

REVEAL & Related Support

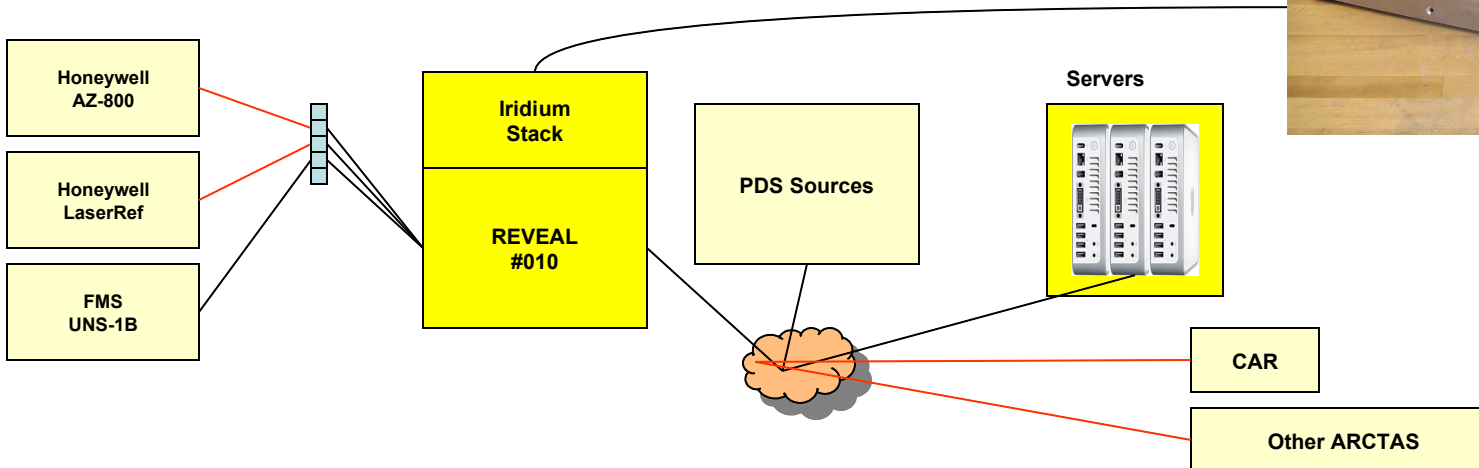

- General:
 - Focus on realtime situational awareness & decision support
 - Prototyping services for “sensorweb” net-centric operations
 - “multi-instrument, multi-platform, in-flight communications
 - Application support
 - Sustainable architecture
 - Platform capability + fleet support “cyberinfrastructure”
 - Mission/flt mgmt vs instrument/science mgmt
 - Operational phase starts in Oct. 2010
- P-3B:
 - {PDS+REVEAL+servers+net} → evolve DC-8-like functionality
- B200:
 - Existing capability interfaced to ground infrastructure
- Instruments:
 - Talk to us if you need/want to automate low bandwidth data transfers

B-200

Wallops P-3B

- The dominant activity 1st Qtr FY08
- Goal: DC-8-like functionality for ARCTAS
- Design/fab antenna farm
 - Simplified re: DC-8 solution
 - Baseline for other aircraft
- Design/fab compute server mount system
 - Supports on-board flight data monitoring & displays, file transfer, XChat, etc.
 - 3 Mac Minis to be mounted, MacOS and Linux (FedoraCore)
- Fab'd REVEAL system
- Status:
 - REVEAL and multichannel Iridium link Install Dec08
 - in use Jan flights. 3 servers online and tested (partially functional)

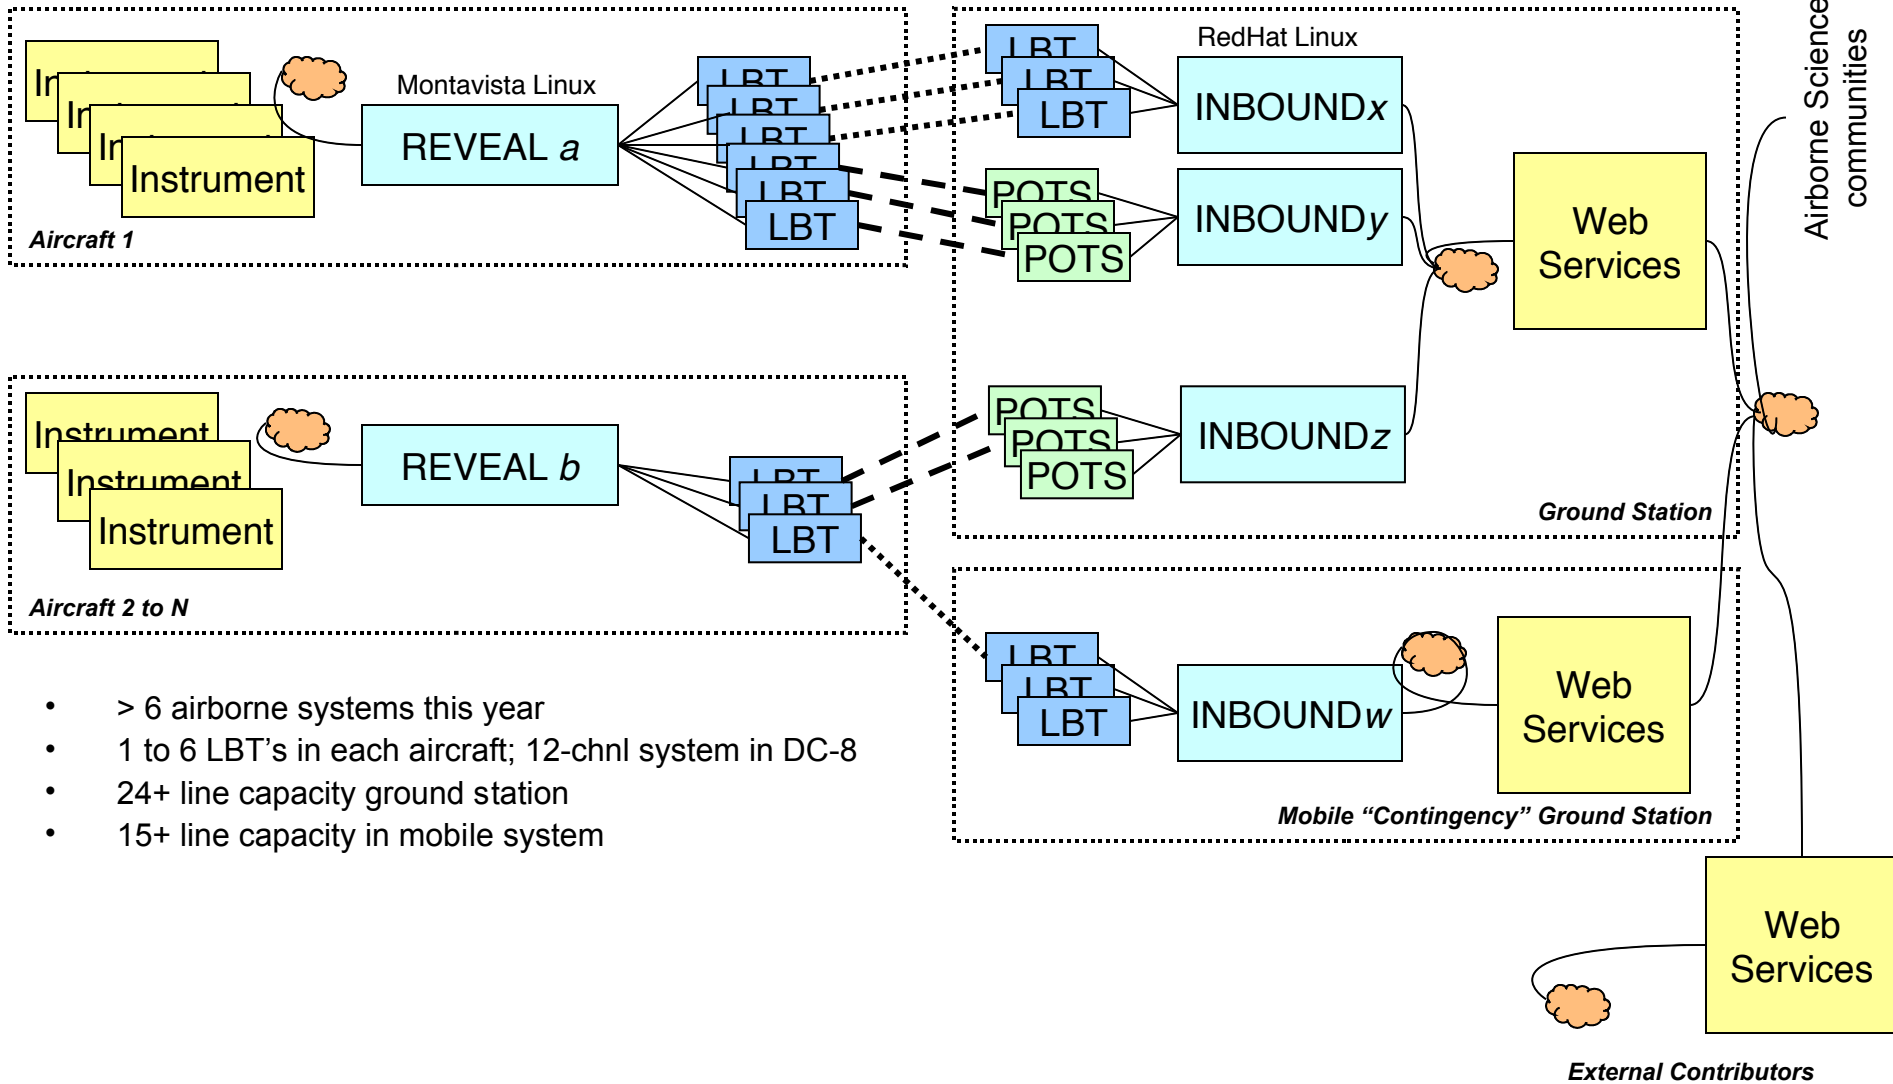

The P-3's REVEAL System: An Inside Look

Multi-Channel Iridium Evolution

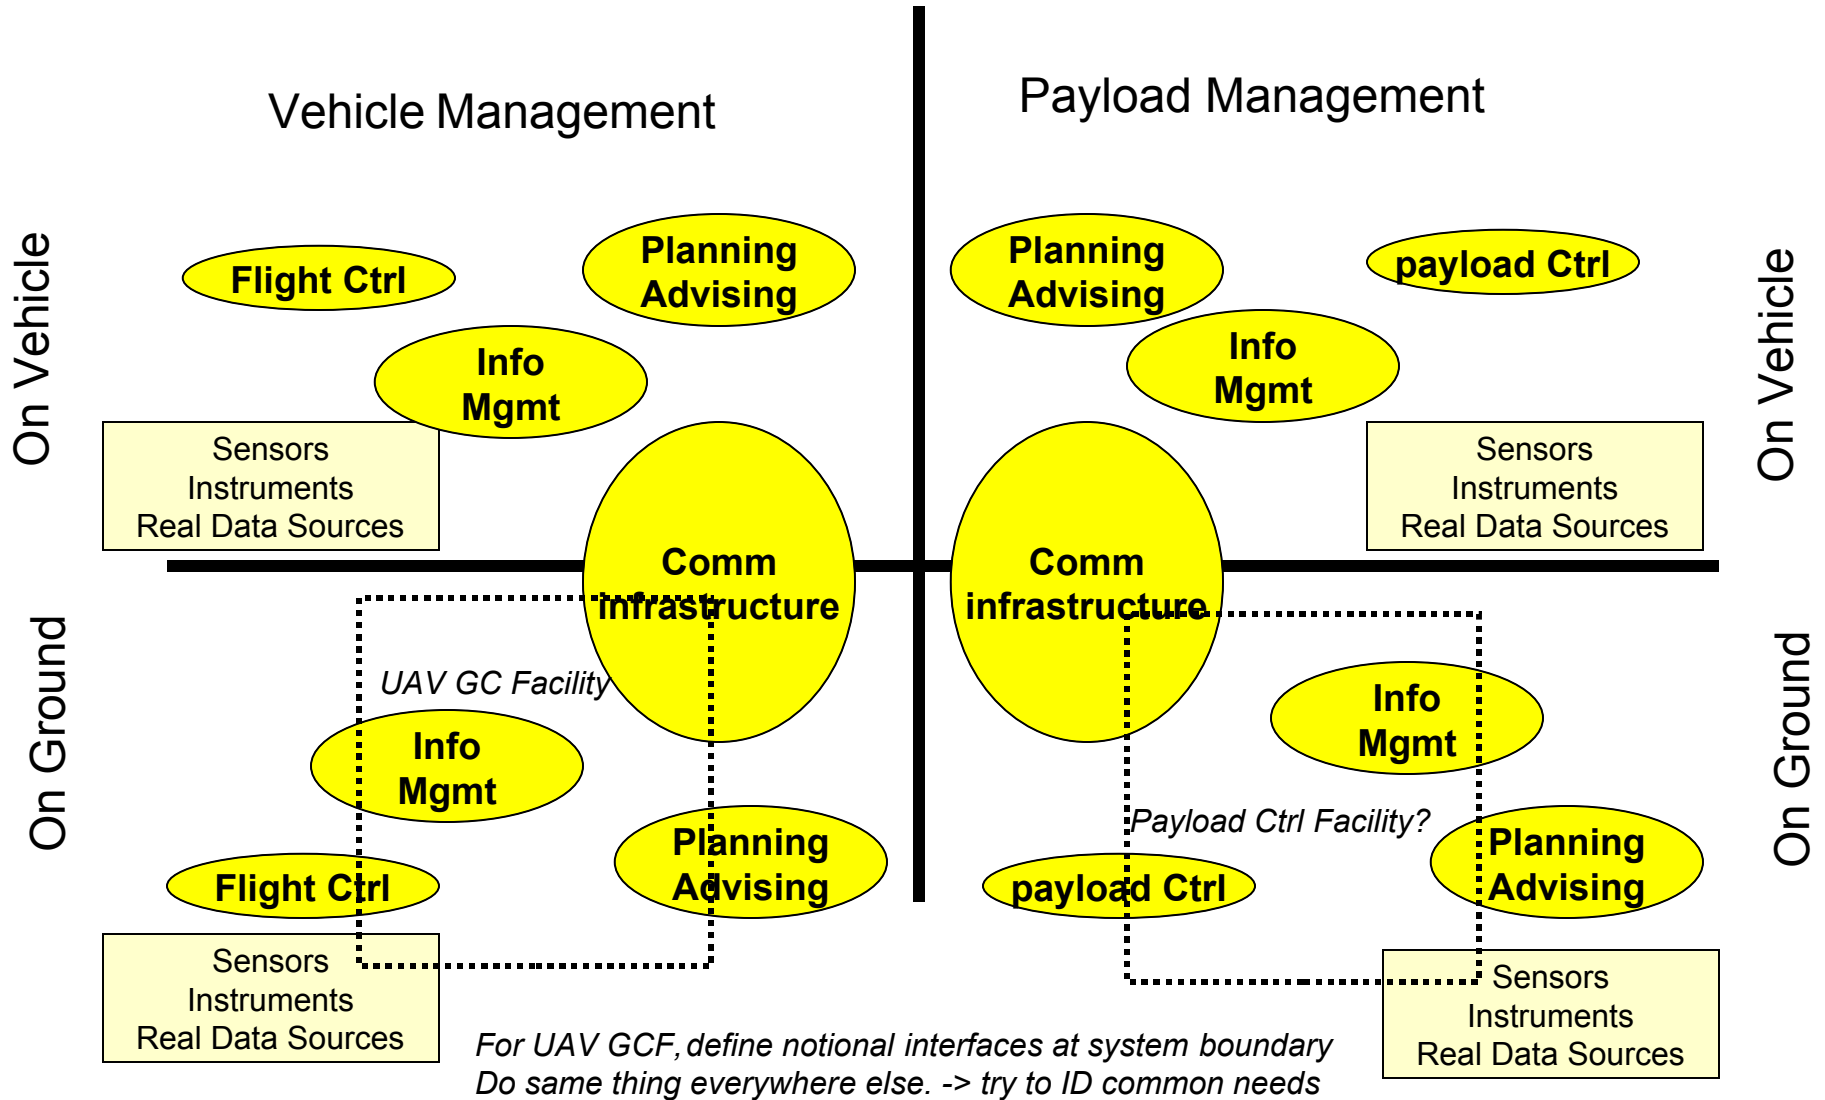

Notional Global Test Range (We have this today)

- > 6 airborne systems this year
- 1 to 6 LBT's in each aircraft; 12-chnl system in DC-8
- 24+ line capacity ground station
- 15+ line capacity in mobile system

Architectural framework

Cyberinfrastructure, sensor webs, system symmetry

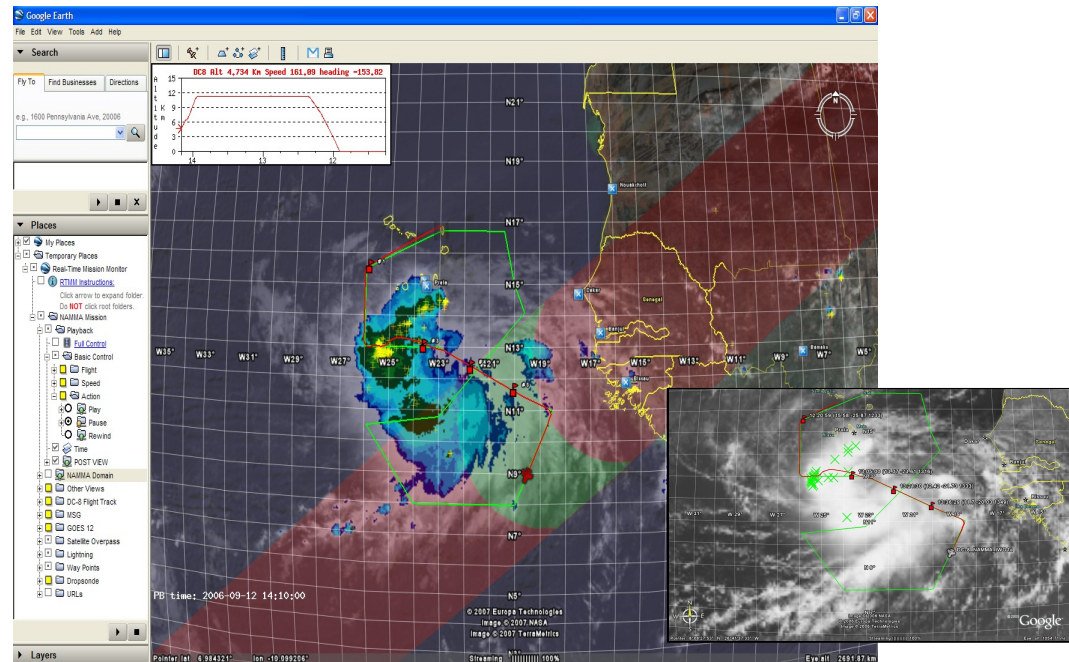

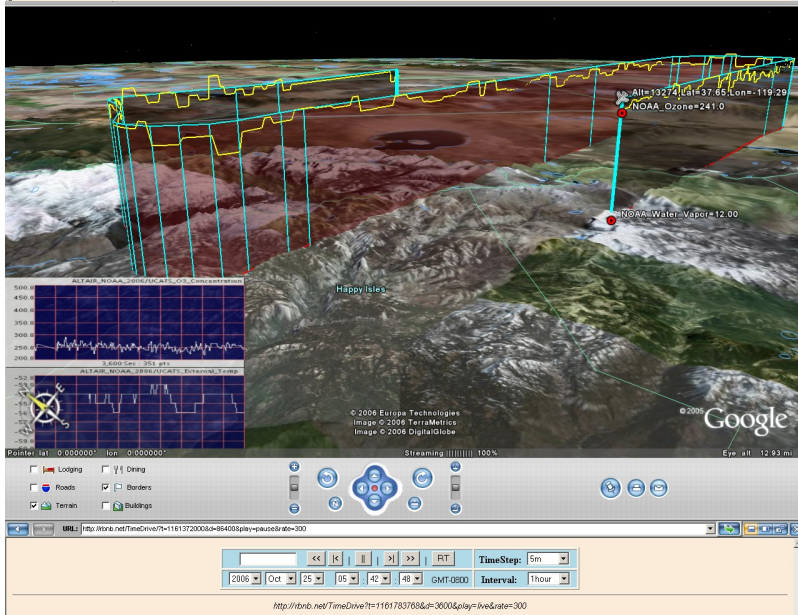

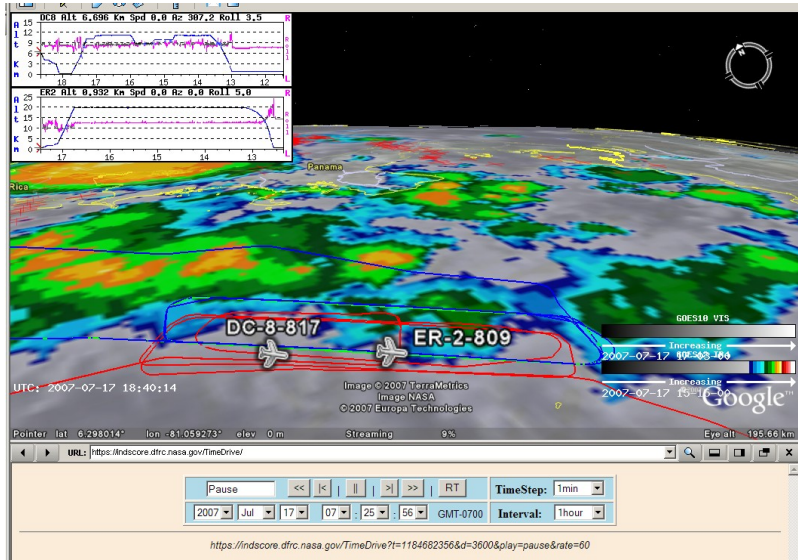

Contingency System Prototype

Creating Sensor Webs for Airborne Science

- Strategy: Productivity & decision support from situational awareness and network distributed systems integration
 - Customers need more...
Bandwidth, availability, flexibility
w/o proportional cost growth
- This strategy realizes the sensor web vision

ARCTAS requirements

- *Spatiotemporal measurement*: time correlation across datasets
 - Coordinated flight plans
 - Near realtime situational awareness
 - Flexibility/adaptability

 **Motivations**

- Questions that ARCTAS and POLARCAT address involve measurements that are on different A/C.
- Scientific return and a broader spatial and temporal context is enhanced through coordinating A/C with satellite overpasses and/or surface sites.
- Similar measurements on different platforms need intercomparisons to confirm a common data set.
- Some objectives require concurrent measurements with diverse platforms.
- Integrating these measurements require coordinated flight plans.

Aircraft Coordination for Interdisciplinary Science

Phil Russell
with key inputs from: Antony Clarke, Jack Dibb, Rich Ferrare, ...

ARCTAS
Science Team Meeting
Lanham-Seabrook, MD
8-10 Jan 2008

ARCTAS SUPPORT PLAN

REVEAL & Global Test Range
