INTRODUCTION

This document is a support document for the DOE Evaluation Document for DOT 7A Type A Packaging, MLM-3245, March 1987.

Provided herein are details concerning the performance requirements specified in 178.350 Specification 7A, General Packaging, Type A. MLM-3245 references appropriate sections in this document.

This document does not by itself meet the documentation requirements specified in 49 CFR 173.415 and has compliance value only when used in conjunction with MLM-3245.

DISCLAIMER

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

173.24 - STANDARD REQUIREMENTS FOR ALL PACKAGES

(a) Each package used for shipping hazardous material under this subchapter shall be so designed and constructed, and its contents so limited, that under conditions normally incident to transportation:

	<u>ACTION REQUIRED/BY WHOM</u>	<u>PACKAGING CATEGORY</u> <u>STEEL DRUMS</u>
(1) There will be no significant release of the hazardous materials to the environment;	To be considered during package design evaluation. <u>Shipper</u> responsibility to ensure.	All packagings met the intent of this requirement as demonstrated by meeting the more severe Type A packaging requirements of 173.411, .412, .465, and/or .466 as demonstrated in MLM-3245 and this addendum.
(2) The effectiveness of the packaging will not be substantially reduced; and	To be considered during package design evaluation. <u>Shipper</u> responsibility to ensure. One aspect for strong consideration is effect of contents on packaging effectiveness.	All packagings met the intent of this requirement as demonstrated by meeting the more severe Type A packaging requirements of 173.411, .412, .465, and/or .466 as demonstrated in MLM-3245 and this addendum. NOTE: <u>Shipper</u> responsibility to consider and evaluate, if necessary, the effect of the contents.
(3) There will be no mixture of gases or vapors in the package which could, through any credible spontaneous increase of heat or pressure or through an explosion, significantly reduce the effectiveness of the packaging.	<u>Shipper</u> responsibility to ensure.	<u>Shipper</u> responsibility to ensure.
(b) Materials for which detailed specifications for packaging are not set forth in this part must be securely packaged in strong, tight packages meeting the requirements of this section.	Does not apply.	Does not apply.

ACTION REQUIRED/BY WHOM

(c) Packaging used for the shipment of hazardous materials under this subchapter shall, unless otherwise specified or exempted therein, meet all of the following design and construction criteria:

(1) Each specification container must be marked as follows:

(i) In an unobstructed area with letters and numerals identifying the container specification (e.g., DOT-1A, DOT-17E-304HT, DOT-23G40). See 178.0-2 of this subchapter.

(ii) The name and address or symbol of person making the mark specified in paragraph (c)(1)(i) of this section. Symbol letters, if used, must be registered with the Director, OHMT. Duplicate symbols are not authorized.

(iii) The markings must be stamped, embossed, burned, printed, or otherwise marked on the packaging to provide adequate accessibility, permanency, and contrast so as to be readily apparent and understood.

(iv) Unless otherwise specified, letters and numerals must be at least 1/2 in. high.

Package must be marked "DOT 7A Type A." Shipper responsibility to ensure.

ACTION REQUIRED/BY WHOM

(v) Packaging which does not comply with the applicable specification listed in parts 178 and 179 of this subchapter must not be marked to indicate such compliance (see 178.0-2 and 179.1 of this subchapter).

(2) Steel used shall be low-carbon commercial quality steel. Stainless, open hearth, electric, basic oxygen, or other similar quality steels are acceptable. Steel sheets of specified gauges shall comply with the following:

<u>Gauge No.</u>	<u>Normal Thickness (in.)</u>	<u>Minimum Thickness (in.)</u>
12	0.1046	0.0946
13	0.0897	0.0817

Shipper responsibility to ensure.

ACTION REQUIRED/BY WHOM

(3) Lumber used shall be well-seasoned, commercially dry, and free from decay, loose knots, knots that would interfere with nailing, and other defects that would materially lessen the strength.

Designer and fabricator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(4) Welding and brazing shall be performed in a workmanlike manner using suitable and appropriate techniques, materials, and equipment.

Fabricator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(5) Packaging materials and contents shall be such that there will be no significant chemical or galvanic reaction among any of the materials in the package.

Designer to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(6) Closure shall be adequate to prevent inadvertent leakage of the contents under normal conditions incident to transportation. Gasketed closures shall be fitted with gaskets of efficient materials which will not be deteriorated by the contents of the container.

Designer to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(7) Nails, staples, and other metallic devices shall not protrude into the interior of the outer packaging in such a manner as to be likely to cause failures.

Fabricator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(8) The nature and thickness of the packaging shall be such that friction during transport does not generate any heating likely to decrease the chemical stability of the contents.

Fabricator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

ACTION REQUIRED/BY WHOM

(d) Polyethylene packagings and receptacles:

(1) Polyethylene used in packagings and receptacles must be of a type compatible with the lading and may not be permeable to an extent that a hazardous condition occurs during transportation, handling, or refilling.

Designer to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(2) Each polyethylene packaging or receptacle which is used for liquid hazardous materials must be capable of withstanding without failure the procedure specified in Appendix B of this part ("Procedure for Testing Chemical Compatibility and Rate of Permeation in Polyethylene Packagings and Receptacles") and the maximum rate of permeation of hazardous lading through or into the polyethylene packaging or receptacles may not exceed the following rates:

Designer, tester, and evaluator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(i) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 18°C (64°F) for 180 days in accordance with Test Method 1;

(ii) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 50°C (122°F) for 28 days in accordance with Test Method 2;

ACTION REQUIRED/BY WHOM

(iii) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 60°C (140°F) for 14 days in accordance with Test Method 3;

(3) Alternative procedures or rates of permeation are permitted if they yield a level of safety equivalent to or greater than that provided by paragraph (d) (2) of this section and are approved by the Director, OHMT.

(4) Each polyethylene packaging used as an outside packaging for materials meeting the definition of a poison according to this subchapter shall be permanently marked, by embossment or other durable means, with the word "POISON" in letters of at least 1/4 in. in height. Additional text or symbols may be included in the marking. The marking shall be located within six inches of the packaging's closure. The requirements of this subparagraph do not apply prior to September 1, 1985.

(e) For specification containers, compliance with the applicable specifications in Parts 178 and 179 of this subchapter shall be required in all details, except as otherwise provided in this subchapter.

PACKAGING CATEGORY
FIBERBOARD CONTAINERS

(c) Packaging used for the shipment of hazardous materials under this subchapter shall, unless otherwise specified or exempted therein, meet all of the following design and construction criteria:

(1) Each specification container must be marked as follows:

(i) In an unobstructed area with letters and numerals identifying the container specification (e.g., DOT-1A, DOT-17E-304HT, DOT-23G40). See 178.0-2 of this subchapter.

(ii) The name and address or symbol of person making the mark specified in paragraph (c)(1)(i) of this section. Symbol letters, if used, must be registered with the Director, OHMT. Duplicate symbols are not authorized.

(iii) The markings must be stamped, embossed, burned, printed, or otherwise marked on the packaging to provide adequate accessibility, permanency, and contrast so as to be readily apparent and understood.

(iv) Unless otherwise specified, letters and numerals must be at least 1/2 in. high.

Package must be marked "DOT 7A Type A." Shipper responsibility to ensure.

(1) Polyethylene used in packagings and receptacles must be of a type compatible with the lading and may not be permeable to an extent that a hazardous condition occurs during transportation, handling, or refilling.

Designer to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(2) Each polyethylene packaging or receptacle which is used for liquid hazardous materials must be capable of withstanding without failure the procedure specified in Appendix B of this part ("Procedure for Testing Chemical Compatibility and Rate of Permeation in Polyethylene Packagings and Receptacles") and the maximum rate of permeation of hazardous lading through or into the polyethylene packaging or receptacles may not exceed the following rates:

Designer, tester, and evaluator to do and shipper responsibility to ensure.

Shipper responsibility to ensure.

(i) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 18°C (64°F) for 180 days in accordance with Test Method 1;

(ii) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 50°C (122°F) for 28 days in accordance with Test Method 2;

ACTION REQUIRED/BY WHOM

(iii) 0.5 percent for materials meeting the definition of a poison according to this subchapter and 2.0 percent for other hazardous materials, when subjected to temperatures no lower than 60°C (140°F) for 14 days in accordance with Test Method 3;

(3) Alternative procedures or rates of permeation are permitted if they yield a level of safety equivalent to or greater than that provided by paragraph (d)(2) of this section and are approved by the Director, OHMT.

(4) Each polyethylene packaging used as an outside packaging for materials meeting the definition of a poison according to this subchapter shall be permanently marked, by embossment or other durable means, with the word "POISON" in letters of at least 1/4 in. in height. Additional text or symbols may be included in the marking. The marking shall be located within six inches of the packaging's closure. The requirements of this subparagraph do not apply prior to September 1, 1985.

(e) For specification containers, compliance with the applicable specifications in Parts 178 and 179 of this subchapter shall be required in all details, except as otherwise provided in this subchapter.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL DRUMS

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All the drums evaluated meet the intent of this requirement. In all cases, the shipper should avoid loading a top-heavy package and should be aware of the need for tie-downs for any such packages.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

All the drums evaluated meet the intent of this requirement when in the 10-kg (22-lb) to 50-kg (110-lb) range.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
STEEL DRUMS

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

All the drums evaluated meet the intent of this requirement. There are many drum/barrel handling devices which have proven effective and safe for drums weighing more than 50 kg (110 lb).

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only -- not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

All the drums evaluated meet the intent of this requirement. The only drum with a handle is the 17C (178.115) 5-gal drum. This packaging was tested (1) at greater than 300 lb with no failure of handle, and (2) at 400 lb where the handle did fail, but only pulled free from the side coupling. Thus, the failure was in an acceptable mode. There were no other lifting devices or attachments.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL DRUMS

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

All the drums evaluated meet the intent of this requirement.

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

All the drums evaluated meet the intent of the regulation. A newly designed package should consider this requirement.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL BOXES

(a)*The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All the steel boxes evaluated meet the intent of this requirement. None are intended for manual handling and all have a large, stable base.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

This does not apply since all the steel boxes will weigh more than 50 kg (110 lb).

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
STEEL BOXES

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

These boxes are typically designed for handling with a truck or forklift. In all the steel box packagings, experience, testing, and/or design analysis have demonstrated compliance.

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only — not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

The M-4 bin and the SAND box have lifting devices which far exceed the required safety factor of 3; however, because of the strength of the lifting device, in each case the box will fail before the lifting device. This will not negatively affect the evaluation of these boxes since both are used within overpacks and the lifting devices are not used during transportation. RoGar boxes have lifting devices on the lid. These are intended only for lifting the lid and must be removed or rendered inoperable before transport. This is the shipper's responsibility.

GUIDANCE FOR APPLICATION

STEEL BOXES

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

All the boxes evaluated meet the intent of this requirement.

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

All the boxes evaluated meet the intent of the requirement.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
WOODEN BOXES

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All the wooden boxes evaluated meet the intent of this requirement. In all cases the shipper should avoid loading a top-heavy package and should be aware of the need for tie-downs for any such packages.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

All the wooden boxes evaluated meet the intent of this requirement when used in the 10-kg (22-lb) to 50-kg (110-lb) range.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
WOODEN BOXES

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

These boxes are typically designed for handling with a truck or forklift. For all of these packagings, experience, testing, and/or design analysis have demonstrated compliance.

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only -- not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

None of the wooden boxes have lifting attachments; this requirement does not apply.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
WOODEN BOXES

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

All the boxes evaluated meet the intent of this requirement. If contamination is a significant potential problem, then sanding, painting, or similar surface preparation should be completed.

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

All the boxes evaluated meet the intent of the requirement.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
FIBERBOARD PACKAGINGS

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All the fiberboard boxes and drums meet the intent of this requirement. In all cases the shipper should avoid loading a top-heavy package and should be aware of the need for tie-downs for any such packages.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

Designer to do and shipper responsibility to ensure.

All fiberboard boxes and drums meet the intent of this requirement when used in the 10-kg (22-lb) to 50-kg (110-lb) range. Obviously, the Tri-wall packaging (Page D-11) is intended for weights exceeding 50 kg and will require mechanical handling equipment.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
FIBERBOARD PACKAGINGS

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

The boxes and drums evaluated are typically designed for handling with hand-trucks and/or forklifts when weighing in excess of 50 kg. For all of these packagings, experience, testing, and/or design analysis have demonstrated compliance. As in all packages, but particularly important in Tri-wall packaging, the shipper shall ensure that the content load is in the center of the box or evenly distributed along the bottom.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
FIBERBOARD PACKAGINGS

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

(e) The external surfaces, as far as practical, may be easily decontaminated;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only -- not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

None of the fiberboard packagings have lifting attachments; this requirement does not apply.

All the packagings evaluated meet the intent of this requirement. If contamination is a significant potential problem, covering, painting, or similar surface preparation should be completed.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
FIBERBOARD PACKAGINGS

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

All the packagings evaluated meet the intent of the requirement.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
UF-6 CYLINDERS

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All cylinders evaluated meet the intent of this requirement. The experience data base demonstrates the stability of these packages in transport and their ease of handling.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

This applies only to the 1S, 2S, and 5A cylinders. As stated above, a vast experience base demonstrates compliance.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
UF-6 CYLINDERS

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

For the cylinders other than 1S, 2S, and 5A, a variety of mechanical systems are provided and have been used effectively and reliably for years. See Table C-4, page C-39.

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only — not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

All cylinders meet this requirement, as demonstrated in Table C-4, Page C-39.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
UF-6 CYLINDERS

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

The metal and painted metal surfaces have demonstrated, through experience, compliance with this requirement.

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

These packages meet the intent of the requirement as shown in the sketches in MLM-3245.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

No features are added other than those described in operating procedures, and these are evaluated by the shipper.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
LIQUIDS AND GASES

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All packagings meet the intent of this requirement per analysis of the sketches and as demonstrated by actual experience. In all cases, the shipper should avoid loading a top-heavy package and should be aware of the need for tie-downs for any such packages.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

All the packagings evaluated meet the intent of this requirement when used in the 10-kg (22-kg) to 50-kg (110-lb) range.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

PACKAGE CATEGORY
LIQUIDS AND GASES

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

The only two packagings that fit these criteria are the ORNL Returnable Shielded Shipping Container and the J. L. Sheppard Gas Cylinder No. 4 (see Pages F-26 and F-36 of MLM-3245). Both of these packages have outer boxes designed for routine handling with hand/mechanical devices. Experience has demonstrated packaging compliance with this requirement

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only -- not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

The only package with a lifting attachment is ORNL's returnable plastic box (Page F-30, MLM-3245). Tests at ORNL demonstrated compliance with this requirement, and failure of the handle would not impair the ability of the packaging to meet the containment integrity requirements.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
LIQUIDS AND GASES

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

The variety of surfaces meet the intent of this requirement

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

These packages meet the intent of this requirement by analysis of the sketches/engineering drawings in MLM-3245.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.411 - GENERAL DESIGN REQUIREMENTS

Except for a package that contains a limited quantity or excepted instrument or article under 173.421 through 173.424, each package used for shipment of radioactive materials shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
MISCELLANEOUS

(a) The package can be easily handled and properly secured in or on a conveyance during transport;

This does not necessarily mean handles are required. The intent is to maintain a package size and geometry which allow conformance to paragraph (a). For example, a package 4 ft x 6 ft x 4 ft cannot be easily handled by hand. For such a package, other handling methods would be designed. A package with sharp edges or components may not be easily handled manually. Also, package stability is required during transport. A round-shaped package, a top-heavy package, or any similar package which would not maintain its initial orientation and load position under conditions incidental to routine transportation would not meet these requirements. Tie-downs are required for the packagings mentioned in this paragraph, and exclusive use shipments or documented special provisions with the carrier are required. Designer to do and shipper responsibility to ensure.

All the packagings meet the intent of this requirement per analysis of the sketches and as demonstrated by actual experience. In all cases, the shipper should avoid loading a top-heavy package and should be aware of the need for tie-downs for any such packages.

(b) A package with gross weight exceeding 10 kilograms (22 lb) and up to 50 kilograms (110 lb) has a means for manual handling;

This does not necessarily mean that handles are required. As in the comment on paragraph (a) above, physical size, geometry, and exterior surface design should be conducive to manual handling. Excluded are:

- Large, awkward packages or odd-shaped packages with no reasonable way to lift, hold, or move by hand;
- Surfaces with sharp edges or points which make handling difficult.

Only the LLNL shielded container (see Page G-1, MIM-3245) fits this criterion and, as can be seen, it has a handle.

Designer to do and shipper responsibility to ensure.

GUIDANCE FOR APPLICATION

(c) A package with a gross weight of 50 kilograms (110 lb) or more can safely be handled by mechanical means;

Thought should be given to how the the packages will be handled, and they should be designed accordingly. If skids are used, the balance stability of the package on the forklift must be considered. One must also ensure that, when lifted by a forklift, the bottom structure can support the weight without significant distortion or loss of containment integrity. If hooks/lifting devices are used, they must meet 173.411(d). In most cases, this is for the shipper to evaluate, particularly the requirement that failure "would not impair the ability of the package to meet all other requirements." Designer to do and shipper responsibility to ensure.

PACKAGE CATEGORY
MISCELLANEOUS

The three packages exceeding 110 lb all have means for mechanical handling, and experience has demonstrated compliance.

GUIDANCE FOR APPLICATION

(d) Each lifting attachment on the package, when used in the intended manner, with a minimum safety factor of 3, does not impose an unsafe stress on the structure of the package. In addition, the lifting attachment shall be so designed that failure under excessive load would not impair the ability of the package to meet all other requirements of this subpart. Each attachment or other feature on the outer surface of the packaging that could be used to lift the package must be removable or otherwise capable of being made inoperable for transport, or shall be designed with strength equivalent to that required for lifting attachments;

A sign saying "Do Not Use As A Lifting Device," "Not A Lifting Device," etc. is not adequate to prevent the use of the unauthorized lifting devices. The procedures for use of the packaging should also state the intended use of any attaching points for other purposes (i.e., "For lifting the lid only -- not entire packaging"). Designer, and perhaps tester and evaluator, to do and shipper responsibility to ensure.

PACKAGING CATEGORY
MISCELLANEOUS

The ORNL TRU Package (see Page G-5, MLM-3245) and the FEMA Source Overpack (see Page G-9, MLM-3245) are the only two packagings with lifting devices. A structural analysis by Mound has demonstrated compliance with three times the gross weight requirement for both packages. With the ORNL TRU package, the outer metal skin will fail prior to the handle, but this would not compromise the overall ability to comply with this requirement. A similar analysis demonstrated that the handles of the FEMA package also comply with the three times the gross weight requirement, and failure of the lid handles or side handles would not reduce the ability of the packaging to comply with this requirement.

GUIDANCE FOR APPLICATION

(e) The external surfaces, as far as practical, may be easily decontaminated;

Plywood, although not normally thought of as easily decontaminated, is acceptable. The intent is to promote surfaces that are relatively smooth and that minimize cracks and crevices in which surface contamination could reside. Consideration should be given to actions such as sanding or painting surfaces. Designer to do and shipper responsibility to ensure.

The external surfaces are all metal and comply with this requirement.

(f) The outer layer of packaging will avoid, as far as practical, pockets or crevices where water might collect; and

This is not intended to eliminate 55-gal drums as Spec 7A packaging. The intent is for packaging design personnel to consider this aspect. Do not design a puddle on top of a box or provide cavities to collect water which could spill during transport or handling or could promote rusting and general deterioration of the packaging, possibly in locations difficult to detect. Designer to do and shipper responsibility to ensure.

Compliance is obvious by analysis of the sketches. The only exception is the SNL drum (see Page G-13, MLM-3245), which complies with the intent per the column on the left.

(g) Each feature that is added to the package at the time of transport and that is not part of the package will not reduce the safety of the package.

For example, a canvas cover placed over a package for protection against the rain must not adversely affect heat transfer requirements. Shipper responsibility to ensure.

This is a shipper responsibility since the regulation addresses items added to the packaging that was already evaluated.

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL DRUMS

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

Designer to do and shipper responsibility to ensure.

As shown on the sketches and as given in the packaging description in MIL-3245, all packagings meet this requirement.

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

All evaluated packagings meet this requirement.

PACKAGING CATEGORY
STEEL DRUMS

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

This does not mean any of the tests must necessarily be performed at the temperature extremes. [Note: 173.461(b).] The regulations allow the assumption that the packaging is in equilibrium at 38°C prior to testing. One must evaluate the packaging components with respect to behavior at the temperature extremes under conditions incidental to transportation (i.e., the jiggles, bounces, and bumps normally encountered in transportation). Gaskets and packaging components need to be evaluated to determine if they will become excessively brittle at -40°F . This may be accomplished by actual testing, referring to property of material tables, obtaining data from manufacturers, etc. The shipper must consider such things as freezing of liquid contents and evaluate the effect to ensure continued containment integrity. The shipper must also consider the buildup of pressure at elevated temperatures and ensure continued containment. Designer, tester, and evaluator to do and shipper responsibility to ensure.

(e) It is able to withstand the effects of any acceleration, vibration, or vibration resonance that may arise during normal transportation, without any deterioration of the effectiveness of closing devices or of the integrity of the package as a whole and without loosening or unintentional release of nuts, bolts, or other securing devices even after repeated use;

Typically, one uses actual experience as a guide. If experience is not available, one normally uses a comparison to a similar packaging with an experience profile. If this isn't possible, vibration testing can be performed. The purpose of this section is to prevent the loosening of nuts, bolts, and containment devices under conditions incident to routine transportation. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Metals used in these drums will not become excessively brittle at -40°C and all gaskets used also meet this requirement. None of these packagings are authorized for liquids, so freezing of contents is not a concern. Temperatures of $+70^{\circ}\text{C}$ will not result in any significant decrease in containment integrity, as show in property of materials tables.

Experience has consistently demonstrated that these packagings or similar designs comply with this requirement. The shipper must ensure the application of quality assurance necessary to achieve this requirement.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL DRUMS

(f) It includes a containment system securely closed by a positive fastening device that cannot be opened unintentionally or by pressure that may arise within the package during normal transport. Special form, as demonstrated in accordance with 173.469, may be considered as a component of the containment system;

(g) The materials of the packaging and any components or structures are physically and chemically compatible with each other and with the contents, taking into account the behavior of each under irradiation;

(h) For each component of the containment system, account is taken where applicable of radiolytic decomposition of materials and the generation of gas by chemical reaction and radiolysis;

(i) The containment system will retain its radioactive contents under the reduction of ambient pressure to 0.25 kilograms per square centimeter (3.5 lb/in²);

"Screw-type" closures can qualify.
"Friction fit" normally does not qualify. Security clips on cans could be acceptable. However, one cannot depend on friction alone. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

The containment system is defined as the components intended to retain the radioactive contents during transportation. Thus, one starts by identifying the containment system. The radioactive contents must be completely retained in the containment system if the package is subjected to reduced

All packagings evaluated meet this requirement, as shown on the sketches or in the packaging descriptions.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

This analysis requires a more detailed description to provide adequate information. See Table C-1.

TABLE C-1
SUMMARY OF "REDUCED PRESSURE" TESTS
ON THE EVALUATED STEEL DRUMS

INTRODUCTION:

Paragraph 173.412(i) in effect requires a pressure differential of 0.75 atm (11.2 psi) across the surfaces of the containment system acting from the inside to the outside. In all of the steel drum packagings the containment system is defined as the drum itself. To achieve the pressure differential, the inside of the packaging was pressurized to 11.2 psig using compressed air and held for approximately 5 min. The pass/fail criteria were:

- (1) No release of contents as determined by the absence of any detectable air flow or fluorscein after the test.
- (2) The retention of pressure, 11.2 ± 0.3 psig. This was held for approximately 5 min.
- (3) No structural distortion which would cause an increase exceeding 20% in the dose rate at the surface of the package as compared to the dose rate prior to beginning the test.

17C 55-gal drums with vent clips and with high-efficiency filters installed in the lids were tested. In this case the criteria became just containment (no release of contents) since the packaging will not hold pressure. This last statement is technically correct; however, in the instance above (vent clips and filters in lid), the pressure was raised to 11.2 psig and held for 5 min by adjusting the inward flow to equal the loss through the vent clip and/or filter. This was over-testing since there are no realistic conditions of normal transport in which a pressure differential of this magnitude could arise in a matter of seconds. In the unlikely event of such a pressure change over longer periods of time, the vent clip or filter would allow the pressures to equilibrate before differentials approaching 11.2 psi could be reached. The table below provides detailed information concerning the testing of the steel drums and the results.

TABLE C-1

PACKAGING CATEGORY
STEEL DRUMS

GUIDANCE FOR APPLICATION

pressure. A filtered packaging is possible as long as it can be demonstrated that the filtered package will retain the contents and that the filter is not susceptible to damage from any other tests. Caution should be exercised to ensure that the contents and internal packaging components (i.e., plastic boxes, etc.) will not effectively seal the filter during normal use. In cases where a pressure differential will not build up because of the free-flow through a filter, the requirement of demonstrating the retention of contents must still be met. For a package that breathes (does not hold 11.2 psi), such as a wooden box, one must demonstrate that, even with breathing, the contents will be retained. Otherwise, a separate inner containment capable of meeting the reduced pressure requirement is required. Designer, tester, and evaluator to do and shipper responsibility to ensure.

(j) Each valve through which the radioactive contents could otherwise escape is protected against damage and unauthorized operation and, except for a pressure relief device, has an enclosure to retain any leakage;

Designer to do and shipper responsibility to ensure.

None of these packagings have valves.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL DRUMS

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellotex on top of a lead shield with a press-fit lid in which closure of the cellotex holds the lid in place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

None of these packagings have shielding as described.

(l) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart.

Designer, tester, evaluator to do and shipper responsibility to ensure.

None of these packagings have tie-down attachments as described.

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
STEEL BOXES

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

Designer to do and shipper responsibility to ensure.

As shown on the sketches and as given in the packaging description in MLM-3245, all packagings meet this requirement.

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

All evaluated packagings meet this requirement.

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

(e) It is able to withstand the effects of any acceleration, vibration, or vibration resonance that may arise during normal transportation, without any deterioration of the effectiveness of closing devices or of the integrity of the package as a whole and without loosening or unintentional release of nuts, bolts, or other securing devices even after repeated use;

This does not mean any of the tests must necessarily be performed at the temperature extremes. [Note: 173.461(b).] The regulations allow the assumption that the packaging is in equilibrium at 38°C prior to testing. One must evaluate the packaging components with respect to behavior at the temperature extremes under conditions incidental to transportation (i.e., the jiggles, bounces, and bumps normally encountered in transportation). Gaskets and packaging components need to be evaluated to determine if they will become excessively brittle at -40°F . This may be accomplished by actual testing, referring to property of material tables, obtaining data from manufacturers, etc. The shipper must consider such things as freezing of liquid contents and evaluate the effect to ensure continued containment integrity. The shipper must also consider the buildup of pressure at elevated temperatures and ensure continued containment. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Typically, one uses actual experience as a guide. If experience is not available, one normally uses a comparison to a similar packaging with an experience profile. If this isn't possible, vibration testing can be performed. The purpose of this section is to prevent the loosening of nuts, bolts, and containment devices under conditions incident to routine transportation. The containment system is defined as the components intended to retain the radioactive contents during transportation. Thus, one starts by identifying the containment system. The radioactive contents must be completely retained in the containment system if the package is to be subjected to reduced

This analysis requires a more detailed description to provide adequate information. See Table C-2.

TABLE C-2
STEEL BOXES

The containment system is defined as the box itself. To achieve the pressure differential, the inside of the packaging (steel box) was pressurized to 11.2 psig using compressed air, compressed nitrogen, or water, as described below. In all cases, the pressure was held for approximately 5 min. The pass/fail criteria were essentially the same as given in Table C-1, with the exception of the Capital Industry test, which used water. In this case, obviously no flour or fluorescein was used; however, the absence of a visible water leak (and retention of water pressure) was really a more sensitive test than detection of fluorescein. Note that this test applies only to the nonfiltered packagings since this differential could not reasonably be expected to be encountered in transportation with a filtered packaging.

GUIDANCE FOR APPLICATION

pressure. A filtered packaging is possible as long as it can be demonstrated that the filtered package will retain the contents and that the filter is not susceptible to damage from any other tests. Caution should be exercised to ensure that the contents and internal packaging components (i.e., plastic boxes, etc.) will not effectively seal the filter during normal use. In cases where a pressure differential will not build up because of the free-flow through a filter, the requirement of demonstrating the retention of contents must still be met. For a package that breathes (does not hold 11.2 psi), such as a wooden box, one must demonstrate that, even with breathing, the contents will be retained. Otherwise, a separate inner containment capable of meeting the reduced pressure requirement is required. Designer, tester, and evaluator to do and shipper responsibility to ensure.

(j) Each valve through which the radioactive contents could otherwise escape is protected against damage and unauthorized operation and, except for a pressure relief device, has an enclosure to retain any leakage;

Designer to do and shipper responsibility to ensure.

None of these packagings have valves.

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

(l) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart.

GUIDANCE FOR APPLICATION

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellotex on top of a lead shield with a press-fit lid in which closure of the cellotex holds the lid in place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

Designer, tester, evaluator to do and shipper responsibility to ensure.

PACKAGING CATEGORY STEEL BOXES

None of these packagings have shielding as described.

None of these packagings have tie-down attachments as described.

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
WOODEN BOXES

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

Designer to do and shipper responsibility to ensure.

As shown on the sketches and as given in the packaging description in MM-3245, all packagings meet this requirement.

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

All evaluated packagings meet this requirement.

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

(e) It is able to withstand the effects of any acceleration, vibration, or vibration resonance that may arise during normal transportation, without any deterioration of the effectiveness of closing devices or of the integrity of the package as a whole and without loosening or unintentional release of nuts, bolts, or other securing devices even after repeated use;

This does not mean any of the tests must necessarily be performed at the temperature extremes. [Note: 173.461(b).] The regulations allow the assumption that the packaging is in equilibrium at 38°C prior to testing. One must evaluate the packaging components with respect to behavior at the temperature extremes under conditions incidental to transportation (i.e., the jiggles, bounces, and bumps normally encountered in transportation). Gaskets and packaging components need to be evaluated to determine if they will become excessively brittle at -40°F . This may be accomplished by actual testing, referring to property of material tables, obtaining data from manufacturers, etc. The shipper must consider such things as freezing of liquid contents and evaluate the effect to ensure continued containment integrity. The shipper must also consider the buildup of pressure at elevated temperatures and ensure continued containment. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Typically, one uses actual experience as a guide. If experience is not available, one normally uses a comparison to a similar packaging with an experience profile. If this isn't possible, vibration testing can be performed. The purpose of this section is to prevent the loosening of nuts, bolts, and containment devices under conditions incident to routine transportation. Designer, tester, and evaluator to do and shipper responsibility to ensure.

PACKAGING CATEGORY WOODEN BOXES

The materials (wood, caulking, metal strips, nails, gaskets, etc.) would not become excessively brittle at -40°C and all gaskets used met this requirement. None of these packagings are authorized for liquids, so freezing of contents is not a concern. Temperatures of $+70^{\circ}\text{C}$ would not result in any significant decrease in integrity either, as shown in property of materials tables.

Experience has consistently demonstrated that these packagings or similar designs comply with this requirement. The shipper must ensure the application of quality assurance necessary to achieve this requirement.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
WOODEN BOXES

(f) It includes a containment system securely closed by a positive fastening device that cannot be opened unintentionally or by pressure that may arise within the package during normal transport. Special form, as demonstrated in accordance with 173.469, may be considered as a component of the containment system;

(g) The materials of the packaging and any components or structures are physically and chemically compatible with each other and with the contents, taking into account the behavior of each under irradiation;

(h) For each component of the containment system, account is taken where applicable of radiolytic decomposition of materials and the generation of gas by chemical reaction and radiolysis;

(i) The containment system will retain its radioactive contents under the reduction of ambient pressure to 0.25 kilograms per square centimeter (3.5 lb/in.²);

"Screw-type" closures can qualify. "Friction fit" normally does not qualify. Security clips on cans could be acceptable. However, one cannot depend on friction alone. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

The containment system is defined as the components intended to retain the radioactive contents during transportation. Thus, one starts by identifying the containment system. The radioactive contents must be completely retained in the containment system if the package is subjected to reduced pressure. A filtered packaging is possible as long as it can be demonstrated that the filtered package will retain the contents and that the filter is not susceptible to damage from any other tests. Caution should be exercised to ensure that the contents and internal

All packagings evaluated meet this requirement, as shown on the sketches or in the packaging descriptions.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

Based on the testing discussed below (see Table C-3), these packagings all meet this requirement for Form 2 and 3 materials. The containment system in each case is the wooden box itself. Obviously, the box is not expected to be air-leak tight with a significant pressure differential applied. Thirteen separate boxes were subjected to this test. The contents in all

GUIDANCE FOR APPLICATION

package will retain the contents and that the filter is not susceptible to damage from any other tests. Caution should be exercised to ensure that the contents and internal packaging components (i.e., plastic boxes, etc.) will not effectively seal the filter during normal use. In cases where a pressure differential will not build up because of the free-flow through a filter, the requirement of demonstrating the retention of contents must still be met. For a package that breathes (does not hold 11.2 psi), such as a wooden box, one must demonstrate that, even with breathing, the contents will be retained. Otherwise, a separate inner containment capable of meeting the reduced pressure requirement is required. Designer, tester, and evaluator to do and shipper responsibility to ensure.

PACKAGING CATEGORY WOODEN BOXES

cases were flour, fluorescein, and sand. In each case, the box did not hold pressure, as expected. Typically, boxes started leaking air at less than 1 psi. As the pressure increased, leak-paths increased until they began leaking all over (at the seams, around nails, etc.) at 9 psi. In each case, no sand was released, so these packagings passed for Form 2 and 3 materials (which is what they were evaluated for). In all cases, fluorescein was detected, but again, this simply means the packaging cannot be authorized for Form 1 materials. This does not present a problem since the boxes were never intended for use with Form 1 materials, and each evaluation states that Form 1 materials are "Not authorized without separate containment tested to Type A requirements with appropriate documentation."

TABLE C-3
WOODEN BOXES

This test method, raising the internal pressure to 9-11 psi and maintaining it for several minutes, is very conservative. This is because, in transport, any pressure differential encountered would be equilibrated very slowly, and the strong driving force encountered in this test would not exist.

<u>Type of Wooden Box/ Principal User</u>	<u>Model/Size</u>	<u>Test/Analysis</u>	<u>Results</u>	<u>Comments</u>

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
WOODEN BOXES

(j) Each valve through which the radioactive contents could otherwise escape is protected against damage and unauthorized operation and, except for a pressure relief device, has an enclosure to retain any leakage;

Designer to do and shipper responsibility to ensure.

None of these packagings have valves.

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellotex on top of a lead shield with a press-fit lid in which closure of the cellotex holds the lid in place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

None of these packagings have shielding as described.

(l) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart;

Designer, tester, evaluator to do and shipper responsibility to ensure.

None of these packagings have tie-down attachments as described.

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

Designer to do and shipper responsibility to ensure.

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

PACKAGING CATEGORY
FIBERBOARD CONTAINERS

As shown on the sketches and as given in the packaging description in MIM-3245, all packagings meet this requirement.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

All evaluated packagings meet this requirement.

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

(e) It is able to withstand the effects of any acceleration, vibration resonance that may arise during normal transportation, without any deterioration of the effectiveness of closing devices or of the integrity of the package as a whole and without loosening or unintentional release of nuts, bolts, or other securing devices even after repeated use;

This does not mean any of the tests must necessarily be performed at the temperature extremes. [Note: 173.461(b).] The regulations allow the assumption that the packaging is in equilibrium at 38°C prior to testing. One must evaluate the packaging components with respect to behavior at the temperature extremes under conditions incidental to transportation (i.e., the jiggles, bounces, and bumps normally encountered in transportation). Gaskets and packaging components need to be evaluated to determine if they will become excessively brittle at -40°F . All cylinders are designed to withstand pressures far in excess of 11.2 psi. The minimum service pressure for any of these cylinders is 100 psig and extends up to 200 psig for nine of the cylinders.

GUIDANCE FOR APPLICATION

from any other tests. Caution should be exercised to ensure that the contents and internal packaging components (i.e., plastic boxes, etc.) will not effectively seal the filter during normal use. In cases where a pressure differential will not build up because of the free-flow through a filter, the requirement of demonstrating the retention of contents must still be met. For a package that breathes (does not hold 11.2 psi), such as a wooden box, one must demonstrate that, even with breathing, the contents will be retained. Otherwise, a separate inner containment capable of meeting the reduced pressure requirement is required. Designer, tester, and evaluator to do and shipper responsibility to ensure.

(j) Each valve through which the radioactive contents could otherwise escape is protected against damage and unauthorized operation and, except for a pressure relief device, has an enclosure to retain any leakage;

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

Designer to do and shipper responsibility to ensure.

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellotex on top of a lead shield with a press-fit lid in which closure of the cellotex holds the lid in

Each valve is protected against damage, sealed against unauthorized operation, and capped to retain any leakage.

None of these packagings have shielding as described.

GUIDANCE FOR APPLICATION

place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

Designer, tester, evaluator to do and shipper responsibility to ensure.

Only one configuration (48-in. cylinder) uses/incorporates tie-down attachments. Table C-4 shows the calculated safety factors and the failure mode analyses. In all cases, it was demonstrated that the lug would fail, not the cylinder. Thus, the integrity of the cylinder would not be impaired.

(1) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart.

TABLE C-4

<u>Cylinder</u>	<u>Weight</u> <u>(lb)</u>	<u>Calculated</u> <u>Safety Factor</u>	<u>Result</u>
48X	25,530	12	Pass
48Y	32,760	10	Pass

48HX	31,190	10	Pass

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

Designer to do and shipper responsibility to ensure.

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

PACKAGING CATEGORY
LIQUIDS AND GASES

As shown on the sketches and as given in the packaging description in MILM-3245, all packagings meet this requirement.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

All evaluated packagings meet this requirement.

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

(e) It is able to withstand the effects of any acceleration, vibration resonance that may arise during normal transportation, without any deterioration of the effectiveness of closing devices or of the integrity of the package as a whole and without loosening or unintentional release of nuts, bolts, or other securing devices even after repeated use;

This does not mean any of the tests must necessarily be performed at the temperature extremes. [Note: 173.461(b).] The regulations allow the assumption that the packaging is in equilibrium at 38°C prior to testing. One must evaluate the packaging components with respect to behavior at the temperature extremes under conditions incidental to transportation (i.e., the jiggles, bounces, and bumps normally encountered in transportation). Gaskets and packaging components need to be evaluated to determine if they will become excessively brittle at -40°F . This may be accomplished by actual testing, referring to property of material tables, obtaining data from manufacturers, etc. The shipper must consider such things as freezing of liquid contents and evaluate the effect to ensure continued containment integrity. The shipper must also consider the buildup of pressure at elevated temperatures and ensure continued containment. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Typically, one uses actual experience as a guide. If experience is not available, one normally uses a comparison to a similar packaging with an experience profile. If this isn't possible, vibration testing can be performed. The purpose of this section is to prevent the loosening of nuts, bolts, and containment devices under conditions incident to routine transportation. Designer, tester, and evaluator to do and shipper responsibility to ensure.

PACKAGING CATEGORY LIQUIDS AND GASES

The materials (wood, caulking, metal strips, nails, gaskets, etc.) would not become excessively brittle at -40°C . Temperatures of $+70^{\circ}\text{C}$ would not result in any significant decrease in integrity either, as shown in property of materials tables. The shipper must ensure that, if the contents freeze, no rupture of the container will occur. In addition, the shipper must evaluate the potential for pressure buildup at elevated temperatures.

Experience has consistently demonstrated that these packagings or similar designs comply with this requirement. The shipper must ensure the application of quality assurance necessary to achieve this requirement.

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
LIQUIDS AND GASES

(f) It includes a containment system securely closed by a positive fastening device that cannot be opened unintentionally or by pressure that may arise within the package during normal transport. Special form, as demonstrated in accordance with 173.469, may be considered as a component of the containment system;

(g) The materials of the packaging and any components or structures are physically and chemically compatible with each other and with the contents, taking into account the behavior of each under irradiation;

(h) For each component of the containment system, account is taken where applicable of radiolytic decomposition of materials and the generation of gas by chemical reaction and radiolysis;

(i) The containment system will retain its radioactive contents under the reduction of ambient pressure to 0.25 kilograms per square centimeter (3.5 lb/in.²);

"Screw-type" closures can qualify. "Friction fit" normally does not qualify. Security clips on cans could be acceptable. However, one cannot depend on friction alone. Designer, tester, and evaluator to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

Designer to do and shipper responsibility to ensure.

The containment system is defined as the components intended to retain the radioactive contents during transportation. Thus, one starts by identifying the containment system. The radioactive contents must be completely retained in the containment system if the package is subjected to reduced pressure. A filtered packaging is possible as long as it can be demonstrated that the filtered package will retain the contents and that the filter is not susceptible to damage from any other tests. Caution should be exercised to

All packagings evaluated meet this requirement, as shown on the sketches or in the packaging descriptions.

Shipper responsibility to ensure.

Shipper responsibility to ensure.

This analysis requires a more detailed discussion to provide adequate information. See Table C-5.

TABLE C-5

<u>Packaging/ Principal User</u>	<u>Model/Size</u>	<u>Containment System</u>	<u>Test/Analysis</u>	<u>Results</u>
LOVELACE	MS-24347-7	Glass bottle with screw cap	Two of these glass bottles with caps screwed on by hand were inverted in a beaker of water, and a vacuum was drawn (3.6 psi). After 5 min there was no evidence of leakage (bubbles in the water). Also, the metal drum <u>itself</u> passed the reduced pressure test, so the tests on the bottles would not have been required.	Pass
IASL	Fiberboard box with inner lead container	Inner lead container with screw-top cap and O-ring seal	The inner lead container was inverted in a beaker of water, and a vacuum was drawn (3.6 psi). After 5 min, there was no evidence of leakage (bubbles in the water).	Pass
LLNL	3A-1800 3E-1800	Steel drum- Gas cylinders	Each of the cylinders was pressurized before being sent to Mound. The pressure was measured in each one upon receipt and averaged approximately 92 psig per cylinder. These data and the fact that the service pressure is 1800 psig demonstrated compliance with the 11.2 psi requirements.	Pass

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellophane on top of a lead shield with a press-fit lid in which closure of the cellophane holds the lid in place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

The packagings meeting this criterion are discussed below.

Only a few packages have a design fitting this criterion. These are:

<u>Packaging</u>	<u>Containment System</u>	<u>Analysis</u>	<u>Results</u>
IASL fiberboard box with inner lead shielded containers	Inner lead container (2-in. o.d.) with screw-cap and O-ring seal.	As shown in the sketch on p. F-6, the inner container is held in place by a lid with three bolts. Thus, the outer shield is securely closed. There was no rearrangement during the tests specified in 173.465.	Pass
ORNL fiberboard boxes with shielded inner containers	Glass ampule or bottle with screw cap and a sealed metal can.	As shown on pp. F-20 and 21, the packaging components are firmly held in place by the sealed metal can.	Pass
ORNL aluminum clad wood box	Glass bottle and the 2R containers.	As shown on p. F-26, the 2R container is held in place by the bolt closure lid of the stainless steel-clad lead carrier.	Pass

Packaging

ORNL gas cylinder

(1) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart.

Containment System

The cylinder itself.

Designer, tester, evaluator to do and shipper responsibility to ensure.

Analysis

As shown on pp. F-31, 32, and 36, the lead shielding, when used, fills the void between the inner and outer wall and prevents escape.

Results

Pass

None of these packagings have tie-down attachments as described.

173.412 - ADDITIONAL DESIGN REQUIREMENTS FOR TYPE A PACKAGES

In addition to meeting the general design requirements prescribed in 173.411, each Type A packaging shall be designed so that:

GUIDANCE FOR APPLICATION

PACKAGING CATEGORY
MISCELLANEOUS

(a) The smallest overall external dimension of the package is not less than 10 centimeters (4 in.);

Designer to do and shipper responsibility to ensure.

As shown on the sketches and as given in the packaging description in MLM-3245, all packagings meet this requirement.

(b) The outside of the packaging incorporates a feature, such as a seal, that is not readily breakable, and that, while intact, is evidence that the package has not been opened. In the case of packages shipped in exclusive use closed transport vehicles, the cargo compartment may be sealed instead of the individual packages;

For this requirement, the package designer may need to be skilled and creative. This is especially true for packages such as fiberboard cartons and wooden boxes. A padlock is not effective as a security seal. It is not possible with most types of padlocks to ascertain if they have been illicitly opened. One acceptable approach toward meeting this requirement is serially numbered lead-wire seals, or, in the case of fiberboard packages, a tape of sufficient adhesive strength to damage the fiberboard upon removal. Designer to do and shipper responsibility to ensure.

There are acceptable approaches to compliance for all evaluated packagings. It is the shipper's responsibility to ensure compliance with this requirement.

(c) As far as practicable, the external surfaces are free from protrusions and are designed so that they can be easily decontaminated;

The intent is to minimize the number and nature of protrusions by consideration during design and/or as a result of any modifications to the packaging. Designer to do and shipper responsibility to ensure.

All evaluated packagings meet this requirement.

GUIDANCE FOR APPLICATION

(d) Containment and shielding would be maintained during transportation and storage in a temperature range of -40°C (-40°F) to $+70^{\circ}\text{C}$ ($+158^{\circ}\text{F}$) with account taken of the possibilities of brittle fracture;

MISCELLANEOUS

filtered package will retain the contents and that the filter is not susceptible to damage from any other tests. **Caution should be exercised** to ensure that the contents and internal packaging components (i.e., plastic boxes, etc.) will not effectively seal the filter during normal use. In cases where a pressure differential will not build up because of the free-flow through a filter, the requirement of demonstrating the retention of contents must still be met. For a package that breathes (does not hold 11.2 psi), such as a wooden box, one must demonstrate that, even with breathing, the contents will be retained. Otherwise, a separate inner containment capable of meeting the reduced pressure requirement is required. Designer, tester, and evaluator to do and shipper responsibility to ensure.

(j) Each valve through which the radioactive contents could otherwise escape is protected against damage and unauthorized operation and, except for a pressure relief device, has an enclosure to retain any leakage;

Designer to do and shipper responsibility to ensure.

The only packaging meeting this criterion is the SNL Tritium Waste Package. The 17H 30-gal drum provides the physical protection against unauthorized operation. The asphalt which surrounds the entire inner packaging and the 17H steel drum will retain any contents.

GUIDANCE FOR APPLICATION

(k) Any radiation shield that encloses a component of the packaging specified as part of the containment system will prevent the unintentional escape of that component from the shield;

(l) Failure of any tie-down attachment on the packaging under excessive load will not impair the ability of the package to meet other requirements of this subpart.

The shield shall be securely closed or, by way of packaging design, ensure against escape of a containment component. One example is a package with cellotex on top of a lead shield with a press-fit lid in which closure of the cellotex holds the lid in place. The shipper must make sure that under the tests prescribed in 173.465 there will be no rearrangement of the original containment/shield orientation. Designer, tester, evaluator to do and shipper responsibility to ensure.

Designer, tester, evaluator to do and shipper responsibility to ensure.

PACKAGING CATEGORY
MISCELLANEOUS

The only packaging meeting this criterion is the LINL (Spec. 55) container. The packaging/shield is one piece, so it is obviously the containment system also. Since the containment system and the radiation shield are all the same, they cannot escape/separate.

None of these packagings have tie-down attachments as described.

SUMMARY OF TYPE A PACKAGING TESTS
(49 CFR 173.465)

The purpose of this section is to provide more details concerning the Type A packaging tests that were conducted or against which the packages were analyzed for compliance. The tests involved are:

1. Water Spray
2. Free Drop
3. Compression
4. Penetration

These tests, test methods, and determination of pass/fail criteria are discussed at length in the MLM-3245 Introduction.

- 173.465 (a) The proposed packaging with proposed contents must be capable of withstanding the tests prescribed in this section. One prototype may be used for all tests if the requirements of Paragraph (b) of this section are complied with.

WATER SPRAY TEST

(b) Water Spray Test.

The water spray test must precede each test or test sequence prescribed in this section. The water spray test shall simulate exposure to rainfall of approximately 5 centimeters (2 in.) per hour for at least one hour. The time interval between the end of the water spray test and the beginning of the next test shall be such that the water has soaked in to the maximum extent without appreciable drying of the exterior of the specimen. In the absence of evidence to the contrary, this interval may be assumed to be two hours if the water spray is applied from four different directions simultaneously. However, no time interval may elapse if the water spray is applied from each of the four directions consecutively.

Major Points.

- (1) Must precede each test
- (2) 2 in./hr
- (3) 1-hr duration

Comments:

This is usually a conditioning of a package, rather than a test as such. One would not expect a loss of contents or significant increase in dose rate resulting from just the water spray test. However, consideration must be given to the possibility of water leakage into the package with subsequent transport of radioactive contents out as leakage.

Designer, tester, evaluator to do and shipper responsibility to ensure.

WATER SPRAY TEST

PACKAGING CATEGORY: STEEL DRUMS

In evaluating steel drums against this requirement, one would consider such things as:

- (1) The effect the water spray would have on the ability of the steel drums to meet the other Spec 7A performance requirements;
- (2) The potential for inleakage of water with the subsequent potential for transport of the radioactive contents out of the packagings;
- (3) Because these same packagings are air-leak tight, one would also expect them to prevent the inleakage of water under such passive conditions as a water spray (rain).

As shown in Table D-1, nine different types of steel drums (a total of 26 different packagings) were subjected to this test. In all cases, as one would expect based on materials and methods of construction, closure mechanisms, gaskets, and the painted surfaces, the water spray had no effect that could possibly be interpreted as decreasing the ability of the steel drums to meet all Spec 7A performance criteria. This is not surprising since there are years of experience demonstrating that lengthy exposures to rain have not had a negative effect on containment integrity. In addition, in each of the 26 individual tests, a careful inspection demonstrated there was no inleakage of water as a result of these tests. Because these same packagings are air-leak tight, one would also expect them to prevent the inleakage of water under such passive conditions as a water spray (rain).

As a final point of mainly academic discussion, since the steel drums are air-leak tight to begin with, in the unlikely event of an inleakage of water, it would be equally unlikely that this expected minute quantity of water would leak out. Thus, based on the test data below and after comparison of the similarity in materials and methods of construction of the untested steel drums, one can readily conclude that these steel drums meet this requirement.

WATER SPRAY TEST RESULTS FOR STEEL DRUMS

TABLE D-1

Specific
Packaging

Test/Analysis Results

Spec 6C 5-gal	By comparison, this drum would meet this requirement.
Spec 6C 10-gal	By comparison, this drum would meet this requirement.
Spec 17C 5-gal	By comparison, this drum would meet this requirement.
Spec 17C 30-gal	By comparison, this drum would meet this requirement.
Spec 17C 55-gal	Three drums were subjected to this test and passed.
Spec 17C 55-gal with pressure relief device	Three lids with the "Nuc-Fil" filters were subjected to the water spray test and no water passed through the filter.
Spec 17C 55-gal w/HDPE liner	The same data shown for the 17C 55-gal drum would apply here.
Spec 17H 30-gal	Three drums were subjected to this test and passed.
Spec 17H 55-gal	Three drums were subjected to this test and passed.
MS-24347-1	By comparison, this drum would meet this requirement.
MS-24347-7	Two drums were subjected to this test and passed.
MS-27684-1	By comparison, this drum would meet this requirement.
MS-27684-2	By comparison, this drum would meet this requirement.
MS-27684-3	Three drums were subjected to this test and passed.
MS-27684-6	By comparison, this drum would meet this requirement.
MS-27684-8	Three drums were subjected to this test and passed.
MS-27683-7	Three drums were subjected to this test and passed.
MS-27683-13	By comparison, this drum would meet this requirement.
MS-24683-21	Three drums were subjected to this test and passed.

WATER SPRAY TEST

PACKAGING CATEGORY: STEEL BOXES

In evaluating steel boxes against this requirement, one would consider such things as:

- (1) The effect the water spray would have on the ability of the steel boxes to meet the other Spec 7A performance requirements;
- (2) The potential for inleakage of water with the subsequent potential for transport of the radioactive contents out of the packagings;
- (3) Because these same packagings are air-leak tight, one would also expect them to prevent the inleakage of water under such passive conditions as a water spray (rain).

In all cases but one (the ANL-West 7A 960 steel box), as one would expect based on materials and methods of construction, closure mechanisms, gaskets, and painted surfaces, the water spray would have no effect that could be interpreted as decreasing the ability of the steel boxes to meet all Spec 7A performance criteria. This is not surprising since there are years of experience demonstrating that lengthy exposures to rain have not had a negative effect on containment integrity. Because these same packagings are air-leak tight, one would also expect them to prevent the inleakage of water under such passive conditions as a water spray (rain).

As a final point of mainly academic discussion, since the steel boxes are air-leak tight to begin with, in the unlikely event of an inleakage of water, it would be equally unlikely that this expected minute quantity of water would leak out. Thus, based on the information below and after comparison of the similarity in materials and methods of construction of the steel boxes, one can readily conclude that all the steel boxes meet this requirement (with the exception of the ANL-West 7A-960 discussed in Table D-2).

WATER SPRAY TEST RESULTS FOR STEEL BOXES

TABLE D-2

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>
All - Capital Industries - Container Products Corp. - RoGar Chemical and Nuclear Services - Rocky Flat SAND Boxes - Argonne M-4 Steel Bin	All these boxes <u>pass by analysis</u> of materials, methods of construction, years of experience (exposure to a variety of weather conditions, including heavy rains), and air-leak or water-leak tests which have demonstrated the boxes to be leak tight. The tests referenced are the reduced pressure tests, Page C-14, of this document. The filters (for filtered boxes) have been tested and demonstrated to be water-leak resistant also.
ANL-West 7A-960	Since this package does not have a gasket, one has to assume there could be an inleakage of water, however slight. To protect against this possible exposure to water, the contents must be enclosed in plastic or equally water resistant materials, or the shipper must ensure that, if the contents were exposed to such water, there would be no transfer of radioactive materials to the liquid. See Restriction/Specification section on Page B-28. A <u>preferred method</u> (since the introduction of any water into a radioactive material shipping container is highly undesirable) is to use a gasket. Thus, all of the steel boxes except the ANL-West 7A-960 meet this requirement without any restrictions or specifications, and the ANL-West 7A-960 meets this requirement when used as prescribed on Page B-28.

WATER SPRAY TEST

PACKAGING CATEGORY: WOODEN BOXES

In evaluating wooden boxes against this requirement, one would consider such things as:

- (1) The effect the water spray would have on the ability of the wooden boxes to meet the other Spec 7A performance requirements;
- (2) The potential for inleakage of water with the subsequent potential for transport of radioactive contents out of the packagings.

As shown in Table D-3, 14 different types of wooden boxes (a total of 24 different packagings) were subjected to this test. In all cases, as one would expect based on materials and methods of construction, closure mechanisms, and caulking/glue, the water spray had no effect that could be interpreted as decreasing the ability of the wooden boxes to meet the remaining Spec 7A performance criteria. This is not surprising since there are years of experience demonstrating that exposure to rain has not had a significant effect on containment integrity.

With respect to Item 2 above, the potential for inleakage of water, some boxes constructed of normal exterior grade plywood did allow small amounts of water to penetrate. For test purposes, the insides of the test boxes were lined with paper, and the box was subjected to the water spray test for 1 hr and allowed to sit for 2 hr. At the end of this period, the paper was inspected for spots which would indicate the presence of water.

WATER SPRAY TEST RESULTS FOR ANL AND LINL WOODEN BOXES

TABLE D-3

Specific Packaging

Test/Analysis Results

ANL-West Family
of Boxes

By comparison these boxes would meet this requirement.

LINL Flush
Panel Box

By comparison these boxes would meet this requirement.

WATER SPRAY TEST RESULTS FOR MOUND WOODEN BOXES

TABLE D-4

<u>Configuration (Dimensions in Inches)</u>	<u>1st Test As Built</u>	<u>2nd Test RTV Used to Seal Seams on Inside</u>	<u>3rd Test Water Sealant Applied to Boxes^a</u>
Mound Configuration A 8 x 8 x 36	Pass - No indication of water	Fail ^b	Pass
Mound Configuration B 12 x 12 x 36	Pass - No indication of water	Pass	Pass
Mound Configuration C 12 x 12 x 36	Fail - Water absorbed on paper	Fail	Pass
Mound Configuration D 12 x 15 1/2 x 48	Fail - Water absorbed on paper	Fail	Pass

WATER SPRAY TEST RESULTS FOR WOODEN BOXES

TABLE D-5

Specific
Packaging

Test/Analysis Results

NLO Family of
Boxes

By comparison these boxes would meet this requirement.

Y-12 B Series

B-1 through
B-8

Each of these packagings was subjected to the water spray for 1 hr, allowed to sit for 2 hr, and then subjected to the drop test. There was no evidence of a decrease in containment integrity as a result of this test. Considering the materials and methods of construction, all of the other wooden boxes would also meet this requirement.

Y-12 Picture
Frame Boxes

PF-1 through
PF-8

By comparison these boxes would meet this requirement.

Rocky Flats - RA
Series of Boxes

By comparison these boxes would meet this requirement.

As shown in Table D-4, small amounts of water did appear at times on the paper, indicating an inleakage of water. The majority of the inleakage occurred at the corners and at some points in the seams; however, a few spots occurred that indicated inleakage through the walls themselves. Three possible approaches are described that are acceptable with respect to addressing this inleakage and ensuring that there is no transport of radioactive materials out of the packaging.

- (1) Securely enclose the radioactive contents within the box so that any inleaking water cannot come in contact with the radioactive material.
- (2) Seal the box using GEOCEL or its equivalent. If the box is reused, it must be recoated with at least one coat to cover the seal areas before each shipment.
- (3) Assure that there is no loose or removable contamination which could be entrained in any liquid and that the radioactive material is not soluble in the liquid. Thus, even if the liquids come in contact with the radioactive material, there could be no transport from the package.

NOTE: These three approaches are presented in the Restrictions/Specifications section for each of the evaluated packagings in MIM-3245. There are obviously other possible approaches; however, if an alternative approach is chosen, the basis for the choice must be supported and documented. The use of one of these alternatives or an equivalent allows these wooden boxes to meet this requirement.

WATER SPRAY TEST RESULTS FOR FIBERBOARD CONTAINERS

TABLE D-6

Specific
Packaging

Test/Analysis Results

Fiberboard Boxes
12B-65
(p. D-2)^a

Each of these packagings was subjected to this test prior to each of the three tests: free drop, compression, and penetration. As a result of the water spray, the addition of triple-wall support was required in many of the containers so that these packagings could withstand the compression test. This test also demonstrated the need for water-resistant tape as required in the Restrictions/Specifications section. As one would expect, the boxes were softened considerably; however, this didn't seem to make much difference in the drop or penetration tests.

Fiberboard Box
LLNL (p. D-6)

Fiberboard Box
Tri-Wall (p. D-11)

Fiberboard Drums

Since one has to assume an inleakage of water, each shipper must address this potential inleakage of water and ensure there is no transport of radioactive materials out of the packaging by the following methods or their equivalent.

^aPage numbers refer to MLM-3245.

Two possible approaches are described that are acceptable with respect to addressing this potential inleakage and ensuring that there is no transport of radioactive materials out of the packaging.

- (1) Securely enclose the radioactive contents within the box so that any inleaking water cannot come in contact with the radioactive material.
- (2) Ensure that there is no loose or removable contamination which could be entrained in any liquid and that the radioactive material is not soluble in the liquid. Thus, even if the liquids come in contact with the radioactive material, there could be no transport from the package.

NOTE: These two approaches are presented in the Restrictions/Specifications section for each of the evaluated packagings. There are obviously other possible approaches; however, if an alternative approach is chosen, the basis for the choice must be supported and documented. The use of one of these alternatives or an equivalent method allows these fiberboard packagings to meet this requirement.

WATER SPRAY TEST RESULTS FOR UF-6 CYLINDERS

TABLE D-7

Specific
Packaging

Models 1S, 2S, 5A,
8A, 12A, 12B, 30A, 30B,
48G, 48H, 48HX, 48X, 48Y

Test/Analysis Results

The factors to be considered in evaluating compliance as mentioned previously were:

- (1) The effect the water spray would have on the ability of the UF-6 cylinders to meet the other Spec 7A performance requirements;
- (2) The potential for inleakage of water with the subsequent potential for transport of the radioactive contents out of the packagings.

The materials and method of construction make it obvious that a water spray (rain) would not have any significant effect on the structural integrity. This is well-substantiated by years of shipping thousands of these packagings through a wide variety of weather conditions. With respect to the second aspect, inleakage of water, since these cylinders have welded seams and threaded valves which are gas-leak tight, the inleakage of water is not credible. Thus, these packagings meet this requirement.

WATER SPRAY TEST RESULTS FOR LIQUIDS AND GASES

TABLE D-8

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>
Steel Drum MS 24347-7 (p. F-1) ^a	This test was not conducted on this packaging since the outer packaging component is a steel drum, and compliance is demonstrated as described on Page D-3.
IASL-12B-62 Fiberboard Box (p. F-6)	The test was conducted prior to each of the three tests: 30-ft drop, compression, and penetration. Since the packaging successfully passed these three tests, this demonstrates the lack of significant effect with respect to structural aspects. Also, since the 2-in. inner container is air-leak tight, there is no potential for inleakage of water. Thus, this packaging meets this requirement.
LLNL Steel Drums with Gas Cylinders	The compliance of the outer packaging, Spec 17H 30-gal steel drum, has already been demonstrated as described on Page D-3.
ORNL Liquids and Solids (p. F-15)	 The water spray was performed prior to each test, and the packaging successfully met all requirements. Since there is a sealed metal inner container, there is no potential for further inleakage of water.
Disposable Container with Shielding (pp. F-20 and 21) - Liquids, Solids, or Gases	The water spray was performed prior to each test, and the packaging successfully met all requirements. Since there is a sealed metal inner container, there is no potential for further inleakage of water.

^aPage numbers refer to MLM-3245.

TABLE D-8 (continued)

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>
Wooden Box Returnable, Shielded (p. F-26)	The water spray was performed prior to each test, and the packaging successfully met all requirements. The sealed inner metal containers preclude any potential for further inleakage.
Gas Cylinder Returnable - Hoke (p. F-30)	The water spray was performed prior to each test, and the packaging successfully met all requirements. The plastic box used as an overpack typically precludes any significant effect due to the water spray. Then, considering that the inner cylinders are gas-leak tight, there is no potential for further inleakage of water.
Gas Cylinder Returnable J. L. Shephard (p. F-36)	Considering the materials and method of construction and the fact that these cylinders are gas-leak tight, there is no potential for inleakage of water.

WATER SPRAY TEST RESULTS FOR MISCELLANEOUS PACKAGINGS

TABLE D-9

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>
LINL Spec 55 (p. G-1)	This test was not conducted since, considering the materials and methods of construction, it is obvious that this test would not adversely affect the ability of the package to meet the additional Spec 7A requirements. In addition, since the package was demonstrated to be water-leak tight even after the 4-ft drop, there is no potential for inleakage of water.
ORNL TRU Shipping Container	This test was not conducted since, considering the materials and methods of construction, it is obvious that this test would not adversely affect the ability of the package to meet the additional Spec 7A requirements. In addition, since the inner (source) containment has to meet the Special Form [173.412(z)] criteria, the inleakage of water would not result in a potential transport of radioactive material from the package.
FEMA Source Overpack	This test was not conducted since, considering the materials and methods of construction, it is obvious that this test would not adversely affect the ability of the package to meet the additional Spec 7A requirements. In addition, since the inner (source) containment has to meet the Special Form [173.412(z)] criteria, the inleakage of water would not result in a potential transport of radioactive material from the package.
SNL Tritium Waste Package	The compliance of the outer packaging, Spec 17H 30-gal steel drums, has already been demonstrated and discussed on Page D-3.

FREE DROP TEST

(c) Free Drop Test.

The free-drop test consists of a fall onto the target in a manner that causes maximum damage to the safety features being tested; and

(1) For packages weighing 5,000 kilograms (11,000 lb) or less, the distance of the fall measured from the lowest point of the packaging to the upper surface of the target shall not be less than 1.2 meters (4 ft).

(2) For packages weighing more than 5,000 kilograms (11,000 lb), the distance of the fall shall not be less than the distance specified in Table II, for the applicable packaging weight.

Major Points.

- (1) 4-ft drop
- (2) Manner to cause maximum damage

Comments

- (1) The orientation causing maximum damage may not be readily apparent. Typically, the following guidelines should be considered:
 - (a) Drums - side drop with bolt closure ring (BCR) at impact point;
 - angle drop (approx. 45° on BCR and on bottom at intersection of chime and side seam);
 - (b) Boxes - Top (lid) corner near features, such as lifting rings and filters, if any exist;
 - (c) Approximate center of gravity over impact point.
- (2) A quick release device is required to ensure no change in package orientation.

Straightforward

Comments

TABLE II - FREE FALL DISTANCE FOR
PACKAGING WEIGHING MORE THAN 5,000 KG

Packaging Weight		Free-Fall Distance	
(kg)	(lb)	(ft)	(m)
> 5,000-10,000	>11,000-22,000	3	0.9
>10,000-15,000	>22,000-33,000	2	0.6
>15,000	>33,000	1	0.3

Designer, tester, and evaluator to do and shipper responsibility to ensure.

(3) For Fissile Class II packagings, the free drop specified in subparagraph (1) or (2) of this paragraph shall be preceded by a free drop from a height of 0.3 meter (1 ft) on each corner. For cylindrical packagings, the 0.3-meter (1-ft) drop shall be onto each of the quarters of each rim.

For packagings to be used for Fissile Class II shipments, further testing and evaluation per Paragraph 3 are required.

(4) For fiberboard or wood rectangular packages not exceeding 50 kilograms (110 lb) in weight, a separate specimen of the proposed packaging shall be subjected to a free drop onto each corner from a height of 0.3 meters (1 ft).

Designer, tester, evaluator to do and shipper responsibility to ensure.

(5) For fiberboard cylindrical packages weighing not more than 100 kilograms (220 lb), a separate specimen of the proposed packaging shall be subjected to a free drop onto each of the quarters of each rim from a height of 0.3 meters (1 ft).

Designer, tester, evaluator to do and shipper responsibility to ensure.

(6) The target shall have a flat, horizontal surface of such mass and rigidity that any increase in its resistance to displacement or deformation upon impact by the specimen would not significantly increase the damage of the specimen.

As a rule of thumb: An essentially nonyielding surface is one at least five times the mass of the impacting object.

Tester, evaluator to do and shipper responsibility to ensure.

<u>Manufacturer:</u>				
RoGar Chemical and Nuclear Services				
Model R-3	7,920	F/F/S	Pass	This package was dropped 4 ft on a top (lid) corner. There was no loss of contents or significant change in package geometry. Authorized for Form 1, 2, and 3 materials.
Model R-4	7,920	Not Tested	Pass	Evaluated by analysis and comparison (lids, lid reinforcing angle, bolt size, bolt spacing, container flange, materials of construction, etc.) to Model R-3. All materials and methods of construction were equal to or better than the test packaging, the dimensions were substantially less, and the gross weight remained the same.
<hr/>				
Rocky Flats SAND Box				
Style 1	7,000	Gravel and water	Pass	A number of tests were conducted at different orientations (45° on top, 45° on bottom, etc.) for each packaging. After each test, the packagings were successfully air-leak tested to 0.5 psi. The use of water and gravel was more conservative than the use of flour and fluorescein to simulate the contents. Authorized for Form 1, 2, and 3 materials.

NOTE: Even though these packagings passed the drop test without release of the floor and fluorescein, they were authorized for only Form 3 materials since their performance in the penetration test was sporadic.

FOUR-FT FREE DROP TEST RESULTS FOR UF-6 CYLINDERS

TABLE D-17

<u>Specific Packaging</u>	<u>Weight (lb)</u>	<u>Orientation</u>	<u>Comments</u>
1S	2	This category of packagings was evaluated based on numerous drop tests conducted on Models 5A, 8A, 12B, 30B, and 48X cylinders. These tests included the 4-ft drop (side and angle), the much more severe 30-ft drop (side and angle), and the 4-ft drop onto the bar (puncture test). In all of these tests, there was no loss of contents. When analyses were performed, data such as materials of construction, dimensions, authorized gross weight, and effects of testing were used to verify that the cylinders not tested meet the Spec 7A requirements.	These packagings are authorized for Form 1, 2, and 3 materials (recognizing that Forms 2 and 3 are not really appropriate).
2S	9.5		
5A	110		
8A	375		
12A	645

30B	6,420		
48G	30,600		
48H	30,150		
48HX	30,150		
48X	25,530		
48Y	32,760		

THIRTY-FT FREE DROP TEST RESULTS FOR LIQUIDS AND GASES

TABLE D-18

<u>Specific Packaging</u>	<u>Weight (lb)</u>	<u>Contents</u>	<u>Results/Comments</u>
Steel Drum MS-24347-7 (p. F-1)	6	Water	<p>Top (45°): No. Tested - 3; Results - 3 pass Flat on Top: No. Tested - 1; Results - 1 pass Bottom (45°): No. Tested - 3; Results - 3 pass Side: No. Tested - 2; Results - 2 pass</p> <p>Three 30-ft drops were done consecutively on the same package, then the inner containment vessel (glass bottle) was removed and inverted for 10 min to determine if there had been any loss of contents. After nine 30-ft drops, there was no evidence of leakage, and the package was evaluated as meeting all requirements.</p>
IASL 12B-62 Fiberboard Box	62	Water	<p>One 30-foot drop was done on this packaging. The impact point was a top corner (package was inverted). After completion of the test, the inner containment vessel (glass ampule) was removed and inverted for 10 min to determine if there had been any loss of contents. There was no loss of contents. In addition, after an additional 30-ft drop, the 2-in. diameter inner shield container with the threaded cap and O-ring seal was air-leak tested and passed. Thus, this packaging meets all requirements with any appropriate inner containment.</p>
LLNL Steel Drums with Gas Cylinders (p. F-11)			
3A 1800	68	Air	<p>A 30-ft drop test was conducted on both configurations. After each drop test, it was determined that there had been no loss of contents (by comparison of pretest pressure to posttest pressure) from any of the seven test cylinders. Thus, there was no loss of contents and this packaging meets all requirements.</p>
3E 1800	60	Air	

TABLE D-18 (continued)

<u>Specific Packaging</u>	<u>Weight (lb)</u>	<u>Contents</u>	<u>Results/Comments</u>
ORNL Fiberboard Box - Liquids and Solids (p. F-15)	33	Water	A 30-ft drop test was conducted on this packaging. The impact was on the bottom edge of the cardboard box. There was no evidence of loss of contents, and this packaging meets all requirements.
ORNL Fiberboard Box - Gases (p. F-20)	33	Water	A 30-ft drop test was conducted on this packaging. The impact was on the bottom edge of the cardboard box. There was no evidence of loss of contents, and this packaging meets all requirements.
ORNL Fiberboard Box - Liquids and Solids with Shielding (p. F-21)	33	Water	A 30-ft drop test was conducted on this packaging. The impact was on the bottom edge of the cardboard box. There was no evidence of loss of contents, and this packaging meets all requirements.
ORNL Wooden Box - Returnable, Shielded (p. F-26)	212	Water	Two 30-ft drops were conducted; one with the entire packaging assembly and one with just the stainless steel clad lead shield by itself (without the wooden box). The second drop indicated that this inner assembly could withstand the 30-ft drop test by itself. After both tests, the glass inner container was removed and examined. There was no loss of contents (leakage of water), and this packaging meets all requirements.
ORNL Gas Cylinder Returnable (Hoke Cylinders)			
HOH-50	9		Thirty-ft drop tests were conducted on the 1000 mL (not currently used) and 500 mL gas shipping cylinders. The test packages were dropped with the valve cover down. There was no loss of contents, and these packagings meet this requirement. These two tests subjected the packaging to maximum stress, so, after consideration of material of construction, thickness of materials, package weights, etc., the analysis demonstrated that all listed packagings meet all requirements.
HOXe-50	15		
HOKr-50	15		
HOH-150	11		
HOXe-150	35		
HOKr-150	35		
HOH-300	12

TABLE D-18 (continued)

<u>Specific Packaging</u>	<u>Weight (lb)</u>	<u>Contents</u>	<u>Results/Comments</u>
ORNL Gas Cylinder Returnable (J. L. Shepard)			
Cylinder 1	24		A 30-ft drop test was conducted on J. L. Shepard Model 394-500-L gas shipping cylinder. The cylinder landed on its top. Helium leak testing before and after the testing demonstrated that there was no loss of contents and this packaging meets this requirement. Since this packaging would be subject to the greatest stress, all smaller packagings also meet all requirements.
Cylinder 2	40		
Cylinder 3	60		

FOUR-FT FREE DROP TEST RESULTS FOR MISCELLANEOUS PACKAGINGS

TABLE D-19

<u>Specific Packaging</u>	<u>Weight (lb)</u>	<u>Comments</u>
LINL-Old Spec 55	50	Two of these packagings were filled with a water/fluorescein solution, sealed, and dropped on a lid edge. There was no loss of contents, even with these conservative contents. Thus, this packaging meets all requirement.
ORNL TRU Shipping Container	3,700	Since this packaging is certified only for Special Form [49 CFR 173.403(z)] contents, this test has little meaning from a loss of contents standpoint. However, the test was conducted on the top edge with no significant effect on the packaging. Thus, the packaging plus the Special Form contents meet all requirements.
FEMA Source Over Pack	200	Since this packaging is authorized only for Special Form [49 CFR 173.403(z)] contents, this test has little meaning from a loss of contents standpoint. However, the test was conducted on the top edge with no significant effect on the packaging. Thus, the packaging plus the Special Form contents meet all requirements.
SNL Tritium Waste Package	200	The inner container was dropped 6 ft on a chime and 4 ft on a protected valve, and the entire package was dropped 4 ft on the top bolt closure ring, all with no loss of contents. The packaging meets all requirements.

COMPRESSION TEST

(d) Compression Test

The compression test shall last for a period of at least 24 hr and consist of a compressive load equivalent to the greater of the following:

- (1) Five times the weight of the actual package; or
- (2) 1300 kilograms per square meter (265 lb/ft²) multiplied by the vertically projected area of the package. The compressive load shall be applied uniformly to two opposite sides of the packaging specimen, one of which must be the base on which the package would normally stand.

Major Points

- (1) 5 times actual weight
- (2) 265 lb/ft² times the area of package

Comments

- (1) Be alert. For packages with a large top surface area, the 265 lb/ft² can quickly become very large.
- (2) Any decreases in distances to package surfaces should be documented for use in evaluating the "No significant dose rate increase" requirement.

Tester and evaluator to do and shipper responsibility to ensure.

COMPRESSION TEST RESULTS FOR STEEL DRUMS

TABLE D-23

<u>Specific Packaging</u>	<u>Authorized Gross Weight (lb)</u>	<u>Compression Test Weight (lb)</u>	<u>Test Duration (hr)</u>	<u>Test/Analysis Data and Results</u>		<u>Comments</u>
				<u>No. Tested</u>	<u>Results</u>	
Spec 6C 5-gal	80	500	>24	1	1 Pass	No detectable effect.
Spec 6C 10-gal	160	928	>24	1	1 Pass	No detectable effect.
Spec 17C 5-gal	100	520	>24	1	1 Pass	No detectable effect.
Spec 17C 30-gal	500	Not Tested ^a				Pass, based on testing of 17H 30-gal drum.
Spec 17C 55-gal	1,000	Not Tested ^b				Pass, based on testing of 17H 55-gal drum ^c .
Spec 17C 55-gal with pressure relief devices	1,000	Not Tested ^c				Pass, based on testing of 17H 55-gal drum ^c .
Spec 17C 55-gal with HDPE liner	1,000	Not Tested ^b				Pass, based on testing of 17H 55-gal drum ^c .
Spec 17H 30-gal	500	2,700	>24	1	1 Pass	No detectable effect.
Spec 17H 55-gal	1,000	5,100	>74	1	1 Pass	No detectable effect.

^aThe test data for the Spec 17H 30-gal drum are directly applicable since the construction specifications for these two drums (17H 30-gal and 17C 30-gal) are essentially the same.

^bA 17C 55-gal drum filled with concrete was tested to 8,142 lb (for 24 hr) and passed.

^cThe test data for the Spec 17H 55-gal drum are directly applicable (although conservative), since the only major difference between the 17H and the 17C 55-gal drums is the thickness of the body sheet. The 17H body sheet is 18 gauge, and the 17C is 16 gauge.

<u>Specific Packaging</u>	<u>Authorized Gross Weight (lb)</u>	<u>Compression Test Weight (lb)</u>	<u>Test Duration (hr)</u>	<u>Test/Analysis Data and Results</u>		<u>Comments</u>
				<u>No. Tested</u>	<u>Results</u>	
ORNL Fiberboard Box - Liquids and Solids with Shielding (p. F-21)	33	165	>24	1	1 Pass	Deformation of up to 1 in. on all four sides and less than 0.5 in. on the top end button.
ORNL Wooden Box - Returnable, Shielded (p. F-26)	212	1,040		1	1 Pass	Tests on a slightly smaller packaging at a slightly less compressive load demonstrated that this packaging would be expected to meet this requirement.
ORNL Gas Cylinder Returnable (Hoke Cylinders)	212	1,060	>24	1	1 Pass	No damage to the packaging.
HOH-50	9	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOXe-50	15	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOKr-50	15	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOH-150	11	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOXe-150	35	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOKr-150	35	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.

TABLE D-28 (continued)

<u>Specific Packaging</u>	<u>Authorized Gross Weight (lb)</u>	<u>Compression Test Weight (lb)</u>	<u>Test Duration (hr)</u>	<u>Test/Analysis Data and Results</u>		<u>Comments</u>
				<u>No. Tested</u>	<u>Results</u>	
HOH-300	12	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOKr-300	36	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOH-500	15	Not Tested				Pass, based on comparison to test data on heaviest cylinder, HOKr-500, shown below.
HOKr-500	50	285	24	1	1 Pass	No damage to the packaging.

Tests were also conducted with a 1,000 mL container in which a compressive load of 580 lb was applied for 24 hr. There was no damage to the package. Since these cylinders are all identical in construction except for size and weight, the testing of the two heaviest packagings represents the worst possible cases. Thus, all of the above cylinders would pass this test.

ORNL Gas Cylinder
Returnable
(J. L. Shepard)

Cylinder 1	24
Cylinder 2	40
Cylinder 3	60

Evaluated based on letter describing testing conducted by ORNL, subject "J. L. Shepard Gas Cylinder," D. M. Ferren/D. A. Edling, April 30, 1985.

COMPRESSION TEST RESULTS FOR MISCELLANEOUS PACKAGINGS

TABLE D-29

<u>Specific Packaging</u>	<u>Authorized Gross Weight (lb)</u>	<u>Compression Test Weight (lb)</u>	<u>Test Duration (hr)</u>	<u>Test/Analysis Data and Results</u>		<u>Comments</u>
				<u>No. Tested</u>	<u>Results</u>	
LLNL Old Spec 55	50	300	>24	1	1 Pass	No detectable effect.
ORNL TRU Shipping Container	3,700	Not Tested				Analysis demonstrates that even 50,000 lb, a severe over-test, would not have a significant effect.
FEMA Source Over Pack	200	1,070	>24	1	1 Pass	No detectable effect.
SNL Tritium Waste Package	200	Not Tested				Pass, see Page D-51 of this document for test data on the 17H 30-gal drum.

PENETRATION TEST

(e) Penetration Test.

For the penetration test the packaging specimen shall be placed on a rigid, flat, horizontal surface that will not move while the test is being performed. The test shall consist of:

(1) A bar 3.2 centimeters (1.25 in.) in diameter with a hemispherical end, weighing 6 kilogram (13.2 lb) being dropped with its longitudinal axis vertical, onto the center of the weakest part of the packaging specimen, so that, if it penetrates far enough, it will hit the containment system. The bar must not be deformed by the test; and

(2) The distance of the fall of the bar measured from its lower end to the upper surface of the packaging specimen shall not be less than 1 meter (3.3 ft).

Major Points.

- (1) 13-lb bar
- (2) 1 m (3.3 ft)
- (3) Most vulnerable point

Comments

Penetration of the outer packaging(s) is not necessarily a cause for failure. The question is, "Did the test result in a loss of contents?" For outer packaging components not meeting this requirement, one could specify an inner component(s) that will or design protective devices to ensure that the bar cannot reach the primary containment system.

Tester and evaluator to do and shipper responsibility to ensure.

PENETRATION TEST RESULTS FOR STEEL DRUMS

TABLE D-30

Specific Packaging	Test/Analysis Results			Comments
	No. Tested	Location	Results	
Spec 6C (5-gal)	1	Lid at center	1 Pass	0.5-in. dent
	1	Side at seam	1 Pass	1-in. dent
	1	Lid near closure ring	1 Pass	0.25-in. dent
Spec 6C (10-gal)	1	Lid at center	1 Pass	0.5-in. dent
	1	Side at seam	1 Pass	0.75-in. dent
	1	Lid near closure ring	1 Pass	0.5-in. dent
Spec 17C (5-gal)	Not Tested			Pass, based on test data shown for comparable or lesser gauge steels.
Spec 17C (30-gal)	Not Tested			Pass, based on test data shown for comparable or lesser gauge steels.
Spec 17C (55-gal)	Not Tested			Pass, based on test data shown for comparable or lesser gauge steels.
Spec 17C (55-gal) with Pressure Relief Device Nuc-fil filter	3	Center of filter	3 Pass	Air flow was established after each test with flour/fluorescein as contents. There was no visible evidence of loss of contents, and no loss of contents was detected under a black light.

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>			<u>Comments</u>
	<u>No. Tested</u>	<u>Location</u>	<u>Results</u>	
<u>Capital Industries</u>				
S-0510-0823	1	Middle top	Pass	In all cases below, including the filter test, the only effect was a minor dent. This is expected based on materials of construction and comparative testing of lesser gauge materials.
V-0510-0823	1	Center of filter	Pass	
S-0840-1440	1	Middle top	Pass	
S-0730-1006	1	Middle top	Pass	
S-0730-0846	Not Tested		Pass	Evaluated by analysis and comparison (lid, lid reinforcing angle, bolt size, bolt spacing, container flange, and materials) to packaging S-0730-1006 which was tested and evaluated. All materials and methods of construction were equal to or better than those of the tested packaging.
S-0480-0906	Not Tested		Pass	Evaluated by analysis and comparison (lid, lid reinforcing angle, bolt size, bolt spacing, container flange, and materials) to packaging S-0510-0823 which was tested and evaluated. All materials and methods of construction were equal to or better than those of the tested packaging.

PENETRATION TEST RESULTS FOR UF-6 CYLINDERS

TABLE D-34

<u>Specific Packaging</u>	<u>Test/Analysis Results</u>		<u>Comments</u>
	<u>No. Tested</u>	<u>Location</u>	
<u>Model No.</u>			
1S			Evaluated based on the materials and material thicknesses and by comparison to test data shown for much lesser thicknesses. This test would not have any effect (as verified by testing) on the sides of these cylinders. Testing was also conducted to demonstrate that this test, when conducted on the valve assembly/ assembly cover, would also have no effect. Thus, all these cylinders meet this requirement.
