

U.S. Marine Recreational Fisheries

DATA COLLECTION. Detailed information on marine recreational fishing is required to support a variety of fishery management and development purposes and is mandated by the Sustainable Fisheries Act, 1996 (PL 104-297) and the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act, 2007 (PL 109-479). In 1981, following 2 years of preliminary surveys, the NMFS began a comprehensive survey of marine recreational fisheries covering all fishing modes (private/rental boat, party/charter boat, and shore), and including estuarine and brackish water. Although the annual recreational harvest is only about 9 percent of the total U.S. harvest of finfish for states covered by this program, the fishing activities of millions of anglers are important to monitor because they are directed at relatively few species. Marine recreational fishing significantly impacts the stocks of many finfish species, and recreational catches surpass commercial landings of some species (see figure on preceding page).

METHODS. On the Atlantic and Gulf coasts of the US, the marine recreational fisheries statistics program consists of a coastal household telephone survey (CHTS), a telephone survey of for-hire fishing vessel operators (charter and party boats; FHS), and a field intercept survey of angler fishing trips. Additional information is also obtained from state or regional logbook programs and is used to supplement survey data to produce more robust catch and effort estimates. The CHTS collects data on the number of marine recreational fishing trips by residents of coastal counties. The intercept survey collects data on the proportion of fishing trips by residents of non-coastal counties, the species composition of catches, catch rates by species, and lengths and weights of landed fish. These data are combined to produce estimates of catch and effort. Catch estimates are separated into two categories – harvested catch and catch released alive. Harvested catch includes landed fish and catch reported as dead. Whenever possible, field interviewers identify, count, weigh, and measure landed fish that are available in whole form. Angler reports are obtained for catch released alive and for all other harvested catch, such as catch released dead, used for bait, or filleted fish. Catch estimates are stratified by subregion, state, wave (bi-monthly sampling period), species, fishing mode (private/rental boat, party/charter boat, and shore), primary area fished, and catch type. In addition, estimates of participation are produced. Texas estimates are from Texas Parks and Wildlife Department recreational survey data.

On the Atlantic and Gulf Coasts, California, and Washington's Puget Sound, effort for the party/charter fishing mode is now estimated through For-Hire Surveys (FHS). These surveys differ from the CHTS because they use a telephone survey of boats as the primary method for estimating fishing effort. The weekly survey uses directories of charter boats and party/headboats as the sampling frames. These telephone surveys estimate the number of angler-trips on boats included in the sampling frames. Dockside and on-board angler-intercept surveys collect catch data. The total catch of any one species is calculated as the product of the adjusted estimate of total angler trips and the estimated mean catch per trip. Although the FHS produces separate estimates for charter boat and party boats on the Atlantic and Gulf Coasts, for-hire fishing vessels are not designated by type in California or Puget Sound. This effort methodology was initiated in 2000 on the Gulf coast, in 2001 on the Pacific coast, and in 2005 on the Atlantic coast. FHS numbers are included here for the Atlantic and Gulf coasts and California but not for Puget Sound.

In place of the CHTS, Oregon and Washington conduct ocean boats surveys to produce catch and effort estimates. Oregon's Ocean Recreational Boat Survey (ORBS) and Washington's Ocean Sampling Program (OSP) consist of a field intercept survey for effort and catch of passenger and private boats. Estimates of mean catch per boat, catch per angler, total angler trips and boat trips are produced for each port inlet or port group stratified by time period, type of boat, type of trip and water area. Catch estimates in numbers of fish and weight are produced for each species of fish.

COVERAGE. In 2007, the recreational fishing statistics program conducted by the NMFS included the Atlantic coast (ME-East FL), Gulf coast (LA-West FL), Puerto Rico and Hawaii. Detailed information and access to the data are available on the Fisheries Statistics web page (www.st.nmfs.gov/st1). Care is advised when comparing catch estimates across an extended time series because of differences in sampling coverage through the years.

In the South Atlantic and Gulf sub-regions (NC- LA) head boat catch data have not been collected since 1985, so estimates for these sub-regions only include charter boats in the for-hire sector. Marine recreational fishing in Texas is monitored by the Texas Parks and Wildlife Department and has not been surveyed by the NMFS' survey program since 1985. Current year statistics are not

U.S. Marine Recreational Fisheries

available for Texas. Prior to 1998, on the Pacific coast, ocean boat trips and salmon trips were not sampled during certain waves because they were surveyed by state natural resource agencies. Alaska conducts an annual mail survey in place of the NMFS' program. Harvest, effort and participation data are included, but not available for the current year. West Pacific U.S. territories have not been included in the national survey program since 1981. Hawaii was not surveyed between 1981 and 2002. The U.S. Caribbean was not surveyed between 1981 and 2000. The numbers reported for Washington and Oregon for 2005 & 2006 include only private boat and for-hire-fisheries. Data from other NMFS and state surveys are not included in this report.

Historically, only about five percent of the annual recreational catch on the Atlantic and Gulf coasts is taken during Wave 1 (Jan/Feb). Costs to sample these months are very high due to low fishing activity. Therefore, in Jan/Feb of 1981 the surveys were not conducted in any region. In 1982, Jan/Feb data collection resumed on the Pacific and Gulf coasts and also on the Atlantic coast of Florida. With a few exceptions the marine recreational statistics program has not collected data in Jan/Feb on the Atlantic coast north of Florida since 1980.

Time periods when the marine recreational statistics program has not been conducted: Nov/Dec (ME & NH) - 1987 to present; Mar/Apr (ME & NH) - 1986 to present; Jan/Feb (Northern CA & OR) – 1994; Jan/Feb (Southern CA & OR) – 1995 Nov/Dec (OR) – 1994; Nov/Dec (WA shore modes) – 2003; July - Dec (OR shore modes) – 2003; All Waves (CA - WA) - 1990 to 1993, 2004 to present; All Waves (WA) - 1993 to 1994.

DATA TABLES. The estimated harvests (numbers and weight of fish) for the continental U.S. and Hawaii are presented. Numbers of fish harvested and released alive are also presented for many important species groups. Estimated harvests are presented by subregion and primary fishing area: inland [sounds, rivers, bays], state territorial seas [ocean to 3 miles from shore, except for Florida's Gulf coast, where state territorial seas extend to 10 miles from shore], and Exclusive Economic Zone (EEZ) [ocean from the outer edge of the state territorial seas to 200 miles from shore]. The total

numbers of estimated trips and participants are presented by state.

2007 MARINE RECREATIONAL FISHING DATA.

In 2007, more than 12 million anglers made almost 87 million marine recreational fishing trips on the Atlantic, Gulf and Pacific coasts. The estimated total marine recreational catch was more than 468 million fish, of which 58 percent were released alive. The estimated total weight of harvested catch was 255 million pounds. The Atlantic coast accounted for the majority of trips (67 percent) and catch (over 60 percent). The Gulf coast accounted for 28 percent of trips, and nearly 36 percent of the catch. The Pacific coast accounted for nearly 1 percent of trips, and nearly 3 percent of the catch. Nationally, most (almost 61 percent in numbers of fish) of the recreational catch came from inland waters, 30 percent from state territorial seas, and over 9 percent from the EEZ. The majority of Atlantic, Gulf and Pacific trips fished primarily in inland waters.

ATLANTIC. In 2007, 8.7 million residents participated in marine recreational fishing. All participants, including visitors, took 58 million trips and caught a total of more than 282 million fish. About 26 percent of the trips were made in east Florida, followed by nearly 13 percent in New Jersey, 12 percent in North Carolina, almost 11 percent in New York, 8 percent in Massachusetts, 7 percent in Maryland, and more than 6 percent in Virginia. Together, South Carolina, Connecticut, and Rhode Island accounted for 10 percent of the trips, and Delaware, Maine, Georgia, and New Hampshire accounted for the remaining percentage. The most commonly caught non-bait species (in numbers of fish) were Atlantic croaker, bluefish, summer flounder, spot, and striped bass. The largest harvests by weight were striped bass, bluefish, dolphinfish, summer flounder, and Atlantic croaker.

From 1998 to 2007, total annual catch of black sea bass has averaged nearly 13 million fish. Catch increased overall from 6.3 million fish (1998) to over 14 million fish (2007). From the total catch in 2007 (over 14 million fish), almost 84 percent were released alive. Annual bluefish catch increased overall from 9.2 million fish (1998) to nearly 24 million fish (2007). At nearly 24 million fish, 2007 bluefish catch was above the 10-year

U.S. Marine Recreational Fisheries

mean of over 17 million. The species most commonly caught on Atlantic coast trips that fished primarily in federally managed waters were black sea bass, summer flounder, Atlantic cod, dolphinfish, and bluefish. Nearly 30 percent of the total Atlantic catch came on saltwater trips that fished primarily in the state territorial seas, and more than 60 percent came on trips that fished primarily in inland waters.

GULF OF MEXICO. In 2007, almost 3.6 million residents participated in marine recreational fishing. All participants, including visitors, took over 24 million trips and caught 168 million fish. Almost 68 percent of the trips were made in west Florida, followed by almost 19 percent in Louisiana, almost 9 percent in Alabama, and 5 percent in Mississippi. The most commonly caught non-bait species (numbers of fish) were spotted seatrout, red drum, gray snapper, sand seatrout, and Atlantic croaker. The largest harvests by weight were for red drum, spotted seatrout, blue runner, sheepshead, red snapper, and king mackerel.

From 1998 to 2007, total annual catch of gray snapper has averaged almost 4.5 million fish. Catch increased overall from more than 4.1 million fish (1998) to almost 5.6 million fish (2007). From the total catch in 2007 (almost 5.6 million fish), over 82 percent were released alive. Annual red drum catch has been generally stable. At over 9 million fish, 2007 red drum catch was above the 10-year mean of over 8.2 million. The species most commonly caught on Gulf of Mexico trips that fished primarily in federally managed waters were red snapper, gag, red grouper, white grunt, and black sea bass. About 26 percent of the total Gulf catch came on trips that fished primarily in the state territorial seas, and nearly 66 percent came on trips that fished primarily in inland waters.

PACIFIC. In 2007, over 181,000 marine recreational fishing participants took over 730,000 trips and caught a total of 13 million fish. The most commonly caught non-bait species (in numbers of fish) were kelp bass, black rockfish, barred surfperch, white croaker, and barred sandbass. By weight, the largest harvests were albacore, black rockfish, Chinook salmon, lingcod, blue shark, and Pacific barracuda.

Annual barred surfperch catch declined to a low in 2000 but has been increasing. At more than 463,000 fish, 2007 barred surfperch catch was below the 10-year mean of more than 514,000. Annual catch of black rockfish has varied between more than 680,000 fish and 1.4 million fish over the last ten years, with an average catch of more than 1 million fish per year. Of the more than 680,000 caught in 2007, almost 54,000 fish (nearly 8%) were released alive. The most commonly caught Pacific coast species in federally managed waters were California scorpionfish, Pacific sanddab, Chinook salmon, Pacific barracuda, and vermilion rockfish. About 76 percent of the total Pacific catch came from trips that fished primarily in the state territorial seas, and almost 17 percent came from trips that fished primarily in inland waters.

ALASKA. In 2006, 948,000 marine recreational fishing participants took nearly 1.4 million trips and caught a total of more than 2 million fish. Commonly caught fishes included pacific halibut, rockfishes, lingcod, pacific cod, and the salmons: chinook, chum, coho, pink and sockeye. The most abundantly harvested of the salmons were coho salmon and sockeye salmon. Current year statistics are not available.

HAWAII. In 2007, almost 317,000 marine recreational participants took nearly 2.6 million trips and caught a total of 3.7 million fish. The most commonly caught non-bait species (in numbers of fish) were yellowfin tuna, skipjack tuna, yellowstripe goatfish, bluefin trevally, and hawaiian flagtail. By weight, the largest harvests were yellowfin tuna, dolphinfish, skipjack tuna, wahoo, bigeye tuna, and bluefin trevally.

PUERTO RICO. In 2007, more than 185,000 marine recreational participants took nearly 1.1 million trips and caught a total of nearly 1.3 million fish. The most commonly caught non-bait species (in numbers of fish) were dolphinfish, lane snapper, yellowtail snapper, Spanish sardine, and redear sardine. By weight, the largest harvests were dolphinfish, blue marlin, king mackerel, crevalle jack, vermilion snapper, and lane snapper.

NOTES: (1) Number or pounds less than 1,000 or less than 1 metric ton.

(2) With the exception of West Florida where the state territorial seas extend 0 to 10 miles.

(3) Includes all Oregon harvest (where distance from shore is unknown).

** Fish included in these groups are not equivalent to those with similar names listed in the commercial tables.

Alaska and Texas data not included.
