e., three large important ones in Italy could probably delay by at least 18 months the launching of any new U-boats, and that most important components were made in those yards, the committee argued that the quick recuperative capacity and large facilities available would minimize the effects of anything other than a devastation attack; for the industry as a whole, and that even such complete destruction could not reduce the operating U-boat fleet for approximately one year. The five operating bases along the French coast suffered not much more damage. They had been attacked at an increasing rate since October 1942 in the hope that repair and refitting work might be slowed up and the number of operating U-boats consequently be reduced. But evidence on this point, though plentiful, was not yet complete,

~~ALL INFORMATION~~

APPENDIX

~~CONFIDENTIAL~~

265

was considered to be of an essentially inconclusive nature. It appears, therefore, that the committee was well on the way toward the healthy skepticism regarding the bombing of submarine installations which by the end of the year had become very popular and which has since been fully confirmed by German records.⁶⁹

In ninth and tenth place came respectively military motor transport vehicles and the transportation system in general. In the face of it, motor transport vehicles were to offer a fairly profitable target, for supply was estimated to fall considerably short of military requirements, and 85 to 90 per cent of the truck production was believed concentrated in seven plants. It now appears that, if a concentrated attack had been planned on oil and rubber, motor transport vehicles might well have been ignored as a separate objective.⁷⁰ As for rail and water transport, the committee labored under no illusions, however, without for a moment minimizing the vital importance of transport facilities to the entire enemy war economy, it maintained that limited and scattered attacks upon transport would be of little consequence because the recuperative powers and flexibility of such systems permitted rapid and successful readjustment. Therefore, it stated, no key or isolated transport targets, the destruction of which would be decisive, an attack would have to be widespread and sustained; and at that time the committee was unwilling to think in terms of mass attack or of attack on any but the most concentrated industries. Although the bombing of transportation has since been recognized as of decisive importance in the defeat of one axis,⁷¹ it is very probable that less effective types could not have been

~~CONFIDENTIAL~~

M.W.-13

2.7

~~CONFIDENTIAL~~

realized until a sufficient force had been built up to use the necessarily heavy and ubiquitous attack feasible, and until it was possible to take full advantage of a generally unorganized transport system by decisive ground action.

Owing to the large number of coal batteries in Axis Europe, coal-mining plants were not considered a suitable target system, despite their vulnerability and an undoubtedly basic importance of coal production in a number of critical industries. Iron and steel received still less favorable consideration. Slightly enough, in the light of later investigation,⁷² the CGI considered that the Central Axis position with respect to steel was generally strong and that the destruction of even one-half of the steel-producing plants could have little effect on the military effort over a period of one year. Such plants were, moreover, relatively invulnerable to attack on account of the ruggedness of their construction and equipment. Even the production of high-grade alloy steels, which are one more critical and more vulnerable than that of ordinary steel, was believed to involve enough potential plant facilities to incur a substantial time-lag between destruction and effect on front-line strength.

Machin.-tools were considered generally to lie too deep in the industrial process to constitute high-priority targets as long as the industries they supported were in operation. Tools required for new or changed types of final product might, however, be more critical items. The destruction of 12 selected plants, it was stated, could reduce machine-tool replacement capacity by 10 per cent, with effects

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

REF ID: A618

268

that would eventually be felt throughout this country. Although the machine-tool industry was only placed twelfth on the list, the fact that it was given consideration at all betrays a faulty understanding of that industry as carried on in Germany. At this point the assumption of essential similarity between industrial processes in Germany and the U. S. proved misleading. German manufacturers had an entirely different conception of the use of machine tools than did their counterparts in America, hence rapid turnover of plant inventory and a tendency toward early obsolescence in machine-tool types generally discouraged the accumulation of large replacement stocks. In Germany, where machine tools were treated a long-term investment, the industry had managed to build up a comfortable reserve, leaving excess production capacity in the form of plants at one time devoted to manufacturing for export. We might have been too easy in assuming tools being attacked systematically is hard to see, but the fact remains that at no time did German industry as a whole come anywhere near being short on machine tools.⁷³

A curious omission in the list of high-priority targets was the electric power system. It was recognized, of course, that industry in modern Germany was largely dependent on electrical energy for continued operations. But it was believed that in almost no instance was any single industry dependent on one electric generating plant. Rather they depended upon a network which pooled the greater part of the electrical energy within an area. It was considered that by destroying 32 targets in the Ruhr-Ahr area, for example, heavy industry in that area could be in large part eliminated. But an attack on the

REF ID: A618
ALL INFORMATION

AMM-13

269

power industry as a whole was felt to be of questionable validity.

Equally questionable was the vulnerability of electrical power plants to aerial bombing, judging from British experience during the "blitz."

It is easy for one observer after the fact, provided with knowledge that the knowledge of subsequent events alone can confer, to criticize conclusions arrived at without any such assistance. Yet the failure of the Allies to attack German electric power and the failure of the COA to recommend it both stem from a lack not of prescience but of inadequate information regarding the situation as it currently prevailed—a distinction of the utmost importance in a historical study of this sort. It now appears that the Germans themselves were constantly concerned about the limitations of their so-called grid system, the difficulty of adding capacity, the relationship of curtailments and shortage of electric energy to production losses in industry as a whole, and, above all, the danger that the allied command could discover the extreme vulnerability of their electric power industry. The U. S. Strategic Bombing Survey summed up the situation by saying that, in the state of critical shortage in which industry found itself, any loss of production in electric power would have directly affected essential war production, a fact which the Germans themselves readily admitted.⁷⁴

Electrical equipment, optical precision instruments, food production, and antiaircraft and antiaircraft armament were treated by the COA, for good and sufficient reasons, as of little significance in the bombing program. But the chemical industry, and in particular the nitrogen

~~SECURITY INFORMATION~~

MAR 11-18

200

~~CONFIDENTIAL~~

industry, received equally scant recognition. A parate studies had been prepared on several aspects of that complex, namely on coal, synthetic oil, synthetic rubber, and nitrogen. Analyses of the production of explosives and other chemical products were not separately undertaken, either because of the known availability of substitute products, the number and dispersion of plants, the existence of large amounts of excess capacity, or the fact that one product had only an indirect relationship toward military activity. The COI's views on coal, rubber, and oil have already been canvassed. Admittedly nitrogen was important to Axis military effort in the fields of explosives, synthetic oil, and fertilizer. But only eight per cent of nitrogen production was believed used in the manufacture of explosives. And, although it was estimated that 42 per cent was devoted to synthetic oil production, and that if 21 principal nitrogen plants were destroyed the effect would be felt in the oil industry within three months, no attempt appears to have been made to correlate the two for the purpose of strategic destruction.

The COI . as in this instance again hampered by a faulty understanding of the German chemical industry. Synthetic rubber, synthetic oil, nitrogen, ethanol, and other important chemicals formed inter-dependent parts of a single industrial complex. The production of nitrogen and ethanol, both of extreme significance in the manufacture of explosives, was heavily concentrated in synthetic oil plants. As it happened, the attack on synthetic oil, when it finally came, in fact succeeded in producing, as a fortuitous by-product, a marked

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AMAR-10

- 291

~~CONFIDENTIAL~~

drop in the production of nitrogen, which in turn contributed to the shortage of explosive materials on the market in the closing campaigns of the war. The nitrogen industry, according to the strategic bombing survey, possessed "all the qualifications to have been a primary bombing target." Not only was nitrogen essential, but there were no possible substitutes for it, and most of its production was "unusually concentrated" in a few plants. Moreover, an attack on it would also have been an attack on the synthetic oil industry. It therefore appears that, had the interdependence of the synthetic oil, the synthetic rubber, and the principal chemical industries been fully appreciated, they might all have been subject to early and concentrated attacks with much profit to the allied cause.⁷⁵

On 20 March 1944 the CGO report, after being favorably considered by General Arnold's Advisory Council, was sent to the U. S. for coordination with the British authorities and the Eighth Air Force.⁷⁶ On 5 April the Ministry of Economic Warfare reported its conclusions:

"We are in substantial or close agreement with the CGO report in the opinion which they express in their covering letter, insofar as these are within our province; and with their conclusions on the following classes of targets: Aircraft, ball carriers, Petroleum, non-ferrous metals, synthetic rubber and tyres, Transportation, cottonseed.

On the other hand the A. E. spokesman, Mr. C. G. Vickers, expressed some reservations. Several, he said, "appear to have been based on that in regard as a somewhat superficial examination of the CGO's position and also a certain divergence of opinion between us on questions of fact, which we are already in process of trying to reconcile by discussion now and in Washington." But, he added, these divergencies

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AM-1-15

392

~~CONFIDENTIAL~~

uttered little because they related to industries which neither agency considered as likely candidates for adoption as primary targets. In three points only was there significant disagreement. The USAF took a less optimistic view than the CBI of the damage an attack on propeller plant factories could inflict on that industry, and based its argument mainly on the large number of plants and the probable existence of considerable stocks. In the second place, it advocated closer study of the possibilities of attacking major transport and aircraft facilities by way of selected internal-combustion engine components and accessories. Finally the USAF believed the possibilities of attacking aircraft production through attack on propeller factories worthy of further investigation. It is interesting to note in passing that on the subject of nitrogen, the USAF was even less enthusiastic than the CBI, claiming that some 20 per cent of enemy producing capacity was at the time lying idle.⁷⁷

Like the USAF, the Eighth Air Force declared its full agreement with the CBI report.⁷⁸ But it is not clear from available documents how that paper was received by other critical agencies. suffice it therefore to say that on the basis of the CBI report--and on the advice of the USAF, the critical Air Staff, and the Eighth Air Force--a final list of primary objectives was drawn up consisting of 73 targets in six systems arranged as follows in order of priority:⁷⁹

- Automobile construction yards and bases
- Aeronautic industry
- Fuel bearings
- Oil
- Synthetic rubber and tires
- Military transport vehicles

It will be noticed that shipping vessels and warships and the non-ferrous metal industry, given respectively fourth and fifth place in the COA report, were deleted from the final list of primary objectives, no doubt on the advice of the British. On this specific ground, submarines retained the priority given them at Casablanca. It is not apparent from the document at hand; but it is safe to assume that the problem of shipping in the Atlantic convoys, losses, which had reached a climax in April, had forced the issue. Otherwise there appears to have been general unanimity of opinion. Concerning German fighter aircraft, especially, the British War Staff agreed heartily, urging, indeed, not only an attack on the single-seater fighter industry but on all fighters. In a paper dated 9 April it argued that all British and American bombardment forces should, in the first stages of the proposed offensive at least, be concentrated against the RAF, especially the fighter force, to the exclusion of all other objectives. For, it maintained,

The most formidable weapon being used by the enemy today against our bomber offensive is his fighter force--his single-seater fighters by day and his twin-seated fighters by night--and the elimination or serious depletion of this force would be the greatest contribution to the furtherance of the joint heavy bomber offensive of the RAF and AAF.

After the principal target systems had been determined, there remained to be elaborated an operating plan to accomplish the destruction of the 70 specific objectives of which those systems consisted. For this purpose General Ulmer appointed a committee composed of General Macmillan, General Anderson, and plans personnel of the USAF, AF, and Ninth Air Force. Lt. Gen. Macmillan's task, also, was to decide, in the

~~SECURITY INFORMATION~~

AAFRH-18

294

~~SECRET~~
CONFIDENTIAL

light of operating experience, what force of planes would be required to do the job and what chronological order of attack against the six target systems would make best use of the increasing forces being made available. This operational plan, together with the list of targets, became known as the "Plan for the Combined Bomber Offensive from the United Kingdom," or, more briefly, the CBO Plan. It received "un-qualified endorsement" by the Commanding General, ETOUSA, the Chief of Air Staff, RAF, and the Air Officer Commanding-in-Chief, RAF Bomber Command.⁸¹ Late in April General Eaker brought the plan to Washington.⁸²

It was a comprehensive and impressive report which Eaker presented to the JCS on 29 April 1943.⁸³ In order to accomplish the mission of the bomber offensive as set forth at Casablanca the plan provided for the neutralization of a given percentage of each industrial system agreed upon. Destruction of the submarine building yards selected would reduce current submarine construction by 89 per cent. Destruction of 43 per cent of German fighter capacity and 65 per cent of German bomber production was provided for. Of the ball-bearing production, 76 per cent could be eliminated by destroying the targets selected. The attack on oil was made clearly contingent upon certain already planned attacks against Ploesti from the Mediterranean. Should that effort succeed, it would then, but only then, be necessary to attack the oil installations in the Ruhr in order to exploit the advantage gained in Rumania. Together these attacks would account for 48 per cent of Germany's oil production. Provision was next made for destroying 50 per cent of the synthetic rubber capacity and nearly all

~~SECRET~~
SECURITY INFORMATION

AAERH-18

~~CONFIDENTIAL~~

295

of the tire production of Axis Europe. Finally, the elimination of seven selected plants producing military transport and armored vehicles should have a considerable, though not readily measurable, effect on enemy strength. "The cumulative effect of the destruction of the targets comprising the systems just listed will fatally weaken the capacity of the German people for armed resistance." QED.

But there was one overriding consideration which the planners declared would, temporarily at least, alter this order of priority. The CBO Plan warned that the Germans, recognizing the vulnerability of their vital industries, were rapidly increasing the strength of their fighter defenses, especially on the Western Front. The German fighters were taking constant toll of Allied bombing forces both by day and by night, "not only in terms of combat losses but more especially in terms of reduced tactical efficiency." If their number were materially increased, "it is quite conceivable that they could make our daylight bombing unprofitable and perhaps our night bombing too." For this reason, the plan concluded, with more force than clarity, "German fighter strength must be considered as an Intermediate objective second to none in priority."⁸⁴

As finally determined, target priority in the CBO Plan stood as follows:

- (1) Intermediate objectives:
German fighter strength.
- (2) Primary objectives:
German submarine yards and bases.
The remainder of the German aircraft industry.
Ball bearings.
Oil (Contingent upon attacks against Ploesti from the Mediterranean).

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AARH-18

(continued from p. 295) 297

~~CONFIDENTIAL~~

- (3) Secondary objectives in order of priority:
 Synthetic rubber and tires.
 Military motor transport vehicles.

It is not the province of this study to evaluate the CEO in terms of positive results. But later events and subsequently acquired information cast on the planning phase a degree of light the implications of which cannot at this point be entirely ignored. This is especially true with regard to target selection. Generally speaking the bomber offensive succeeded. It is, therefore, not a question of explaining any failure in attaining ultimate objectives. But it now appears that over-all target selection might in a few instances have been improved and the bombing force have been utilized more effectively. Electric power might well have been given a high priority. Nonfriction bearings might well have been accorded a lower priority. Probably more important than either the inclusion of bearings or the exclusion of electric power was the failure to concentrate at an earlier date on oil and to appreciate the vital interdependence of synthetic oil, synthetic rubber, nitrogen, and other elements in the vast chemical complex. Submarine installations received no doubt an undue weight of bombs. But in that case the choice was dictated not by industrial analysis but by what was felt to be strategic necessity. The attack on transportation, when it came, was decisive, but it is probable that it could not have been undertaken directly at an earlier date without overwhelming force and complete concentration of effort. It must be remembered, of course, that contingent factors of a purely operational nature which could not have been foreseen affected the results of the offensive. The day bomber force, for example, was not

~~CONFIDENTIAL~~

~~ALL INFORMATION CONTAINED~~

AAFRH-18

~~CONFIDENTIAL~~

298

built up so rapidly as had been planned, a fact which made it impossible to strike the ball-bearing industry as rapidly and decisively as had been anticipated. The CBO Plan had made it very clear that a successful initial attack on that industry would demand the immediate concentration of effort on the remaining elements of that system in order to exploit the initial success. The fact remains, however, that the final choice of targets in April of 1943 did not correspond in every respect to the points of most extreme vulnerability in the German war economy.

Was, then, the method of industrial analysis, in this instance identified especially with the COA, an effective instrument for the appraisal of strategic objectives? Did it result in a more penetrating choice of target systems than had hitherto been achieved? It may be instructive before answering these questions to examine some of the priority lists which had been drawn up by U. S. agencies (British examples are not available) prior to the work of the COA.

ANPD-1, prepared in AAF Headquarters and dated 12 August 1941, had envisaged a strategic bombardment attack on German industry by an American bomber force and arranged the industrial systems in the following order of priority:⁸⁵

Electric power
Transportation
Oil and petroleum supplies
The morale of the German population

As a possible "intermediate" objective, the accomplishment of which might be essential to the destruction of the above target systems, the German Air Force would have to be neutralized by attacks on air bases, aircraft factories (both engine and airframe), and aluminum and magnesium factories. In addition, other lines of action, such as the

~~SECURITY INFORMATION~~

Lu .-13

203

~~CONFIDENTIAL~~

bombing of submarine bases, might possibly be forced by the necessity
of maintaining the security of bases.

"Plan for the Initiation of Air Force Bombardment in the British
Isles," also emanating from Headquarters, AAF and dated 10 March 1942,¹³ had selected some 100 targets within four categories in the following
priority:

U nitions industry
Electric and motor power
Petroleum and fuel
Oil and rubber transportation

MPD-42, issued 9 September 1 42, constituted the most thorough
effort made up to that date by U. S. agencies. It had arrived at the
following list:

Met. Mf: Fiber factories, tire factories, and engine plants
Submarine building yards
Transportation system: buildings, shops, repair works, railroads;
yards, and canals
Electric power
Oil
Aluminum
Rubber

It was becoming a commonplace in strategic planning, that destruction
of the U-boat could be a prerequisite to any systematic reduction of
Germany's war potential. And as the submarine was mounted it was
becoming clear that something drastic, involving temporary diversion
of strategic bombing forces, would have to be done. These considera-
tions in fact dictated the priorities for Eighth Air Force operations
during the fall and winter of 1942. Both the directive under which
the American bombers began their base and chase of 20 October which
supplemented it, listed submarines, aircraft, and transportation in
that order.¹⁴ Similarly, the Casablanca Directive of 21 January 1943

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

APR 21 1968

00

has listed priority targets in the following order:

Submarine construction yards
The aircraft industry
Transportation
Oil

It is obvious that the COI priorities were to target sources even nearer to the answer as were substantively by events than did the earlier lists, and in some instances only failed to come as close. In other words, the systematic approach to the problem made by the COI obtained, in an over-all sense, an end result no more satisfactory than that achieved by the efforts of our earlier analysts. This fact, however, does not mean that the COI failed to apply a more or less scientific method to the problem of target selection was duly conceived. It merely means that conditions were not entirely favorable to a project carried out at that level. Insofar as it was possible to solve the problem on the basis of facts, rather than of hypotheses, there could be no limit to the valid application of a scientific method. And potentially it was a question of ruthlessly factual investigation. But actually there existed in almost every instance a serious shortage of reliable information, and the resulting lacuna had to be bridged by intelligent guesswork and the clever use of analogies. In dealing with this kind of inexactitudes and approximations the social scientist as such finds himself in a position of no special advantage over the military strategist or any other intelligent layman; and no elaboration of dogma may, by virtue of a considerable but unavoidably misguided豪傑， lead one investigator far astray. The moral of this story is obvious.

~~CONFIDENTIAL~~

AIR 64-18

and has frequently been done. Strategic bombing, probably more than any other strategic undertaking, requires the most complete body of intelligence data possible. Without its strategic bombing campaign was successful--the one, if operation successful notably--but only at the expense of such ineffective effort.

The Operational Plan: Organization of the C.O.

As presented by General Major, the plan of operations was divided into four phases, each marked by an increase in the size and capabilities of the American bombing force. In activating this force, the authors of the C.O. plan also referred to the experience of the British Air Force, which, by April of 1943, represented a very useful body of information. They were not therefore forced, as the authors of AAFB-12 had been, to resort to highly theoretical calculations. From the experience of the British in 12 missions against assembled targets it was concluded that 100 bombers dispatched on such successful mission could effect satisfactory destruction on that part of the target area within 1,000 feet of the aiming point when bombing from altitudes of 20,000 to 30,000 feet. Each target was accordingly evaluated in terms of the number of circles of 1,000-foot radius in which destructive effects had to be produced, and the total number of sorties required for total destruction was calculated on that basis. As for rate of operations, the British Air Force had averaged six per month over the preceding half year. Experience also indicated that at least 200 aircraft must be in the theater to make possible the dispatch of 100 on operations, and that 500 planes constituted the

~~CONFIDENTIAL~~

REF ID: A6413

~~CONFIDENTIAL~~

CO2

minimum score for deep penetrations in the face of existing
fighter opposition.

By 30 June 1943, the Obo Plan recommended, there should be in
the Saarland 300 heavy and 200 medium bombers. It could not, however,
be possible to attain such before the date. There was for the force
of 600 planes required for deep penetrations. Consequently, missions
during the first phase of operations (April to July) would be lim-
ited to the range of fighter escort or to areas of objectives
not demanding flights deep into enemy territory. Targets in this
phase would consist mainly of submarine yards and not too distant
aircraft installations. Only 60 minutes would be long missions;
an attack on oil installations to exploit prior attacks on Rieschti,
and a very-long-range attack against the Saarbrueck ball-bearing
industry. During the next phase, from July to October, the campaign
in heavy losses should reach 1,100 and objectives right up to a radius
of 100 miles from the base area in England. Aircraft
would be concentrated against major fighter bases by all fighter
aircraft factories as well as airfields and repair facilities.
Probably 75 percent of the striking force would be used for this
purpose, the remaining 25 percent being left to continue the assault
on submarine construction yards. Within the third phase, from Octo-
ber to January, the German fighter forces would continue to be attrac-
ted and the other sources of German power would be undermined. During
this phase, the bombing force would now be able to perform
all its major tasks; by January 1944 it should number 1,740 heavy
b. b.s. The final phase, during the early months of 1944, should

~~CONFIDENTIAL~~

~~SECURITY INFORMATION~~

AU 6-16

~~CONFIDENTIAL~~

605

see the entire bombing force used to sustain the effect already produced and to prepare the way for a combined operation on the Continent. To accomplish these tasks 2,702 heavy bombers would be needed by 31 March 1944.

The plan made no specific provision for the use of U. S. medium bombardment. But it clearly indicated that medium bombers would be required for supplementary attacks against all strategic targets within their range. They would be especially useful for attacking German fighter airfields in order to aid the passage of the heavy bombers until the delivery of the heavy aircraft industry had made itself felt. For those purposes, and for the final phase in support of cross-Channel operations, an eventual force of 600 medium bombers should be in the theater by 31 March 1944. In addition, of course, there would be still more need for an extensive American fighter force to protect the bombers and to assist in the reduction of German fighter strength.

For the integration of American USAAF operations in the combined offensive the Q30 Plan made only a surprisingly informal provision. "Fortunately," it said, the capabilities of the two forces were "entirely complementary." It argued that the best effective results from strategic bombing would be obtained by directing the combined day and night efforts of the U. S. and British bomber forces to all-out attacks against targets which were naturally complementary, in a campaign to undermine decisively a limited number of selected target systems. The American bombers could thus, in general, use

~~SECURITY INFORMATION~~

REF ID: A61813

34

~~CONFIDENTIAL~~

specific industrial objectives by day, and that this would ordinarily be done by night. The cities associated with these objectives, however, may depend on the tactical situation.

This plan does not attempt to prioritize the major effort of the bomber command. It simply recognizes the fact that non precision targets are bombed by the night air force in daylight, the efforts should be so planned that and completed by day bombing actions against the surrounding industrial areas at night. Targets truly in industrial areas to be attacked are in most cases identical with the industrial areas which the British have themselves selected for the destruction anyway. These include the R&D, the R.A.F., A.R.M., A.R.M.Y., R.A.F.A.T., and the like. [REDACTED] Some [REDACTED], CEMA, etc., and many other priority cities. In any case, of course, smaller towns whose principal significance is connected with one precision target to be selected for an night air force.

In the course of the year 1942, through the JCS had had a number of bitter opposition. But our division took these concerns on the proposed commitment of forces. General Arnold understood that cancellation of U.S. bombers to the combined offensive should be substantially as the forthcoming general letter.¹⁹ The Army Air Forces, however, raised the objection to this, the first commitment in virtue of the recent bombing problems; and they recalled a decision of the CCS concerning priority of future operations in which G.C.H., together with A.C.C. and A.R.M.Y., had been bracketed with operations in the southwest Pacific. Nevertheless, on 1 May the JCS approved the C.O.P. Plan as presented by G.C.H. and recommended planning is to the maximum extent practicable, consistent with aircraft precision objectives, available shipping, and current strategic commitments.²⁰ On 11 May the JCS presented the plan to the Combined Chiefs, who were evidently in agreement, [REDACTED] [REDACTED]

00

Conference. It was decided on the preceding day, 8th JUN, that it was intended, first, to let the CO's be given top priority in build-up and its execution facilitated, and second, that its progress be watched continuously with an eye to determining a date for cross-Channel operations.³¹

Before the CO's could accept the plan, including the commitment of forces in their parts, certain strategic decisions had to be made involving the exact course of the European war. It was no longer a question of provoking the concert of a combined Western offensive. That had been settled at Dusablon, where that campaign was inseparably linked with the ABD-UP operation; and, since all parties still agreed to fulfill their cross-Channel invasion as a major objective to a front on the European Axis, the combined rather often involved an unprofitably pure of allied strategy. Whether it was a question of "no room" due prior to the war offensive should be given to our other major commitments in the allocation of forces, Britain and U. S. strategists had come to the conclusion with divergent views regarding the best disposition of allied force after the accomplishment of US V. the American representative argued, as did Churchill, in favor of getting forces in the U. S. as rapidly as possible in preparation for an invasion of Normandy at the earliest practicable date. In British, with equal consistency, advocating more or less-scale operations in the Balkans based on the ground that such operations could be eliminated easily and seriously disturbing German forces, the ABD-UP were

CONFIDENTIAL

SECURITY INFORMATION

AAFBH-18

306

~~CONFIDENTIAL~~

certain of success. With the American view, the CBO Plan, calling as it did for a cross-Channel invasion as soon as the bomber offensive had completed its final phase in April 1944, was in perfect accord. The British, on the other hand, were reluctant to make too firm a commitment in that direction for fear it might "tie our hands" regarding plans in other directions.⁹²

At the same time the British representatives agreed that the intensity of the bombing campaign would have a material effect on any land operation, whether in northwestern Europe or in the Mediterranean area, and that it should not be reduced except after "critical examination." Sir Charles Portal, without maintaining that the utmost priority should continue to be accorded to SICKLE, expressed deep concern for the rate of that undertaking. The important thing about the CBO Plan, he emphasized, was to be found not so much in the "tremendous effect" it promised on German production and morale, as in the proposed elimination of the German fighter force, which, he believed, was growing so rapidly that every week's delay made the task of defeating Germany more difficult, no matter where the principal effort was to be applied.⁹³

On 18 May, after considerable discussion, the CCS approved the CBO Plan as presented.⁹⁴ And the conference finally decided that the CBO would, as planned, culminate in a cross-Channel invasion for which 1 May 1944 was selected as the target date. Operations in the Mediterranean were to consist only of action calculated to eliminate Italy. In addition, it was decided to launch bombing attacks as soon as possible from Mediterranean bases against the Ploesti oil fields. The question of priority among these specific undertakings for 1943 and 1944 was happily avoided, for, after balancing available resources with

~~SECURITY INFORMATION~~

AAFRE-18

307

requirements more thoroughly than at any previous meeting, the conference concluded that all were possible, and that, broadly speaking, "there are sufficient air forces to meet all requirements in all theaters."⁹⁵

In compliance with the decisions made at TRIDENT, the C/AS, RAF, in whose hands, as agent of the CCS, the direction of the bomber offensive rested, issued on 10 June 1945 to the Air Officer Commanding-in-Chief, Bomber Command and Fighter Command and to the Commanding General, Eighth Air Force a directive to govern the CEO. This paper confirmed the primary object of the bombing campaign as set forth at Casablanca, and incorporated the essential elements of the CEO Plan as adopted at TRIDENT. Of the necessary coordination between the two forces involved, it was stated: "While the forces of the British Bomber Command will be employed in accordance with their main aim in the general disorganization of German industry their action will be designed as far as practicable to be complementary to the operations of the Eighth Air Force." The British Fighter Command would, "consistent with the needs of the air defence of the United Kingdom" (which, by the way, had been left entirely up to the RAF), be employed to further the bomber offensive. The American fighter forces would also be employed in the furtherance of the bomber offensive in accordance with the instructions of the Commanding General, Eighth Air Force and in cooperation with forces of Fighter Command. The allocation of targets and "the effective co-ordination of the forces involved" was to be insured by "frequent consultation between the Commanders concerned."⁹⁶

~~CONFIDENTIAL~~
~~SECURITY INFORMATION~~

AIR C - 18

303

~~CONFIDENTIAL~~

This matter of coordination was of crucial importance. To insure how well the overall plan was to be conclusive, the COA, to be truly co-ordinated effort, required constant and often detailed cooperation between the two forces. As Commandant, it had been generally assumed by the Chief of Air Staff, that would supersede the combined offensive as agent for the CCS, but no specific authority had been given by which the two forces could coordinate their plans. In this respect the COA had said nothing to the Commandant concerning... On the 15th the COA informed General Arnold's staff, to Sir Charles Portal or in; the creation of "the committee for military liaison for closest possible co-ordination, or rather, inter-action, of all the battle air forces." Now, as usual, "the maximum compatibility of their operations would appear to be as soon as beyond the capabilities of our commandants, in practice, to co-ordinate." It accordingly suggested that a permanent committee be established for said purpose, to operate within the limits of the established regulations.⁵⁷

Under secret direction of 10 Jun 1942, a committee of operational planning, committee was set up. First body was to consist of representatives from the RAF Bomber and Fighter Commands, Eighth Air Force, VIII Army Command, and VIII Army Command. An Air Ministry representative from the Directorate of Battle Operations would be available "to be co-opted as a committee for purposes of liaison with the Air Staff." It was not clear that the committee was to be concerned with coordination and with the tactical plans.

SECURITY INFORMATION

For specific combat operations, which should be prepared well in advance of requirements, and with critical examination of the tactical execution of those plans. It is no less responsible for the conduct of operations, which it divides the responsibility of the commanders concerned.⁹³

Despite such arrangements as a CIO, a team was retained in the organization of the CIO. The CIO Plan and the directive of 10 June 1943 both purposedly avoided committing the USAF to a rigid adherence to the particular objectives they set forth. The mission of the Strategic Air Force, for which these target systems appear to have been primarily devised, would "as far as practicable" be complemented by that of the AF's older Command. It was "Fortunate" that the objectives of the two forces did for the most part coincide, but it was also fortuitous: such coincidence of effort was not explicitly made a necessary part of the plan, however much its authors may have considered it essential for practical purposes. The strategic and operational forces were still engaged in bombing the enemy according to widely divergent operational theories; and, moreover, it was no longer to bring about the general disorganization of German society by attacking civilian morale as a primary objective, but strategic doctrine differed radically from that upon which the CIO Plan had been erected. It was probably inevitable, therefore, that the two forces would continue to operate along lines not so nearly parallel as had originally been intended. The combined bombing effort did not in fact achieve close integration until late in the campaign, and the right of the AF to receive objectives and to direct application was on fine-point and area.

"Have so come read b/w in connection with our future air planning.
Especially where are ideas which we should have in our minds. It
looks best way to do."

18. See origins, pp. 41-50, for fuller treatment of both criticism and U. S. doctrines.
19. ... 200-1, 12 Aug. 1941, in NMIC files, Office of Security Officer.
20. In the New York Times, 8 August 1942, John Morton cited "British-U. S. air raids warning by Air Offensive," a report dated b. Spaatz, 11 August 1942. An article by Col. R. Macmillan in The Sunday Times, 13 August 1942, inspired a cable from David W. Jackson to the New York Times, 16 August, "British see our heavy bombers unsuited for raids on continent. U. S. finds subjects for use B-17's for controlling Atlantic and concentrate on Lancasters." On 13 August, General Dwight D. Eisenhower reported that there was no "U.-B." friction over methods and objectives of the sector offensive. New York Times, 16 August 1942.
21. Origins, pp. 101-107.
22. Prepared history, VIII - Major Command b. Lt. Col. ... C. Pinrich, p. 72-75, in L-S-O files.

Chapter II

1. Although one mission was made in the European Theater by American heavy bombers, the first mission by American bombers operating out of the U. S. was flown on 4 July 1942 by six crews of the 15th Bomb Sq. (Light) at Kimbolton. Targets for this intrinsically difficult night mission consisted of four airfields in Holland. It was not a very successful effort, three of the planes having failed to drop their bombs on the targets, two having been destroyed, and only one having bombed the objective, but with unobserved results. Victory, first to bomb, activation on 17 August 1942, p. 1' 11".

BIBLIOGRAPHICAL NOTE

Because of the nature of this history, the sources of the information were found chiefly in highly classified documents of AAF, British, and Allied staff offices. As cited in the Notes, much reliance was placed on CCS and JCS papers; on British Air Ministry reports, correspondence, and analyses; and on the files of the Assistant Chief of Air Staff-5. Other sources frequently used include the files of AC/AS-2; interpretation reports, evaluations, and interviews in the A-2 Library; letters in the Air Adjutant General and Secretary of Air Staff files; reports of the Office of Strategic Services, Operational Research Section and Operations Analysis Section of Eighth Air Force, the AAF Evaluation Board, the Committee of Operations Analysts; the U. S. Strategic Bombing Survey; the Eaker Report; Statistical Summaries; and unit histories, cables, Tactical Mission Folders, and special studies in the Archives of the AAF Historical Office. The reference to "Butcher MS" concerns the manuscript copy by Capt. Harry C. Butcher, USNR, for his book My Three Years With Eisenhower, later published by Simon and Shuster: New York, 1946.
