

### Adaptive Management for Threatened and Endangered Species

---

- **The Challenge:** Threatened and endangered species have to be managed in the face of uncertainty, but traditionally, there has been reluctance to think about adaptive management of listed species. Management agencies with responsibility for threatened and endangered species need tools to help manage in the face of uncertainty, with the hope of reducing that uncertainty.

- **The Science:** We have worked closely with management agencies in the US and Australia to develop adaptive frameworks for management of polar bears, wolves, Tasmanian devils, Florida scrub-jays, bull trout, Mead's milkweed, and humpback chub.

- **The Future:** A vision for the use of adaptive management under the U.S. Endangered Species Act is being developed, and a special section in the Journal of Fish and Wildlife Management is being prepared.
