Non-Discrimination Policy

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, DC 20250-9410 or call (800) 759-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

APPENDIX A

DEFINITION OF SCHOOL MEAL PROGRAM PARTICIPATION

A crucial issue in the analysis of school meal program participation is how to measure and define whether a student participates in the programs. The School Nutrition Dietary Assessment (SNDA)-III asked respondents whether they consumed a National School Lunch Program (NSLP) lunch on the day dietary intakes were measured. However, self-reports are often subject to reporting error, as students may not distinguish reimbursable school meals from other cafeteria offerings. Furthermore, respondents were not directly asked whether they participated in the School Breakfast Program (SBP) on the target day.¹ Therefore, SBP and NSLP participation measures were developed based on information from various sources, including student self-reports and information on the food items they consumed at breakfast and lunch.

This appendix describes how SBP and NSLP participation was measured and defined for the SNDA-III data analyses. The final SBP participation measure used for the analyses was based on whether the student reported having consumed at least one breakfast item purchased in the school cafeteria that was on the school breakfast menu. The final NSLP participation measure used for the analyses was based on dietary intake data and the self-reported measure of NSLP participation on the target day. Students were counted as NSLP participants if they reported either (1) consuming food items from all the food groups required for a reimbursable meal and also found on the lunch menu; or (2) consuming at least one of the items counting toward a reimbursable meal, as well as reporting consuming a school lunch on the target day.

Section A of this appendix describes possible approaches for defining SBP and NSLP participation in the SNDA-III sample. Section B describes alternative definitions of SBP and NSLP participation that were developed, and Section C describes the criteria and benchmarks used to select among the definitions developed. Section D presents estimated participation rates

¹ The “target day” is the day for which dietary recall data were collected (the first recall day for the subsample that completed two recalls).

according to the final participation measures, as well as estimated rates under the alternative definitions considered.

A. APPROACHES FOR MEASURING SBP AND NSLP PARTICIPATION

Participation in the school meal programs can be measured in several ways. One approach is to simply ask students whether they participated. Another approach is to ask students what foods they ate during the target day, then examine the extent to which these foods correspond to the rules laid out for the school meal programs by the Food and Nutrition Service (FNS), determine whether they were from the school menu, and assess whether they were bought from sources that offered reimbursable meals. While each approach has some limitations, each provides information that can be used in complementary ways to develop a reliable measure of participation.

1. Measuring Participation Using Self-Reports

SNDA-III collected student self-reports on usual and target day participation in the NSLP, as well as self-reports of usual participation in the SBP.² Using the self-reports was one option for measuring participation. However, previous studies suggested that self-reported school meal program participation might be subject to reporting errors (Gleason and Suitor 2001; Gleason 1996). Students often neither know nor care whether their meals are NSLP- or SBP-reimbursable meals—they know only what foods they take from the cafeteria. Recognizing these limitations, the SNDA-III study did not rely solely on self-reports to determine SBP and NSLP participation.

² Specifically, students were asked whether they “usually eat a regular school lunch” or “usually eat a regular school breakfast.”

2. Measuring Participation Using Intake Data

Actual participation in the SBP and NSLP is determined by well-defined rules specifying the mix and quantity of food groups that students must select for their meal to count as a reimbursable meal. Items counting toward a reimbursable school meal were also specified in data on school menus collected from school food service managers (the SNDA-III Menu Survey, results of which were discussed in Volume I). As part of the dietary recall interviews, SNDA-III interviewers asked students what foods they ate and if those foods were obtained from the school cafeteria. Examining the extent to which the mix and quantity of the items students reported eating corresponded to FNS rules and whether these items were obtained from the cafeteria and were on the school menu provided another approach to measuring participation.

Measuring participation from intake data presented two main challenges. First, although the students reported which foods were obtained from the school cafeteria, it was not always known whether these school cafeteria foods were part of a reimbursable school meal or were purchased on an a la carte basis.³ However, it *was* known whether the item was on the school menu, and this information could be used, in conjunction with information on the mix and quantity of food groups that the student reported consuming from the school cafeteria during breakfast or lunch, to reach conclusions about school meal program participation. A second challenge arose, however: the definition of a reimbursable meal, per FNS rules, pertains to foods *selected* by students from the school cafeteria, but SNDA-III collected information only on the foods students reported having *consumed*. There was no information on foods students selected from the school cafeteria but did not consume. Thus, even students who selected a reimbursable meal

³ SNDA-III collected data on the point of sale for the item, but that information was not always found to be very useful, because many lines offered both reimbursable and a la carte items. However, in cases in which an item was obtained from an exclusively a la carte point of sale, this information was used to classify the item as not “on menu.”

might (correctly) not report consuming the right mix and quantity of food components, if they threw away an entire item belonging to a required food group for the reimbursable meal.

To define participation as accurately as possible, it was necessary to balance these two challenges. The first challenge implied that, if the bar (in terms of quantity and mix of food items required to be defined as a participant) was set too low, participation might be overestimated, because students who bought enough a la carte items belonging to the relevant food groups might incorrectly be classified as participants. The higher this standard was set, the smaller the misclassification error would be. The second challenge implied that, if the bar was set too high, participation might be underestimated, because true participants probably would not always consume the relevant food groups in the appropriate quantities, if they did not consume all items selected as part of the reimbursable meal.

B. ALTERNATIVE DEFINITIONS OF SBP AND NSLP PARTICIPATION

To determine the most reliable definitions of SBP and NSLP participation, several alternative measures of participation were developed and assessed. Incorporating information from self-reports and intake data, the parameters that could be varied to measure SBP and NSLP participation were:

- The number of food items from different categories required (separately for Food-Based Menu Planning [FMP] schools and Nutrient Standard Menu Planning [NSMP] schools, with the strictest standard being the FNS rules for each).
- Whether the items counting toward a school meal were required to be on the school menu (as measured by matching food items from the Menu Survey to the recall data and excluding items obtained from exclusively a la carte points of sale).
- Whether the student reporting taking a school meal on the target day (available for lunch only) or whether they reported usual participation (three or more times per week) in the SBP or the NSLP.

To assess the reliability of various approaches, participation was defined in several ways, then compared to information from administrative data. Because the FNS rules for what constitutes a reimbursable meal differed by menu-planning system, participation was defined differently for the two menu-planning systems. Some key alternative definitions of participation are described below.

There were two important intermediate steps in defining participation from intake data. The first was defining which foods were consumed at lunchtime and which were consumed at breakfast. The definitions of lunch and breakfast foods used for defining participation were adapted from the time-of-day and meal-type definitions used by Gleason and Suitor (2001). Breakfast items were largely those reported to have been eaten between 5:00 A.M. and 9:30 A.M. and called “breakfast” by the student, and lunch items were largely those reported to have been consumed between 10:00 A.M. and 2:00 P.M. and designated as “lunch” by the student.⁴ Other important steps were to define which foods were consumed from the school cafeteria and whether they were on the lunch menu on the intake day. Foods were defined to be “on menu” if the reported food (or a similar food) was found to be on the menu (1) on the day of the recall, the day before, or the day after; or (2) in the rare situations where recall and menu survey dates did not overlap, the reported food was on the menu two or more times during the week of the dietary intake or there was evidence of a comparable meal (for example, cold cereals offered every day).

⁴ All foods reported between 5:00 A.M. and 9:30 A.M. and foods reported between 9:30 A.M. and 10:30 A.M. and called “breakfast” by the student were counted as breakfast foods. There were a small number of legitimate breakfasts reported earlier in the day (3:00-4:00 A.M.) and later in the day (10:45-11:30 A.M.), and these were also counted as such. The following were counted as lunch: (1) all foods reported between 10:00 A.M. and 2:00 P.M., unless reported as breakfast; (2) all foods reported between 9:30 A.M. and 10:00 A.M. that were reported as lunch, supper, or dinner; and (3) all foods reported between 2:00 P.M. and 3:30 P.M. that were reported as lunch. In some instances, legitimate lunches were reported later than the 3:00 P.M. cutoff used by Gleason and Suitor, and these were counted toward lunch also.

The measures of participation developed were not sensitive to modifications in the definition of being “on menu.”

1. Alternative Definitions of SBP Participation

The following definitions of SBP participation were developed, and their reliability assessed:

- ***Definition 1 (FNS rules in schools with offer-versus-serve [OVS]):*** In FMP schools: the student consumed at least three of the four meal component servings (two grains and/or meat/meat alternate servings, one serving of fruits or vegetables, one serving of milk). In NSMP schools: the student consumed at least two menu items (which could be sides or milk).
- ***Definition 2:*** In FMP schools: the student consumed at least one of the four servings and the item was on menu. In NSMP schools: the student consumed at least one menu item.
- ***Definition 3:*** In FMP schools: the student consumed at least two of the four servings *or* consumed at least one breakfast item on the menu and was a self-reported “usual” participant. In NSMP schools: the student consumed at least two menu items *or* consumed at least one menu item and was a self-reported “usual” participant.

2. Alternative Definitions of NSLP Participation

The following alternative definitions of NSLP participation were developed, and their reliability assessed:

- ***Definition 1 (FNS rules in schools with OVS):*** In FMP schools: the student consumed at least three of the five servings offered (one grain, one meat/meat alternate, two fruits and/or vegetables, one milk). In NSMP schools: the student consumed at least one entree and one side.
- ***Definition 2 (FNS rules with menu information):*** In FMP schools: the student consumed at least three of the five servings offered (one grain, one meat/meat alternate, two fruits and/or vegetables, one milk). In NSMP schools: the student consumed at least one entree and one side. All items were required to be on the menu.

- ***Definition 3:*** In FMP schools: the student consumed at least two of the five offered servings, and both items were on the menu. In NSMP schools: the student consumed an on-menu entree.
- ***Definition 4 (FNS rules or self-report combined with intake):*** In FMP schools: the student consumed at least three of the five on-menu servings *or* consumed at least one on-menu serving and was a self-reported target day participant. In NSMP schools: the student consumed at least one entree and one side (both on menu) *or* consumed at least one on-menu entree or side and was a self-reported target day participant.
- ***Definition 5:*** In FMP schools: the student consumed at least three of the five on-menu servings (one grain, one meat/meat alternate, two fruits and/or vegetables, one milk) *or* consumed at least two on-menu servings and was a self-reported target day participant. In NSMP schools: the student consumed at least one on-menu entree and side *or* consumed at least one on-menu entree or side and was a self-reported target day participant.
- ***Definition 6:*** In FMP schools: the student consumed at least three on-menu servings *or* consumed at least one on-menu servings and was a self-reported target day participant. In NSMP schools: the student consumed at least one on-menu entree and side *or* consumed at least one on-menu entree and was a self-reported target day participant.

C. APPROACH TO SELECTING THE BEST SBP AND NSLP PARTICIPATION MEASURES

The alternative definitions of SBP and NSLP participation were assessed according to several criteria. The implied SBP and NSLP participation rates under each measure were compared to benchmark participation rates from administrative data and student self-reports, described below.

1. Criteria Used for Selection

The criteria used to determine which of the alternative definitions of SBP and NSLP participation were most reliable for the SNDA-III data analyses were:

- Degree of conformity with FNS rules for defining reimbursable meals, as reported in Tables A.1 and A.2.
- Accordance of the estimated participation rate with benchmark rates based on administrative data—both overall and among students certified to receive free or reduced-price meals. The target day participation rate was expected to be close to the

TABLE A.1
FNS RULES FOR DEFINING SBP BREAKFASTS

	Basic Requirements	Requirements Under Offer-Versus-Serve (OVS)
Food-Based Menu Planning (FMP)	1 serving milk 1 serving fruits and vegetables 2 servings meat/meat alternate <i>or</i> 2 servings bread <i>or</i> 1 serving bread <i>and</i> 1 serving meat/meat alternate	At least 3 of the required servings
Nutrient Standard Menu Planning (NSMP)	3 menu <i>items</i> , 1 of which must be milk	At least 2 menu items

Note: Since only a small percentage of students were in schools without OVS, the rules as defined under OVS were used as the starting rules for all students.

TABLE A.2
FNS RULES FOR DEFINING NSLP LUNCHES

	Basic Requirements	Requirements Under Offer-Versus-Serve (OVS)
Food-Based Menu Planning (FMP)	1 serving milk 1 serving meat/meat alternate 1 serving bread 2 servings fruits and vegetables (different types)	At least 3 of the required servings
Nutrient Standard Menu Planning (NSMP)	3 menu <i>items</i> , 1 of which must be milk	At least 2 menu items

Note: Since only a small percentage of students were in schools without OVS, the rules as defined under OVS were used as the starting rules for all students.

average daily number of breakfasts and lunches claimed by schools divided by the number of students enrolled in SBP or NSLP schools, respectively (adjusted for attendance), from FNS administrative data.

- Correlation with self-reports of participation. Despite the errors in self-reports, they were expected to be positively correlated with actual participation.
- Correlation with other measures known to be correlated with participation from previous research. In particular, previous research suggested that participation rates were highest in elementary schools and lowest in high schools. Examining whether the rates resulting from the various alternative definitions followed the same pattern was an additional check of the accuracy of the definitions.

2. Benchmark Participation Rates

Participation rates based on FNS administrative data for all schools served as the primary benchmark for evaluating alternative definitions of participation. The number of participants in the SBP and NSLP was derived from the number of average daily breakfasts and lunches, respectively, served during the months of September to May (reported on form FNS-10), adjusted by the absentee factor of 0.927 (historically derived). Participation rates were estimated by dividing the number of participants by the number of students attending schools offering the SBP and NSLP.⁵ Self-reports of participation were used as additional benchmarks.

a. SBP Benchmark Participation Rates

According to FNS administrative data, the participation rate in the SBP for fiscal year 2005 among schools that had the SBP program was 23.0 percent. SNDA-III did not collect self- or parent-reported measures of target day participation in SBP, but it did collect information on “usual” participation—defined as consuming a school breakfast at least three times per week. The participation rate constructed from child reports of usual participation was 29.8 percent, and that based on parent reports of usual participation was 33.7 percent. In general, parents were

⁵ Data were provided by FNS staff from the USDA National Databank.

more likely to report that their child usually ate a school breakfast than were the children themselves, and the discrepancies between child and parent reports were greatest for students certified to receive free or reduced-price meals.

b. NSLP Benchmark Participation Rates

FNS administrative data suggested that the NSLP participation rate in fiscal year 2005 was 59.7 percent. Participation rates based on student self-reports were considerably higher, with nearly 67.7 percent of students reporting that they ate a school lunch on the target day. Participation rates based on self-reported data were consistently higher than those based on administrative data, both for students certified to receive free or reduced-price lunches and for those paying full price. On the target day, 84.7 percent of certified students reported having a school lunch, while the participation rate based on administrative data was 77.7 percent.

D. COMPARISON OF FINAL SBP AND NSLP PARTICIPATION MEASURES WITH ALTERNATIVE MEASURES AND BENCHMARK PARTICIPATION RATES

Tables A.3 and A.4 show participation rates based on the final and alternative definitions of SBP and NSLP participation for all schools. The tables also show how participation rates based on the different measures compared to the benchmark participation rates and how they performed based on the criteria described above.

1. SBP Participation

After assessing the alternative SBP participation measures using the criteria described above, the final measure (Definition 2; shaded in gray in Table A.3) was selected:

- FMP Schools
 - Consumed at least one of the four servings (two grains or meat/meat alternates, one fruit and vegetable, one milk) and item was on menu

TABLE A.3

**SBP PARTICIPATION MEASURES (ALL SCHOOLS OFFERING SBP)
(FINAL MEASURE SHADED IN GRAY)**

Definition of Participation	Participation Rate	Participation Rate Among “Usual” Participants	Participation Rate Among “Usual” Non Participants	Free/Reduced-Price Recipients	Participation in Elementary Schools	Participation in Middle Schools	Participation in High Schools

FMP: Consumed at Least Three on-Menu Servings OR (Consumed at Least One on-Menu Servings AND Self-Reported Target Day Participant)

NSMP: Consumed at Least One Entree and One Side OR (Consumed at Least One Entree and Self-Reported Target Day Participant)

B = bread

MA = meat/meat alternate

F = fruit

V = vegetable

M = milk

- NSMP Schools
 - Consumed at least one menu item (including milk)

The overall participation rate, measured by this definition, was 22.6 percent, which was close to the 23.0 percent rate suggested from administrative data. The measure also had a reasonable correlation with self-reported usual participation. It suggested that 64.4 percent of self-reported usual participants—and only 4.7 percent of students who did not usually have a school breakfast—had a school breakfast on the target day. One possible concern about this measure was that it might overestimate participation in schools where menu items are also sold a la carte. To address this, participation rates were examined separately in schools that sold a la carte items (milk, food, and juice beverages with at least 50 percent juice) at breakfast and those that did not. The increase in participation rates under the recommended measure compared with the one based strictly on FNS rules was found to be larger for schools without a la carte items than for those that did sell a la carte items at breakfast.⁶ This provided some suggestive evidence that relaxing the required rules to account for plate waste did not overestimate participation because of the presence of a la carte items. Finally, the measure implies participation rates among students certified to receive free or reduced-price breakfasts that were close to those estimated from administrative data.

2. NSLP Participation

After assessing the alternative NSLP participation measures using the criteria described above, the final measure (Definition 4, shaded in gray in Table A.4) was selected:

⁶ Children in schools where breakfast items were sold a la carte reported lower levels of usual participation: 17 percent, compared with 26 percent in schools without a la carte items. However, the usual participation rates reported by parents in both types of schools were very similar. Defining participation using FNS rules strictly implied participation rates of 8.4 and 9.4 percent in schools with and without a la carte items, respectively. This increased to 17.9 and 29.4 percent when the recommended measure was used.

- FMP Schools
 - Students were counted as participants if they reported either (1) consuming items from the school menu that counted toward three of the required five servings; or (2) consuming at least one item from the school menu that counted toward an NSLP lunch, as well as reporting that they consumed a school lunch on the target day.
- NSMP Schools
 - Students were counted as participants if they reported either (1) consuming at least one entree and one side; or (2) consuming at least one item from the school menu that counted toward an NSLP lunch, as well as reporting that they consumed a school lunch on the target day.

The overall participation rate using this measure was 61.7 percent and, among the alternate measures, came closest to the 59.7 percent estimated using administrative data. The measure also correctly predicted participation among 87.2 percent of self-reported participants and nonparticipation for 95.6 percent of self-reported nonparticipants; therefore, it had the highest correlation with self-reported measures. Using this measure, the participation rate among students certified to receive free and reduced-price meals was 78.8 percent, which was similar to the 77.7 percent suggested from administrative data. This measure implied a slightly higher participation rate among noncertified students than that suggested by administrative data. However, the difference in participation rates between students certified to receive free or reduced-price meals and those who were not did not change with alternate measures, including those that were stricter. Compared to the alternate measures, the recommended measure also seemed to best predict the differential rates of lunch participation between elementary, middle, and high schools suggested by self-reports.

APPENDIX B

PARTICIPATION AND CUSTOMER SATISFACTION (SUPPLEMENTAL TABLES)

TABLE B.1
AVERAGE PARTICIPATION RATES IN SECONDARY SCHOOLS

	Target Day Participation		Usual Participation	
	NSLP	SBP	NSLP	SBP
Gender				
Male	56.4	15.3	70.5	22.7
Female	45.0	9.4	56.8	14.9
Income Relative to Poverty				
Less than or equal to 130 percent	62.6	23.3	75.2	33.8
Between 130 and 185 percent	63.8	13.5	78.8	23.5
More than 185 percent	43.2	7.5	55.7	10.7
Receipt of Free or Reduced-Price Meals (Parent Report)				
Receives free or reduced-price meals	68.6	23.6	82.3	36.1
Does not receive free or reduced-price meals	40.5	5.7	53.2	8.6
Race/Ethnicity				
Black, non-Hispanic	49.7	13.1	67.7	24.4
Hispanic	54.0	9.2	60.3	13.0
White, non-Hispanic	49.6	21.4	66.7	31.3
Other	51.4	12.1	66.1	17.7
All Students	50.5	12.2	63.4	18.7
Number of Students	1,582	1,379	1,582	1,379

Source: School Nutrition Dietary Assessment Study-III, school year 2004-2005, Child Interview, Dietary Recalls, Parent Interview. Weighted tabulations prepared by Mathematica Policy Research, Inc.

Note: Target day participation is defined using several sources, primarily the foods reported in the dietary recall data and sources of foods; see further discussion in text and Appendix A. Secondary schools include both middle and high schools.

TABLE B.2
**TOP REASON FOR EATING SCHOOL LUNCH ON TARGET DAY,
BY USUAL PARTICIPATION STATUS**
(Percentage of Students)

	Usual NSLP Participants	Not Usual NSLP Participants
Among Students Who Ate School Lunch on Target Day, Top Reason for Eating School Lunch		
Felt hungry	36.0	28.3
Likes the food (general)	21.1	20.8
Liked meal served that day	11.8	21.0
Easy/convenient to get	9.7	4.8
Parents want me to/no other choice	8.9	5.7
No one at home/no time to make lunch	5.7	10.6
It's free, prices are good	2.6	0.7
Other	4.3	7.9
Number of Students	1,382	134

Source: School Nutrition Dietary Assessment-III, Student Interview, school year 2004-2005.
Weighted tabulations prepared by Mathematica Policy Research, Inc.

Note: N = 1,534 (18 respondents did not give a top reason for eating a school lunch on the target day). List of possible answers was read out loud to respondents.

TABLE B.3

**TOP REASON FOR EATING SCHOOL LUNCH ON TARGET DAY,
BY HOUSEHOLD INCOME
(Percentage of Students)**

	Students from Low-Income Households (Less than or Equal to 185 Percent of Poverty Level)	Students from High-Income Households (Greater than 185 Percent of Poverty Level)	All Students
Among Students Who Ate School Lunch on Target Day, Top Reason for Eating School Lunch			
Hunger	40.1	30.6	35.1
Likes the food (general)	20.7	21.4	21.1
Liked meal served that day	10.5	14.9	12.8
Easy/convenient to get	5.6	12.2	9.1
Parents want me to or no other choice	10.7	7.2	8.9
No one at home or no time to make lunch	5.3	7.1	6.2
It's free, prices are good	2.9	2.0	2.4
Other	4.3	4.8	4.5
Number of Students	743	724	1,467

Source: School Nutrition Dietary Assessment-III, Student Interview, school year 2004-2005.
Weighted tabulations prepared by Mathematica Policy Research, Inc.

Note: N = 1,483 (16 respondents did not give a top reason for eating a school lunch on the target day). List of possible answers was read out loud to respondents.

TABLE B.4

TOP REASON FOR EATING SCHOOL BREAKFASTS, BY HOUSEHOLD INCOME
 (Percentage of Students Who Ever Eat School Breakfasts)

	Students from Low-Income Households (Less than or Equal to 185 Percent of Poverty Level)	Students from High-Income Households (Greater than 185 Percent of Poverty Level)	All Students
Easy/Convenient to Get	31.9	39.5	34.9
Food Is Good	35.1	28.9	32.6
I Am Hungry	22.6	19.2	21.2
Parents Make Me	3.4	5.0	4.0
No Other Choice	2.9	3.1	3.0
Friends Eat Breakfast There	2.5	2.2	2.4
Prices Are Good	1.1	1.8	1.4
Other	0.5	0.5	0.5
Number of Students	549	330	879

 Weighted tabulations prepared by Mathematica Policy Research, Inc.

Note: N = 879 (10 respondents did not give a top reason for eating school breakfasts). List of possible answers was read out loud to respondents.

TABLE B.5
REASONS FOR NOT PARTICIPATING IN THE SBP, BY HOUSEHOLD INCOME
(Percentage of Students)

	Students from Low-Income Households (Less than or Equal to 185 Percent of Poverty Level)	Students from High-Income Households (Greater than 185 Percent of Poverty Level)	All Students
Among Students Who Do Not Usually Eat School Breakfasts, Reasons for Not Eating School Breakfasts^a			
Eats breakfast at home	41.7	51.7	48.7
No time	27.4	24.7	25.5
Never eats breakfast	12.2	7.7	9.0
Doesn't like what is served	10.4	5.9	7.2
Monetary reasons	3.8	5.1	4.7
Transportation issue	1.6	2.4	2.2
Lack of choice	1.6	2.4	2.1
Not convenient	0.5	1.2	1.0
Not nutritious enough	0.0	1.5	1.0
Busy with school activities	0.3	0.8	0.7
Doesn't like taste	0.1	0.5	0.3
Other	10.0	8.5	9.0
Number of Students Reporting	365	677	1,042
Likely to Eat School Breakfasts			
More Often if Served in Classroom ^b	63.5	55.5	60.0
Number of Students Reporting	141	218	359
Number of Students	919	985	1,980

Source: School Nutrition Dietary Assessment-III, Student Interview, school year 2004-2005.
Weighted tabulations prepared by Mathematica Policy Research, Inc.

Note: N = 1,980 (276 respondents did not report on why they do not eat school breakfasts).

^aMultiple answers allowed; open-ended question.

^bAmong students who eat school breakfasts three or fewer days per week *and* who do not eat school breakfasts in the classroom (n = 359).

TABLE B.6
STUDENTS' GENERAL VIEWS ON SCHOOL LUNCHES, BY HOUSEHOLD INCOME
(Percentage of Students Who Ever Ate a School Lunch)

	Students from Low-Income Households (Less than or Equal to 185 Percent of Poverty Level)	Students from High-Income Households (Greater than 185 Percent of Poverty Level)	All Students
General Opinion of School Lunches			
Like them	47.2	47.4	47.3
Only okay	46.9	49.5	48.3
Doesn't like them	5.9	3.2	4.4
Number of Students Reporting	768	773	1,541

APPENDIX C

TECHNICAL APPENDIX ON THE MULTIVARIATE ANALYSIS OF PARTICIPATION IN THE NATIONAL SCHOOL LUNCH PROGRAM AND SCHOOL BREAKFAST PROGRAM

Chapter IV of this report examined the factors associated with school meal program (NSLP or SBP) participation in a multivariate context, simultaneously controlling for personal and family characteristics; key programmatic variables such as full price of the U.S. Department of Agriculture (USDA) meal; characteristics of meals offered; alternatives to the USDA meal; other school-level factors; and location, region, and day of week. Results were presented as predicted probabilities of participation for students with a particular characteristic (for example, girls), holding all other specified factors constant at their mean value for the full sample. Comparing the predicted probabilities for students who differed according to a particular characteristic (for example, girls versus boys) indicated the relationship between this characteristic (for example, gender) and the likelihood that the student participated in the school meal program, holding constant other observable characteristics.

The results of this analysis were based on probit models of school meal program participation that controlled for the factors listed in Table IV.1. Probit models were estimated in Stata using the survey commands to account for the complex sample design, including sample weights, clustering, and stratification. Predicted probabilities were computed as the predicted value of the outcome variable (NSLP or SBP participation), holding all other factors constant at the mean value for the full sample. Where the characteristic did not vary for a particular set of students (for example, all high schools used offer-versus-serve (OVS) at both breakfast and lunch), this was incorporated into the calculation of the predicted probability (for example, the predicted probability of participation for students in schools that used OVS was computed as the predicted value *among elementary and middle school students* in schools with OVS who otherwise had the characteristics of the average sample member). Similarly, some variables were not defined for the full sample (for example, elementary school students were not asked whether they were on a diet). In these cases, the variable was set to zero for the group for which

it was undefined, and the predicted probabilities were estimated only for the group for which the variable was defined. Predicted probabilities were multiplied by 100 so as to be interpretable as predicted participation rates.

The estimation sample for the NSLP participation models included all students with completed dietary recalls and parent interviews. The estimation sample for the SBP participation models included all students with valid child and parent interview data in schools that offered the SBP. Where the value for a particular covariate was missing for a particular student, the value for this covariate was imputed. Across the different covariates included in the analysis, the percentage of sample members with missing values ranged from zero to nine percent. Missing values of continuous school-level variables were imputed as the mean value of that variable by region and grade level (elementary, middle, or high school). Missing values of school-level binary and categorical variables were imputed as the modal value for that variable by region and grade level, and missing values of student-level binary and categorical variables were imputed as the modal value for that variable by region, grade level, and gender. There were no continuous student-level covariates included in the multivariate analysis of school meal program participation. Models included controls for imputation indicators for each imputed covariate, if the covariate was imputed for one percent or more of the sample. The base NSLP participation model included eight such imputation indicators, and the base SBP participation model included four imputation indicators.

Results of the estimation of the base NSLP participation model are shown in Table IV.2 in the text, and results of the base SBP participation model are shown in Table IV.3. The base models includes the variables listed in Table IV.1 in the text; however, results were generally not sensitive to the choice of covariates.

Table C.1 shows the marginal effects of the base NSLP participation model specification, as well as marginal effects from alternative specifications, that controlled for fewer or more covariates. Marginal effects were multiplied by 100 so as to be interpretable as marginal effects on predicted participation rates. The marginal effect can therefore be interpreted as the difference between the predicted participation rate if the student (or school) had a particular characteristic (for example, the student was a girl) and the predicted participation rate if the student had the characteristic of the reference category (or omitted group—for example, boys), controlling for other characteristics.

In general, estimated marginal effects and associated significance levels were similar across the models estimated. The first column of Table C.1 displays estimated marginal effects from the base model. The second and third columns displays results from models that include more limited sets of covariates than the base model. Model 2 controls for only key programmatic variables; a basic set of personal and family characteristics; and location, region, and day of week. Model 3 adds controls for characteristics of meals offered and other school-level factors, but it does not control for the full set of personal and family characteristics included in the base model. The third and fourth columns control for more factors than the base model. Model 4 controls for all the characteristics in the base model, plus additional school-level factors, including whether healthy foods were available in vending machines, snack bars, a school store, or a la carte, and whether the school had a pouring rights contract or served branded foods. Model 5 adds controls for additional personal and family characteristics, including whether the student ate more or less than others of the same age, hours of TV watching, frequency of cigarette smoking, student's health (according to parent reports), and whether the family received public assistance. In general, patterns of results were similar in magnitude and significance across all five model specifications.

TABLE C.1

ESTIMATED MARGINAL EFFECTS OF INDEPENDENT VARIABLES ON THE PROBABILITY
OF PARTICIPATION IN THE NSLP, UNDER ALTERNATIVE MODEL SPECIFICATIONS

	Model 1 (Base Model)	Model 2	Model 3	Model 4	Model 5

Note: Models were estimated using probit analysis. Figures shown are marginal effects multiplied by 100.

*Significantly different from zero at the .05 level.

**Significantly different from zero at the .01 level.

Table C.2 shows the marginal effects of the base SBP participation model (Model 1), as well as marginal effects from alternative specifications, that controlled for fewer (Models 2 and 3) or more (Models 4 and 5) covariates. Estimated marginal effects were again similar in magnitude and significance level across the various model specifications. One exception was for whether the student lived in a rural location—although this marginal effect was similar in magnitude in all five models, it was statistically significant at the 0.05 level in Models 3 through 5, but not in the base model.

APPENDIX D
FOOD GROUPS

A food grouping system with major and minor food groups was developed to provide further insight into the various types of foods offered in menus and the types of foods consumed by children in the dietary recall data (see Appendix Table D.1). Major and minor food groups were created, similar to those used in the Second School Nutrition Dietary Assessment Study (SNDA-II). Each menu item was assigned to one of nine major food groups—milk, fruits, vegetables, combination entrees, meat/meat alternates, grains/breads, desserts, accompaniments (condiments and toppings), and other menu items (e.g., snack items, juice drinks—not 100% juice). To further classify foods, the major food groups were expanded into subgroups (minor food groups). The minor food groups were established based on how often foods were reported in breakfast and lunch menus and dietary recalls and a review of the minor food groups used in SNDA-II. Vegetable minor groups were based on the U.S. Department of Agriculture's (USDA's) My Pyramid subgroups (dark green, deep yellow, legumes, starchy, and other vegetables). Also taken into consideration during the development of the food grouping system was the desire to describe the frequency with which schools offered fresh produce and self-serve food bars. The major and minor food groups were assigned to all menu and dietary recall items using the SurveyNet food codes.

TABLE D.1

MAJOR AND MINOR FOOD GROUPS

Major	Minor	Examples
Milk	Whole, unflavored	Whole milk with no added flavoring
	Whole, flavored	Whole chocolate or strawberry milk
	2%, unflavored	2% milk with no added flavoring
	2%, flavored	2% chocolate or strawberry milk
	1%, unflavored	1% milk with no added flavoring
	1%, flavored	1% chocolate or strawberry milk
	Skim, unflavored	Skim milk with no added flavoring
	Skim, flavored	Nonfat chocolate or strawberry milk
	Other milk beverages	Milkshakes, cocoa made with milk, powdered breakfast drink made with milk
		Any fresh fruit including apples, oranges, bananas, strawberries, and self-serve fruit bars
Fruits	Canned, sweetened	Any canned fruit in light, medium or heavy syrup, or juice-packed, including peaches, pears, fruit cocktail
	Canned, unsweetened	Any canned fruit water-packed or drained, including peaches, pears, fruit cocktail
	Frozen	Any frozen fruit, including strawberries, blueberries, peaches, cherries
	Dried	Any dried fruit, including raisins, cranberries
	Citrus fruit juice, 100%	Orange juice, grapefruit juice, orange-blend juice, including calcium fortified juice
	Non-citrus fruit juice, 100%	Apple juice, grape juice, juice blends, including vitamin C fortified juice
	Cooked, starchy	Potatoes, French fries, tater tots, corn, green peas
	Cooked, dark green	Cooked broccoli, spinach, collards, kale
	Cooked, deep yellow	Cooked carrots, sweet potatoes
	Cooked, other	String beans, cauliflower, asparagus, mixed vegetables, vegetable soups
Vegetables	Vegetable soups and vegetable casseroles	Tomato soup, broccoli cheese soup, vegetable noodle soup

TABLE D.1 (*continued*)

Major	Minor		Examples
	Legumes		Pinto beans, kidney beans, black beans, lentils, bean soups
	Raw, dark green		Raw spinach, romaine, broccoli
	Raw, deep yellow		Raw carrots
	Raw, other		Raw green or red peppers, iceberg lettuce, cabbage
Combination Entrees	Entree food bars		Self-serve salad bars, sandwich or deli bars, nacho or taco bars, pasta bars, potato bars
	Bag lunches/pre-plated meals		Pre-packaged meals, including Lunchables
	Hamburger, similar beef/pork sandwiches		Hamburgers, sloppy joes, beef steak sandwiches, and riblet sandwiches
	Cheeseburger, similar beef/pork sandwiches		Cheeseburgers, sloppy joes with cheese, beef steak and cheese sandwiches, meatball and cheese subs
	Hot dog, corn dog, similar sausage sandwiches		Hot dog on bun, corn dogs, and pancake-on-a-stick
	Sandwiches with breaded/fried meat, poultry, or fish		Chicken patty, chicken-fried steak, breaded beef or pork patty, and breaded fish patty sandwiches
	Sandwiches with plain meat, poultry, or fish		Turkey, ham, turkey ham, grilled chicken, roast beef, and salami sandwiches
	Sandwiches with mayonnaise-based poultry, egg, or tuna salads		Chicken, egg, and tuna salad sandwiches
	Sandwiches with only cheese		Grilled cheese, cheese sandwiches, Uncrustables
	Peanut butter sandwiches		Peanut butter and jelly sandwiches, Uncrustables
Entree salads	Breakfast sandwiches		Sausage, egg, and cheese on bagel; chicken patty on a biscuit; croissant with ham and cheese
	Pizza with meat		Sausage, pepperoni, and breakfast pizzas
	Pizza without meat		Cheese pizzas and vegetable pizzas
	Pizza-type product with meat		Calzones with pepperoni and cheese
	Pizza-type product without meat		Pizza dippers, pizza sticks, pizza rolls, mozzarella sticks
	Mixtures with pasta or noodle base		Spaghetti with sauce, lasagna, macaroni and cheese, ravioli
	Other mixtures with meat, grain, and/or vegetables		Chili, beef or chicken stir-fry, egg rolls, frozen meals, chili cheese fries, baked potato with cheese and meat
	Mexican-style entrees		Burritos, tacos, nachos, quesadillas, fajitas, enchiladas, taquitos, tamales
	Entree salads		Chef salads, chicken caesar salad, taco salad, salads with tuna or chicken salad

TABLE D.1 (*continued*)

Major	Minor	Examples
Meat/Meat Alternates	Chicken and turkey, breaded/fried	Chicken nuggets, patties, fillets, tenders, poppers, and fried chicken
	Chicken and turkey, plain (not breaded/fried)	Chicken or turkey salad, grilled chicken strips, chicken fajita strips, and roasted chicken breast
	Fish and shellfish, breaded/fried	Fish sticks, nuggets or patties, and shrimp poppers
	Fish and shellfish, plain (not breaded/fried)	Tuna salad, salmon, cod, shrimp
	Meat, breaded/fried	Chicken fried steak, breaded beef patty
	Meat, plain (not breaded/fried)	Ground beef, pork chops, meatloaf, meatballs
	Sausage, frankfurters and cold cuts	Sausage patties/links, hot dogs, bologna, salami
	Other protein (cheese, eggs, beans, or meat substitutes)	Cheese slices, omelets, hard boiled eggs, cheese sauce
	Nuts, nut butters, seeds, trail mixes	Peanut butter, sunflower seeds, trail mixes, mixed nuts
	Yogurt	Fruited or plain yogurt, including nonfat and lowfat
Grains/Breads	White breads, rolls, bagels, and other plain breads	White bread, pita bread, bagels, English muffins, toast, dinner rolls
	Whole grain breads, rolls, bagels, and other plain breads	Wheat, whole wheat, oatmeal, and rye bread or rolls
	Cold cereal, sweetened ^a	Any type of sweetened cold cereal: Honey Nut Cheerios, Fruit Loops, Lucky Charms, Frosted Flakes
	Cold cereal, unsweetened	Any type of unsweetened cold cereal: Rice Krispies, Corn Flakes, Wheaties, Chex
	Hot cereal	Any type of cooked hot cereal, including oatmeal, grits, cream of wheat
	Crackers and pretzels (hard)	Saltines, oyster crackers, cheese-filled crackers, hard pretzels
	Biscuits, croissants, seasoned breadsticks, cornbread, and stuffing	Biscuits, croissants, cornbread, hush puppies, stuffing, dumplings, flavored bread sticks
	Corn/tortilla chips	Corn chips, tortilla chips, taco shells
	Bread or bread alternates with added fat	Buttered toast, bagel with cream cheese, garlic bread
Pancakes, waffles, French toast	Muffins (excluding English muffins), sweet/quick breads	Blueberry muffins, chocolate chip muffins, banana or pumpkin bread
	Pancakes, waffles, French toast	Pancakes, waffles, French toast or French toast sticks

TABLE D.1 (*continued*)

Major	Minor	Examples
Rice		White, yellow or brown rice, rice pilaf, rice with vegetables, flavored rice not included in a combination entree
Pasta		Noodles, macaroni, and spaghetti not included in a combination entree; pasta salad without meat; macaroni and cheese as a side dish
Pastries ^b		Pop-Tarts, cinnamon or sweet rolls, coffee cake, danishes, doughnuts
Granola bars, fruit and grain bars ^b		Cereal bars with fruit filling, granola bars, Power Bars
Desserts	Baked (grain-based) desserts	Cookies, cakes, brownies, pies
	Granola bars, fruit and grain bars	Granola bars, breakfast bars, Rice Krispies treats
	Desserts containing fruit item or fruit juice	Fruit juice bars, gelatin with fruit, fruit sorbet
	Dairy based desserts	Pudding, ice cream, ice cream bars, frozen yogurt, yogurt
	Other (non-fruitied gelatin)	Gelatin without fruit, ice pops
Other	Candy	Chocolate bars, licorice, gum, fruit roll-ups, hard candies
	Juice drinks (not 100% juice)	Lemonade, grape juice, fruit punch, orange drinks
	Carbonated soda with caloric sweetener	Regular sodas, fruit-flavored sodas, cream sodas, root beer, ginger ale, tonic water
	Carbonated soda with non-caloric sweetener	Diet sodas, diet fruit-flavored sodas, and club soda
	Tea and coffee	Caffeinated/decaffeinated tea and coffee, including sweetened
	Bottled water, non-carbonated, unsweetened	Plain spring or mineral water
	Bottled water, non-carbonated, sweetened	Sugar-sweetened spring or mineral water, including flavored water
	Bottled water, non-carbonated, vitamin-fortified	Spring or mineral water, including sweetened and/or flavored, fortified with vitamins (Propel, Vitamin Water)
	Bottled water, non-carbonated, sugar-free	Spring or mineral water sweetened with diet sweetener, including flavored water
Accompaniments	Fat-free/low-fat condiments and toppings	Ketchup, barbecue sauce, mustard, syrup, jelly, salsa, pickles, vegetable items used as toppings

TABLE D.1 (*continued*)

Major	Minor	Examples
	Higher fat condiments and toppings	Mayonnaise, tartar sauce, butter, margarine, cheese sauce, chili, gravy, cream cheese, sour cream
	Fat-free/low-fat salad dressings	Fat-free, low-fat, reduced-calorie, or low-calorie ranch, Italian, and French dressing
	Regular salad dressings	Ranch, Italian, honey mustard, French, and caesar dressing
	Condiment or fixins bar	Self-serve condiment, toppings, or ‘fixins’ bars

^aA cereal was classified as sweetened if it contained 21.3 grams of sugar or more per 100 gram serving—the current criterion for cereals allowed under the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC).

^bSweet rolls, doughnuts, toaster pastries, coffee cake, grain fruit bars, and granola bars included as a grain/bread at breakfast.

APPENDIX E

TECHNICAL APPENDIX ON THE MULTIVARIATE ANALYSIS OF MEAN DIETARY INTAKES

This appendix describes the methodology used for the analysis of mean dietary intakes of school meal program participants and nonparticipants. As noted in the report, students who participated in the school meal program likely differed from nonparticipants in many ways, both observable and unobservable. Because of these differences between the two groups of students, it is possible that their dietary intakes would have differed even if the school meal programs were not available and participants obtained their meals from other sources.

To adjust for some of the underlying differences between participants and nonparticipants, the mean dietary intakes presented in the report were regression-adjusted for observable factors that may be correlated both with a student's decision to participate in the school meal programs and with his or her dietary intakes.¹ Differences between the regression-adjusted means for participants and nonparticipants therefore represent differences among students who were similar along many observable characteristics. Because there may have been important unobservable differences between participants and nonparticipants that could not be accounted for in the regression-adjustment, differences between the two groups still do not represent causal effects of the school meal programs. Nonetheless, the regression-adjustment accounts for some of the differences between the two groups.

The process used to generate the regression-adjusted estimates had three steps. First, linear regression models of students' intakes of each nutrient were estimated (both at breakfast or lunch and over 24 hours), with National School Lunch Program (NSLP) and School Breakfast Program (SBP) participation status and other relevant observable factors included as covariates.² Second,

¹ Unadjusted mean intakes of school meal program participants and nonparticipants are presented in Appendix F of this report.

² These regression models were estimated on the full sample of students with completed 24-hour dietary recalls and parent interviews. For students with two dietary recalls, only the first was included.

the estimated coefficients from the regression models were used to calculate two different predicted intake levels for each sample member—one assuming that the student was a school meal program participant, and the other assuming that he or she was a nonparticipant. Third, the regression-adjusted estimate of mean intakes for participants was computed as the weighted mean value of the predicted intake levels assuming all students were participants, and the regression-adjusted estimate of mean intakes for nonparticipants was computed as the weighted mean value of the predicted intake levels assuming all students were nonparticipants.

The regression used to generate regression-adjusted mean intakes took the following form:

$$(1) \quad y_i = \alpha_0 + X_i\beta + \alpha_1 NSLP_i + \alpha_2 SBP_i + \varepsilon_i,$$

where y_i is student i 's intake of nutrient y ; X_i is a set of observable characteristics; $NSLP_i$ is an indicator of the student's NSLP participation status; SBP_i is an indicator of the student's SBP participation status; and ε_i is a random error term. Table E.1 lists the covariates included in the model.³ Tables E.2 through E.5 present the full results of these regression models for all students.

After the regression model was estimated, the resulting coefficient estimates were used to calculate two predicted intake values for each student in the sample—one predicted intake assuming the student was an NSLP (or SBP) participant, and the other predicted intake assuming

³ When the value for a particular covariate was missing for a particular student, the value for this covariate was imputed. Across the different covariates included in the analysis, the percentage of sample members with missing values ranged from zero to eight percent. Missing values of continuous school-level variables were imputed as the mean value of that variable by region and grade level (elementary, middle, or high school), and missing values of continuous student-level variables were imputed as the mean value of that variable by region, grade level, and gender. Missing values of school-level binary and categorical variables were imputed as the modal value for that variable by region and grade level, and missing values of student-level binary and categorical variables were imputed as the modal value for that variable by region, grade level, and gender. Models included imputation indicators for each imputed covariate as control variables, if the covariate was imputed for one percent or more of the sample. The models included five such imputation indicators.

the student was a nonparticipant. The former predicted intake value (assuming NSLP participation) was calculated as follows:

$$(2) \quad y_i^P = \hat{\alpha}_0 + X_i \hat{\beta} + \hat{\alpha}_2 SBP_i + \hat{\alpha}_1,$$

where $\hat{\alpha}_0$, $\hat{\beta}$, $\hat{\alpha}_1$, and $\hat{\alpha}_2$ are estimated coefficients from model (1).

The predicted intake value assuming NSLP nonparticipation was calculated as follows.

$$(3) \quad y_i^{NP} = \hat{\alpha}_0 + X_i \hat{\beta} + \hat{\alpha}_2 SBP_i.$$

Thus, the difference between the predicted intakes among NSLP participants and the predicted intakes among nonparticipants is $\hat{\alpha}_1$, the estimated coefficient on NSLP participation status. The regression-adjusted mean intake values for participants and nonparticipants were calculated as the mean values of y_i^P and y_i^{NP} . The regression-adjusted mean intakes of SBP participants and nonparticipants were calculated analogously.

TABLE E.1
COVARIATES INCLUDED IN REGRESSION MODELS OF MEAN DIETARY INTAKES

Covariate	Values
NSLP Participation	A binary variable indicating the student participated in the NSLP
SBP Participation	A binary variable indicating the student participated in the SBP
Gender	A binary variable indicating the student's gender
Race/Ethnicity	A set of three binary variables indicating the student's race/ethnicity
Age	A set of 12 binary variables indicating the student's age
Hearty Eater	A set of two binary variables indicating how much the student eats relative to others
Picky Eater	A set of two binary variables indicating whether the student is not picky, somewhat picky, or very picky
Height	The student's height in feet
Food Allergies	A binary variable indicating whether the student has food allergies or special dietary needs
Dieting	A binary variable indicating whether the student is on a diet
Dietary Supplement Use	A binary variable indicating whether the student takes dietary supplements
Health Status	A set of three binary variables indicating how healthy the student is, based on parent reports
Physical Activity	A set of three binary variables indicating the student's level of physical activity relative to others
TV Watching	A set of three binary variables indicating the amount of television the student watches per day
Family Income	A set of four binary variables indicating the student's family income relative to poverty
Public Assistance	A binary variable indicating whether the student's family receives public assistance
Number of Children in Household	A set of two binary variables indicating the number of children in the household
Relationship of Respondent to Student	A binary variable indicating whether the respondent was the student's parent or partner of parent
Parental Employment	A set of four binary variables indicating the employment status of the student's parent(s)
Primary Language Spoken at Home	A set of two binary variables indicating the primary language spoken in the student's home

TABLE E.1 (*continued*)

Covariate	Values
Parental Education	A set of two binary variables indicating the highest level of education completed by the student's parent(s)
Family Dining Habits	A binary variable indicating whether the student's family eats dinner together 5 nights a week or more
School SBP Participation	A binary variable indicating whether the student's school participated in the SBP
Open Campus	A binary variable indicating whether the student's school has an open-campus policy
Competitive Foods Offered During Mealtimes	A binary variable indicating whether the student's school offers competitive foods during mealtimes
Healthy Foods Offered Competitively	A binary variable indicating whether the student's school offers healthy foods offered in vending machines, snack bars, or school store
Healthy Foods Offered a la Carte ^a	A binary variable indicating whether the student's school offers healthy foods a la carte
Recess	A binary variable indicating whether the student's school offers recess
Urbanicity	A set of three binary variables indicating whether the student's school serves an urban area, urban fringe, town, or rural area
Region	A set of six binary variables indicating region of the country in which the student lives
Day of Week	A set of four binary variables indicating the day of the week of the student's dietary recall
Imputation Indicators	A set of five binary variables indicating whether the values of particular covariates were imputed for that student

^aIncluded only in models for NSLP participants and nonparticipants.

Source: School Nutrition Dietary Assessment–III, 24-Hour Dietary Recalls, school year 2004–2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes children who did not consume a lunch. Intakes of NSLP participants include all foods consumed, including those that may have been brought from home or obtained in school from sources other than the reimbursable meal.

*Significantly different from zero at the .05 level.

**Significantly different from zero at the .01 level.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes children who did not consume a lunch. Intakes of NSLP participants include all foods consumed, including those that may have been brought from home or obtained in school from sources other than the reimbursable meal.

*Significantly different from zero at the .05 level.

**Significantly different from zero at the .01 level.

TABLE E.3c (*continued*)

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample includes all students, including those who did not consume a lunch.

DFFE = Dietary Folate Equivalents.
RAE = Retinol Activity Equivalents.
RE = Retinol Equivalents.

*Significantly different from zero at the .05 level.

**Significantly different from zero at the .01 level.

Source:

School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes children who did not consume a breakfast. Intakes of SBP participants include all foods consumed, including those that may have been brought from home or obtained in school from sources other than the reimbursable meal.

*Significantly different from zero at the .05 level.
**Significantly different from zero at the .01 level.

School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes children who did not consume a breakfast. Intakes of SBP participants include all foods consumed, including those that may have been brought from home or obtained in school from sources other than the reimbursable meal.

DFE = Dietary Folate Equivalents.

RAE = Retinol Activity Equivalents.

RE = Retinol Equivalents.

*Significantly different from zero at the .05 level.

**Significantly different from zero at the .01 level.

APPENDIX H

PC-SIDE SOFTWARE AND ESTIMATION PROCEDURES

As discussed in Chapter V of this report, the personal computer version of a specialized software package, the Software for Intake Distribution Estimation (PC-SIDE), was used to estimate usual intake distributions and the prevalence of inadequate and excessive intakes. Since the Dietary Reference Intakes (DRIs) used to assess nutrient inadequacy are based on student's *usual* intakes, but only *daily (24-hour)* intakes are observed, PC-SIDE applies a procedure recommended by the Institute of Medicine to estimate the distribution of usual intakes from daily intakes (Institute of Medicine, 2000) and the prevalence of inadequacy or excess. This section describes the PC-SIDE software and estimation procedures used for the analysis.

OVERVIEW OF THE PC-SIDE SOFTWARE AND PROGRAMMING ENVIRONMENT

PC-SIDE version 1.02 was used for all analyses of usual intake distributions and nutrient inadequacy or excess. This software follows the procedures described by Nusser et al. (1996) to estimate usual intake distributions by estimating the intra-individual variation in nutrient intake, based on a subsample of individuals with two days of intake data, and removing this source of variation in order to estimate the distribution of usual nutrient intakes across a population.

In order to implement these procedures, PC-SIDE first performs preliminary adjustments to the dietary intake data, including incorporation of sample weights and adjustments for day 1 (first 24-hour recall, collected from all sample members) and day 2 (second 24-hour recall, collected from 29 percent of sample members) intakes. The software then uses a power transformation and a nonparametric transformation based on a grafted polynomial model to transform the data into a normal distribution. It then uses a measurement error model to estimate the within-individual variation in intakes as well as the distribution of usual intakes. Finally, it "back-transforms" the data from the normal distribution to the original scale. Once the usual intake distribution in the original scale has been estimated, PC-SIDE can estimate percentiles of

the usual intake distribution as well as the proportion of the population with intakes above or below a particular value.

ESTIMATES BY NSLP AND SBP PARTICIPATION STATUS

In order to estimate usual intake distributions for groups defined by NSLP or SBP participation status, the sample was defined based on students' participation status on the *first day* of intake data, regardless of their participation status on the second day, since day-2 intakes were used only to estimate the with-person variation in intakes. In practice, the inclusion of students who changed participation status between day 1 and day 2 made virtually no difference in the estimated means, standard errors, or distributions of usual intakes. However, in some cases PC-SIDE failed to produce estimates when day-2 intakes were limited only to students who did not change status, due to the smaller number of second-day intakes. For this reason, estimates based on groups defined by day-1 participation status only were preferred and were used for the main analysis.

ESTIMATION OF NUTRIENT INADEQUACY OR EXCESS

Estimates of usual intake distributions and nutrient inadequacy or excess for the SNDA-III analyses were generated for all students, as well as for 112 subgroups defined by age or grade level, gender, and NSLP or SBP participation status. In some cases, these estimates were made for population groups that had more than one reference standard. For example, two Estimated Average Requirements (EARs) are generally defined for children 14 to 18 years: one for males and one for females. A simple adjustment to the EAR cut-point method was used to estimate the prevalence of nutrient inadequacy for these combined groups. Each individual's observed intake was divided by the appropriate EAR, and the resulting ratios were adjusted using PC-SIDE to

obtain the “usual” intake-to-EAR ratios. Calculating the percentage of the group with ratios less than one yielded an estimate of the prevalence of nutrient inadequacy for the combined group.

Accounting for Sample Weights and the Complex Sample Design. Sample weights were used to account for unequal selection probabilities and for survey nonresponse, so estimates would be nationally representative. In addition, to account for the complex sampling design in the estimation of standard errors, PC-SIDE’s jackknife replicate weighting procedure was used. This approach draws repeated subsets of the sample defined by a set of “replicate weights” provided by the researcher, calculates the usual intake distribution for each subset, and then estimates the variance based on how much the estimates vary over repeated subsamples (Carrington et al. 2000).¹

Estimation Procedures. Several parameters must be defined for the PC-SIDE analysis, including those affecting the transformation of the data to a normal distribution. These parameters include: (1) the Type I error rate used to test significance with an Anderson-Darling test for normality of the transformed data, (2) the minimum number of join points used to fit the grafted polynomial function to a normal probability plot, and (3) the maximum number of join points allowed. SNDA-III generally used the default values of these parameters—a Type I error rate of 0.15, a minimum of three join points, and a maximum of 12. In only one case (intakes of vitamin A for all students combined) was the test of the normality hypothesis rejected under these default settings. For this case the maximum number of join points was increased to 14, and the hypothesis of normality was not rejected under these settings.

¹ Developing the jackknife replicate weights required dividing the sample into “pseudo-strata” with two to three primary sampling units (PSUs) per pseudo-stratum. The initial SNDA-III sample was selected using Chromy’s (1978) selection procedure, which created “implicit strata,” or zones, based on geography, poverty level, and other characteristics of the school food programs. The resulting zones were used to sort the sample into pseudo-strata for the purposes of developing the replicate weights, by pairing PSUs in adjacent zones.

The statistical formula used by PC-SIDE to estimate the usual intake variance subtracts the within-individual variability from the total variability in the sample. In some cases, the estimated within-individual variance exceeded the total variance in the sample, and PC-SIDE was unable to produce nonnegative estimates of the usual intake variance for certain population subgroups. This typically occurred for subgroups with a small number of second 24-hour recalls relative to the total sample size. In these cases, the usual intake variance was estimated by supplying an external estimates of the within-individual variance, following a procedure used in an Agricultural Research Service (ARS) analysis of the National Health and Nutrition Examination Survey (NHANES) (Moshfegh et al. 2005).

Specifically, for the SNDI-III analyses, if PC-SIDE was unable to produce a nonnegative estimate of the usual intake variance for a particular nutrient intake for a particular population subgroup (for instance, folate intakes of high school male National School Lunch Program (NSLP) participants), an external estimate of the within-individual variance component was supplied from a model estimated on a more aggregated sample (for instance, a pooled model of folate intakes of high school male NSLP participants and nonparticipants). This pooled estimate of the within-individual variance, computed as the “variance of measurement error” in the PC-SIDE output divided by the sum of the variance of measurement error and the “variance of usual intakes,” was then used as the estimate of the within-individual variance for the problematic subgroup (in this example, high school male NSLP participants). In the majority of cases, this resulted in a positive estimate of the usual intake variance. If the estimate was still not positive, the within-individual variance was estimated from a further aggregated sample (for instance,

high school male and female NSLP participants and nonparticipants), and this pooled estimate was used as the with-individual variance estimate for the problematic subgroup.²

To supply the external variance estimate to PC-SIDE, the procedure described by (Moshfegh et al. 2005) was used. Specifically, the PC-SIDE parameter for the within-individual variance (PEVCR) was set to the within-individual variance estimate from the pooled sample, and the parameter NPEVCR was set to “999999” to force PC-SIDE to use the external estimate.

The Probability Approach for Estimating Iron Inadequacy. As discussed in Chapter V, the EAR-cutpoint method cannot be used to estimate the prevalence of iron inadequacy, since the assumptions underlying the method are violated due to the skewed distribution of iron requirements. Instead, the probability approach must be used to estimate the prevalence of iron inadequacy, based on a published distribution of iron requirements (IOM 2001). These distributions vary across the population and are defined separately for different age-gender groups (in the case of the SNDA-III sample, the relevant subgroups were 4 to 8 year old children, 9 to 13 year old males, 9 to 13 year old females, 14 to 18 year old males, and 14 to 18 year old females). To implement the probability approach, the following steps were followed:

1. PC-SIDE was used to compute the usual intake distribution of iron for each of the five age-gender subgroups and to produce a dataset containing the estimated intake values at 499 evenly spaced percentiles.
2. This dataset was merged to a dataset with intake values ranging from 1 to 14.39—the maximum of the iron requirement distribution for the five subgroups examined—increasing in 0.01 increments. Percentiles for the intake values between the 499 estimated percentiles were linearly interpolated. This resulted in a dataset with every possible intake values between zero and the maximum of the iron requirement

² Since the external variance estimation procedure was used only for the problematic subgroups rather than the full sample, it is possible that estimates of nutrient inadequacy (or excess) for the full sample could in some cases exceed the estimates for each of the component subgroups. This is because variance estimates for the full sample will reflect the actual data for each subgroup, including that of the problematic subgroup(s), while estimates for the problematic subgroup(s) will reflect the (smaller) external variance estimates rather than the true sample variability.

distribution and an associated estimate of the percentage of the population with intakes below this value, for each of the five age-gender subgroups.

3. This dataset was then compared with the distribution of iron requirements for each of the five age-gender subgroups. The distribution of iron requirements provided estimates of the probability of inadequacy for individuals with dietary intakes within given ranges for each of the five subgroups. Subtracting the estimated percentage of the subgroup with intakes at the bottom of each range from the estimated percentage at the top of the range provided an estimate of the fraction of the subgroup with intakes in each range of the distribution of iron requirements.
4. For each range of the published distribution of iron requirements, the probability of inadequacy for individuals with intakes in that range was multiplied by the estimated fraction of the subgroup with intakes in that range, and summed over the full distribution of that age-gender subgroup to produce a weighted estimate of the probability of inadequacy for the entire subgroup.
5. To estimate the prevalence of iron inadequacy for subgroups comprising multiple age-gender subgroups (for instance, 9- to 13-year-old girls and boys combined), the prevalence of inadequacy was estimated separately for each iron requirement subgroup, and a weighted average was computed based on the fraction of the overall population subgroup in each of the five iron requirement subgroups.

Standard errors were not produced for estimates of iron inadequacy, due to the difficulty of producing reliable standard error estimates when using the probability approach.

APPENDIX I

TECHNICAL APPENDIX ON THE PROPENSITY SCORE MATCHING ANALYSIS OF NUTRIENT INADEQUACY AND EXCESS

This appendix describes the propensity score matching methodology used to adjust for observable differences between school meal program participants and nonparticipants in the analysis of nutrient inadequacy and excess. As noted in the report, students who participated in the school meal program likely differed from nonparticipants in many ways, both observable and unobservable. Because of these differences between the two groups of students, it is possible that their dietary intakes would have differed even if the school meal programs were not available and participants obtained their meals from other sources. Statistically adjusting for these underlying differences allows a comparison of the intakes of school meal program participants and nonparticipants who are otherwise similar according to many observable characteristics.

A standard approach in the literature to account for differences in observable characteristics between groups is regression adjustment, and this approach was used in the analysis of mean dietary intakes, as described in Appendix E, as well as in other analyses of mean dietary intakes (Devaney et al. 1993; Gleason and Suitor, 2001; Gleason and Suitor, 2003). However, regression-adjustment cannot be used for analysis of nutrient inadequacy and excess, since it requires information on nutrient inadequacy (or excess) for each person in the sample. As discussed in Appendix H, nutrient inadequacy and nutrient excess can typically only be estimated at the *group* level, using the procedure recommended by the Institute of Medicine (IOM 2000). Therefore, in order to adjust for differences in observable characteristics between participants and nonparticipants in the analysis of nutrient inadequacy and excess, a propensity score matching approach was used instead. This approach used observable characteristics to construct a comparison group of nonparticipants who were similar to participants according to observable characteristics, and then applied the IOM procedure to estimate nutrient inadequacy and excess for school meal program participants and for the matched comparison group.

As with the regression-adjustment of mean intakes, the propensity score matching procedure can only adjust for differences in *observable* characteristics, and participants may also differ from nonparticipants in unobservable ways that may influence their dietary intakes. For this reason, neither the regression-adjusted nor propensity score matched differences in intakes between participants and nonparticipants can be definitively interpreted as causal effects of the school meal program on students' dietary intakes. The goal of such adjustment was rather more modest: to adjust to the extent possible for observable factors likely to be correlated with dietary intakes so as to compare similar groups of participants and nonparticipants, while still acknowledging that unobservable factors may influence differences in dietary intakes.

A. PROPENSITY SCORE MATCHING ESTIMATION—OVERVIEW

Propensity score matching is a well-established technique (Rosenbaum and Rubin 1983; Dehejia and Wahba 2002; Smith and Todd 2001) for adjusting for observable differences between two groups—a “program group” (in this case, NSLP or SBP participants) and a comparison group that did not participate in the program (NSLP or SBP nonparticipants). In general, to implement this technique, the researcher estimates a probit or logit model of program participation as a function of covariates that are thought to influence the participation decision and be correlated with the outcome(s) of interest (in this case, dietary intakes). The results of this model are then used to predict a “propensity score” reflecting the estimated probability that each individual, in both the program and comparison groups, participated in the program based on their observed characteristics.

Each individual in the program group is then matched to an individual (or individuals) in the comparison group with a similar estimated propensity score. The original approach developed in the propensity score matching literature is “nearest neighbor matching,” which matches each program group member with the comparison group member (or members) with the closest value

of the propensity score (Rosenbaum and Rubin 1983). Alternative, more recently developed approaches include caliper matching, kernel matching, and local linear matching, each of which constructs a matched comparison group as a weighted average of nonparticipants, with weights reflecting the “quality” of the match to each program group member based on the estimated propensity score. Each of these approaches is described in greater detail by Heckman, Ichimura, and Todd (1997). Nearest neighbor matching remains one of the most commonly used methods, in part because of the clear intuition underlying the approach of constructing a matched comparison group comprised of nonparticipants who are similar to participants according to observed characteristics. In general, research has shown that nearest neighbor matching tends to perform as well as alternative matching methods with cross-sectional data, although all estimates may fail to fully account for selection bias due to differences in unobservable characteristics (Heckman, Ichimura, and Todd 1997).

Although each matched comparison group member will not necessarily have identical characteristics to the treatment group member to whom he or she is matched, the matched pair will have a set of observable characteristics that suggests they are equally likely to participate in the program. Furthermore, on average, the participants and matched comparison groups should have similar observable characteristics if the two groups are well matched. The researcher may perform various “balancing” tests to determine whether the program group is on average similar to the matched comparison group according to observable characteristics. If the two groups are not balanced, the researcher may re-estimate the propensity score model, adding interaction terms and/or higher order terms of the covariates.

Once the researcher is satisfied that the two groups are similar according to observable characteristics, a simple comparison of the average value of the outcome variable(s) (in this case, dietary intakes) between the program and matched comparison groups yields an estimate of the

difference in the outcome between the program group and a similar group of individuals who did not participate in the program. If the researcher is confident that all factors that affect both participation and the outcome(s) in the absence of participation are both observed and controlled for in the model of program participation, a comparison of the average value of the outcome variable for the program and matched comparison groups provides an estimate of the *causal* effect of the program on the outcome of interest. However, if the researcher believes there are unobservable characteristics that may be correlated with both program participation and the outcome of interest, propensity score matching can still be a useful approach for adjusting for differences in observable characteristics between the program group and the comparison group.

B. PROPENSITY SCORE MATCHING FOR THE SNDA-III ANALYSES

To implement the propensity score matching approach for the SNDA-III analysis, a logit model of school meal program (NSLP or SBP) participation was estimated, separately for elementary, middle, and high school students, using Stata statistical software. The covariates included in this model were characteristics that regression analysis had shown to be correlated with students' intakes of several nutrients (see Tables E.2A-E.5D) and were thought to influence participation. The results of this model were used to predict a propensity score for each student.¹

Table I.1 displays the results of the final logit models of NSLP and SBP participation.

Each student in the program group (NSLP or SBP participants) was then matched to the student in the comparison group (nonparticipants in the relevant program) using the nearest neighbor matching method, with a single nearest neighbor. Matching was done "with

¹ Specifically, the propensity score was calculated as the predicted probability of participation, or $\Lambda(X_i \hat{\beta})$, where X_i is a vector of observed values of covariates for individual i , $\hat{\beta}$ is a vector of estimated coefficients from the logit model, and $\Lambda(X_i \hat{\beta})$ is the logistic cumulative distribution function of $X_i \hat{\beta}$.

replacement,” meaning a given student in the comparison group could be matched to multiple students in the program group. Analysis weights for matched participants were simply their initial sampling weight (which accounted for selection probabilities and nonresponse). The analysis weight for each matched nonparticipant was the sampling weight of the participant to whom he or she was matched, if he or she was matched to only one participant. If a nonparticipant was matched to more than one participant, his or her analysis weight was the sum of the sampling weights of the participants to whom he or she was matched.

To test whether the participants and matched comparison groups were similar according to observable characteristics, two sets of tests were performed for each model: Hotelling’s t-squared test of the joint equality of the means all covariates in the model across the two groups and separate two-tailed t-tests of the equality of means of each covariate in the model. The participant and matched comparison groups were considered balanced if (1) the null hypothesis of the Hotelling test was not rejected with a 5 percent critical value and if (2) fewer than 5 percent of the individual t-tests were rejected with a 5 percent critical value for each model. Table I.2 displays p-values from the Hotelling and individual t-tests for the final NSLP and SBP participation models. As shown in the table, across all groups, the p-values of the Hotelling tests are well over the 5 percent critical value. Furthermore, across all groups and characteristics, differences in means are generally small, and statistically significant for 5 percent or fewer characteristics in each group. These statistics suggest that the participant and matched comparison groups are well-balanced in terms of observable characteristics.

Once the participant and matched comparison group samples had been constructed, the IOM approach for estimating nutrient inadequacy and excess for the two groups was applied (Appendix H), using the analysis weights described above. These results are displayed in Tables VI.5-6 and VII.5-6 of the main report. Jackknife standard errors were estimated to account for

clustering and stratification, but did not take into account variation due to the fact that the propensity score was estimated and the matching process itself (Heckman, Ichimura, and Todd 1997). This is because no analytic formula for determining the correct standard errors is currently available even for simple comparisons of means in propensity score matching analyses, much less in the context of the IOM procedure for estimating usual nutrient intake distributions.²

Although the primary goal of the propensity score matching was to construct groups of similar participants and nonparticipants in order to apply the IOM method for estimating usual intake distributions and nutrient inadequacy and excess at the group level, the weighted propensity score matched samples can also be used to estimate differences in *mean dietary intakes* between school meal program participants and nonparticipants.³ These estimates are similar in spirit to the regression-adjusted estimates presented in the main report (Tables VI.2-VI.4 and VII.2-VII.4), since both adjust for observable characteristics likely to be correlated with dietary intakes, albeit using different approaches. However, one important conceptual difference between the two sets of estimates is that, in the propensity score matching estimates, mean intakes for both participants and matched nonparticipants are estimates of the mean intakes of a student with the characteristics of the average *participant*. In contrast, the regression-adjusted mean intake estimates are estimates of the mean intakes of a student whose characteristics are similar to those of the *average student*.

Tables I.3-I.5 display the mean intakes of the matched NSLP participants and nonparticipants, along with tests of the significance of the difference between the two groups,

² Although in some cases researchers apply a bootstrap procedure to estimate standard errors for propensity score matching analyses, research has shown that the bootstrap may yield biased standard error estimates in the case of nearest neighbor matching (Abadie and Imbens 2006), so this approach was not used.

³ Standard errors for the mean intakes of the propensity score matched sample accounted for clustering and stratification, but did not account for variation due to the fact that the propensity score was estimated or the matching process itself.

and Tables I.6-I.8 displays comparable results for matched SBP participants and nonparticipants. Table I.9-I.12 compare the sign and significance levels of estimated mean differences from the regression-adjusted (Tables VI.2-VI.4 and VII.2-VII.4) and propensity score matching estimates (Tables I.3-I.8). In general, results for mean lunch intakes of NSLP participants and nonparticipants are very similar in sign and significance between the regression-adjusted and propensity score matching estimates (Table I.9), and are also similar in magnitude. For the full sample, all statistically significant results from the regression models are also statistically significant and of the same sign in the propensity score matching estimates, and this is the case for the majority of grade-level estimates as well. The regression-adjusted and propensity score matching estimates for mean daily intakes of NSLP participants and nonparticipants, mean breakfast intakes of SBP participants and nonparticipants (Table I.11), and mean daily intakes of SBP participants and nonparticipants (Table I.12) are less similar than those for lunch intakes, but are still generally similar in magnitude and rarely contradictory in sign. The existing differences in these estimates likely arise from the fact that the regression adjustment and propensity score matching estimates using different approaches for controlling for differences in participants' and nonparticipants' characteristics.

Source: School Nutrition Dietary Assessment-III, Student and Parent Interviews, school year 2004-2005 and 2002-2003 U.S. Department of Education Common Core of Data.
 Weighted estimates prepared by Mathematica Policy Research, Inc.

Note: Estimated p-values are from tests of the difference in the mean values of the specified characteristic between school meal program participants and the matched comparison group. Matched comparison group constructed as described in text. Estimates weighted to account for sample design and the fact that students in the comparison group may be matched to multiple participants.

*Difference in mean value of characteristic for participants and matched nonparticipants is significantly different from zero at the .05 level.

**Difference in mean value of characteristic for participants and matched nonparticipants is significantly different from zero at the .01 level.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a lunch. Lunch intakes of both NSLP participants and matched nonparticipants include all foods and beverages consumed at lunch. For NSLP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable lunch, foods/beverages that were obtained in school from non-reimbursable sources and/or foods that were brought from or consumed at home.

Note: Matched participant sample constructed using propensity score matching to adjust for differences in personal, family, and school characteristics between NSLP participants and nonparticipants, including age, sex, race and ethnicity, height, household income relative to poverty, region, and several other characteristics, as described in text. Estimates weighted to account for sample design and the fact that students in the comparison group may be matched to multiple participants.

*Difference between participants and matched nonparticipants is significantly different from zero at the .05 level.

**Difference between participants and matched nonparticipants is significantly different from zero at the .01 level.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a breakfast. Breakfast intakes of both SBP participants and matched nonparticipants include all foods and beverages consumed at breakfast. For SBP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable breakfast, foods/beverages that were obtained in school from non-reimbursable sources and/or foods that were brought from or consumed at home.

Note: Matched participant sample constructed using propensity score matching to adjust for differences in personal, family, and school characteristics between SBP participants and nonparticipants, including age, sex, race and ethnicity, height, household income relative to poverty, region, and several other characteristics, as described in text. Estimates weighted to account for sample design and the fact that students in the comparison group may be matched to multiple participants.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

*Difference between participants and matched nonparticipants is significantly different from zero at the .05 level.

** Difference between participants and matched nonparticipants is significantly different from zero at the .01 level.

¹ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a lunch.

¹ Linoleic acid is an essential n-6 polyunsaturated fatty acid.² Standard error not displayed when percentage is less than 3 or greater than 97.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

AMDR = Acceptable Macronutrient Distribution Range.

¹ Linolenic acid is an n-3 fatty acid. Dietary Reference Intakes are defined for a specific form of linolenic acid (alpha-linolenic acid). Intakes reported in this table are for the undifferentiated fatty acid.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake

Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a lunch.

AI = Adequate Intake.

¹ Linolenic acid is an n-3 fatty acid. Dietary Reference Intakes are defined for a specific form of linolenic acid (alpha-linolenic acid). Intakes reported in this table are for the undifferentiated fatty acid.² Standard error not displayed when percentage is less than 3 or greater than 97.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by

Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

AMDR = Acceptable Macronutrient Distribution Range.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by

Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

AMDR = Acceptable Macronutrient Distribution Range.

¹ For students with a Body Mass Index (BMI) within the healthy range (BMI>=5th percentile and <85th percentile), actual body weight was used. For other students a weight was used that would place the individual at the nearest end of the healthy weight range, based on his or her height.

² Standard error not displayed when percentage is less than 3 or greater than 97.

³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

EAR = Estimated Average Requirement.

Sample excludes students with unreliable height or weight data.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

EAR = Estimated Average Requirement. RAE = Retinol Activity Equivalents.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The EAR for vitamin C for smokers is 35mg greater than for nonsmokers. This table uses EARs for nonsmokers.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

EAR = Estimated Average Requirement.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

EAR = Estimated Average Requirement; DFE = Dietary Folate Equivalents.

¹ Niacin intakes include preformed niacin only. EARs for niacin are expressed as niacin equivalents, including contributions from tryptophan. Therefore, prevalence of inadequacy may be overestimated.

² Standard error not displayed when percentage is less than 3 or greater than 97.

³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

EAR = Estimated Average Requirement.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

¹ Comparison to EAR was done using the probability approach (see Appendix H). Standard errors for the estimated percentage with usual intakes less than the EAR were not produced.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake

Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a lunch.

EAR = Estimated Average Requirement.

¹ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

AI = Adequate Intake.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a lunch.

¹ The AI is for total fiber (dietary and functional). Intakes include only dietary fiber, so true total fiber intakes are underestimated. The AIs used in this table are based on a standard of 14 grams of fiber/1,000 kilocalories using median energy intakes assessed in national survey data. Table 36 shows fiber consumption on a gram per 1,000 kilocalorie basis, compared to the 14 gram/1,000 kilocalorie standard.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a lunch.

AI = Adequate Intake.

¹ The AI is for total fiber (dietary and functional). Intakes include only dietary fiber, so true total fiber intakes are underestimated. The age- and gender-specific AIs used in Table 35 are based on an assumption of 14 grams of fiber/1,000 kilocalories using median energy intakes in national survey data. This table shows fiber consumption on a gram per 1,000 kilocalories basis, compared to the 14 gram/1,000 kilocalorie standard.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a lunch.

AI = Adequate Intake.

Source: School Nutrition Dietary Assessment-III, 24-hour Dietary Recalls, school year 2004-2005. Weighted tabulations of single 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a lunch. Intakes of both NSLP participants and nonparticipants include all foods and beverages consumed at lunch. For NSLP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable lunch, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

^aIncludes sandwiches with or without cheese.

*Differences between participants and nonparticipants is significantly different from zero at the .05 level.

**Differences between participants and nonparticipants is significantly different from zero at the .01 level.

Sample excludes students who did not consume a lunch. Intakes of both NSLP participants and nonparticipants include all foods and beverages consumed at lunch. For NSLP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable lunch, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

^aIncludes sandwiches with or without cheese.

*Differences between participants and nonparticipants is significantly different from zero at the .05 level.

**Differences between participants and nonparticipants is significantly different from zero at the .01 level.

Source: School Nutrition Dietary Assessment-III, 24-hour Dietary Recalls, school year 2004-2005. Weighted tabulations of single 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a lunch. Intakes of both NSLP participants and nonparticipants include all foods and beverages consumed at lunch. For NSLP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable lunch, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

^aIncludes sandwiches with or without cheese.

*Differences between participants and nonparticipants is significantly different from zero at the .05 level.

**Differences between participants and nonparticipants is significantly different from zero at the .01 level.

¹ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

¹ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

¹ Linoleic acid is an essential n-6 polyunsaturated fatty acid.

2 The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake

Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

AI = Adequate Intake.

¹ Linoleic acid is an essential n-6 polyunsaturated fatty acid.² Standard error not displayed when percentage is less than 3 or greater than 97.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by

Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

AMDR = Acceptable Macronutrient Distribution Range.

¹ Linolenic acid is an n-3 fatty acid. Dietary Reference Intakes are defined for a specific form of linolenic acid (alpha-linolenic acid). Intakes reported in this table are for the undifferentiated fatty acid.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake

Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

AI = Adequate Intake.

¹ Linolenic acid is an n-3 fatty acid. Dietary Reference Intakes are defined for a specific form of linolenic acid (alpha-linolenic acid). Intakes reported in this table are for the undifferentiated fatty acid.² Standard error not displayed when percentage is less than 3 or greater than 97.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by

Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

AMDR = Acceptable Macronutrient Distribution Range.

¹ For students with a Body Mass Index (BMI) within the healthy range (BMI>=5th percentile and <85th percentile), actual body weight was used. For other students a weight was used that would place the individual at the nearest end of the healthy weight range, based on his or her height.

² Standard error not displayed when percentage is less than 3 or greater than 97.

³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

EAR = Estimated Average Requirement.

Sample excludes students with unreliable height or weight data.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by

Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

AMDR = Acceptable Macronutrient Distribution Range.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

EAR = Estimated Average Requirement. RAE = Retinol Activity Equivalents.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The EAR for vitamin C for smokers is 35mg greater than for nonsmokers. This table uses EARs for nonsmokers.³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

EAR = Estimated Average Requirement.

¹ Niacin intakes include preformed niacin only. EARs for niacin are expressed as niacin equivalents, including contributions from tryptophan. Therefore, prevalence of inadequacy may be overestimated.

² Standard error not displayed when percentage is less than 3 or greater than 97.

³ The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

EAR = Estimated Average Requirement.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

¹ Comparison to EAR was done using the probability approach (see Appendix H). Standard errors for the estimated percentage with usual intakes less than the EAR were not produced.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

EAR = Estimated Average Requirement.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.

2 The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE).

Sample includes all students, including those who did not consume a breakfast.

EAR = Estimated Average Requirement.

¹ Standard error not displayed when percentage is less than 3 or greater than 97.² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake

Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

AI = Adequate Intake; UL = Tolerable Upper Intake Level.

¹ The AI is for total fiber (dietary and functional). Intakes include only dietary fiber, so true total fiber intakes are underestimated. The AIs used in this table are based on a standard of 14 grams of fiber/1,000 kilocalories using median energy intakes assessed in national survey data. Table 36 shows fiber consumption on a gram per 1,000 kilocalorie basis, compared to the 14 gram/1,000 kilocalorie standard.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls

prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

AI = Adequate Intake.

¹ The AI is for total fiber (dietary and functional). Intakes include only dietary fiber, so true total fiber intakes are underestimated. The age- and gender-specific AIs used in Table 35 are based on an assumption of 14 grams of fiber/1,000 kilocalories using median energy intakes in national survey data. This table shows fiber consumption on a gram per 1,000 kilocalories basis, compared to the 14 gram/1,000 kilocalorie standard.

² The DRI age group is 4 to 8 years; however, the recall sample does not include 4- and 5-year-olds. This age group is not broken out by gender because of small sample sizes.

~ Estimates may not be reliable due to inadequate cell size or a large coefficient of variation.

Source: School Nutrition Dietary Assessment-III, 24-Hour Dietary Recalls, school year 2004-2005. Weighted tabulations based on first and second 24-hour recalls prepared by Mathematica Policy Research, Inc. Usual intake distributions were determined for each subgroup using the PC version of the Software for Intake Distribution Estimation (PC-SIDE). Sample includes all students, including those who did not consume a breakfast.

AI = Adequate Intake.

APPENDIX M

FOOD SOURCES OF NUTRIENTS: SCHOOL BREAKFAST PROGRAM PARTICIPANTS AND NONPARTICIPANTS

TABLE M.1

FOOD SOURCES OF ENERGY, TOTAL FAT, AND SATURATED FAT CONSUMED AT BREAKFAST BY SBP PARTICIPANTS AND NONPARTICIPANTS, ALL STUDENTS

Food Group/Food(s)	Energy		Total Fat		Saturated Fat	
	Percentage Contribution to Lunch Intake		Percentage Contribution to Lunch Intake		Percentage Contribution to Lunch Intake	
	Participants	Nonparticipants	Food Group/Food(s)	Participants	Nonparticipants	Food Group/Food(s)
Cold cereal	13.7	19.6 **	2% milk, unflavored	10.7	14.6*	2% milk, unflavored
Sweet rolls, doughnuts, toaster pastries	9.0	7.1	Sweet rolls, doughnuts, toaster pastries	9.5	8.9	Whole milk, unflavored
2% milk, unflavored	7.8	9.8	Whole milk, unflavored	7.5	7.1	Condiments and spreads
Fruit juice, 100%	7.6	7.1	Cookies, cakes, brownies	6.6	3.6*	Sweet rolls, doughnuts, toaster pastries
Pancakes, waffles, French toast	5.2	5.1	Condiments and spreads	6.1	6.7	Cookies, cakes, brownies
Condiments and spreads	5.0	4.8	Pancakes, waffles, French toast	5.4	5.9	1% milk, unflavored
Cookies, cakes, brownies	4.1	2.1*	Cold cereal	4.8	7.7**	Breakfast sandwiches
White milk, unflavored	4.0	3.5	Breakfast sandwiches	3.9	5.8	Pancakes, waffles, French toast
White bread, rolls, bagels	3.1	2.6	Sausages, hot dogs, cold cuts	3.3	3.5	Cold cereal
1% milk, unflavored	2.6	2.1	Eggs	3.2	4.8	Sausages, hot dogs, cold cuts
Muffins, sweet/quick breads	2.0	2.0	Pizza and pizza products	2.7	0.6*	Eggs
Breakfast sandwiches	1.9	2.8	Mexican-style entrees	2.4	3.0	2% milk, flavored
Juice drinks (not 100% juice)	1.9	2.8	Peanut butter sandwiches	2.3	0.6	Mexican-style entrees
Crackers and pretzels	1.0	2.3	Biscuits, croissants, cornbread	2.0	2.7	Pizza and pizza products
			Muffins, sweet/quick breads	1.7	2.2	Candy
			Peanut butter/nuts/seeds/trail mixes	1.0	2.1	
			Crackers and pretzels	1.0	2.1	

Source: School Nutrition Dietary Assessment-III, 24-hour Dietary Recalls, school year 2004-2005. Weighted tabulations of single 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a breakfast. Intakes of both SBP participants and nonparticipants include all foods and beverages consumed at breakfast. For SBP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable breakfast, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

*Includes sandwiches with sausage, egg, cheese, ham, or other types of meat on a biscuit, English muffin, bagel, or croissant.

* Differences between participants and nonparticipants is significantly different from zero at the .05 level.

** Differences between participants and nonparticipants is significantly different from zero at the .01 level.

TABLE M.2
FOOD SOURCES OF CARBOHYDRATE AND PROTEIN CONSUMED AT BREAKFAST
BY SBP PARTICIPANTS AND NONPARTICIPANTS, ALL STUDENTS

Food Group/Food(s)	Carbohydrate		Protein

			Other milk items	0.5	2.1	

Source: School Nutrition Dietary Assessment-III, 24-hour Dietary Recalls, school year 2004-2005. Weighted tabulations of single 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a breakfast. Intakes of both SBP participants and nonparticipants include all foods and beverages consumed at breakfast. For SBP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable breakfast, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

*Includes sandwiches with sausage, egg, cheese, ham, or other types of meat on a biscuit, English muffin, bagel, or croissant.

RE = Retinol Equivalents.

*Differences between participants and nonparticipants is significantly different from zero at the .05 level.

**Differences between participants and nonparticipants is significantly different from zero at the .01 level.

Source: School Nutrition Dietary Assessment-III, 24-hour Dietary Recalls, school year 2004-2005. Weighted tabulations of single 24-hour recall prepared by Mathematica Policy Research, Inc. Sample excludes students who did not consume a breakfast. Intakes of both SBP participants and nonparticipants include all foods and beverages consumed at breakfast. For SBP participants, this may include, in addition to foods/beverages obtained as part of the reimbursable breakfast, foods/beverages that were brought from home or obtained in school from non-reimbursable sources.

Notes: Table is limited to foods contributing to at least one percent of the nutrient for participants or nonparticipants. See Appendix Table D.1 for a detailed listing of food items included in each group.

*Includes sandwiches with sausage, egg, cheese, ham, or other types of meat on a biscuit, English muffin, bagel, or croissant.

**Differences between participants and nonparticipants is significantly different from zero at the .05 level.

***Differences between participants and nonparticipants is significantly different from zero at the .01 level.
