

## **Chairman's Summary On The Ad Hoc Committee On Depleted Uranium**

1. The North Atlantic Council on January 10<sup>th</sup> agreed to a robust plan for sharing information on possible effects of depleted uranium (DU) on the health of peacekeepers involved in NATO-led operations, as well as that of the civilian populations. One element of that plan was to establish the Ad Hoc Committee on Depleted Uranium (AHC) under the aegis of the Political Committee and the Chairmanship of the Deputy ASG for Political Affairs. The mandate of the AHC is to serve as a forum for the exchange of information on the possible health risks associated with the use of DU and act as a clearing-house on this issue. This initiative demonstrates NATO's commitment to openness and transparency and to understanding as fully as possible the implications of DU. While the AHC has already exchanged a considerable amount of information, this is an open-ended process and new information that may be produced will continue to be shared. The AHC will meet as necessary to review results.

2. Participants of the AHC are Allies, all past and present non-NATO SFOR and KFOR contributing countries, states of the region and concerned international organisations. Thus 49 countries, including Bosnia and Herzegovina, Croatia and the Federal Republic of Yugoslavia take part in the AHC. Representatives of the European Union (EU), the Organisation for Security and Cooperation in Europe (OSCE), Office of the High Representative in Bosnia and Herzegovina (OHR), the United Nations Mission in Kosovo (UNMIK), the World Health Organisation (WHO), the United Nations Environment Programme (UNEP) and the International Committee of the Red Cross (ICRC) have participated in the AHC as well.

3. Nations have shared copious amounts of information in the AHC, based on their examinations and studies – over 20 nations have been testing their personnel serving or having served in the Balkans and half a dozen nations have been conducting environmental tests. Many Nations provided summary information on their studies and findings in the tables circulated by the International Secretariat (see attached).

4. To facilitate the research, NATO has provided the AHC with maps and co-ordinates, when available, of the locations of the use of DU munitions. This information has been updated as new data became available. Members of the AHC have received a briefing from the NATO Chair of the Committee of Chiefs of Military Medical Services (COMEDS) on their initial findings, and have been subsequently kept informed of further work undertaken by the COMEDS. The AHC has also received several briefings from SHAPE and the International Military Staff, including on SFOR and KFOR policies on handling, recovery, storage and disposal of spent DU munitions. Furthermore, guidelines for civilians who may come into contact with DU, which have been issued to the civilian authorities of the concerned countries, have been shared with the AHC.<sup>1</sup> In addition, the

---

<sup>1</sup> These guidelines are based on the simple principle of "do not touch", as in the case of any ammunition or mines.

acting NATO Spokesman briefed the AHC on public information aspects of the matter, the issue of information handling and the NATO website. The AHC's creation in itself performed a valuable public information role. It was the most visible practical example of NATO's genuine openness, effectively demonstrating its determination to seek out and then circulate as much information as possible. It was also a source of much of the information that went on NATO's website, adding to its growing reputation as an authoritative source for the media.

5. International Organisations provided valuable contributions to the AHC's work. The Representative of the EU Presidency kept the AHC informed of the activities in the EU. The Representative of the European Commission regularly briefed the AHG on the work of the Group of Experts in Radiation Protection and Public Health. The Co-Director of Kosovo's Department of Health and Social Welfare briefed the AHC on his department's examination of hospital records in Kosovo over the past four years. A WHO expert team had visited several sites and hospitals in Kosovo as well. The ICRC reported that it conducted voluntary testing of its personnel in Kosovo. The AHC was also briefed by Mr. Haavisto, Chairman of the UNEP's DU Assessment Team, on the post-conflict environmental assessment carried out in Kosovo on 5-19 November 2000.

6. Based on all this information shared:

- To date no nation has reported finding evidence of an increase in incidence of illness among peacekeepers in the Balkans compared with the incidence of illness among armed forces not serving in the Balkans;
- Thus far none of the nations reported finding a link between health complaints of personnel employed in the Balkans and DU;
- The discussion and information shared by nations and international organisations so far reinforced the preliminary report of the NATO Chiefs of Military Medical Services that at present, based on peer-reviewed medical scientific data, no link has been established between DU and reported cancers;
- To date none of the nations or international organisations has reported finding any indication that would suggest a current threat to human health caused by radioactivity at any of the sites tested.

7. In view of the sizeable amount of information shared in the AHC, all of which points to the conclusion that at present there is no scientific link established between DU and health complaints, the Chairman of the AHC will convene the Committee as necessary. Several studies are being conducted by nations and further reports will become available in due course. Given the Allies' commitment to ensure a full exchange of views and information sharing on possible health effects associated with DU, the Chairman of the AHC remains ready to convene further meetings of the Committee as appropriate.

# TABLE 2 – PERSONNEL TESTING

TABLE 2 – PERSONNEL TESTING

COUNTRY/ ORGANIZATION NAME	Soldiers – civilians (urine –blood) When, how many, where	Preliminary conclusions
BULGARIA MOD	39 soldiers Kosovo, Suva Reka 5-6.01.2001	No data of health problems.

TABLE 2 – PERSONNEL TESTING

COUNTRY/ ORGANISATION NAME	Soldiers - civilians When, how many, where	Preliminary conclusions
	All Danish soldiers (about 18.000) and civilians having been deployed to the Balkans and to the Gulf were freely offered a health exam and a blood testing (erythrocytes, leukocytes and thrombocytes) at their General Practitioner. The General Practitioners report to the Danish Armed Forces Health Services concerning the result of the health exam.	At 7 MAY 2001, 3900 (3450 soldiers and 450 civilians) have used the offer. No cases of leukemia have been found during these exams. All together. The Danish Armed Forces Health Services has the knowledge of 3 cases of leukemia among soldiers having been deployed.

TABLE 2 – PERSONNEL TESTING

COUNTRY/ ORGANIZATION NAME	Soldiers – civilians (urine-blood) When, how many, where	Preliminary conclusions
<p><b>FRANCE</b> Ministry of Defence</p>	<p><b>Personnel in question:</b></p> <ul style="list-style-type: none"> <li>- current or former soldiers who had been deployed in the Gulf or the Balkans;</li> <li>- civilians who might have stayed in the Balkans from 1992 to 2000.</li> </ul> <p><b>Collection of data on past trends and of prospective data:</b></p> <ul style="list-style-type: none"> <li>- collection of information on the pathologies presented by military consultants or former soldiers (cancers, infectious diseases, kidney, pulmonary and neurological diseases, post-traumatic disorders);</li> <li>- identification of place and length of stay.</li> </ul> <p><b>Additional medical clinical study and, if necessary, additional biological studies,</b> Including screening for depleted uranium in 24-hour urine samples and, in some cases, in stool samples.</p> <ul style="list-style-type: none"> <li>- Approximately fifty screenings for depleted uranium were carried out: <ul style="list-style-type: none"> <li>• 8 were on current or former soldiers likely to have had exposure in the Gulf;</li> <li>• roughly 20 were on current or former soldiers who had had exposure, or who were likely to have had exposure, in the Balkans;</li> <li>• 6 were on soldiers who had been in the Balkans and had a blood disease.</li> </ul> </li> </ul>	<p>At this time, no appraisal, not even a preliminary one, can be made with respect to these activities.</p> <p>It is necessary to wait until useable information from these studies becomes available: at least 2 to 3 months for the studies on past trends and at least one year for the prospective studies.</p>

TABLE 2 - PERSONNEL TESTING

COUNTRY/ ORGANIZATION NAME	Soldiers – civilians (urine-blood) When, how many, where	Preliminary conclusions
<p><b>GERMANY</b> Ministry of Defence Office of the surgeon general Tasked the GSF (Society for radiation research) to perform a study on DU in German military personnel</p>	<p>Military personnel  24h urine samples with ICP-MS on uranium from 1999 to 2001  about 120 forces members</p>	<p>The final report of this investigation is attached. No elevated uranium levels have been found in German military personnel. The protective measures taken by the German forces are effective.</p>
<p>Ministry of defence Office of the surgeon general</p>	<p>All German military personnel is checked on the health condition prior to deployment. After deployment all military personnel is questioned about adverse health effects related to the deployment. Additional clinical and laboratory examinations are made as appropriate.</p>	<p>No adverse health effects could be found, which were related to depleted uranium.</p>

TABLE 2 - PERSONNEL TESTING

<b>COUNTRY/ ORGANIZATION NAME</b>	<b>Soldiers – civilians (urine-blood) When, how many, where</b>	<b>Preliminary conclusions</b>
<b>GREECE / HAGS</b>	1800 soldiers (from B – H & Kosovo) Jan 2001 Hellenic Military Hospitals	Normal findings.

TABLE 2 - PERSONNEL TESTING

COUNTRY/ ORGANIZATION NAME	Soldiers – BLOOD	Preliminary conclusions
HUNGARY IFOR	In 1996 / 462 soldiers / Ocucani <b>Investigated 11 samples until 31.01.2001</b>	No pathological values were found
IFOR	Between 1997-1999 / 2082 soldiers / Ocucani <b>Investigated 154 samples until 31.01.2001</b>	No pathological values were found
IFOR	Between 1999-2000 / 550 soldiers / Pristina <b>Investigated 169 samples until 31.01.2001</b>	No pathological values were found
IFOR	In 1999 / 35 soldiers / Durres <b>Investigated 1 sample until 31.01.2001</b>	No pathological values were found
	Soldiers – URINE	Preliminary conclusion
SFOR	Between 1997-1999 / 2082 soldiers / Ocucani <b>81 urine samples were investigated for <i>beta-2-microglobulin</i> until 31.01.2001</b>	No pathological values were found
	Determination of “U” from urine samples is planned, but until now it was not fulfilled.	

TABLE 2 - PERSONNEL TESTING

COUNTRY/ ORGANIZATION NAME	Soldiers – civilians (urine-blood) When, how many, where	Preliminary conclusions
<p><b>IRELAND</b> Permanent Defence Forces</p>	<p>Screening Programme put in place largely for the purpose of reassurance to troops involved. Programme consists of the following:</p> <ul style="list-style-type: none"> <li>a, Health and Exposure Questionnaire</li> <li>b, Full physical examination</li> <li>c, Full blood count including differential white cell count</li> <li>d, blood area and electrolytes and serum creatinine</li> <li>e, test for urinary protein</li> </ul>	<p>All serving and retired personnel who previously served in Bosnia, Kosovo or Kuwait are being tested. 233 have been completed with 467 to be done. All results within normal ranges minor abnormalities are being further investigated but none give a cause for concern</p> <p>Questionnaire is being designed and coordinated with the Chief Medical Officer, Garda Siochana (police service) and the department of public health in University College, Dublin</p>

TABLE 2 - PERSONNEL TESTING

TABLE 3 - ENVIRONMENT TESTING

COUNTRY/ ORGANIZATION NAME	Soil, water, air When, how many, where	Preliminary conclusions
<p><b>UK</b> Enhanced Environmental Monitoring Programme</p>	<p>Visit to MNB(C) – 19-23 Jan. 3 members of the team. Locations of visit – 34T DN 834190 34T DN 886168 34T EM 019990 34T EN 148478 34T EN 178432 34T EN 187470 Samples collected – 3 DU penetrators and 60kg of soil.  Only one site had evidence of DU</p>	<p>Visit report already provided to Ad Hoc Committee – more detailed one to follow once soil sample analysis completed.</p> <p>Preliminary conclusions – see initial report passed to ad hoc committee on 30 January.</p> <p>Site at which penetrators found – 3 complete penetrators recovered. Radiation measurements were taken where a penetrator was found lodged in a wall of a damaged building. The measured dose (gamma) was 0.002mSv/h.</p> <p>Initial examination of the recovered DU penetrators suggests that there is no large scale generation of DU dust when penetrators strike non-armour targets. This suggests that the potential risk due to the inhalation of DU dust is less significant than some think. However, confirmation of this risk is dependent on the outcome of the analysis of the penetrators and soil samples and a more detailed examination of the site.</p> <p>The site where the DU penetrators were found is extensively contaminated with asbestos which is a potent carcinogen and poses a significant risk to health. This may well complicate any future intrusive investigations of DU contamination.</p>

TABLE 3 - ENVIRONMENT TESTING

COUNTRY/ ORGANIZATION NAME	Soil, water, air When, how many, where	Preliminary conclusions
<p><b>USA</b> US Army Center for Health Promotion and Preventive Medicine</p>	<p>Project Silver Falcon March 2000 Nine targets from the NATO target list provided to the UNEP were visited in the MNB-E. Target numbers pertain to listing at: <a href="http://www.nato.int/du/docu/d010124a.htm">http://www.nato.int/du/docu/d010124a.htm</a>.</p> <p>2 target sites were within identified minefields and not surveyed. (Tgt. No. 8 and 49)</p> <p>2 target sites showed no evidence of enemy occupation or battle damage and thus were not surveyed. (Tgt. No. 12 and 107.)</p> <p>2 target sites showed evidence of enemy occupation but no battle damage. Sites were monitored using Field Instruments for the Detection of Low Energy Radiation (FIDLERs). (Tgt. No. 45 and 111.)</p> <p>3 target sites showed evidence of enemy occupation and battle damage. FIDLERs were used at the sites and 5 soil samples were collected. (Tgt. No. 27 and two target sites at Tgt No. 52)</p>	<p>No FIDLER readings were recorded more than 50% above background radiation.</p> <p>Soil samples indicated no measurable levels of depleted uranium.</p>

\* The US Department of Defense conducted several environmental sampling efforts to assess depleted uranium contamination in the Persian Gulf region since the Gulf War. While this sampling does not directly apply to the Balkans, it sheds some light on the environmental presence of depleted uranium in target areas. No sampling, to date, has identified levels of DU that would require action under US Environmental Protection Agency guidelines. A complete discussion of US depleted uranium environmental sampling efforts in the Gulf Region since the Gulf War can be found in Section V.A. of our "Environmental Exposure Report, Depleted Uranium in the Gulf (II)" at [http://www.gulfink.osd.mil/du\\_ii/](http://www.gulfink.osd.mil/du_ii/).
