

Semantic SOA: Key Technologies for DoD Net-Centric Computing

“Sense, Share, Discover, Understand”

NASA Earth Science Sensor Web Meeting
February 14, 2007

Tom Velez, CEO
John McKim, CTO
Computer Technology Associates

Agenda

- Net-Centricity: The Promise vs. the Reality, and the Emerging Role of Semantics
- The Emerging Role of Web Services/Agents in DoD “Sensor Webs”
- WebAgents – a Semantic Agent Framework for Geospatial Intelligence
- Near Term Application – Time Critical Operations
- Future Vision – Achieving the Promise via the “Semantic Wave”

The DoD Sensor Web Evolution

- “Sneaker-nets”
- “Machine-to-Machine”
- Semantic Interoperability

Net-Centricity: Promise vs. Reality

- The growth and nature of “time critical” threats is driving the DoD towards Network-Centric Warfare and “upstream” Multi-Sensor (“Multi-INT”) Fusion
- The promise of these ideas is that “horizontal integration” can shorten decision timelines by leveraging the dynamic relationships among:
 - Multi-INT ISR Sensors regardless of platform/platform “owners”
 - Decision Makers (strategic/tactical) regardless of their location
 - Effectors (warfighters and operators) regardless of service
- SOAs enable interoperability and dynamic compositions of services across diverse tactical network architectures; intelligent agents can autonomously infer and execute actions to provide “smart push” services

Net-Centricity: Promise vs. Reality (cont.)

- However most existing DoD ISR sensor data systems lack semantics
- As a result, although Global Net-Centricity can make disparate data available anywhere at any time, *people*, not machines are still used to “connect the dots”
- Efforts are underway to change this picture:
 - W3C/DAML Programs
 - DoD XML Registry; Intelligence Community Markup Language (ICML); DoD Discovery Metadata Specification
 - Horizontal Fusion Portfolio/Net-Centric Enterprise Services (NCES) Initiatives
 - FEA Data Reference Models (DRM)-Semantic Interoperability Community of Practice (SICoP)

Semantics: Making “Sense” of the Data

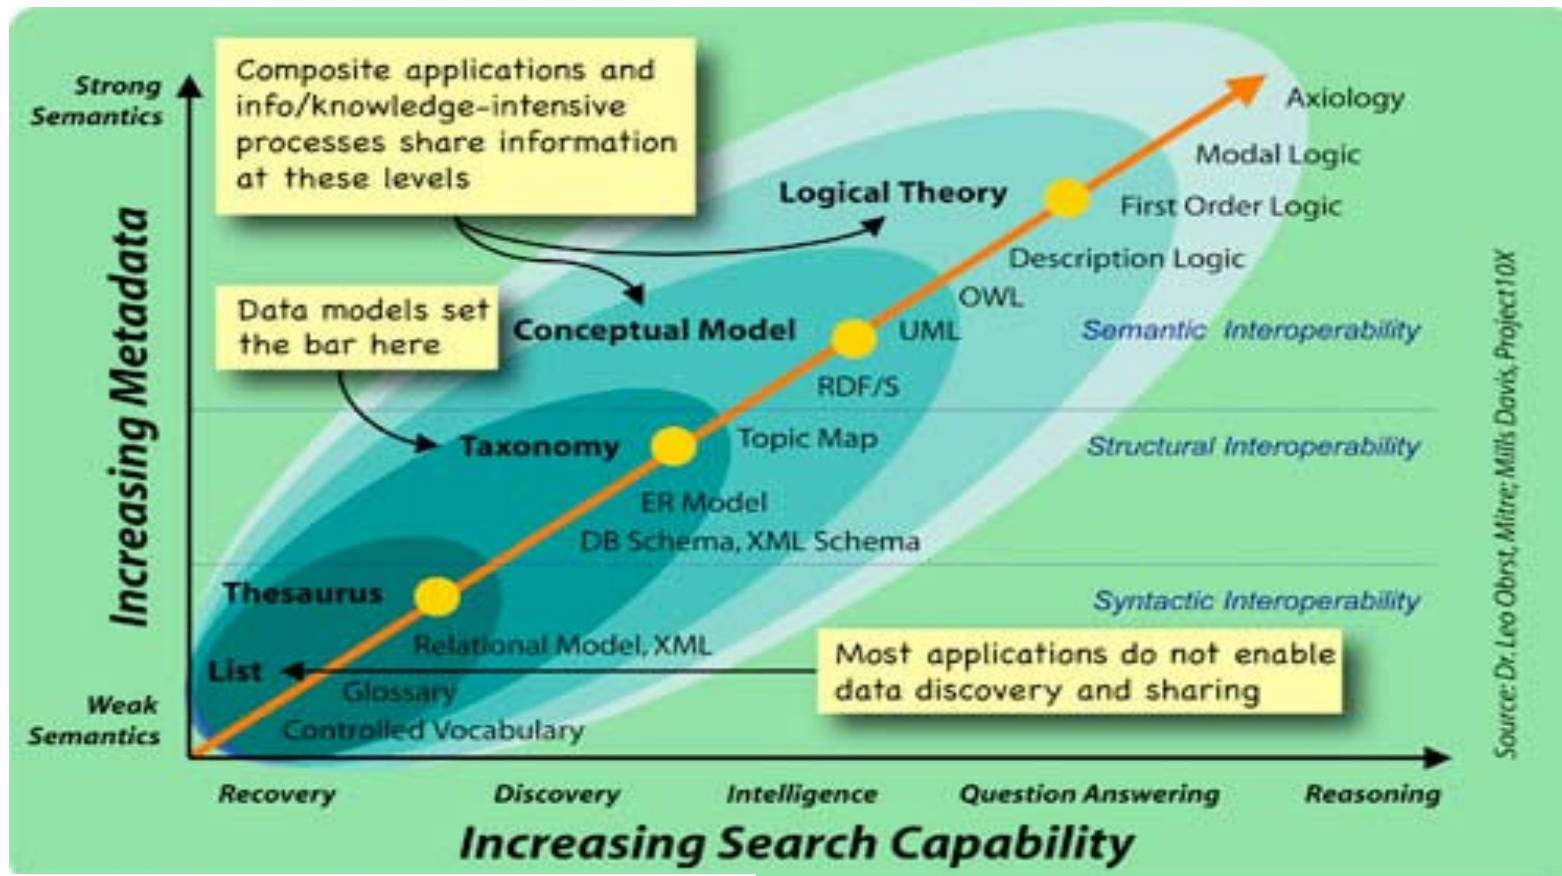

The real race will be won by those who create the most valuable configuration of knowledge in the shortest time....

- Semantic technologies make the meaning of data explicit by representing meanings, associations, and know-how (e.g. rules) about the uses of things separately from data and program code.
- This knowledge representation is called an ontology — a run-time semantic model of information, defined using constructs for:
 - Concepts Relevant to the Domain of Interest
 - Properties and Attributes of Concepts
 - Constraints on properties and attributes
 - Instances of concepts – individuals, threats, places (data, facts)
- Ontologies can make digital content (any form of digital media such as imagery, video, text, etc.) “smart” when annotated with metadata based on an ontology

More Metadata/Knowledge Modeling → More Reasoning Capability*

Illustrative DoD Net-Centric Efforts: The Emerging Role of SOA/Agents in DoD “Sensor Webs”

A Driving Net-Centric Challenge: Time Critical Targeting (TCT)

Best to Worst Case: 83-591 min (prosecute only); 118-786 min (with BDA)

Issues

- Manual read of a large text plan; manual deconfliction for coalition ops

Clients

- A2IPB

Issues

- On Target Detection, Trafficability, Target History Analysis, EBO considerations

Subtasks

- Task ISR Sensors, 5-30min
- Redeploy Sensors, 15-120min
- Fuse Multisource INT, 15-45min
- Additional Analysis, 0-15min
- Mensuration, 1-20min

Clients

- TCTA
- JSWS
- JTAT

Issues

- Extensive check for Collateral damage considerations

Subtasks

- Nominate Targets, 1-1min
- Target Deconfliction, 0-20min
- Prioritize Targets, 1-3min
- Select Targets, 0-1min
- Coordination, 1-20min

Issues

- Range of available weapons

Subtasks

- Weather Effects, 0-1min
- Weapon Selection, 1-10min
- Route Analysis, 0-5min
- Package Construction, 1-10min
- Coordination, 1-20min

Clients

- JEES
- AODA

Subtasks

- Task ISR Sensors, 5-30min
- Redeploy Sensors, 15-120min
- Fuse Multisource INT, 15-45min

Global Net-Centric Surveillance and Targeting

To deliver decision quality intelligence information to the Warfighter by leveraging automated NRT correlation/fusion of airborne and national Multi-Int data to detect, locate, identify, and assess previously undetected/unlocated mobile targets (*initially SAMs, SSMs*)

Application of Technology

- Agent-based data access
- Model-based upstream fusion
- Collaborative visualization

Enables Critical Process Improvements

- Navigation of Stovepipes
- Upstream Fusion
- Specific Target ID
- Dynamic Re-tasking Nominations

Producing

- Reduced decision cycles
- Ambiguity reduced and precision increased

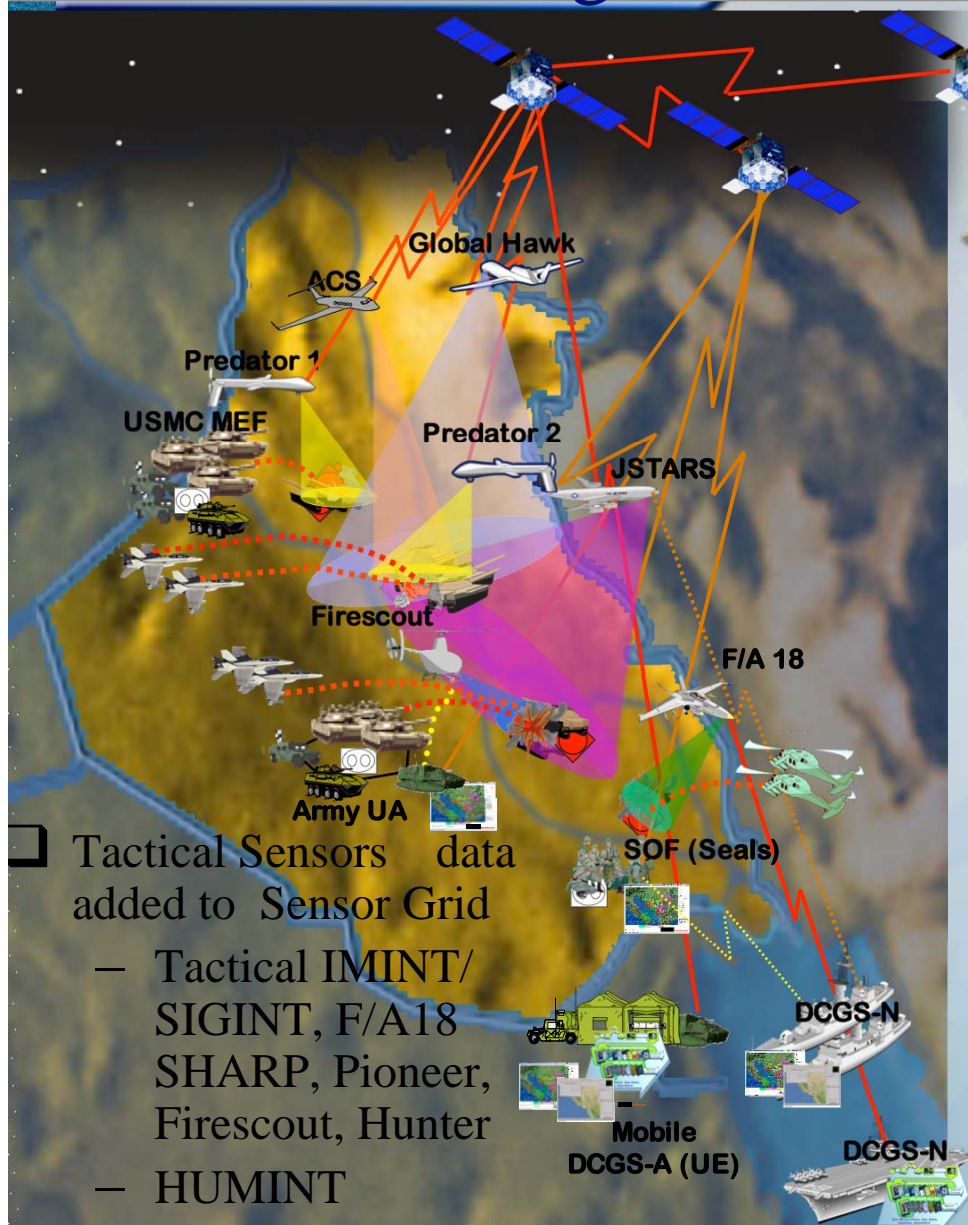

Integrated Picture

Unclassified / For Official Use
Only

Distributed Common Ground System (DCGS)

“Google”-like Intelligence Sharing

- Sensor-to-Shooter Support with Full Integration of Fire Control/C2 Systems

- DCGS Integrates Theater and National Intelligence

- National IMINT and SIGINT
- U-2, GH, Predator, ACS, RJ, JSTARS, etc.

- Multi-INT Visualization provides COP to all forces

- ISR Sensors (National, U-2, GH, Predator, ACS, RJ, UGS, etc)
- Blue Force Tracking
- GCCS-M, ASAS Red/Blue OB

DCGS Metadata Catalog

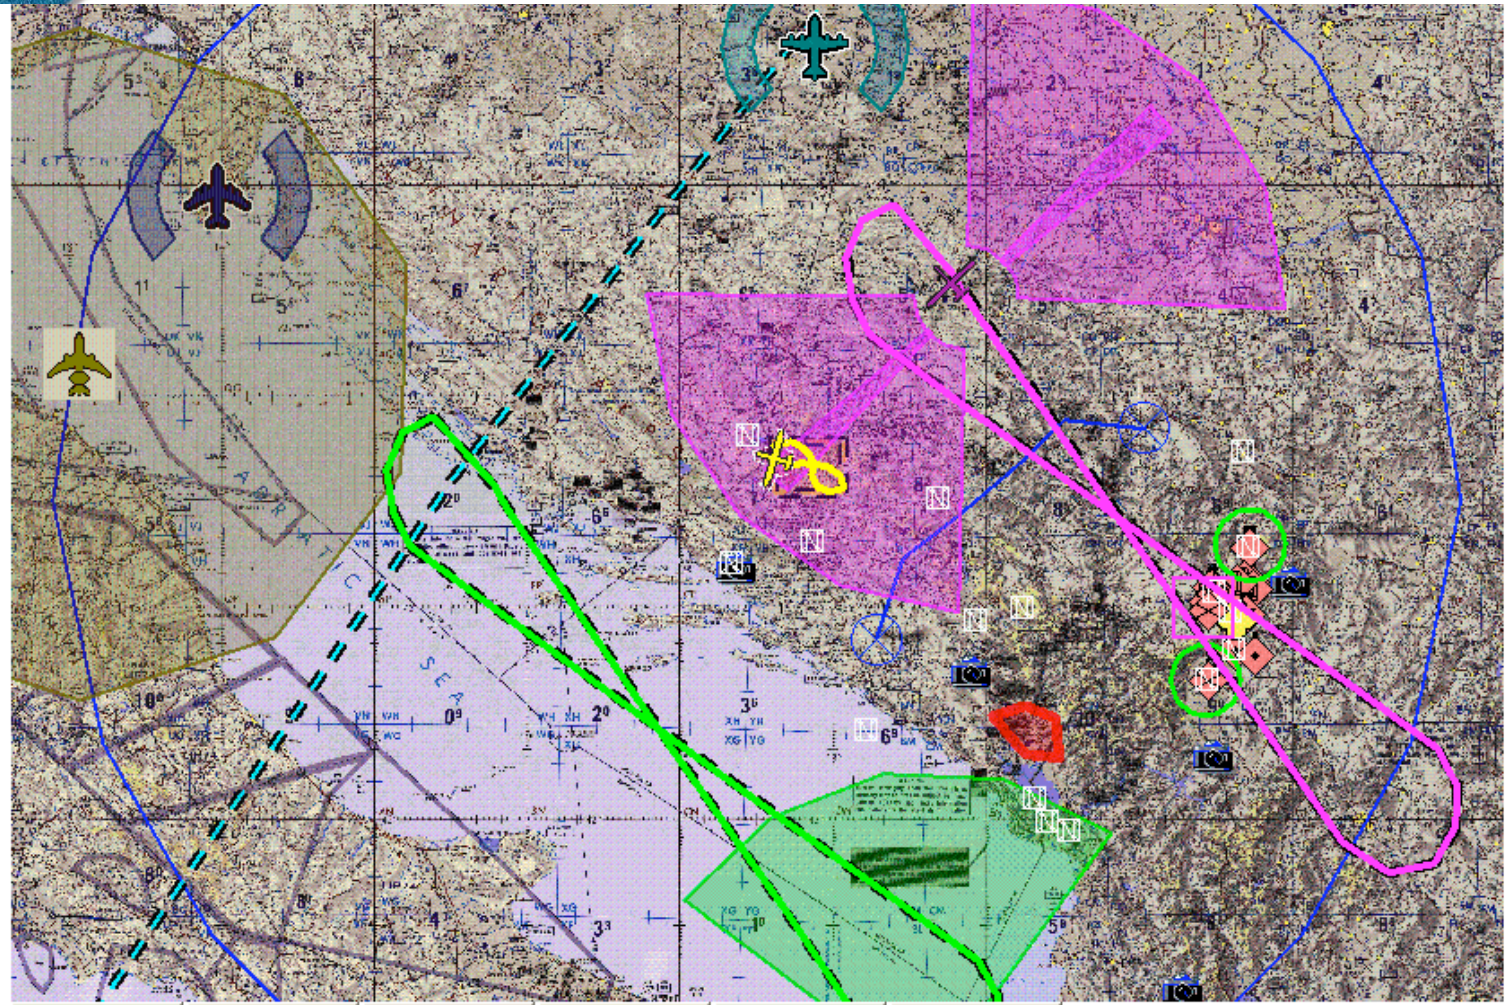

- The DCGS Metadata Service capabilities include
 - Search catalog
 - Catalog data
 - Subscribe and Unsubscribe
 - Agent-Based Alert Notification service (sentries, alert types, etc.)
- The Metadata Catalog Query capabilities include
 - Geospatial search
 - point radius, polygon, spatial operators
 - Temporal search
 - start and end times
 - Contextual search
 - exact match, and, or, either or, wild cards, etc.
 - Compound search
 - combinations of the above queries

DCGS Metadata Catalog Contents

- Air Tasking Order (including Special Instructions)
- Airspace Control Order
- Named Areas of Interest
- Prospective Enemy Courses of Action
- Target Areas of Interest
- Suspected Time Critical Target (TCT) Infrastructure Areas
- Suspected Launch Basket Infrastructure Areas
- High Value Target locations
- Lines of Communication
- Restricted Areas, No-Strike Zones, No-Fly Zones
- Forward Line of Troops
- Fire Support Coordination Line
- Imagery (IMINT), Multiple All Source Intelligence (MASINT), Signals Intelligence (SIGINT)

WMS – Web Map Service
WFS – Web Feature Service
WCS – Web Coverage Service
WS – Web Services (SOAP, WSDL)
KML – Keyhole Markup Language
ACL – FIPA Agent Communication Language
FIPA – Foundations for Intelligent Physical Agents

Dynamically Discover and Add OGC compliant Web Map Services (WMS)

The screenshot displays the AimPoint GIS Web Services Client interface. The main window shows a map with a new WMS layer added, indicated by a blue arrow and the text "New WMS Layer added". The "Web Map Service Dialog" is open, showing a list of WMS Servers. The "global_mosaic" server is selected, and the "Add WMS Layer" button is highlighted. The dialog also displays the "Map Sources" and "WMS Information" for the selected server.

WebAgents: An Agent Framework for Actionable Geospatial Intelligence

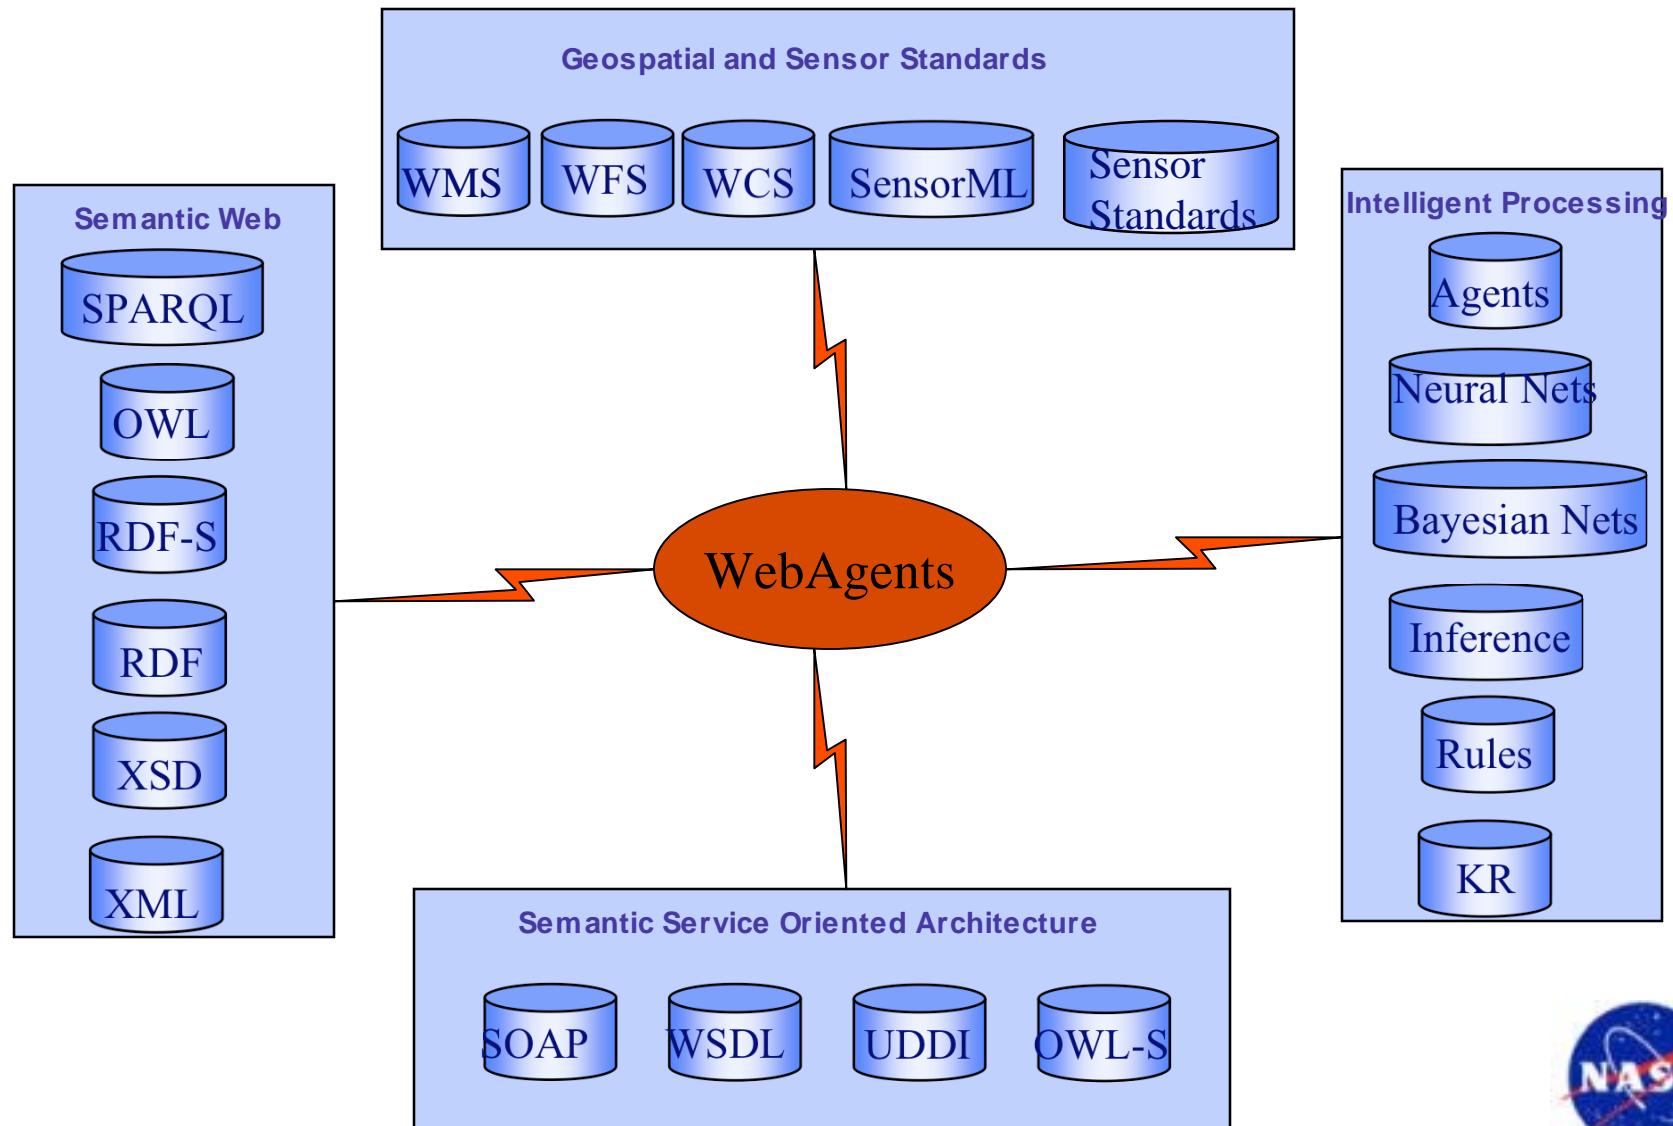

CTA WebAgents Platform

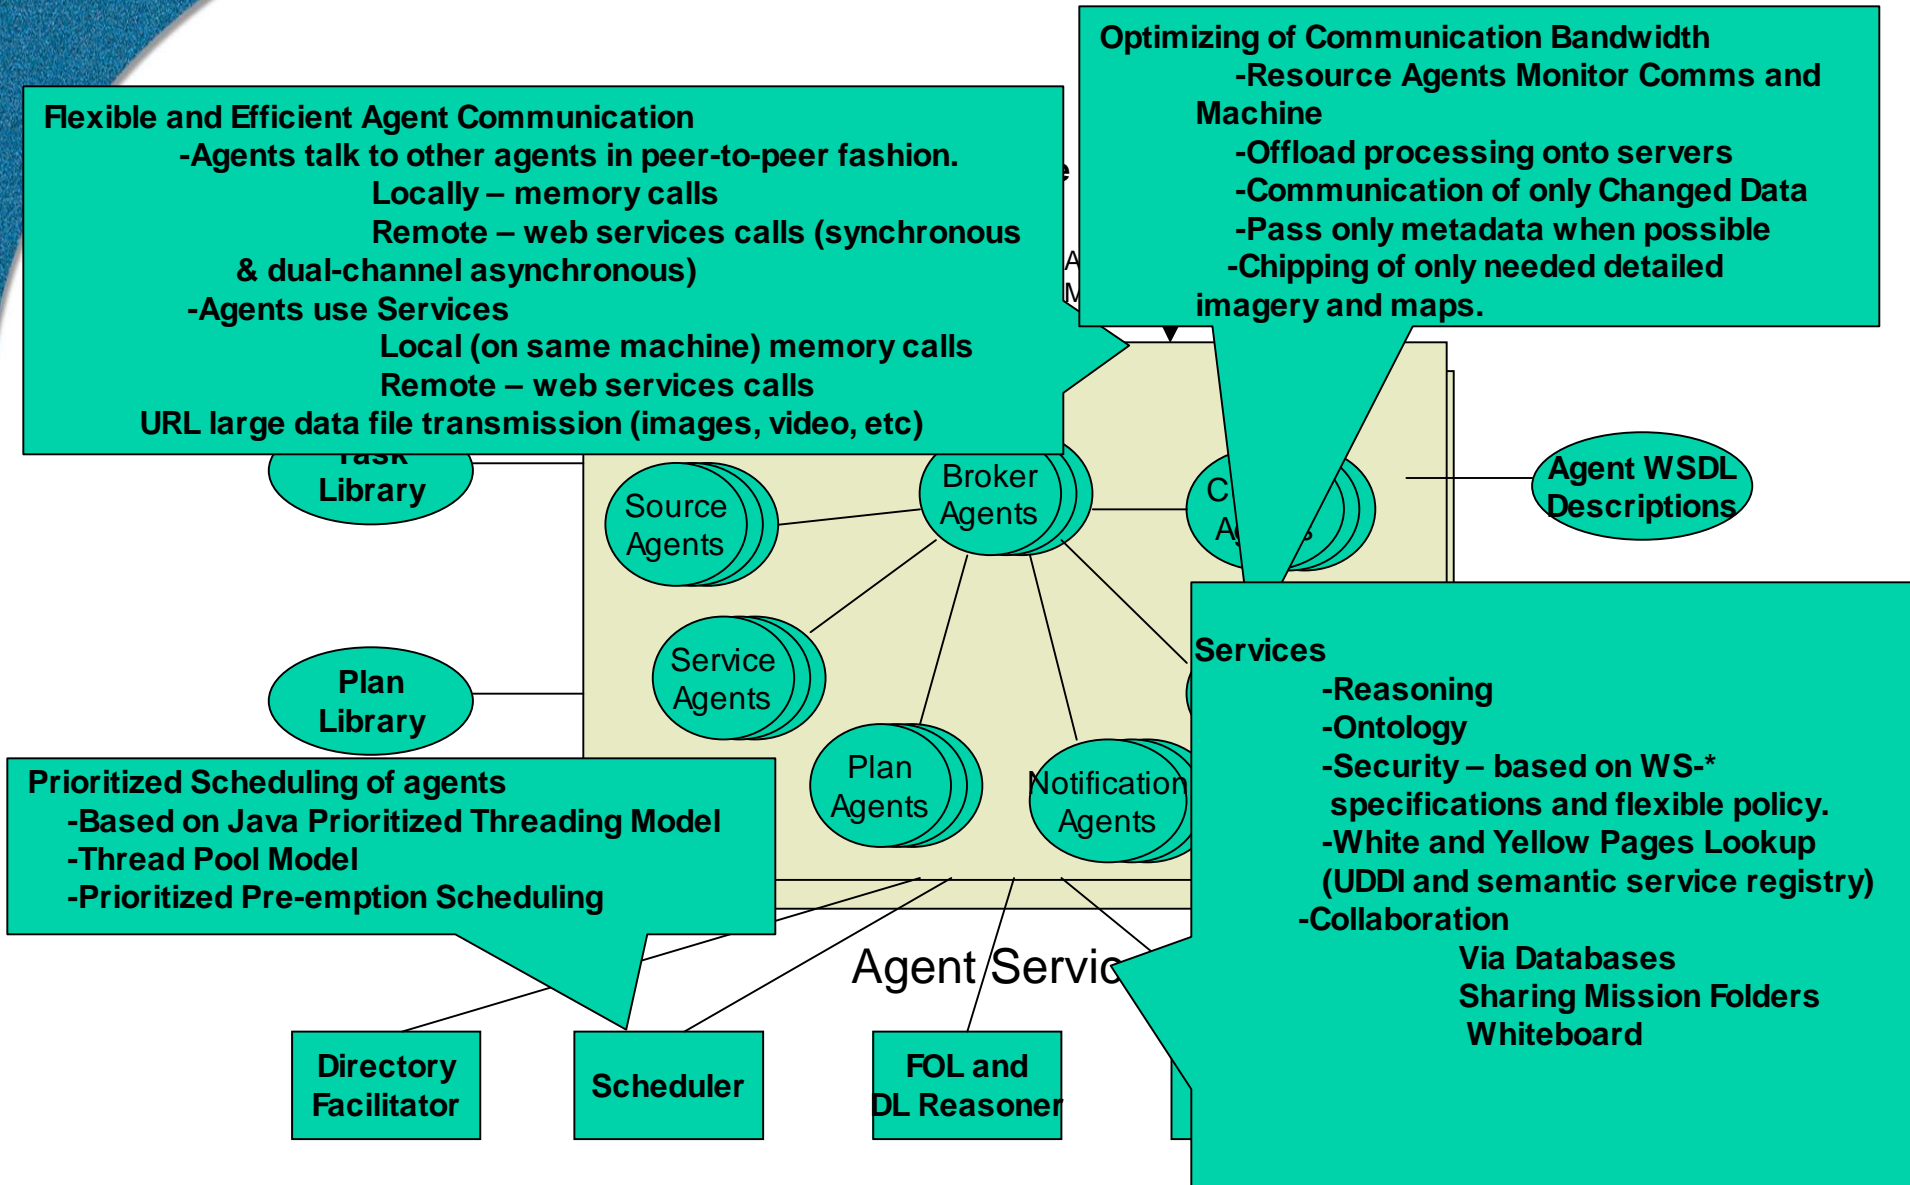

- **WebAgents Developed as element of CTA AFRL SBIR**
 - Agents Compose Complex Web Services Utilizing OWL-S
 - Agents Provide Intelligence to Net-Centric Sensor Webs
- **Addresses issues typically associated with existing agent platforms**
 - Communications based on RMI, JINI, and sockets - can't easily go through firewalls.
 - Not integrated with nor based on semantic web technologies
 - Lack of language and machine interoperability
 - Do not leverage Network Transparency benefits of SOA
 - Not designed for performance
- **Optimized for distributed performance in bandwidth constrained environments**
- **Can be readily configured to collect up-to-date SA information from diverse data sources based on the user's goals and mission ontology**
- **Supports autonomous operations during disconnected periods, anticipating user's information needs**
- **Supports advanced reasoning/collaboration services**

WebAgents: Convergence of Key Processes, Standards and Technologies

WebAgents MAS Architecture

Near Term WebAgents Application: SOF CAS Operations

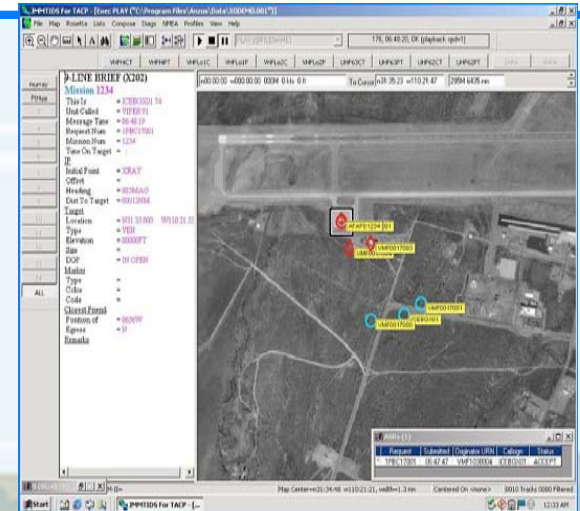

Current TACP/SOF Elements

Litton MK VII LRF

Direct Digital Link to OFP

**Targeting Support Applications
FalconView/BAO/Maps/Imagery**

**HARRIS
AN/PRC-117F**

**Provide Terminal
Attack Control**

TACTER-31A

WebAgents: “Virtual Sensor Webs” for Warfighters

-  Information Grid
-  Engagement Grid
-  Sensor Grid

A/C - SOF-FO - CAOC

User Interface Agents

Agents Facilitate MMI, provide customized interface, facilitate intermittent comms, anticipate user needs

Applications Agents

Agents support precision target coordinate generation, track weapon position, and uplink coordinates to PGW in flight

Middle Tier Agents

Agents “map” cohesive views of battlespace for users. Agents support sensor tasking, BFT, intelligent dissemination, bandwidth management

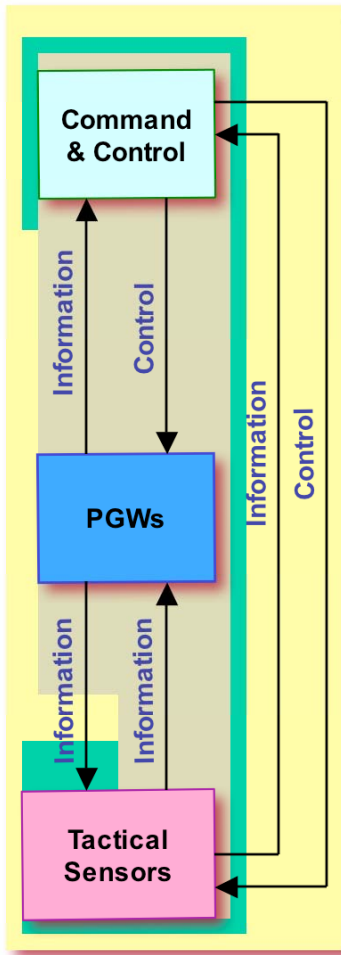

Source Agents

Source agents support integration of domain/context knowledge

Data / Information / Knowledge Flow

Adaptive Processing Control

What Warfighters Need from Smart Systems*

- Information Management – “Help me manage my time, the data I need, the knowledge I’m sent”
- Reach back/Intelligent Push/Chipping – “Handle the ISR requests that go to C2 nodes; help me get most relevant spot area imagery”
- Locations of Interest – “Where are my buddies, where are the threats”
- CoT Events – “Mission ICONS on the map plus , e.g., take picture of a suspect, then send picture and location as a CoT event”
- Ice Fishing – “Wait to see what shows up, then provide me changes that occur...”
- History Channel – What do we know about personalities, patterns of behavior, relationships, of objects I am observing?

Geospatial Semantics

Connectivity
Status

The screenshot shows the AimPoint alpha 0.1 GIS Web Services Client interface. The main window displays an aerial map of a city area with a grid overlay. Several features are highlighted with red and white icons, labeled as "Semantic WFS Features".

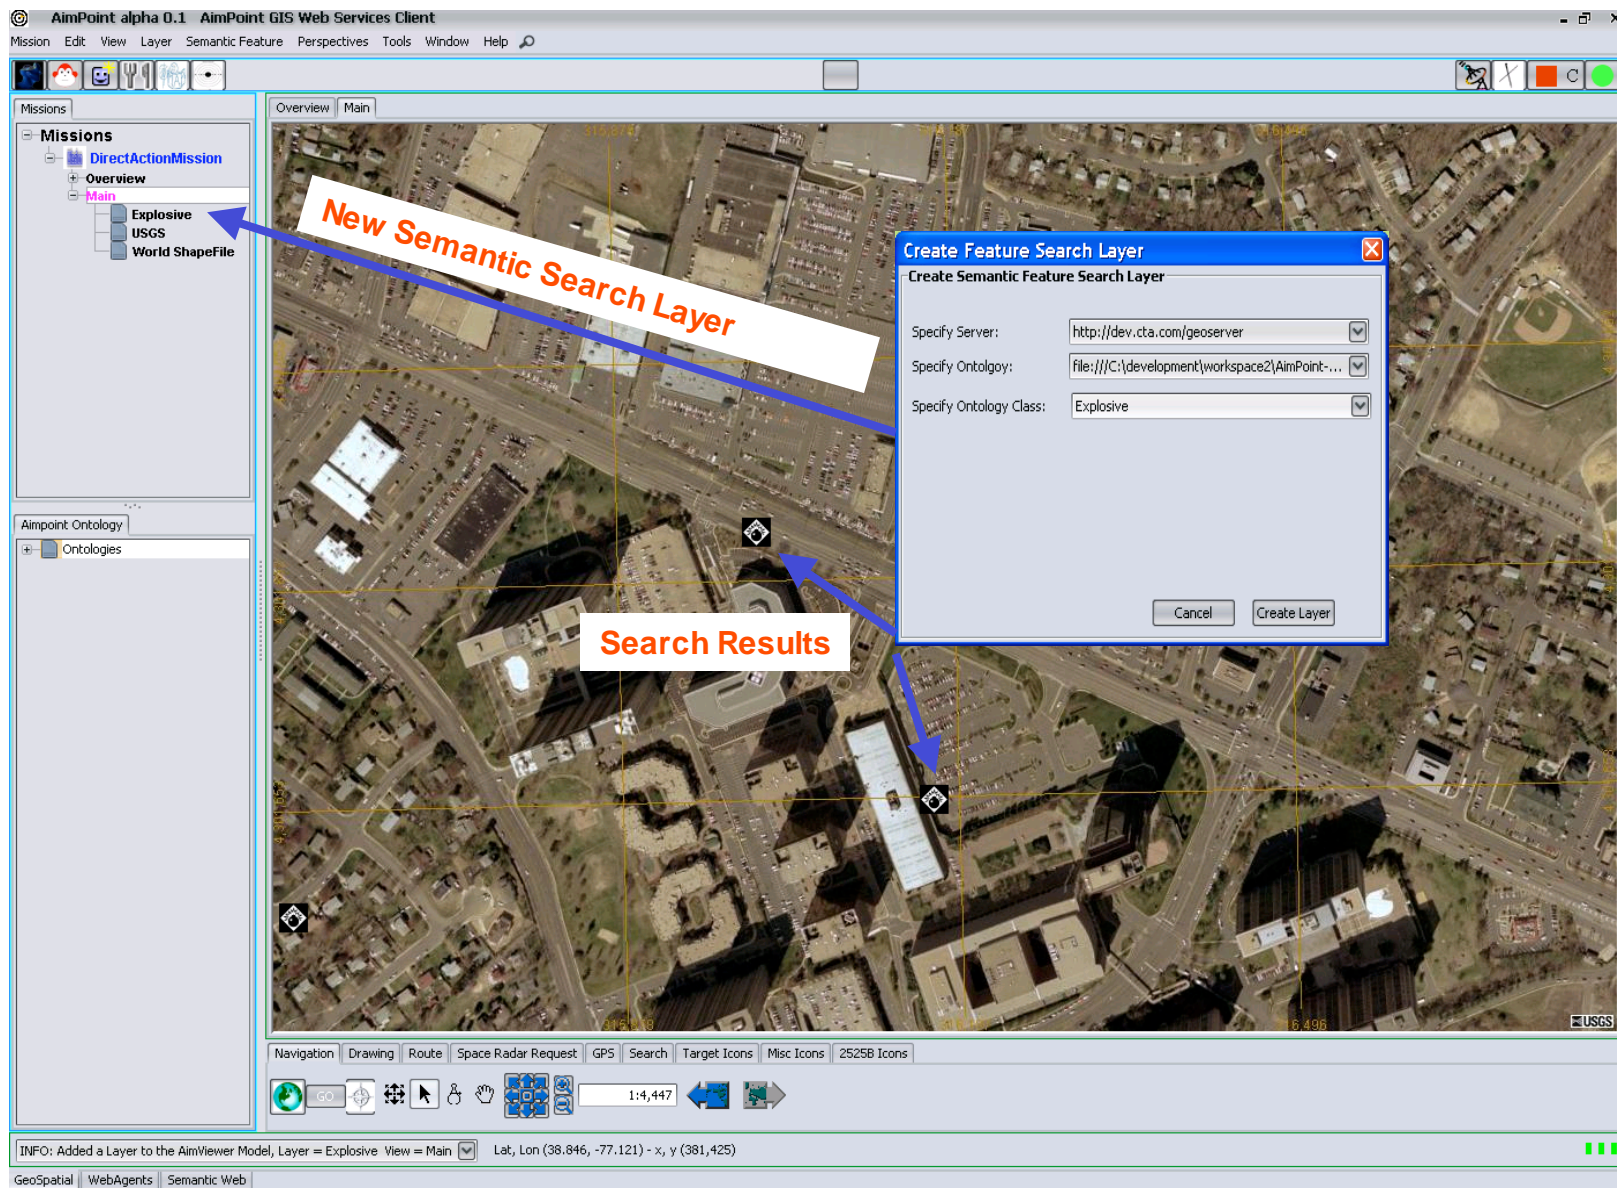

Annotations with arrows point to various parts of the interface:

- Agents**: Points to the top toolbar.
- Alerts/Event Notifications**: Points to a notification icon in the top right.
- GIS Layers**: Points to the "Missions" tree on the left, specifically to the "Semantic Feature" folder.
- Missions**: Points to the "Missions" tree on the left.
- Ontology**: Points to the "Ontologies" tree on the left, specifically to the "GeospatialThing" folder.

The interface includes a menu bar (Mission, Edit, View, Layer, Semantic Feature, Perspectives, Tools, Window, Help), a toolbar, and a status bar at the bottom showing coordinates (Lat, Lon (38.867, -77.052) - x, y (570,783)) and a scale of 1:3,991.

Dynamically Discover and Add OGC compliant WFS Semantic Features

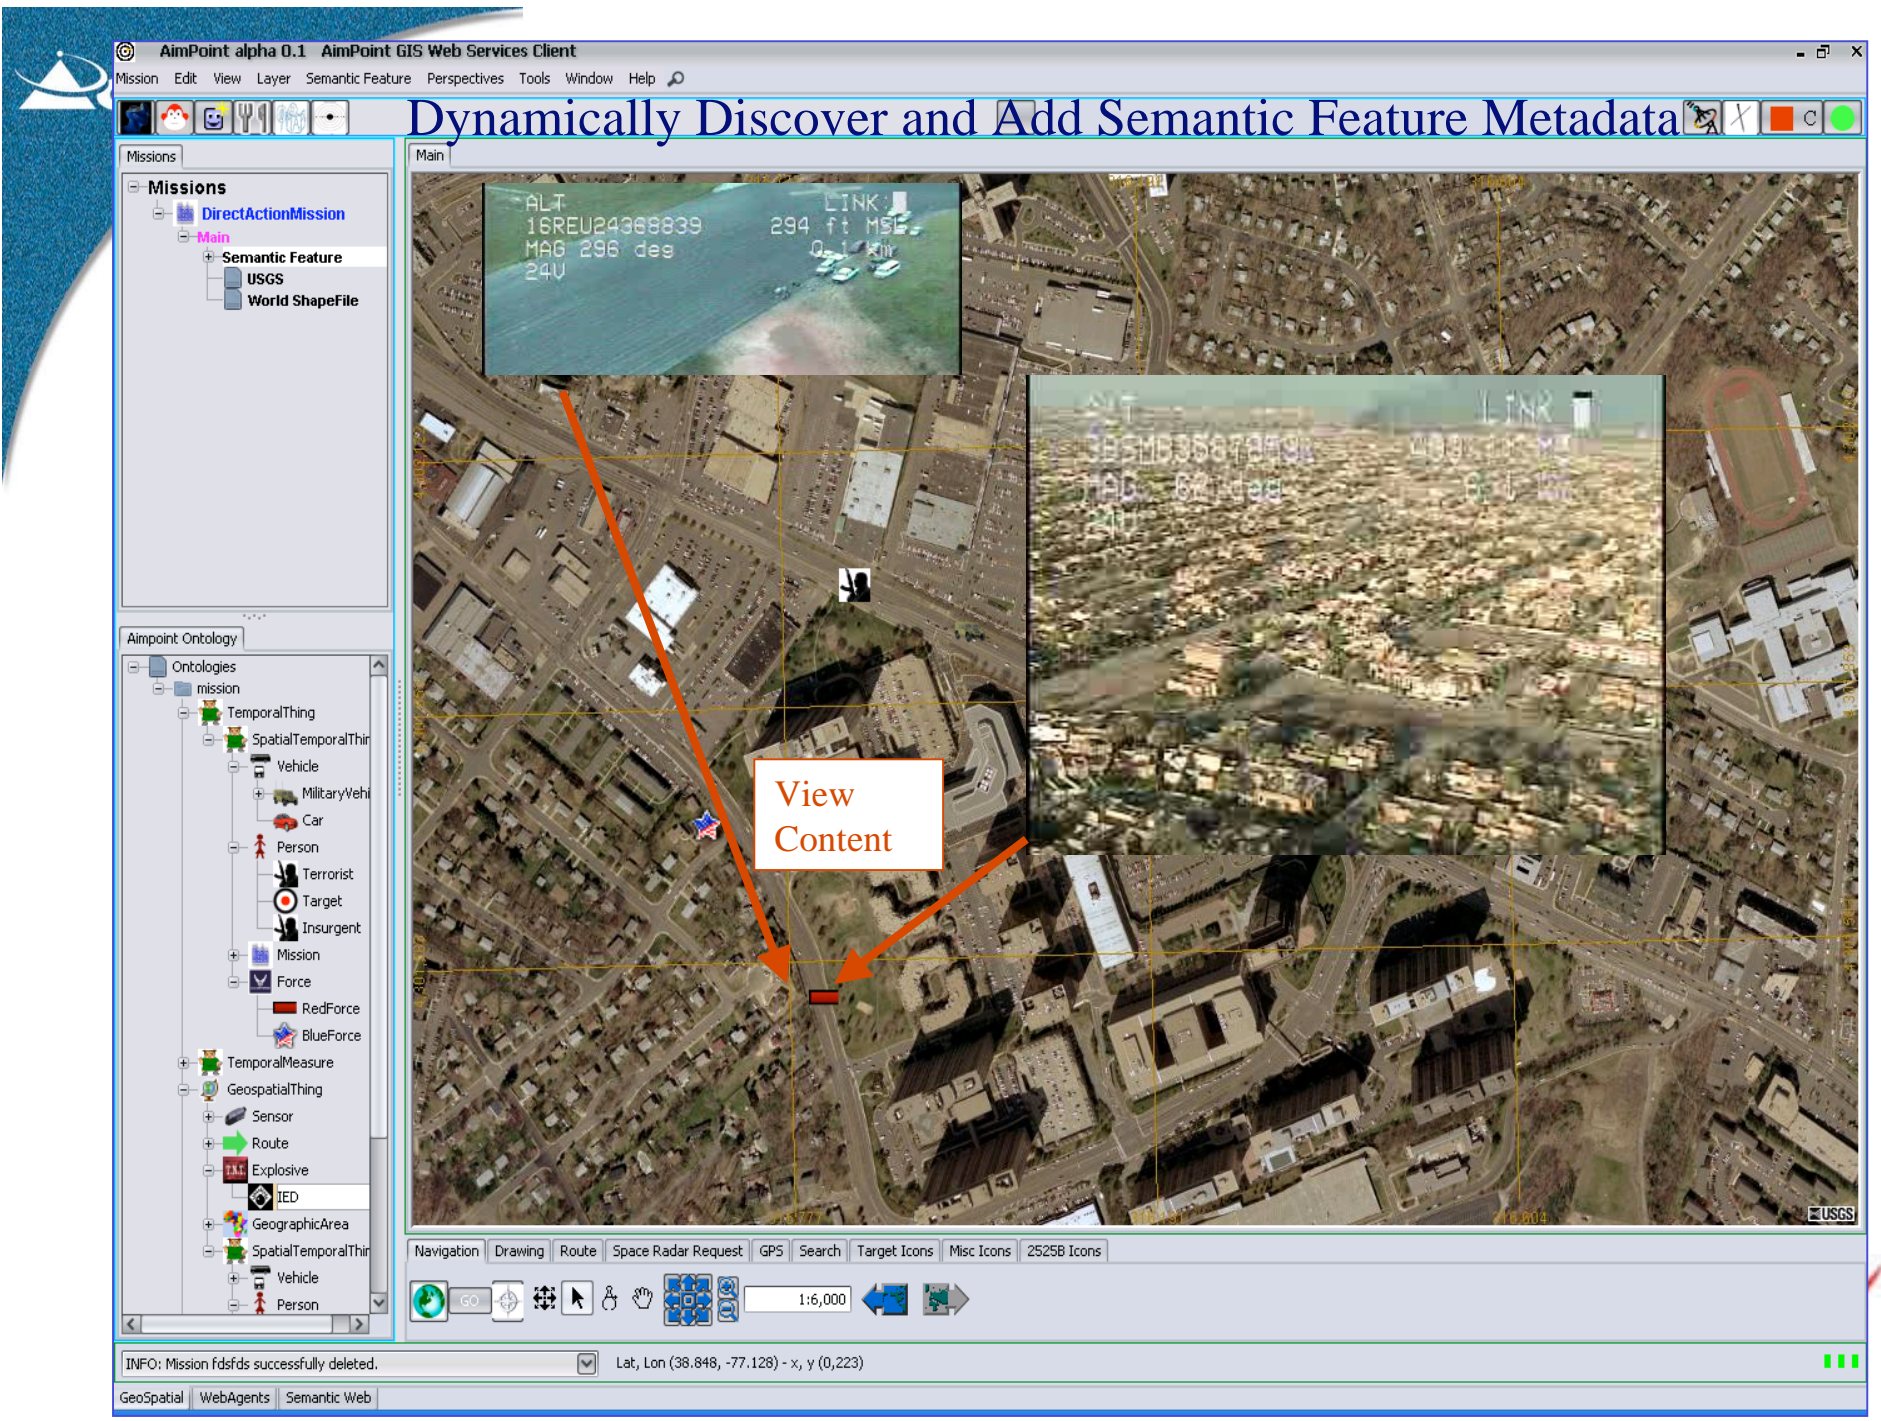

The screenshot displays the AimPoint alpha 0.1 GIS Web Services Client interface. The main window shows an aerial map with several search results marked by black icons. A dialog box titled "Create Feature Search Layer" is open, allowing the user to specify server, ontology, and class information. The "Missions" panel on the left shows a tree structure with "Explosive" selected. The "Aimpoint Ontology" panel shows "Ontologies". The status bar at the bottom indicates the current layer is "Explosive" and provides coordinates: "Lat, Lon (38.846, -77.121) - x, y (381,425)".

Key Elements:

- Dialog Box:** "Create Feature Search Layer" with fields for "Specify Server" (http://dev.cta.com/geoserver), "Specify Ontology" (file:///C:/development/workspace2/AimPoint-...), and "Specify Ontology Class" (Explosive). Buttons for "Cancel" and "Create Layer" are present.
- Map:** Aerial view with search results marked by black icons. A callout "Search Results" points to these icons.
- Left Panel:** "Missions" tree with "Explosive" selected. "Aimpoint Ontology" section with "Ontologies".
- Status Bar:** "INFO: Added a Layer to the AimViewer Model, Layer = Explosive View = Main" and coordinates "Lat, Lon (38.846, -77.121) - x, y (381,425)".
