# Gulf of Alaska Temporary Maritime Activities Area Monitoring Plan

DRAFT

20 June 2010

**DRAFT FINAL**

This Monitoring Plan is submitted to NMFS in support of the  
Taking and Importing Marine Mammals; Request for Letter of  
Authorization for the Incidental Harassment of Marine Mammals  
Resulting from Navy Training Activities in the Gulf of Alaska  
Temporary Maritime Activities Area; Final Rule

AND

Biological Opinion on the U.S. Navy's training in the Gulf of Alaska  
Temporary Maritime Activities Area

[ THIS PAGE INTENTIONAL BLANK ]

8

**EXECUTIVE SUMMARY**

9 The Gulf of Alaska Temporary Maritime Activities Area (GOA TMAA) Monitoring Plan proposes  
10 monitoring goals for marine mammals that are unique with regard to their breadth as well as their focus  
11 on potential impacts of mid-frequency active sonar on marine mammals.

12 To accomplish these goals, the Navy will use similar methods of implementation and data analysis which  
13 have demonstrated success in comparable monitoring programs studying the effects of anthropogenic  
14 sound on marine animals. To this end, the Navy in consultation with the National Marine Fisheries  
15 Service (NMFS) designed a series of focused “study questions” to gather data in various combinations  
16 within the Navy’s range complexes to address:

17 Question 1. Are marine mammals and sea turtles exposed to mid-frequency active sonar (1-10  
18 kHz), especially at levels associated with adverse effects (i.e., based on NMFS’ criteria for  
19 behavioral harassment, Temporary Threshold Shift, or Permanent Threshold Shift)? If so, at what  
20 levels are they exposed?

21 **Question 2. If marine mammals and sea turtles are exposed to mid-frequency active sonar,**  
22 **do they redistribute geographically as a result of continued exposure? If so, how long**  
23 **does the redistribution last?**

24 **Question 3. If marine mammals and sea turtles are exposed to mid-frequency active sonar,**  
25 **what are their behavioral responses to various levels?**

26 Question 4. What are the behavioral responses of marine mammals and sea turtles that are  
27 exposed to explosives at specific levels?

28 Question 5. Is the Navy’s suite of mitigation measures for mid-frequency active sonar and  
29 explosives [e.g., Protective Measures Assessment Protocol, major exercise measures agreed to  
30 by the Navy through permitting] effective at avoiding temporary threshold shifts, injury, and  
31 mortality of marine mammals and sea turtles?

32 Given the larger scope of training events within other Navy range complexes as compared to the GOA,  
33 not every one of these original five study questions will be address within the GOA TMAA (**Tables ES-1**  
34 **and ES-2**). Rather, data collected from the GOA TMAA monitoring will be used to supplement a  
35 consolidate range complex marine mammal monitoring report incorporating data from the Hawaii Range  
36 Complex, Marianas Island Range Complex, Northwest Training Range Complex, and Southern California  
37 Range Complex.

38 Monitoring methods proposed for the GOA TMAA include use of passive acoustic monitoring (PAM) to  
39 primarily focus on providing additional data for study questions 2 and 3. In April of 2009, the U.S. Pacific  
40 Fleet also contributed approximately \$250,000 in funding to support a NMFS marine mammal density  
41 survey of the offshore waters in the GOA. The goal of this validation monitoring was to increase the state  
42 of awareness on marine mammal occurrence, density, and distribution within the GOA.

43 In addition to the U.S. Pacific Fleet funded monitoring initiative, the Chief of Naval Operations  
44 Environmental Readiness Division and the Office of Naval Research have developed a coordinated  
45 Science & Technology and Research & Development program focused on marine mammals and sound.  
46 Total investment in this program from 2004-2008 was \$100 million. FY09 funding was \$22 million.  
47 Continued funding at levels greater than \$14 million is foreseen in subsequent years (>2010).

95

## INTRODUCTION

96 The U.S. Navy has developed this Gulf of Alaska Temporary Maritime Activities Area (GOA TMAA)  
97 **(Figures 1 and 2)** Monitoring Plan to provide marine mammal and sea turtle monitoring as required under  
98 the Marine Mammal Protection Act of 1972 and the Endangered Species Act of 1973.

99 In order to issue an Incidental Take Authorization for an activity, Section 101(a) (5) (a) of the Marine  
100 Mammal Protection Act states that National Marine Fisheries Service (NMFS) must set forth  
101 *“requirements pertaining to the monitoring and reporting of such taking”*. The Marine Mammal Protection  
102 Act implementing regulations at 50 Code of Federal Regulations Section 216.104 (a) (13) note that  
103 requests for Letters of Authorization must include the suggested means of accomplishing the necessary  
104 monitoring and reporting that will result in increased knowledge of the species and of the level of taking or  
105 impacts on populations of marine mammals that are expected to be present (NMFS 2005).

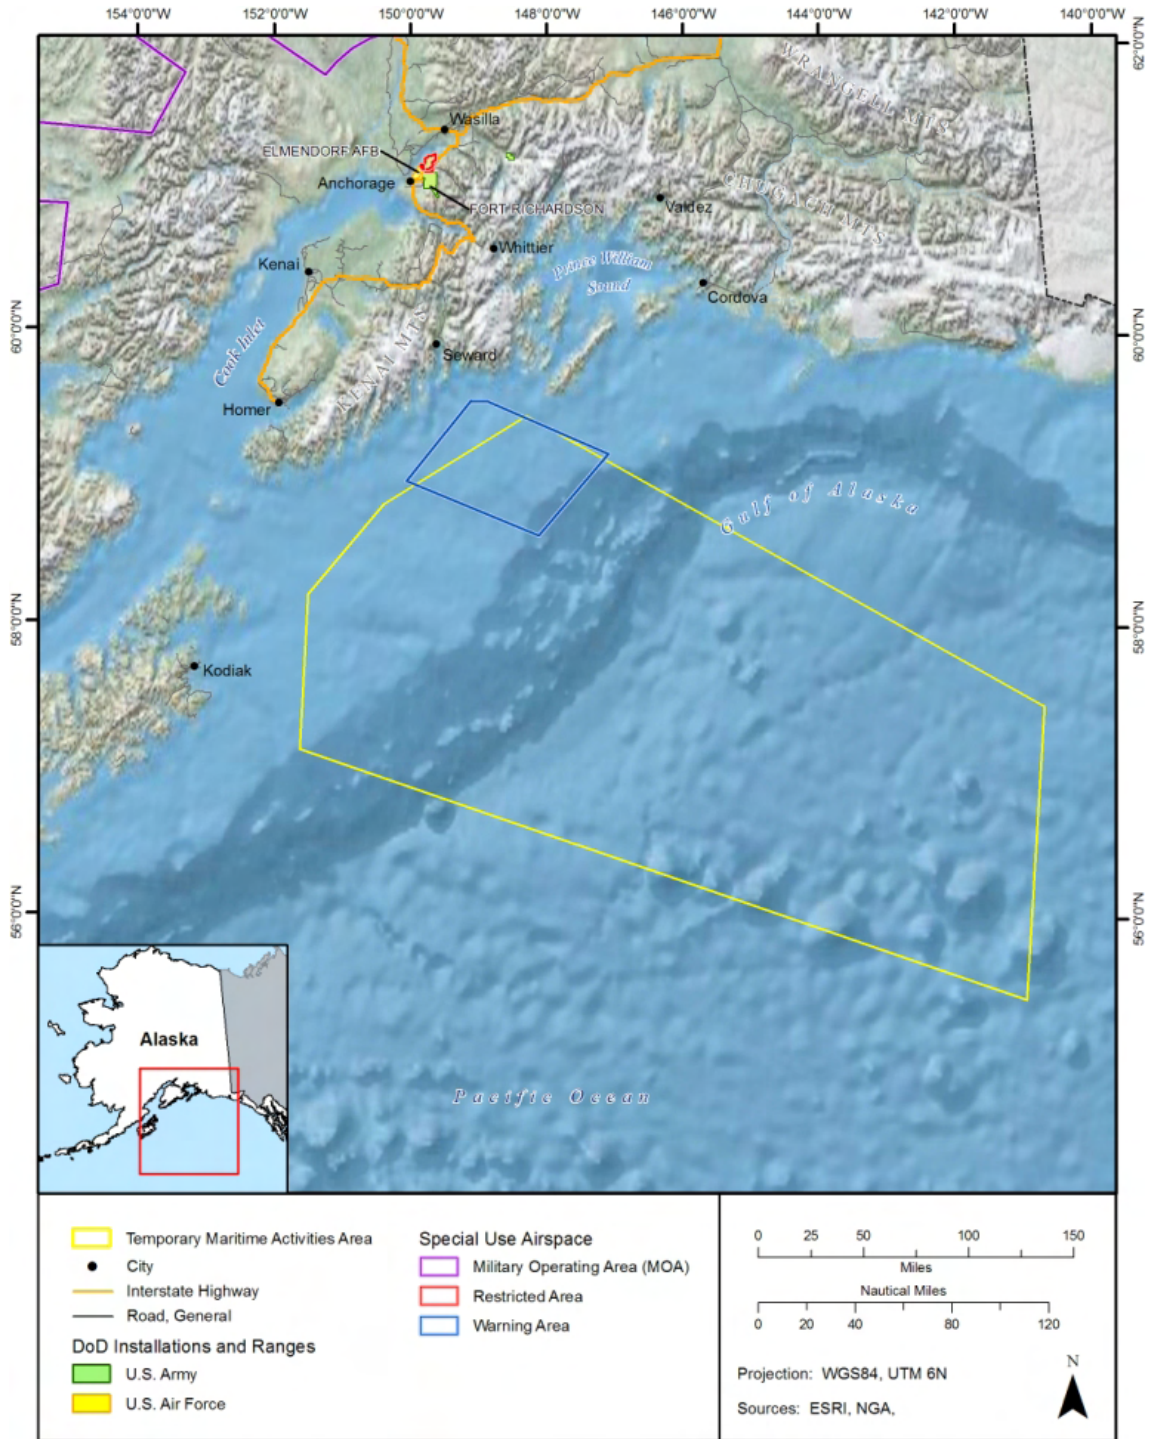

106 While the Endangered Species Act does not have specific monitoring requirements, recent Biological  
107 Opinions issued by NMFS have included terms and conditions requiring the Navy to develop a monitoring  
108 program.

109 Additional Navy funded research and development studies and ancillary research collaborations with  
110 academia and other institutions will be integrated as possible to enhance the available data, and will be  
111 used in part to address objectives of a larger Navy-wide initiative discussed in this Plan. Lastly, as an  
112 adaptive management strategy, the GOA TMAA Monitoring Plan will integrate elements from Navy-wide  
113 marine mammal research into the regional monitoring and data analysis proposed in this Plan when new  
114 technologies and techniques become available. While final areas within the GOA TMAA will be selected  
115 after consultations with NMFS and the science community **(Figures 1 and 2)**, preliminary  
116 recommendations for deployment of passive acoustic monitoring (PAM) devices was developed in May  
117 2010 after talks with marine mammal PAM academic experts at Scripps Institute of Oceanography  
118 **(Figure 3)**.

119 In April of 2009, U.S. Pacific Fleet provided contributory funds of approximately \$250,000 combined with  
120 additional funding from Chief of Naval Operations for a NMFS led marine mammal survey within the GOA.  
121 The objective of this project was to conduct a rigorous scientific abundance and density survey in a region  
122 such as GOA that NMFS recognizes has been under surveyed in the past. The goal of this project was to  
123 further advance the state of knowledge on marine mammal occurrence within the offshore waters of the  
124 GOA. The formal NMFS report for this survey effort was released in May 2010 (see Rone et al. 2010).

131 **INTEGRATED COMPREHENSIVE MONITORING PROGRAM (ICMP)**

132 The Integrated Comprehensive Monitoring Program (ICMP) is Navy-wide monitoring framework and will  
133 provide an overarching structure and coordination that compiles data from all Navy range specific  
134 monitoring plans (**Figure 4**).

135 In addition to the GOA TMAA, a number of other Navy range complex monitoring plans are being  
136 developed for protected marine species, primarily marine mammals and sea turtles, as part of the  
137 environmental planning and regulatory compliance process associated with a variety of training actions in  
138 those regions. Goals of these monitoring plans are to assess the impacts of training activities on marine  
139 species and effectiveness of the Navy's current mitigation practices. Ranges within the Pacific Ocean with  
140 the largest amount of operations will be prioritized for monitoring based on availability of both funding and  
141 scientific resources. These include the Hawaii Range Complex, Marianas Island Range Complex,  
142 Northwest Training Range Complex, and Southern California Range Complex.

143 The GOA TMAA plan is one component of the ICMP and the studies outlined here will also be  
144 implemented in various combinations within other range complexes. The overall objective of the ICMP is  
145 to assimilate relevant data collected across Navy range complexes in order to answer questions  
146 pertaining to the impact of mid-frequency active sonar and underwater explosive detonation on marine  
147 mammals and sea turtles.

148 Monitoring measures prescribed in range/project-specific monitoring plans and Navy-funded research  
149 relating to the effects of anthropogenic sound on protected marine species should be designed to  
150 accomplish one or more of the following top-level goals:

- 151 • An increase in the probability of detecting marine mammals and other threatened or endangered  
152 marine species, both within the safety zone (thus allowing for more effective implementation of the  
153 mitigation) and in general to generate more data to contribute to the effects analyses.
- 154 • An increase in our understanding of how many marine mammals and other threatened or  
155 endangered marine species are likely to be exposed to levels of mid-frequency active sonar, high-  
156 frequency active sonar, underwater detonations, or other stimuli that are associated with specific  
157 adverse effects, such as behavioral harassment, Temporary Threshold Shift, or Permanent Threshold  
158 Shift.
- 159 • An increase in our understanding of how marine mammals and other threatened or endangered  
160 marine species respond (behaviorally or physiologically) to sonar, underwater detonations, or other  
161 stimuli at specific received levels that result in the anticipated take of individual animals.
- 162 • An increase in our understanding of how anticipated adverse effects on individual animals may  
163 impact the population, species, or stock (specifically through effects on annual rates of recruitment or  
164 survival).
- 165 • An increase in our understanding of the effectiveness of certain mitigation and monitoring  
166 measures.
- 167 • A better understanding and record of the manner in which the authorized entity complies with the  
168 incidental take authorization.

169 Under the ICMP and given the larger scope of training events within other Navy range complexes as  
170 compared to the GOA TMAA, not every one of these original five study questions will be addressed within  
171 the GOA (**Table ES-2**). Rather, data collected from the GOA TMAA monitoring will be used to supplement  
172 a consolidated range complex marine mammal monitoring report incorporating data from the Hawaii  
173 Range Complex, Marianas Island Range Complex, Northwest Training Range Complex, and Southern  
174 California Range Complex.

175

178

## GOA TMAA MONITORING PLAN

### 179 MONITORING PLAN OBJECTIVES

180 The GOA TMAA Monitoring Plan proposes monitoring objectives that are unique with regard to their  
181 breadth as well as their focus on potential impacts of mid-frequency and high-frequency active sonar and  
182 underwater explosions on marine mammals and sea turtles.

183 To accomplish these goals, the Navy will use similar methods of implementation and data analysis which  
184 have demonstrated success in comparable monitoring programs studying the effects of anthropogenic  
185 sound on marine animals. To this end, the Navy in consultation with the NMFS designed a series of  
186 focused “study questions” to gather data in various combinations within the Navy’s range complexes to  
187 address:

- 188 1. Are marine mammals and sea turtles exposed to mid-frequency active sonar, especially at  
189 levels associated with adverse effects (i.e., based on NMFS’ criteria for behavioral  
190 harassment, Temporary Threshold Shift, or Permanent Threshold Shift)? If so, at what levels  
191 are they exposed?
- 192 2. If marine mammals and sea turtles are exposed to mid-frequency active sonar in GOA  
193 TMAA, do they redistribute geographically as a result of continued exposure? If so, how long  
194 does the redistribution last?
- 195 3. If marine mammals and sea turtles are exposed to mid-frequency active sonar, what are their  
196 behavioral responses to various levels?
- 197 4. What are the behavioral responses of marine mammals and sea turtles that are exposed to  
198 explosives at specific levels?
- 199 5. Is the Navy’s suite of mitigation measures for mid-frequency active sonar and explosives  
200 (e.g., Protective Measures Assessment Protocol, major exercise measures agreed to by the  
201 Navy through permitting) effective at avoiding Temporary Threshold Shift, injury, and  
202 mortality of marine mammals and sea turtles?

203 Given the larger scope of training events within other Navy range complexes as compared to the  
204 GOA TMAA, not every one of these original five study questions will be address within the GOA  
205 TMAA (**Tables ES-1** and **ES-2**). Rather, data collected from the GOA TMAA monitoring will be used  
206 to supplement a consolidate range complex marine mammal monitoring report incorporating data  
207 from other Pacific Ocean range complexes (*see ICMP section*).

208 To this end, monitoring techniques for the GOA TMAA will be focused to address:

- 209 2. If marine mammals and sea turtles are exposed to mid-frequency active sonar in GOA  
210 TMAA, do they redistribute geographically as a result of continued exposure? If so, how long  
211 does the redistribution last?
- 212 3. If marine mammals and sea turtles are exposed to mid-frequency active sonar, what are their  
213 behavioral responses to various levels?

214

215 **MARINE SPECIES UNDER CONSIDERATION**

216 There are 26 potential marine mammal species or separate stocks with possible or confirmed occurrence  
217 in the marine waters within the GOA, but not all species are expected within the TMAA. **Appendix A**  
218 **Table A-1** has marine mammal species with possible occurrence within the GOA TMAA (derived from  
219 DoN 2009a). The beluga whale, false killer whale, harbor seal, northern right whale dolphin, Risso's  
220 dolphin, sea otter, and short-finned pilot whale are considered extralimital in the TMAA and not expected  
221 to be present given their documented habitat preferences.

222 There are several sources of information on Pacific marine mammals, including the NMFS Stock  
223 Assessment Reports for marine mammals, and the Navy's Gulf of Alaska Navy Training Activities Draft  
224 Environmental Impact Statement/Draft Overseas Environmental Impact Statement (DoN 2009a). The  
225 NMFS U.S. Pacific Stock Assessment Reports are prepared annually and available at:

226 <http://www.nmfs.noaa.gov/pr/sars/>

227 The Gulf of Alaska Navy Training Activities Draft Environmental Impact Statement/Draft Overseas  
228 Environmental Impact Statement contains a summary of the scientific literature on animal distribution and  
229 likely occurrence within the GOA TMAA. In addition, DoN 2009a also summarized some of the general  
230 science on past studies of anthropogenic (i.e., human generated) noise on marine mammals. Other  
231 related references also include Cox et al. 2006, Deeck 2006, Nowacek et al. 2007, and Southall et al.  
232 2008).

233 This GOA TMAA Monitoring Plan has been designed to attempt gathering data on all species of marine  
234 mammals and sea turtles observed in the GOA TMAA study area. However, the Navy will prioritize  
235 monitoring efforts for species based on regulatory requirement due to ESA-listing, and on beaked whale  
236 species where mid-frequency use and strandings have been linked in certain circumstances. Of note, all  
237 of the beaked whale strandings and association with sonar have been in specific geographic locations of  
238 the Atlantic Ocean (Bahamas, Canary Islands) and Mediterranean Sea (Greece). There have been no  
239 beaked whale atypical mass strandings associated with sonar use on U.S. Navy Range Complexes within  
240 the Pacific. A detailed discussion on marine mammal stranding is contained in the Gulf of Alaska Navy  
241 Training Activities Draft Environmental Impact Statement/Draft Overseas Environmental Impact  
242 Statement (DoN 2009a).

243 Therefore, based on the requirements listed above, offshore species for study within the GOA TMAA  
244 Monitoring Plan that regularly occur within GOA TMAA will be prioritized for research as follows:

- 245
- **Beaked whale species** (Baird's beaked whale, Cuvier's beaked whale, Stejneger's beaked whale)
  - **ESA-listed cetacean species** (blue whale, fin whale, humpback whale, North Pacific right whale, sei whale, and sperm whale)
- 246  
247

248 The Plan recognizes that deep diving and cryptic species of marine mammals such as beaked whales,  
249 and sperm whales, may have low probability of visual detection (Barlow and Gisiner 2006). Therefore,  
250 methods will be utilized to address this issue (e.g., passive acoustic monitoring).

**251 OVERVIEW OF MONITORING PLAN RESEARCH ELEMENTS**

252 Each monitoring technique has advantages and disadvantages that vary temporally and spatially, as well  
253 as support one particular study objective better than another (**Table ES-2**). Given potential sea states and  
254 ocean conditions during both winter and summer, and the relative infrequent Navy presence in the GOA,  
255 passive acoustic monitoring represents the best technique to employ within the GOA TMAA.

**256 Passive Acoustic Monitoring (PAM)**

257 There are both benefits and limitations to passive acoustic monitoring as discussed in Mellinger and  
258 Barlow (2003) and Mellinger et al. (2007). Passive acoustic monitoring allows detection of marine  
259 mammals that may not be seen during a visual survey, and monitoring of vocalization/echolocation  
260 rates before, during, and after Navy training events. When interpreting data collected from passive  
261 acoustic monitoring, it should be noted that species specific results must be viewed with caution  
262 because not all animals within a given population may be vocalizing, or may only vocalize only under  
263 certain conditions (Mellinger et al. 2007, Oleson et al. 2007a, 2007b, ONR 2007, NMFS 2008, Oleson  
264 et al. 2008, Mouy et al. 2009, Oleson et al. 2009, Southall and Nowacek 2009). Deployable acoustic  
265 recording packages may offer the first immediately available tools (see Newcomb et al. 2002,  
266 Hildebrand 2005, Hildebrand 2007, Wiggins and Hildebrand 2007, Lammers et al. 2008, Oleson et al.  
267 2008). Other acoustic monitoring buoy types will also be considered for deployment as well (Lammers  
268 et al. 2005). At this preliminary stage, no particular PAM technique is immediately preferred. As the  
269 Plan progresses within the first year and experience gained within the GOA TMAA, either through direct  
270 measurement of results, review of technical PAM specifications, and from guidance of subject matter  
271 experts within the field, future GOA TMAA monitoring may include a different sub-set of PAM devices.

272 PAM in the GOA TMAA will be used to detect, locate, and potentially track vocalizing marine mammals,  
273 as well as provide seasonal estimates of presence/absence. Buoys will be set on a duty cycle that  
274 maximizes battery power, data storage space and provides adequate sampling. All passive acoustic  
275 recording packages will be set on a duty cycle to provide appropriate sampling coverage and maximize  
276 battery power and data storage space. Buoys will be retrieved as required for maintenance and  
277 downloading of data. Autonomous acoustic recording buoys will provide long term, daily information on  
278 the presence and absence of marine mammals in each area and their movements through the area.  
279 These systems will also provide information on the species present and their movements when an  
280 exercise occurs in that area (Mellinger and Barlow 2003, Oswald et al. 2003, Mellinger et al. 2007). In  
281 addition, by collecting marine mammal vocalization and echolocation data before, during, and after any  
282 Navy training event, information can be inferred as to whether the training event has an effect or no  
283 effect on observed vocalizations.

284 All acoustic data will be collected according to standard and accepted passive acoustic monitoring  
285 protocols (NMFS 2008 Passive Acoustic guidelines).

**286 OTHER POTENTIAL MONITORING ELEMENTS FOR FUTURE CONSIDERATION**

287 There may be a number of potential additional marine mammal monitoring techniques, or variations of  
288 those already described, that could be attempted under this Plan. Future modifications to the GOA TMAA  
289 Monitoring Plan may include integration of additional marine mammal monitoring techniques and  
290 research as either new technology or new information becomes available. The previously discussed list of  
291 elements is based on initial identification of the research questions promulgated by NMFS and  
292 subsequent dialog on best immediate techniques to attempt at the outset of this Plan (>Spring 2011)  
293 based on past non-integrated monitoring, and regional availability. As part of future dialog to begin in the  
294 summer of 2011 with NMFS marine mammal scientists, academic scientists, and other subject matter  
295 experts with extensive field monitoring experience, the Navy will continually solicit input and  
296 recommendations to this Plan. An annual formal review with NMFS is being proposed at the end of each  
297 year's monitoring to capture lessons learned, and seek concurrence as to the best mix of monitoring  
298 techniques to employ in the next year's sampling based on scientific merit, applicability to the direct  
299 research questions posed in this Plan, and logistic and economic feasibility (**Table ES-1**). As additional  
300 recommendations are made from the Navy's ICMP as it develops, these too will be integrated into future  
301 GOA TMAA monitoring.

302 **MONITORING PLAN STUDY DESCRIPTIONS**

303 The implementation of various GOA TMAA specific studies and proposed goals for conducting these  
 304 monitoring studies are shown in **Table ES-1** and repeated below.

305 As described later in this Plan, at the end of each monitoring and reporting year, a review of monitoring  
 306 results, expectations, and fit in answering the Plan's overall objectives will be conducted, termed an  
 307 Adaptive Management Review (AMR).

Monitoring Technique									
Passive Acoustics Monitoring (PAM)  STUDIES 2,3	Calendar Year 2011 Implementation	ADAPTIVE MANAGEMENT REASSESSMENT (AMR)	Calendar Year 2012 Implementation	AMR	2013	AMR	2014	AMR	2015
	Deploy two long-term PAM devices for annual coverage including during any Navy training event:  deploy minimum of two (2) passive acoustic buoys; conduct data analysis as available		Maintain two long-term PAM devices for annual coverage including during any Navy training event:  continue data analysis		TBD pending AMR review		TBD pending AMR review		TBD pending AMR review
	<b><u>Navy commitment :</u></b> - Deploy minimum of two (2) passive acoustic buoys and associated data analysis		<b><u>Navy commitment:</u></b> - Maintain minimum of two (2) passive acoustic buoys and continue associated data analysis		<b><u>Navy commitment:</u></b> To be determined (TBD) pending AMR review		<b><u>Navy commitment:</u></b> To be determined (TBD) pending AMR review		<b><u>Navy commitment:</u></b> To be determined (TBD) pending AMR review

308 **STUDY 2: If marine mammals and sea turtles are exposed to MFAS in the GOA TMAA, do they redistribute**  
 309 **geographically as a result of continued exposure? If so, how long does the redistribution last?**

310 **Methods-** In order to address this question, there is a need to detect marine mammals and sea turtles not only at  
 311 the surface, but to the extent possible in the water column. To this effect, passive acoustic monitoring offers the  
 312 best technique within the GOA TMAA.

313 **PAM-** PAM devices can be used to track the presence and absence of vocalizing marine mammals over both  
 314 short (hours-days) and long time scales (weeks-months-annually). Depending on PAM location in relation to  
 315 training events, data from monitoring buoys might be used to assess potential sound exposure levels based on  
 316 receive levels recorded by the buoys. The extent of actual exposure is an extrapolation of potential exposure  
 317 between the source and the buoy, but is not an exact measure of the actual sound level to which an individual  
 318 marine mammal was actually exposed. **Figure 5** shows representative data from Navy funded PAM in Southern  
 319 California as an example of representative information that will be derived from GOA TMAA PAM deployment.

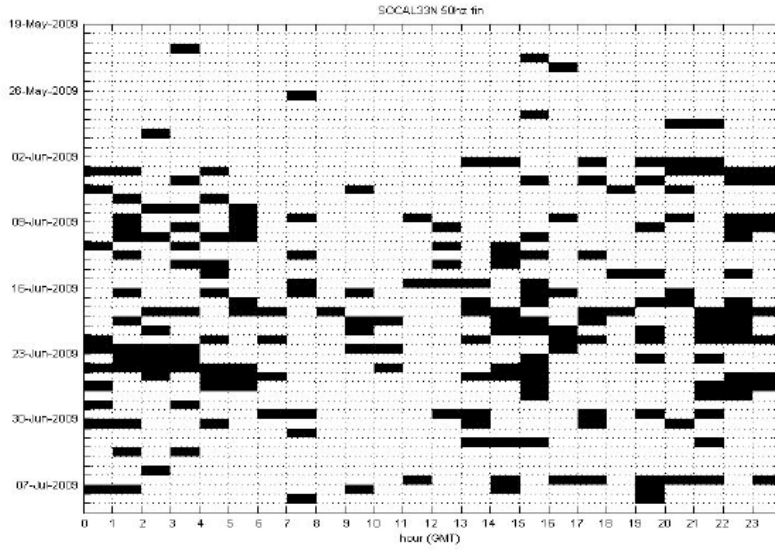

320 **STUDY 3: If marine mammals and sea turtles are exposed to mid-frequency active sonar, what are their behavioral**  
 321 **responses to various levels?**

322 **Methods-** Documenting known at-sea behavioral reactions of marine mammal to military sonar and explosives  
 323 are complicated by lack of information and direct observations of cause-and-effects. Any particular reaction is  
 324 likely to be conditional on the species in question, and a host of other factors such as feeding status, breeding  
 325 status, time of day, overall health, and other issues. In order to address this question, there is a need to assess  
 326 whether marine mammals and sea turtles are not only at the surface, but in the water column where they could  
 327 be potentially exposed to sonar. If animals are not present, then there would be no exposure and no possibility of  
 328 behavioral reaction, or lack of reaction.

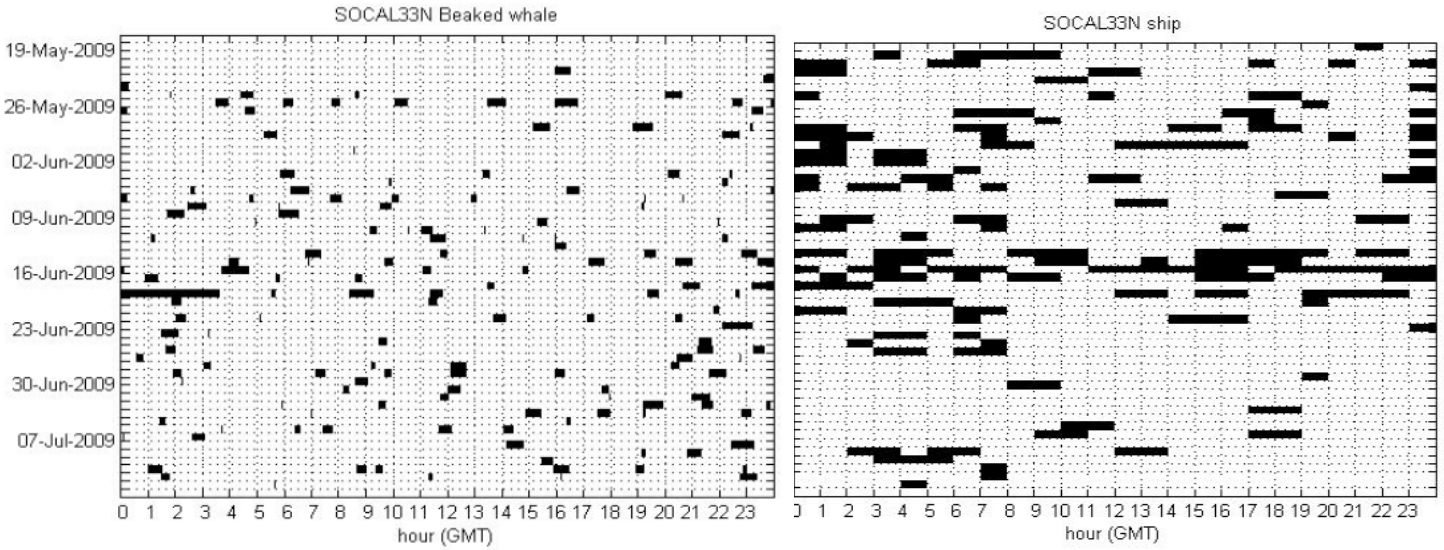

329 **Passive Acoustic Monitoring-** Opportunistic data collected as part of PAM in the GOA TMAA may offer insights  
 330 to animal vocalization rates, potential dive pattern, and possible movement in relation to Navy training events.  
 331 This field is relatively new in terms of defining behavioral context of vocalization and is dependent of knowing  
 332 marine mammal vocalization patterns when no Navy operations are present.

333

338 (*bottom left*) and broadband ship noise 10 Hz to 10 kHz (*bottom right*)]

339

## **IMPLEMENTATION – ANALYSIS – REPORTING**

340 Worldwide, a suite of visual and acoustic monitoring techniques has been used to assess the effects of  
341 anthropogenic sound on marine mammals (Barlow and Gisiner 2006). The GOA TMAA Monitoring Plan  
342 proposes monitoring goals that are unique with regard to their breadth as well as their focus on potential  
343 impacts of sonar and underwater explosions on marine mammals and sea turtles. To accomplish these  
344 goals, the Navy will use similar methods of implementation and data analysis which have demonstrated  
345 success in comparable monitoring programs studying the effects of anthropogenic sound on marine  
346 animals.

### **GOA TMAA MONITORING PLAN IMPLEMENTATION AND ANALYSIS**

348 Data will be collected by qualified, professional marine mammal biologists that are experts in their field.  
349 Researchers will provide annual reports to the Navy, however, this is expected to be an ongoing process  
350 with data collected, analyzed and interpreted over many years. It is not likely that firm conclusions can be  
351 drawn on most questions within a single year of monitoring effort due to the difficulty in achieving  
352 sufficient sample sizes for statistical analysis. The Navy will provide annual reports to NMFS in fulfillment  
353 of the Navy's reporting requirements under Marine Mammal Protection Action Letter of Authorization for  
354 the GOA TMAA. The report will provide information on the amount and spatial/temporal distribution of  
355 monitoring effort as well as summaries of data collected and any preliminary results that may be available  
356 from analysis.

357 **Table ES-1** provides detail about how the GOA TMAA Monitoring Plan will be implemented starting at the  
358 earliest field effort window in 2011.

359 The Navy will be investing significant funding and personnel towards this monitoring program and intends  
360 to conduct the research in a scientifically sound and robust manner. The Navy is committed to conducting  
361 research until the original program objectives have been answered to the satisfaction of both NMFS and  
362 Navy. Therefore, it is in the best interest of the Navy to choose studies wisely in each range complex that  
363 are the most likely to collect large data sets, and will enable the Navy and NMFS to answer required  
364 questions. Some field methods may be applied throughout Navy ranges, while other methodologies may  
365 be specially selected for one or two ranges that are most likely to produce the best quality data.

366 Using previous large scale monitoring programs as a guideline for success, one thing becomes clear - the  
367 key to the success of any monitoring plan's execution and analysis is using scientific professionals that  
368 are the top of their field (Aburto et al. 1997, Au et al. 1997, Frankel and Clark 1998 and 2000, NRC 2000,  
369 2003, 2005, Croll et al. 2001, ONR 2001, Costa et al. 2003, Mobley et al. 2001, Mobley 2005, Clark and  
370 Altman 2006). It's the Navy's intention that the GOA TMAA Monitoring Plan be implemented by a team of  
371 qualified, professional marine mammal biologists that are experts in their field. This team of experts will  
372 include statistical analysts to analyze data and make recommendations as to when they are beginning to  
373 see a pattern in the data and/or when the study designs need to be slightly altered for more robust data  
374 collection. This adaptive management process will provide a critical feedback loop to allow for adapting to  
375 new methods and evolving methodology. The process will be transparent to the public in the sense of  
376 yearly reporting to NMFS as well as encouraging the scientific team to publish results as they become  
377 available. New technology and techniques will be incorporated as part of the Navy's adaptive  
378 management strategy. Adaptive measures and feedback from the experts will allow flexibility within a  
379 given year and/or within years so as to best achieve monitoring plan goals and take into consideration  
380 shifting demands, inclement weather and other unforeseen events. In addition to the studies conducted  
381 under the GOA TMAA Monitoring Plan, the Navy intends to collaborate with other researchers in Alaska  
382 that are conducting complimentary research on this topic. Those studies will not replace the Navy's  
383 obligation under this Plan, but could potentially augment the resources provided to the Plan's specific  
384 questions.

### **ICMP AND RELATIONSHIP TO GOA TMAA MONITORING PROGRAM**

386 The ICMP is currently in development by the Navy. The program does not duplicate the GOA TMAA  
387 Monitoring Plan, instead it's intended to provide the overarching coordination that will support compilation  
388 of data from range-specific monitoring plans (e.g., GOA TMAA plan) as well as Navy funded studies. The

389 ICMP will coordinate the monitoring programs progress towards meeting its goals and develop a data  
390 management plan. A program review board is also being considered to provide additional guidance. The  
391 ICMP will be evaluated annually to provide a matrix for progress and goals for the following year, and will  
392 make recommendations on adaptive management for refinement and analysis of the monitoring methods.

### 393 **ANALYSIS AND REPORTING**

394 The Navy is currently working on the overarching structure and coordination (ICMP) that will, over time,  
395 compile data from both range-specific monitoring plans (e.g., GOA TMAA monitoring plan) as well as  
396 Navy funded research and development studies. The analysis protocols are still in development phase at  
397 this time. However, data collection methods will be standardized to allow for comparison from ranges in  
398 different geographic locations. The sampling scheme for the program will be developed so that the results  
399 are scientifically valid. A data management system will be developed to assure standardized, quality data  
400 are collected towards meeting of the goals. These reports will allow the Navy and NMFS to assess and  
401 adaptively manage the Navy's monitoring effort to more effectively answer the questions outlined above.  
402 Data collection is anticipate to begin by the spring of 2011, when the GOA TMAA authorization is issued  
403 by NMFS and the monitoring plan finalized (See **Table ES-1** for year by year implementation schedule).  
404 Data collected from the GOA TMAA monitoring plan will be added to a Navy wide analysis of monitoring  
405 from other permitted Navy range complexes via the ICMP. All available data will be included in Navy's  
406 annual report for the GOA TMAA. The Navy's reports will provide information on the amount and  
407 spatial/temporal distribution of monitoring effort as well as summaries of data collected and any  
408 preliminary results that may be available from analysis. This also includes an evaluation of the  
409 effectiveness of any given PAM tool within the GOA TMAA monitoring program. All subsequent analysis  
410 shall be completed in time for Navy's five year report to NMFS.

411

## ADAPTIVE MANAGEMENT

### 412 **BACKGROUND**

413 NMFS acknowledges that the GOA TMAA Monitoring Plan will enhance the understanding of how  
414 sonar or underwater detonations (as well as other environmental conditions) may, or may not, be  
415 associated with marine mammal injury or strandings. Additionally, NMFS also points out that information  
416 gained from the investigations associated with this Plan may be used in the adaptive management of  
417 mitigation or monitoring measures in subsequent NMFS authorizations, if appropriate.

418 Adaptive management is an iterative process of optimal decision making in the face of uncertainty, with  
419 an aim to reducing uncertainty over time via system monitoring. Within the natural resource management  
420 community, adaptive management involves ongoing, real-time learning and knowledge creation, both in a  
421 substantive sense and in terms of the adaptive process itself. Adaptive management focuses on learning  
422 and adapting, through partnerships of managers, scientists, and other stakeholders who learn together  
423 how to create and maintain sustainable ecosystems (Williams et al. 2007). Adaptive management helps  
424 science managers maintain FLEXIBILITY in their decisions, knowing that uncertainties exist and provides  
425 managers the latitude to change direction; will improve UNDERSTANDING of ecological systems to  
426 achieve management objectives; and is about taking ACTION to improve progress towards desired  
427 outcomes (Williams et al. 2007). Further discussion of adaptive management in the natural resource  
428 community is available from the U.S. Department of Interior's Adaptive Management Guidelines:

429 <http://www.doi.gov/initiatives/AdaptiveManagement/index.html>

430 The Navy's adaptive management of the GOA TMAA Monitoring Plan involves close coordination with  
431 NMFS to align marine mammal monitoring with the Plan's overall objectives as stated within earlier  
432 sections of this Plan.

433 To recap, the objectives of the Navy's GOA TMAA Monitoring Plan are to determine:

434 2. If marine mammals and sea turtles are exposed to mid-frequency active sonar in GOA TMAA,  
435 do they redistribute geographically as a result of continued exposure? If so, how long does the  
436 redistribution last?

437 3. If marine mammals and sea turtles are exposed to mid-frequency active sonar, what are their  
438 behavioral responses to various levels?

**439 ADAPTIVE MANAGEMENT IMPLEMENTATION**

440 There are periodic exercise and annual reporting requirements contained in NMFS authorization  
441 associated with the GOA TMAA Letter of Authorization. Following the Navy's Annual Report to NMFS, the  
442 Navy will request specific written discussion from NMFS of NMFS's assessment of the Plan's past year  
443 results. The goal of this consultation and collaboration would be to determine if these research elements  
444 and associated results continue to meet the overall objectives of the Plan specific to the GOA TMAA. For  
445 instance, if one particular research element does not provide direct or indirect support to one of the  
446 objectives listed above, then resources for future instances of that element could be re-directed to other  
447 research elements that do provide more support.

448 The actual Adaptive Management Reassessment (AMR) will be a multipart review. Initial  
449 accomplishments will be tabulated by Navy subject matter experts familiar with marine mammal  
450 monitoring. If available, collaboration with regional or recognized NMFS scientists, academic scientists,  
451 and other non-Navy subject matter experts will be informally sought. As of this time, there is no formal  
452 mechanism in which to compensate a non-Navy "expert team", but this is one goal for the ICMP to  
453 designate, structure, and potentially fund. The Navy will then consult with the NMFS Office of Protected  
454 Resources in discussion of lessons learned and recommended way forward for the next year's sampling  
455 effort.

456 Until at least one or two years worth of monitoring data are collected and analyzed both within the GOA  
457 TMAA and in context of the ICMP, it is premature to guess which, if any of the proposed elements  
458 contained in this Plan will provide the most scientifically valid information to address the objectives. The  
459 original intent of this Monitoring Plan is to integrated into both the text discussions on research elements,  
460 and **Table ES-1** allocation of effort, what is anticipated as being the best allocation of resources to  
461 address the Plan's objectives.

462 Proper application of the adaptive management concept will allow future adjustments to be made to the  
463 GOA TMAA Monitoring Plan that will enhance overall scientific conclusions, lead to better statistical  
464 approaches, integrate new technologies in marine mammal monitoring and detection, and provide a  
465 stronger foundation upon which to base mitigation and policy decisions. In addition, as part of the annual  
466 review, a more complete cost-benefit analysis can be presented based on actual monitoring cost by  
467 research element within GOA TMAA.

468

469

**APPENDIX A- COMMON MARINE MAMMAL SPECIES IN GOA TMAA**

470 **Table A-1. Common Marine Mammal Species Likely To Occur In The GOA TMAA.**

Common Name	Stock	Population Trend	Occurrence	Designated Critical Habitat in GOA TMAA
<b>ESA Listed</b>				
<b>Blue whale</b>	Eastern North Pacific	May be increasing	Rare	None
<b>Fin whale</b>	California, Oregon, Washington	May be increasing	Common	None
<b>Humpback whale</b>	Central and Western North Pacific	May be increasing	Common	None
<b>North Pacific right whale</b>	Eastern North Pacific	Unknown; may be decreasing	Very rarely sighted	None
<b>Sei whale</b>	Eastern North Pacific	May be increasing	Very rare	None
<b>Sperm whale</b>	California, Oregon, Washington	Unknown	Unknown	None
<b>Stellar sea lion</b>	Eastern U.S.	Increasing	Common	Yes—outside MAA
<b>Stellar sea lion</b>	Western U.S.	Decreasing	Common	Yes—outside MAA
<b>Non-ESA Listed</b>				
<b>Baird's beaked whale</b>	Alaska	Unknown	Rare	None
<b>California sea lion</b>	U.S.	Increasing	Very rare	None
<b>Cuvier's beaked whale</b>	Alaska	Unknown	Common	None
<b>Dall's porpoise</b>	California, Oregon, Washington	Unknown	Abundant	None
<b>Gray whale</b>	Eastern North Pacific	Increasing	Common	None
<b>Harbor porpoise</b>	Gulf of Alaska	Stable	Rare	None
<b>Killer whale</b>	Multiple stocks: ENP Alaska Resident and Northern Resident, Gulf of Alaska, Aleutian Island and Bering Sea, AT1, West Coast and Offshore	Increasing	Common	None
<b>Minke whale</b>	Alaska	Unknown	Rare	None
<b>Northern elephant seal</b>	California Breeding	Increasing	Common	None
<b>Northern fur seal</b>	Eastern Pacific	Increasing	Common	None
<b>Pacific white-sided dolphin</b>	North Pacific	Unknown	Common	None
<b>Stejneger's beaked whale</b>	Alaska	Unknown	Common	None
