KINGSTON FOSSIL PLANT COAL YARD RUNOFF POND PHASE 1 INPUT

Please refer to Cost Estimate Request No. KIF93-1218-PO dated December 21,1993 (B65 931222 106) concerning the above subject.

Attached is a project development Estimate from Fossil Engineering providing Phase 1 Input for the Kingston Plant Phase 1 Study of the Coal Yard Runoff Pond Project.

Included in this package is a Phase 1 Scope, manhour estimate, and a workload based schedule.

If you have any questions call me at extension 6607.

KINGSTON FOSSIL PLANT

COAL YARD RUNOFF POND

1.0 BACKGROUND

Heavy rains have in the past caused flows to be by-passed around the coal yard drainage pond. The by-passed flows were reported as not complying with the NPDES permit for the pond. It is reported that the two existing pumps are not well suited for the system operating conditions and do not operate reliably.

2.0 PROJECT DEVELOPMENT

- 1) Provide a detailed scope statement for Phase I action. A suggested minimum list of items follows in section 3.0.
- 2) Provide a detailed cost estimate for Phase I.
- 3) Estimate expected duration for performing Phase I.
- 4) Phase I would begin in February 1994 or March 1994.
- 5) Identify possible constraints identified for performing this project in any Phase.

<u>3.0 PHASE I SCOPE</u>

(-)

- 1) Meet with plant and other interested personnel to discuss any additional information, verify scope, and review preliminary plans, proposed solutions, and expectations from the project.
- 2) A hydrologic analysis of the pond and existing pumping capacity will be performed in order to determine if the system will contain the 10-year 24-hour storm. Should it be determined that the system will not contain the above design storm, alternatives would be formulated and evaluated for containing the design storm. Should it be shown that the existing system is capable of containing the design storm, then alternatives for upgrading and improving the reliability of the system will be examined. Improving reliability will be examined by considering such additions as new pumps, new controls, electrical improvements, piping modifications, and other options as appropriate. The analysis of alternatives would result in the selection of a recommended alternative.
- 3) Determine the location, routing, and connection points of any additional piping, valves, and equipment to be installed.
- 4) Determine the drawings and documents which will require revising or preparing.
- 5) Develop and prepare a detailed engineering hours estimate and resource loaded

schedule for Phase II engineering.

- 6) Determine the possible impacts the rehabilitated system will have on any existing or remaining components in the system.
- 7) Review similar systems at other sites for possible information sharing.
- 8) Determine all possible state, federal, or local permits which will be required in the execution of this project.
- 9) Identify needed coordination with local, state, or federal agencies.
- 10) Provide a cost estimate to prepare the Phase II estimate and schedule for Phase III implementation.
- 11) Determine possible environmental issues to be addressed during any Phase.
- 12) Provide input to the Estimating Section, including identification of long lead procurement items to assist in preparation of the Phase II detailed estimate and Phase III preliminary estimate.
- 13) Develop and prepare a preliminary Phase III cost estimate.

4.0 PHASE I DELIVERABLES

 (\cdot)

- 1) Minutes of meetings documenting agreements made on actions to be taken, schedule, etc,
- 2) Memorandums, letters, and documents to the plant, engineering, Mod Svs, partners, etc.
- 3) List of local, state, and federal permits required.
- 4) Detailed hours estimate and schedule for Phase II engineering activities.
- 5) List of drawings and documents to be prepared or revised in Phase II.
- 6) A detailed cost estimate for Phase II and a preliminary estimate for Phase III.
- 7) Copy of all calculations performed.
- 8) Cost estimate from Mods Partner to prepare estimate and level IV schedule, and to participate in a constructability review in Phase II.
- 9) Conceptual drawings indicating the proposed alternative.

- 10) List of all alternatives considered with the evaluation of each alternative. The evaluation should include a conceptual cost estimate for each alternative.
- 11) List of all assumptions made.

with the state of the second second second

12) Final project Phase I report.

ł

KINGSTON FOSSIL PLANT COAL YARD RUNOFF POND - CER NO. KIF93-1218-PO PROJECT DEVELOPMENT ESTIMATE

I. Project Scope:

Problems exist with the coal yard runoff pond in that heavy rainfall causes water flows to bypass the pond. Replacement of the existing sump pumps, which do not operate reliably, will be necessary to accomplish environmental compliancy goals. The study's principle purpose will be to determine the conceptual design and to provide a detailed cost estimate for the detailed design of the solution.

II. Electrical Scope for Phase I:

- A. Examine the types and quantities of equipment required and the feasiblity of their use, and discuss these subjects with FES Civil and Mechanical disciplines and Kingston Fossil Plant representatives to insure we are satisfying the needs of the plant.
- B. Travel to the plant to review existing equipment for replacement.
- C. Prepare a conceptual estimate to perform an economic evaluation.
- D. Determine which drawings and documents require revision or preparation.
- E. Develop and prepare a detailed engineering manhours estimate and schedule for Phase II engineering and preliminary estimate for Phase III.

III. Assumptions

- A. No change in horsepower for the two sump pump motors, currently 30 and 60 hp, respectively.
- B. A power analysis of the Kingston system, including these two undocumented sump pumps, will reveal that it is acceptable to power the proposed replacement pumps from the same board which currently powers them.

IV. Phase I deliverables will include the following:

- 1. A scope of Phase II electrical design.
- 2. A list of electrical drawings to be prepared or revised.
- 3. A bill of materials for electrical equipment including all long lead and engineered materials.
- 4. A detailed manhour estimate and schedule (duration from approval) for Phase II engineering (\pm 10%) and conceptual engineering estimate for Phase III (\pm 20%) with manhours and cost shown on a monthly basis.

COAL YARD RUNOFF POND

MECHANICAL AUXILIARIES

SCOPE FOR PHASE I

During periods of heavy rain the existing Coal Yard Runoff Pond frequently overflows into the river. The mechanical scope consists of the following:

- Determine any pumping modifications required.
- Determine the condition of the existing piping system and any modifications required.
- o Develop a conceptual design of the modifications along with the appropriate materials list.
- o Develop an estimate and schedule for phase 2 and 3.

COST ESTIMATE REQUEST No. KIF93-1218-PO COAL YARD RUNOFF POND

CIVIL SITE ENGINEERING Phase I Scope of work

A phase 1 scope of work for site engineering will require drainage area identification, rainfall volume and runoff rates. After the discharge pipe sizes and layout is determined by the mechanical section, we will check for pipe interferences along the route. The pump station will be designed to use the existing power supply.

Our involvement will include providing for the following:

- 1. Drainage areas identification.
- 2. Volumes, rates and points of entry for runoff.
- 3. Grading and drainage for the new areas.
- 4. Material quantities for a phase II estimate.
- 5. Phase II scope of work.
- 6. Manhour estimates for phase II design & phase III field support.
- 7. A schedule for phase II and III.
- 8. Site visits as necessary to obtain plant concurrence of the plan for phase II and to obtain necessary field information.
