

Outbreak of *Mycobacterium tuberculosis* Among Employees of an Elephant Refuge

Rendi Murphree, PhD

CDR, USPHS CDC Epidemic Intelligence Service Officer Tennessee Department of Health Communicable and Environmental Disease Services

Centers for Disease Control and Prevention Office of Surveillance, Epidemiology, and Laboratory Services

The Outbreak

Notification

- October 2009
- 5 tuberculin skin test (TST) conversions among employees of an elephant refuge

Refuge

- Known to house elephants previously exposed to Mycobacterium tuberculosis
- Rumors that one elephant had tuberculosis disease

Tuberculosis (TB)

- Caused by Mycobacterium tuberculosis (Mtb)
- Spread on airborne droplet nuclei
- Transmitted during close, prolonged contact

TB in Humans and Elephants: Inactive Infection

	Humans	Elephants
Detection method		
Symptoms		
Infectious to others		
Preventive therapy		

TB in Humans and Elephants: Inactive Infection

	Humans	Elephants
Detection method	Positive TST or IGRA	
Symptoms	No	
Infectious to others	No	
Preventive therapy	Recommended	

TB in Humans and Elephants: Inactive Infection

	Humans	Elephants				
Detection method	Positive TST or IGRA	Validation needed				
Symptoms	No	No				
Infectious to others	No	Probably not				
Preventive therapy	Recommended	Efficacy unknown				

TB in Humans and Elephants: Active Disease

	Humans	Elephants						
Diagnosis								
Symptoms								
Infectious to others								
Treatment								

TB in Humans and Elephants: Active Disease

	Humans	Elephants
Diagnosis	Sputum or chest x-ray	
Symptoms	Yes	
Infectious to others	Yes	
Treatment	Required	

TB in Humans and Elephants: Active Disease

	Humans	Elephants					
Diagnosis	Sputum or chest x-ray	Saline trunk wash					
Symptoms	Yes	Rare					
Infectious to others	Yes	Yes					
Treatment	Required	Recommended; efficacy unknown					

TB in Humans and Elephants: Treatment for Disease

	Humans	Elephants
Antibiotics		
Duration		
Delivery		
Efficacious		

TB in Humans and Elephants: Treatment for Disease

	Humans	Elephants
Antibiotics	Izoniazid, rifampin, ethambutol, pyrazinamide	
Duration	6 months	
Delivery	Oral	
Efficacious	Yes	

TB in Humans and Elephants: Treatment for Disease

	Humans	Elephants					
Antibiotics	Izoniazid, rifampin, ethambutol, pyrazinamide	Izoniazid, rifampin, ethambutol, pyrazinamide					
Duration	6 months	12 months					
Delivery	Oral	Oral or rectal					
Efficacious	Yes	Unknown					

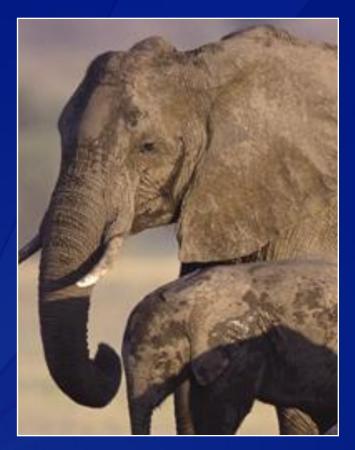

Important Literature

• 1998 Michalak et al. (EID)

- TB outbreak among 4 elephants in Illinois
- One employee had TB isolate matched the elephants
- 11 employees positive TST timing of conversion unknown
- Prompted action from USDA annual *Mtb* testing required

Captive Elephants in North America

220 African elephants 2% infected with *Mtb*

270 Asian elephants 12% infected with *Mtb*

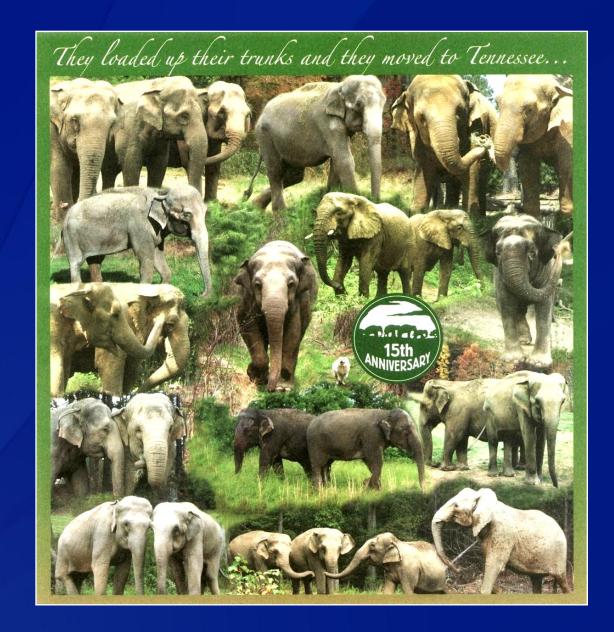

Elephant Refuge in Tennessee

- Established in 1995 with 1 elephant
- Care of sick, old, or abused elephants
- Nonprofit organization
- Accredited and licensed
- Closed to the public

Elephant Refuge in Tennessee

2,700 acres and 14 elephants

3 areas with a barn and dedicated staff
African area — 2 African elephants
Asian area — 6 Asian elephants
3 from Illinois herd
Quarantine area — 7 Asian elephants
All from Illinois herd

www.elephants.com

www.elephants.com

The Outbreak

Notification

- October 2009
- 5 TST conversions
- 1 elephant with TB

Response

- Gained access to the refuge
- Initiated onsite investigation
- December 2009

Investigation Objectives

- Determine extent of outbreak
- Identify risk factors for TST conversion in humans
- Prevent ongoing transmission

Cohort Study

Interviews

Occupational health records

- Preemployment and annual TST results
- Respirator fit testing dates
- Employment dates

TST screening increased to quarterly

TST Conversion

- Refuge employee or intern
- 2006–2009
- Documented negative (<10 mm) TST
- ≥10 mm increase in TST induration within 2 years

Onsite Assessment

- Barn management
- Elephant husbandry practices
- Environmental sampling in targeted areas
- CDC National Institutes of Occupational Safety and Health (NIOSH)

Record Review

Refuge and TN Wildlife Resources Agency (TWRA)

Timeline of events

- Elephants
- Employees

Mtb culture results for respiratory secretions

 Trunk wash
 Participating elephants

Employee Cohort, 2006–2009

57 current and former employees

46/57 (81%) interviewed

- 30 caregivers
- /11 administrators
- 5 maintenance workers
- 9/46 (20%) had positive TST

Characteristics of Employees with Positive TST (n=9)

- 7 female
- Mean age 40 years (range 25–62 years)
- TST ranged 12–24 mm induration
- 1 conversion in 2006
 - Prolonged exposure to a known source of TB
- 8 with documented conversion in 2009
- 6 began preventive therapy
- None have active TB disease

High Risk Work Practices

Unrestricted Air Flow

Environmental Sampling

- Barn housing the *Mtb*infected elephant
- Standard methods
- Mtb not isolated
 - Elephant stool (n = 14)
 - Water (n = 12)
 - Barn surface swabs (n = 23)
 - Air filter (n = 3)
- M. fortuitum isolated from 6 specimens

More on Elephant L *Mtb* Culture Isolation

- Transferred from Illinois herd in 2006 and housed in quarantine
- Respiratory secretions obtained by trunk-wash method annually
- Mtb culture-positive in 2009
 - Susceptible to all 4 first-line antibiotics
 - Mtb genotype PCR01621
 - 2004 CA human patient
 - 2005 TN elephant died with TB (Illinois herd)
 - 2006 TN elephant died with TB (Illinois herd)
 - 2008 MO elephant

Summary

- Employees exposed to the quarantine area in 2009 were 20 times more likely to have TB infection
 - RR 20.3; 95% CI 2.8–146.7

8 TST conversion documented in 2009
 3 administrators without elephant contact

Factors Contributing to Transmission

Delayed response to *Mtb* isolation

- Inadequate infection control
 - Aerosol-generating work practices
 - Inconsistent use of respirators
 - Unrestricted air flow

Immediate Interventions

- Relocate nonessential personnel
- Increase use of respirators
- Revise infection control practices

Limitations

11 former employees not contacted
 None employed during 2009
 2 employed during 2008

Conclusions

Mtb transmitted from elephant to humans
 – Elephant L source of *Mtb*

Indirect exposure associated with *Mtb* infection

 Inadequate infection control practices contributed

Immediate interventions implemented

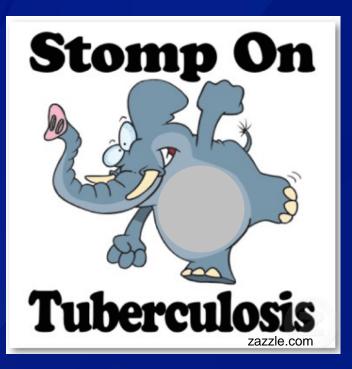

Recommendations

- Reduce aerosol-generating work practices and restrict unfiltered air flow
- Educate workers and provide a comprehensive occupational health program
- Develop and comply with evidence-based TB control guidelines to protect employees working in the elephant industry
- Improve methods for diagnosis and treatment of *Mtb* infection in elephants

EXTRA SLIDES

New Serologic Assays for Detecting *Mtb* Exposure in Elephants

ElephantTB STAT-PAK[®]

- Lateral-flow technology
- Detects reactive antibody to *M. tuberculosis* and *Mycobacterium* bovis antigens
- Simple, rapid, and can be performed onsite
- MAPIA (multiantigen print immunoasay)
 - Detects reactive antibodies in serum specimens
 - After a STAT-PAK-positive result, MAPIA has been used as a confirmatory test for *M. tuberculosis*
 - Monitoring the treatment of elephants with active TB

Important Literature

1998 Michalak et al. (EID)

- TB outbreak among 4 elephants in Illinois
- One employee had TB isolate matched the elephants
- 11 employees positive TST timing of conversion unknown
- Prompted action from USDA annual *Mtb* testing required

• 2002 Oh et al. (EID)

- TB infection among multiple species at California zoo
- 55 employees positive TST 10 with probable conversion

Important Literature

1998 Michalak et al. (EID)

- 5 *Mtb* genotypes circulating among 6 elephant herds

Culture Isolation of *Mtb* from Elephant Respiratory Secretions

- Obtained by trunk-wash method
 - 30–60 mL of saline
 - Raise then lower trunk to collect saline
 - 3 samples collected over 1 week
 - Standard methods for mycobacterial species
- Method has low sensitivity
 - Mtb isolation confirms active TB disease
 - Negative result does not exclude active disease

Trunk Wash Collection

Trunk Wash Results

- Provided by TWRA
- 2006–2008, all trunk-wash results received were Mtb culture-negative
- 2009, *Mtb* isolated from 1 of 14 elephants
- Elephant L
 - *Mtb* culture-positive
 - Housed in quarantine area
 - Arrived in 2006
 - Transferred from Illinois herd
