June Agricultural Survey (JAS) – National in Scope

- 41,000 farms visited
- 11,000 one-square mile sample area segments visited
- Most states contain between 150 – 400 segments
- Planted acreage estimate

Cropland Data Layer depends on the JAS data

- Unbiased statistical estimator of crop area
 - State and county level estimates

Segments

Enumerated

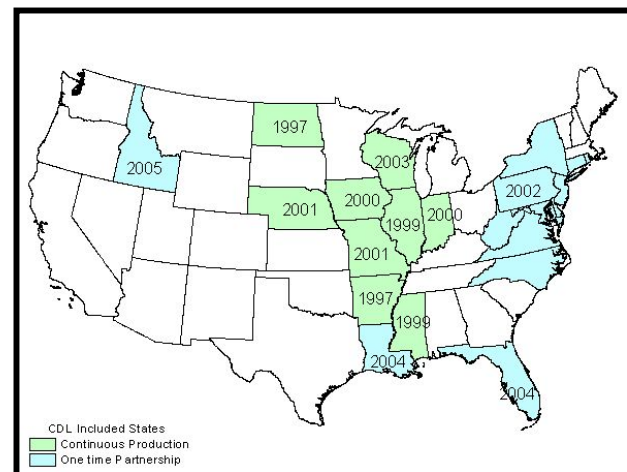

Digitized

Purpose of the Cropland Data Layer

1. Combine remote sensing imagery and NASS survey data to produce supplemental acreage estimates for the state's major commodities
2. Production of a crop-specific digital land cover data layer for distribution in industry standard GeoTiff format

The Landsat Data Gap

Landsat 7 ETM+

Landsat 5 TM

News Release

November 30, 2005 Ron Beck

Landsat 5 Experiencing Technical Difficulties

On November 26, 2005, the back-up solar array drive on Landsat 5 began exhibiting unusual behavior. The solar array drive maintains the proper pointing angle between the solar array and the sun. The rotation of the solar array drive became sporadic and the solar array was not able to provide the power needed to charge the batteries. Maintaining power to the batteries is critical to sustain proper operation of the spacecraft. The primary solar array drive failed under similar circumstances last January. As a result of this current situation, imaging operations will be suspended for at least the next two weeks or until attempts to solve the problem have been resolved.

Summary after Initial Assessments

2004 AWiFS cropland classification results were not as accurate as results derived from multitemporal or unitemporal Landsat data.

2005, multitemporal AWiFS (Kappa = 0.9254) cropland classification results, exceeded those derived from Landsat TM data (Kappa = 0.9170).

AWiFS data appear to be a suitable alternative or supplement to Landsat TM data for production of NASS' Cropland Data Layer product.

Regression Analysis from Sample Estimation

Landsat TM Corn

Plot of CORN Pixels(X) Reported(Y)

AWiFS Corn

Plot of CORN Pixels(X) Reported(Y)

Nebraska 2005 State Level Estimates as % Over/Under
Agricultural Statistics Board (ASB)

Nebraska 2005 State Level Estimates +/- 2% CVs (Coefficient of Variation)

Summary

Overall accuracy as measured by the Kappa statistic is not as high for AWiFS as for TM.

While state level CV are larger for AWiFS than for TM, they are still useful for the NASS estimation program.

AWiFS can provide more frequent cloud-free coverage providing more optimal dates for any crop.

TM *vs.* AWiFS

A comparison of coincident imagery for
classifying croplands

Dave M. Johnson, Geographer
USDA/NASS/Research and Development Division

Goal

To objectively quantify the ability of AWiFS to detect and categorize cropland cover types (using TM as a benchmark).

Need for coincident imagery

The best classification comparison would use not only data from the **same area** but from the **same time**. Thus controlling for variables including:

- Atmospheric conditions
 - Clouds
 - Haze
 - Smoke
- Ground conditions
 - Soil moisture
 - Vegetation phenology
- Sun angle
 - Seasonal variation

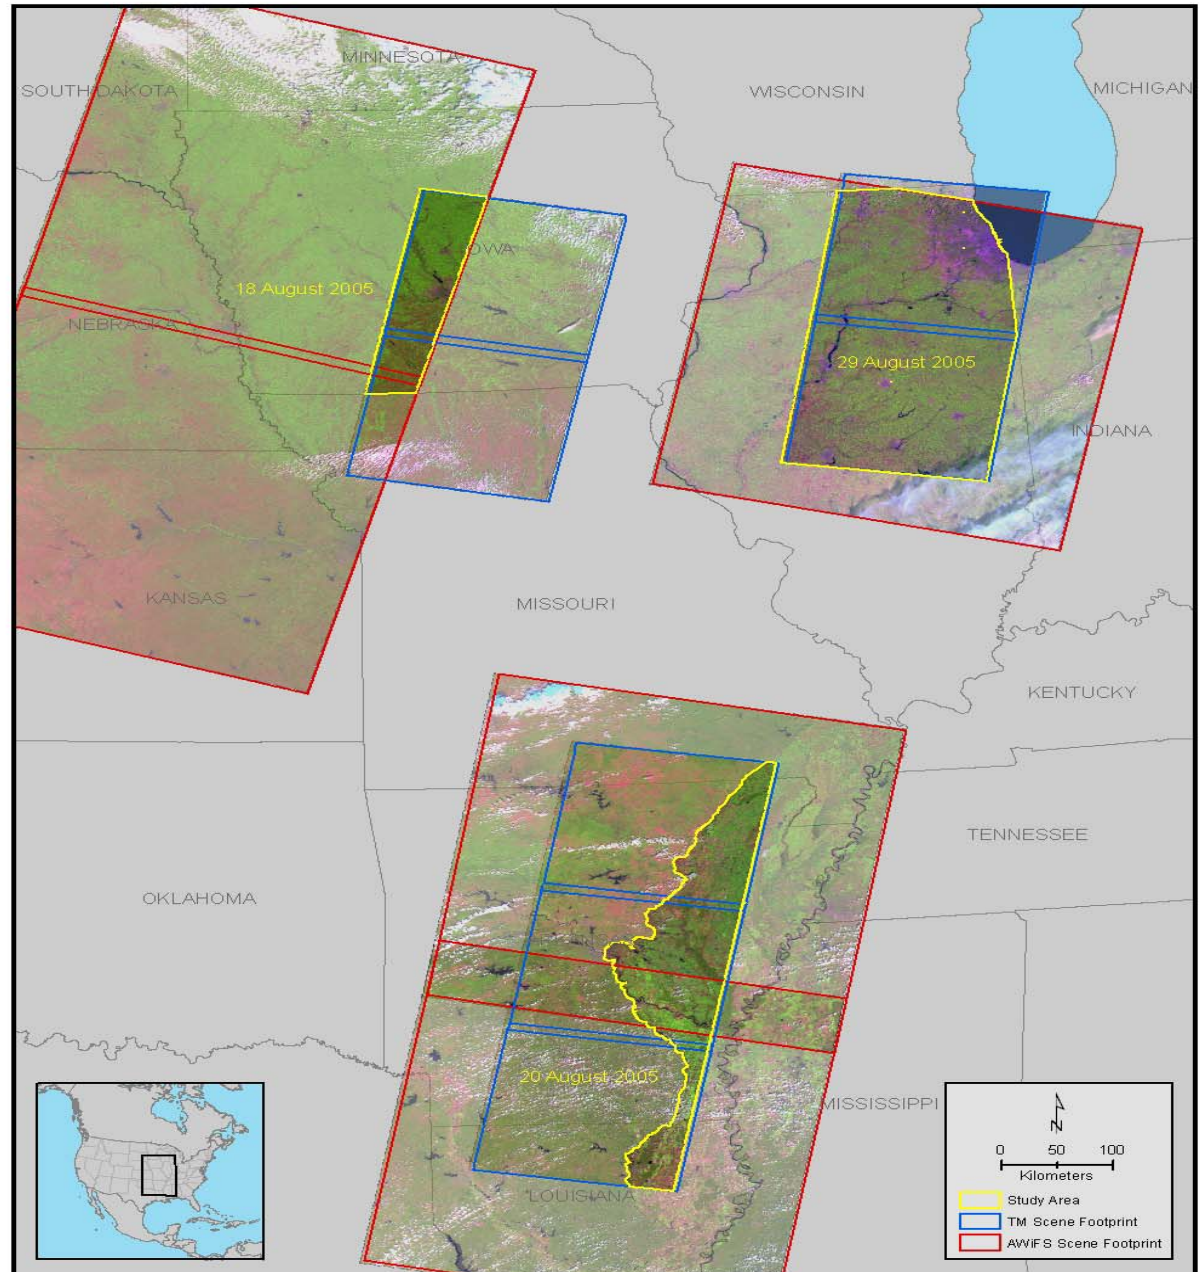

Sensor Specifications Compared

	<u>TM</u>	<u>AWiFS</u>
Altitude	705 km	817 km
Equatorial crossing time	9:45 ± 15 minutes	10:30 ± 5 minutes
Orbit time	99 minutes	101 minutes
Pixel size	30 x 30 m (reflective) 120 x 120 m (thermal)	56 x 56 m
Quantization	8	10
Spectral bands	6 (B, G, R, NIR, SWIR, MIR) + Thermal IR	4 (G, R, NIR, SWIR)
Field of view	14.7°	42.1°
Swath wide	185 km	737 km
Scene size	184 x 152 km	370 x 370 km

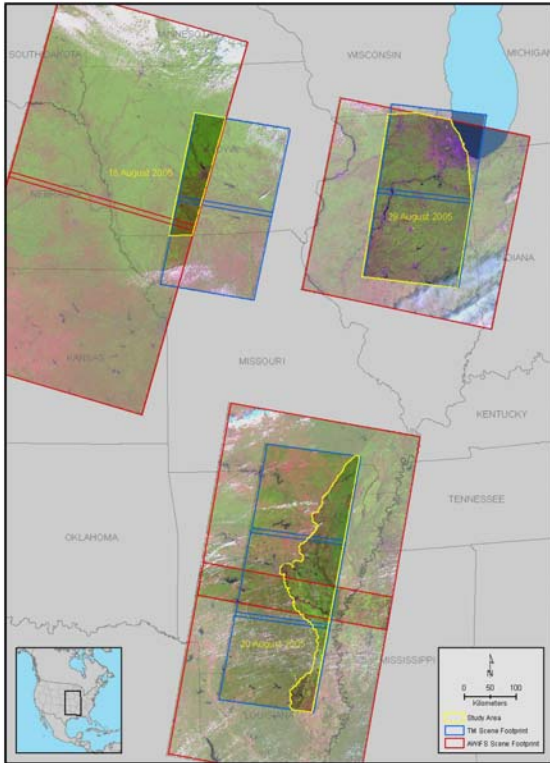

Study sites

Fortunately, several coincident areas were found and three chosen for analysis:

- Arkansas
 - 20 August 2005
- Iowa,
 - 18 August 2005
- Illinois
 - 29 August 2005

Scene specific data statistics

	Arkansas	Iowa	Illinois
Area (sq. miles)	9954	4971	21611
Average TM view angle (from nadir)	+5°	-5°	-0°
Average AWiFS view angle (from nadir)	-10°	+20°	+10°
AWiFS camera	west	east	east
Average AWiFS GSD (sq. m)	60	70	60

Methodology

- Utilized digitized NASS 2005 June Agriculture Survey data for ground truth
 - Arkansas
 - 199 segments, 3000 polygons
 - Iowa
 - 38 segments, 750 polygons
 - Illinois
 - 163 segments, 3500 polygons
- Only dominant cover types employed
- Half of ground truth used for training classifier, other half for accuracy assessment
- Decision tree classifier applied identically and independent to each image pair

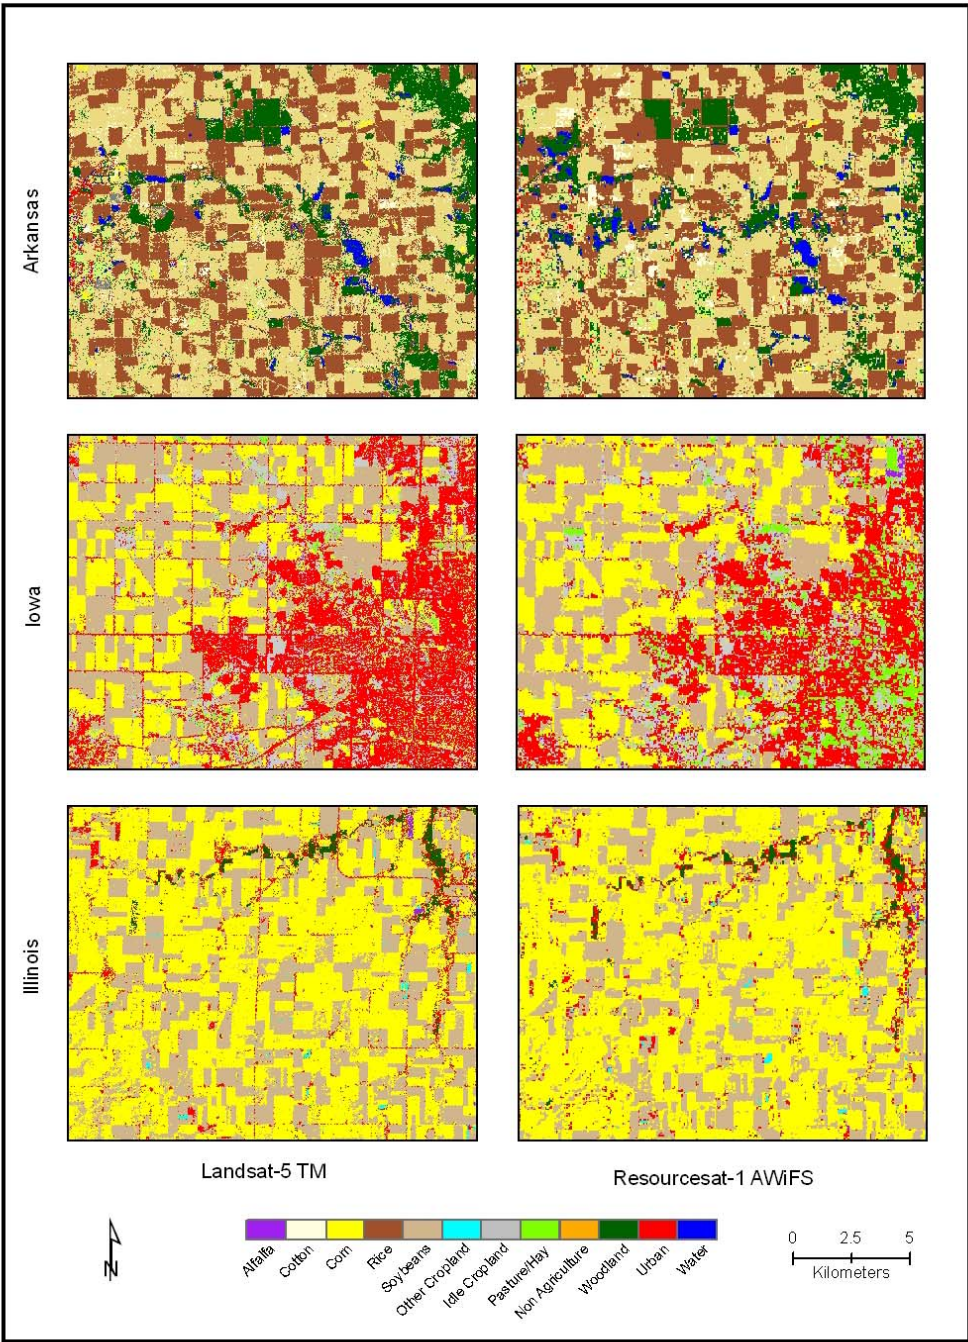

Results

Overall Accuracy

Overall Kappa

...results continued

- Within class accuracies trended similarly to overall accuracies between sensors
- Dominant cropland classes performed best with commission and omission errors typically < 25%
 - Rice, cotton, soybeans in Arkansas
 - Corn and soybeans in Iowa
 - Corn and soybeans in Illinois
- Non-cropland classes tended to struggle for all three cases
 - urban
 - pasture/hay

Simulation of AWiFS with TM

To better understand the impacts of AWiFS having two fewer reflective bands and coarser resolution than TM...

1. Dropped blue and mid-infrared bands (1 & 7) from TM scenes and reran analysis
2. Resampled TM data to 56m and reran analysis
3. Combined both effects and reran analysis

Accuracy drop	Arkansas	Iowa	Illinois
4-band TM	1.9%	0.2%	0.6%
56m TM	1.7%	0.9%	1.7%
4-band, 56m TM	3.4%	2.5%	2.2%

Summary

- TM outperforms AWiFS, but only marginally for cropland cover types.
- Availability of clear-sky and time appropriate data is more important than spatial and spectral resolution.
- AWiFS is more efficient to manage and process.
- Loss of spatial resolution with AWiFS has slightly more impact than loss of TM bands 1 and 7.

....continued summary

- AWiFS could provide benefits to many in the land cover community, especially those in need of imagery:
 - over large regions
 - in often cloudy areas
 - with rapid revisit times
 - cost effectively
- More research needs to be done with AWiFS on the effects of
 - Pixel/sun angle geometry (i.e. bidirectional reflectance)
 - 8 bit versus 10 bit quantization of data
 - smaller field sizes

Thank you

Claire, Bob, Dave, and Rick
