

Toward Global Seismic Imaging based on Spectral-Element and Adjoint Methods

Jeroen Tromp

ACSS 2012

Collaborators: Ebru Bozdogan, Joseph Charles, Dimitri Komatitsch, Daniel Peter, Max Riethmann, Olaf Schenk, and Hejun Zhu

Outline

Forward Modeling

Adjoint Tomography

Spectral-Element Method

Finite-elements:

Spectral-Element Method

Finite-elements:

- hexahedral elements

Spectral-Element Method

Finite-elements:

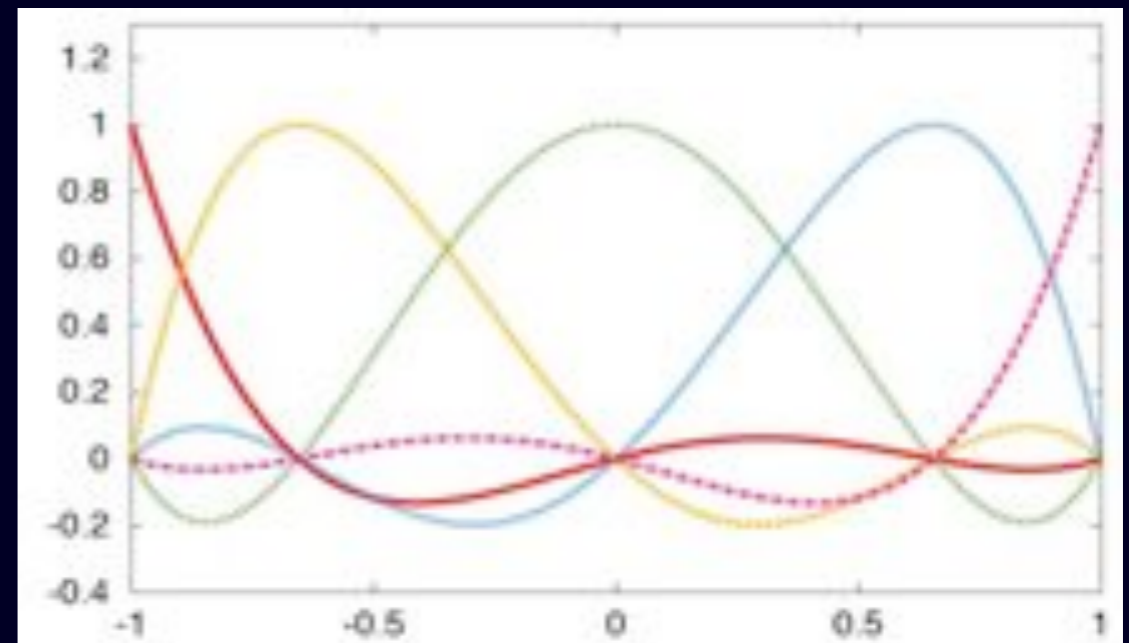

- hexahedral elements
- Gauss-Lobatto-Legendre quadrature

Spectral-Element Method

Finite-elements:

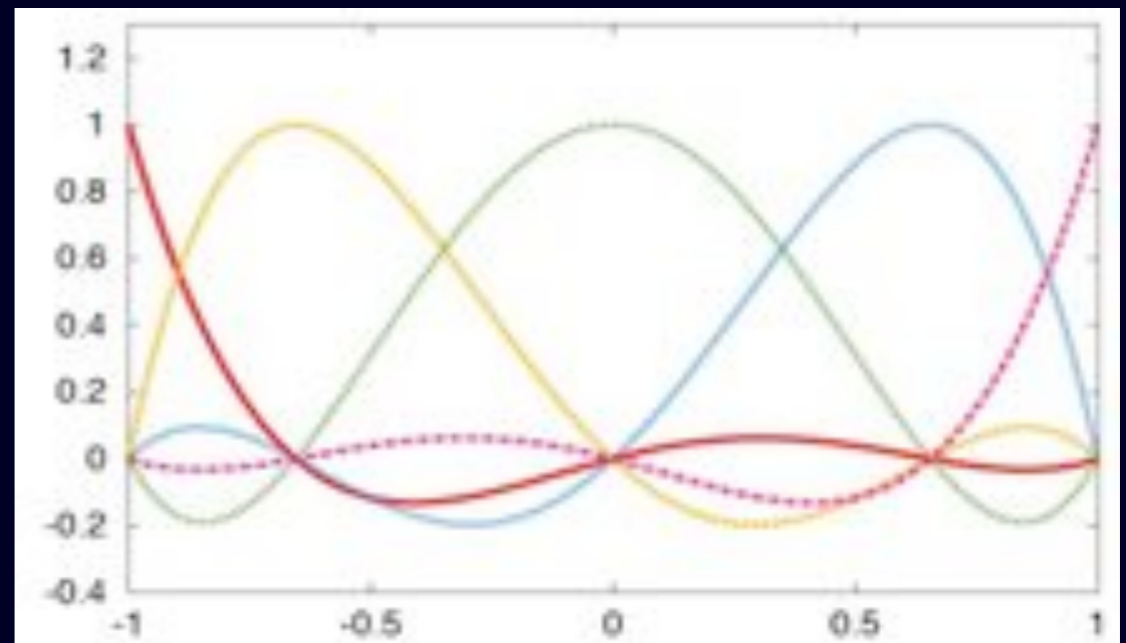

- hexahedral elements
- Gauss-Lobatto-Legendre quadrature
- diagonal mass matrix

Spectral-Element Method

Finite-elements:

- hexahedral elements
- Gauss-Lobatto-Legendre quadrature
- diagonal mass matrix
- explicit time-marching scheme

Spectral-Element Method

Finite-elements:

- hexahedral elements
- Gauss-Lobatto-Legendre quadrature
- diagonal mass matrix
- explicit time-marching scheme

$$M\ddot{U} = -KU + F$$

Towards Global Seismic Imaging

254 earthquakes

$5.8 \leq M_w \leq 7$

shallow: $d \leq 50$ km

intermediate: $50 \text{ km} < d \leq 300$ km

deep: $d > 300$ km

Station Coverage

2.2 million measurements for 254 earthquakes

Conclusions

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy
- Implications for near real-time simulations & hazard assessment

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy
- Implications for near real-time simulations & hazard assessment
 - ‘Adjoint tomography’ is feasible

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy
- Implications for near real-time simulations & hazard assessment
 - ‘Adjoint tomography’ is feasible
 - Future extensions:
 - Include frequency-dependent amplitudes
 - Shear attenuation
 - More general anisotropy

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy
- Implications for near real-time simulations & hazard assessment
 - ‘Adjoint tomography’ is feasible
 - Future extensions:
 - Include frequency-dependent amplitudes
 - Shear attenuation
 - More general anisotropy
- Ultimate goal: To image our entire planet

Conclusions

- Forward modeling at unprecedented speeds, scales & accuracy
- Implications for near real-time simulations & hazard assessment
 - ‘Adjoint tomography’ is feasible
 - Future extensions:
 - Include frequency-dependent amplitudes
 - Shear attenuation
 - More general anisotropy

	# earthquakes	# simulations	CPU core hours
Europe	160	11,200	806,400
Globe (Phase 1)	250	17,500	14,437,400
Globe (Phase 2)	5,000	350,000	739,200,000

Conclusions
