GREAT LAKES WATER TEMPERATURES, 1966-1975*

John L. Grumblatt

A 10-yr bank of water temperature data has been accumulated from a network of stations located at intervals along the United States shores of the Great Lakes and is presented in various tables. For each station, summaries of hourly, daily, and monthly mean data are included as well as tables of the frequency distribution of daily mean water temperatures on an annual basis.

1. INTRODUCTION

A network of water temperature recording stations was installed on the Great Lakes (fig. 1) to provide a continuous, high frequency record of water temperature data for the purpose of

- (a) Defining the short-term and seasonal variations and long-term trends in lake temperature.
- (b) Providing a basis for the establishment and quantification of the relationships between water temperature variations and the limnological and meteorological processes which occur in and over the Great Lakes.
- (c) Providing a continuum of water temperature data with which to interpret the occasional synoptic or near synoptic lake surveys and short-term local observations.

Figure 1. Location of water temperature recording stations.

* GLERL Contribution No. 90.

During fall 1965 and spring 1966, recording stations were established at 10 locations on the Great Lakes. The number of locations was restricted to two per lake and selection was based on the best capability for measuring the temperature of the open lake from an inshore station, necessary depth, accessibility, and ability to physically withstand the rigors of the environment. The United States stations were complemented by similar recorders operated on the Canadian shores of the Great Lakes by the Atmospheric Environment Service. The Canadian stations were removed when it was felt that Airborne Radiation Thermometer surveys better satisfied existing needs. In spring 1972, stations were established at Lewiston and Cape Vincent, N.Y., to provide data for estimates of heat advection through Lake Ontario. In order to provide for more efficient operation of the St. Lawrence Seaway, especially during periods of ice formation and decay, telephone telemetry equipped stations were established along the St. Lawrence River at Cape Vincent, Clayton, and Ogdensburg, N.Y., in 1972 and 1973 at the request of the St. Lawrence Seaway Development Corporation.

2. COLLECTION OF DATA

2.1 Recording Equipment

The original recorders were Bristol Series P-92663 Dynamaster AC powered analog recorders connected by a three-wire temperature compensated cable to a Bristol 7NA resistance thermometer bulb. Output consisted of an analog trace inked on a strip chart 3 inches (7.6 cm) wide. The horizontal scale was 3 inches (7.6 cm) per 24 hours and the vertical scale was 10°C per inch (2.5 cm). The manufacturer's instrumental accuracy claim was $\pm 0.50^\circ\text{C}$. Overall system accuracy under the worst conditions was considered to be $\pm 0.50^\circ\text{C}$.

Since 1972, analog recorders have been replaced by digital recording equipment consisting of Enviro-Labs, Inc., temperature servo systems and temperature probes connected to Stevens Model 7000 digital recorders. Output is on 2 1/8 inches (5.1 cm) wide punched paper tape designed to accommodate four decades of binary coded decimal punching across the tape, 16 bits in parallel. The sensitivity of this instrument is 0.05°C and the manufacturer's instrumental accuracy claim is $\pm 0.15^\circ\text{C}$. Overall system accuracy under the worst conditions using interchangeable thermistors is $\pm 0.30^\circ\text{C}$.

2.2 Observations

Each station is tended by a locally contracted observer who maintains the recorder and several times weekly annotates the record with the correct time and manually observed water temperature. The manually observed water temperature readings are made by means of a mercury-in-glass bucket thermometer lowered to the depth of the water temperature recording sensor. Routine calibration checks are made by laboratory personnel in the field on a semi-annual basis and on an emergency basis, as manpower permits, when equipment is in need of repair. With one

exception, sensors are installed at a standard depth of 3 m below International Great Lakes Datum (1955). A depth of 3 m was chosen to make certain that sensors are deep enough to miss random fluctuations of heating and cooling, are accessible from shore, and yet reflect temperature fluctuations in the main lake mass. The station number and location of each sensor is listed in table 1.

3. DATA PROCESSING

Hourly scalings of analog data were converted to digital form and placed on punched cards by means of a Gerber digitizer. Punched paper tapes from digital recorders were processed on a Fischer-Porter tape translator and placed on punched cards. The data from both analog and digital recorders were edited and stored on disk pack for random access capability. Data were also stored on magnetic tape for permanent record archives. The procedure involved manual inspection of observer notes for notification of apparent equipment malfunction. Processed data were then checked against manually observed readings. If manual readings did not verify recorded data, an emergency calibration was made of manual and automatic equipment. If automatic recording equipment was found to be out of calibration, all data were eliminated from official tabulation to the point of the last verification inspection. If the manual equipment was off calibration, it was replaced.

4. DATA PRESENTATION

4.1 Hourly Temperature Data

Monthly summaries of hourly water temperature data have been arranged by 24-hr periods to provide the daily mean and monthly mean temperatures as well as the monthly maximum and minimum average hourly temperatures. This data, a sample of which is shown in Appendix A, is available for each station on microfiche from the National Technical Information Service, Springfield, Va.

4.2 Daily Mean Temperature Data

Appendix B consists of the annual summaries for each station of daily mean water temperatures listed by month. The monthly mean water temperature is listed at the bottom of each monthly column of daily mean temperatures.

4.3 Frequency Distribution of Daily Average Temperatures

Annual tables of the frequency distribution of daily average temperatures are listed by month and are paired by year with the annual summaries of daily mean water temperatures in Appendix B.

Table 1. Water Temperature Monitoring Station Descriptions

Station Number	Latitude & Longitude	Station Location	Sensor Depth Below I.G.L.D. (meters)

9040	47°17.0' 88°31.9'	On pier near Calumet Water Works, vicinity of Calumet, Mich.	3

5. DISCUSSION

The determination of a long-term water temperature trend will require many more years of observation as evidenced by the fact that during the 10-yr period of record the coldest and warmest years of record apparently occurred back-to-back in 1972 and 1973, respectively.

The most serious shortcoming of the data set is the lack of continuity. Gaps of a month or moresometimes occur in the data. These are due to limitations on the availability of field personnel to repair storm damaged stations on a timely basis.

In spite of this shortcoming, short-term thermal events, such as the beginning dates of spring warm-up, the frequency and duration of upwellings and downwellings, the beginning dates of winter freeze-up, and significant heat advection episodes may be identified and examined.

The beginning dates of spring warm-up at Whitefish Point on Lake Superior; Mackinaw City, Mich., at the Straits of Mackinac; and Buffalo, N.Y., on Lake Erie usually occur later in spring than at other points on these respective lakes due to the tendency of wind-driven ice fields to persist in these areas. In Appendix B, data for these stations show water temperatures at or near 0°C persisting until as late as May after the severe winter of 1971-1972. But spring warm-up began as early as March at these same locations in 1973 after the mild winter of 1972-1973, during which little ice was formed.

Careful inspection of the frequency distribution of daily average temperatures in Appendix B will also indicate those stations subject to upwelling by the large range of summertime water temperatures recorded. Upwellings are especially noticeable at Olcott, N.Y., on Lake Ontario; Harbor Beach, Mich., on Lake Huron; Milwaukee and Oak Creek Harbor, Wis., on Lake Michigan; and Calumet, Mich., on Lake Superior. The sample hourly water temperature record from Olcott, shown in Appendix A, indicates the duration and intensity of several upwelling events which took place during the latter part of July 1963.
