Missile Defense System Software Analyzed During Integrated Ground Test-2 (IGT-2)

Operational Test Agency analysts observe as warfighters complete test runs for record on Integrated Ground Test-2 (IGT-2) in support of the Ground-based Midcourse Defense program. IGT-2 is the first integration and system-level test of the component software used in the GMD initial defensive capability. The test also provided a unique opportunity for warfighter assessment of techniques, training and procedures. Performed in the Prime Consolidated Integration Lab in Huntsville, Ala., IGT-2 provided a realistic testing environment using real world scenarios.
