Date: <u>04/19/2005</u> MLRA: <u>52XN</u> <u>Ecological Site: <u>Subirrigated 10-14" p.z.</u> This *must* be verified based on soils and climate (see Ecological Site Description). Current plant community *cannot* be used to identify the</u>

ecological site.

range of values for above- and below-average years for <u>each</u> community within the reference state (when appropriate), and (3) Facto A maximum of 8 indicators may be changed to 0.5 or 2.0. The rest remain at 1.0. 1.0 A maximum of 8 indicators may be changed to 0.5 or 2.0. The rest remain at 1.0. 1.1 Number and extent of rills: Slopes on this site are between 0 - 2% and with 99 - 100% of the soil surface well-covered there are no rills even with the most extreme convection storms. 2. Presence of water flow patterns: Due to the soil surface being well covered and minimal slope there is no evidence of past or current soil deposition or crossion for this site. 3. Number and height of crossional pedestals or terraceties: Wind and water crossion will not be evident on this site, so pedestals and terraceties will not be present. 4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground): Bare ground should be less than 1% on this site. 5. Number of gullies and crossion associated with gullies: Gully crossion will not be evident on this site. 6. Extent of wind scoured, blowouts and/or depositional areas: Appearance or evidence of these crossional features on the landscape would not be present on this site. 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1	ecological site.	
there are no rills even with the most extreme convection storms. 2. Presence of water flow patterns: Due to the soil surface being well covered and minimal slope there is no evidence of past or current soil deposition or erosion for this site. 3. Number and height of erosional pedestals or terracettes: Wind and water erosion will not be evident on this site, so pedestals and terracettes will not be present. 4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground): Bare ground should be less than 1% on this site. 5. Number of gullies and erosion associated with gullies: Gully crosion will not be evident on this site. 6. Extent of wind scoured, blowouts and/or depositional areas: Appearance or evidence of these erosional features on the landscape would not be present on this site. 7. Amount of litter movement (describe size and distance expected to travel): Because there is little bare ground, litter movement will be minimal at most. Because the site is dominated by taller bunchgrasses, rhizomatous grasses and sedges, litter size will reflect the height and diameter of the reproductive culms and leaves of these grasses as well as the lesser dominate mid-size grasses. 8. Soil surface (top few mm) resistance to crosion (stability values are averages — most sites will show a range of values for both plant canopy and interspaces, if different): Resistance to crosion will be high with soil stability values of 6; rare areas of bare soil on this site may have values less than 6 if not under plant canopy. 9. Soil surface structure and SOM content (include type and strength of structure, and A-horizon color and thickness for both plant canopy and interspaces, if different): Resistance to crosion will be high with soil stability values of 6; rare areas of bare soil on this site may have values less than 6 if not under plant canopy. 9. Soil surface structure, and A-horizon color and thickness for both plant combant of the plant community composi		Wgt. Factor
or current soil deposition or crosion for this site. Number and height of crosional pedestals or terracettes: Wind and water crosion will not be evident on this site, so pedestals and terracettes will not be present. Read and the provided of the pedestals and terracettes will not be present. In the pedestals and terracettes will not be present. In the pedestals and terracettes will not be present.
