SOIL INVESTIGATION

Singleton Laboratories Report 015-672-142A

1

INTRODUCTION

Singleton Laboratories has completed a requested soil investigation for the subject project. This investigation was conducted in general accordance with Singleton Proposal No. 94-232 dated May 2, 1994. The purpose of the investigation was to assess subsurface soil conditions, to determine physical and engineering properties of both undisturbed and borrow soils, and to establish elevations of bedrock. The investigation included both sub-surface exploration and laboratory testing of soil. The following report presents the activities and results of the investigation.

FIELD INVESTIGATION

The field investigation was completed between July 26 and August 19, 1994. A total of 914 linear feet was drilled and sampled at the specified twenty-two (22) locations including 9 split-spoon, 9 undisturbed, and 4 auger borings. A total of 109 split-spoon samples, 30 undisturbed tube samples, and 8 bag samples was completed in this investigation. A CME-550 ATV drill equipped with 6-1/4-in. and 3-3/8-in. hollow stem augers, 3-in. shelby tube samplers, 2-in. split-spoon samplers, and AW rods were used in drilling, sampling, and testing in this investigation. Dry methods of soil sampling were used and procedures conformed to American Society for Testing and Materials (ASTM) Standards D 1452, D 1586, D 1587, and D 2488.

For each split-spoon boring, Standard Penetration Tests (SPT) were performed and SPT samples were taken at 5-ft intervals to the specified depth. SPT tests were performed in accordance with ASTM D 1586 in which a standard 1.4-in. id and 2-in. od split-spoon sampler is driven into the soil with a 140-lb hammer that free falls 30-in. The standard penetration resistance of soil is defined as the number of blows required to drive the final foot. For each boring, field logs showing depths of sampling, and visual classification are enclosed in Appendix B.

Nine (9) split-spoon borings designated as SS-1 through 10 excluding 7, and nine (9) undisturbed borings designated as US-1 through 9 were drilled in the dike areas around Dredge Cells 1, 2, and 3. A total of eight (8) bag samples was obtained at four locations inside the Dredge Cell 2. A boring location plan is enclosed. Refusal was encountered at all split-spoon borings, and depths of refusal ranged from 39 to 92-ft. SPT N values ranged from 0 to 90, indicating soil consistencies varying from very soft to hard. Generally, overburden soils at Borings SS-1 through 6 consisted of a gray fly ash only.

SOIL INVESTIGATION

Singleton Laboratories Report 015-672-142A

2

Residual soils were encountered at depths of 55, 70, and 75-ft at Borings SS-8, 9, and 10, respectively. The 20 to 25-ft thick residual soils were composed of two soil types; a mottled brown, tan, and gray silty clay in the upper layer, and a gray and tan silty sand with gravel in the lower layer.

Ground water was encountered at all borings at depths ranging from 5-ft 8-in. to 29-ft during the time of boring. For Boring SS-10, no ground water reading was taken because the hole collapsed immediately after completion of the boring. However, ground water fluctuations due to seasonal and weather changes should be expected. All the borings were backfilled with natural soils.

LABORATORY TESTING

All split-spoon samples obtained were visually classified and tested for moisture content in accordance with ASTM D 2216, while Atterberg limits, grain-size analysis, and specific gravity tests were performed on representative SPT soil samples in accordance with ASTM D 4318, and D 422, and D 854, respectively. Test results are shown in the field logs. Individual test data sheets are enclosed in Appendix C.

All twenty-five (25) undisturbed soil samples obtained from the dike areas were tested for moisture content, classification, grain-size, Atterberg limits, specific gravity, and unit weight in accordance with ASTM D 2216, D 2488, D 422, D 4318, D 854, and SLP-2, respectively. Unconsolidated-undrained triaxial (Q) and consolidated-undrained triaxial (R) with pore water pressure measurements were performed on five (5) selected undisturbed soil samples in accordance with ASTM D 4767 and D 5084, respectively. Test results are also summarized in Table 1. Individual test data sheets are enclosed in Appendix D. Under Q test conditions, angles of internal friction ranged from zero (with 1.85 tsf cohesion) to 37.4 degrees, and cohesions varied from zero to 1.85 tsf. Under R test conditions, apparent angles of internal friction and cohesions ranged from 4.4 to 35.8 degrees and from 0.32 to 3.65 tsf, respectively, and effective angles of internal friction and cohesions varied from 9.2 to 37.5 degrees and from zero to 2.91 tsf, respectively.

All bulk soil samples obtained from the Dredge Cell 2 were visually classified as a gray silty sand (fly ash) and tested for moisture content on representative samples. Natural moisture contents ranged from 34.5 to 39.9 percent with an average of 37.6 percent. Two (2) soil classes were identified from all the bulk samples. Compaction tests were performed in accordance with ASTM D 698 Method A. Optimum moisture contents and maximum dry densities were determined to be 25.4

3

percent and 79.8 pcf, respectively for soil Class I, and 24.5 percent and 79.9 pcf, respectively for soil Class II. As indicated from the test results, Soil Classes I and II are very similar. A family of compaction curves was established for each soil class and the compaction curves are enclosed. For each soil class, classification tests including grain-size analysis, specific gravity, and Atterberg Limits were performed. Test results are summarized in Table 2 and also shown in the attached compaction curves. Individual test data sheets and compaction curves are enclosed in Appendix E.

Unconsolidated-undrained triaxial (Q) and consolidated-undrained triaxial (R) with pore water pressure measurements tests were performed on the soil samples remolded to the optimum moisture content with 95 and 100 percent maximum dry density. Test results are also summarized in Table 2. Individual test data sheets are also enclosed in Appendix E. Under Q test conditions, angles of internal friction ranged from 23.7 to 24.0 degrees and cohesions varied from 1.04 to 1.10 tsf. Under R test conditions, apparent angles of internal friction and cohesions ranged from 17.9 to 17.9 degrees and from 0.19 to 0.21 tsf, respectively, and effective angles of internal friction and cohesions varied from 28.3 to 38.3 degrees and from 0.06 to 0.27 tsf, respectively.

SUMMARY

Twenty-two (22) soil borings consisting of a total 914 linear feet of drilling including 109 SPT testing and samples, 30 undisturbed tube samples, 8 bag samples were completed at the dikes and dredge cell areas. Laboratory testing including moisture content, classification, grain-size, specific gravity, Atterberg Limits, compaction, unconsolidated-undrained triaxial (Q), and consolidated-undrained triaxial (R) with pore water pressure measurements was performed in accordance with appropriate ASTM methods on both undisturbed and remolded soil samples.

Based on this limited soil investigation including field exploration and laboratory testing conducted for this project, the following recommendations are made. If sub-surface conditions encountered during construction vary from those reported, Singleton Laboratories should be consulted immediately.

1. The predominant overburden soil in the dike area was a fly ash classified as a brown and gray silty sand. However, residual soils were encountered at depths ranging from 55 to 75-ft at Borings SS-8, 9, and 10. Two types of in-situ soil were identified as a mottled brown, tan, and gray silty clay in the

4

upper layer, and a gray and tan silty sand with gravel in the lower layer. The standard penetration testing showed the soil consistencies ranging from soft to hard. The soils have low to medium shear strengths. Refusal was encountered at depths ranging from 39 to 92-ft.

2. In the borrow area (dredge cells), two soil classes were identified. The soils were generally classified as a gray silty sand (fly ash). Test results indicate the two soil types are similar. Optimum moisture contents ranged from 24.5 to 25.4 percent, and maximum dry densities varied from 79.8 to 79.9 pcf. At the molding conditions of optimum moisture content and 95 to 100 percent maximum dry density, the soils exhibit medium to high shear strength.

Link.[®]

June 21, 1994

Gilbert Commonwealth, Inc.
Route 10 & Pheasant Road
Reading, Pennsylvania 19607

Attn: Mr. David R. Erali

Re: TVA KINGSTON FOSSIL PLANT - DREDGE CELLS/CLOSURE PERMIT
SUBSURFACE INVESTIGATIONS - PROPOSAL No. 94-309

Dear Mr. Erali:

Singleton Laboratories Division of United Energy Services Corporation (Singleton) is pleased to submit this proposal to Gilbert Commonwealth to provide geotechnical investigation services for the TVA Kingston Fossil Plant Project.

Our understanding of the project requirements, after discussion with Mr. Lynn Petty of TVA on this unsolicited proposal, is to perform subsurface exploration and laboratory testing of split-spoon, undisturbed, and bulk samples. Details of the subsurface investigation for the Dredge Cells Area are enclosed. Singleton will provide qualified test personnel and test equipment to complete the investigations. Also Singleton will perform the required survey work.

SCOPE OF SERVICES

Singleton agrees to perform all work outlined by TVA for the Dredge Cells Area as shown in the attached request. The scope of work of the investigation is briefly described as follows:

1. Field Exploration

Mobilize field personnel and equipment to perform approximately 10 split-spoon borings to top of rock (average 90-ft estimated) at 5-ft intervals of SPT sampling; approximately ten (10) undisturbed borings at locations assigned by TVA to obtain approximately twenty-five (25) Shelby tube samples; and approximately five (5) bag

TVA KINGSTON FOSSIL PLANT - DREDGE CELLS/CLOSURE PERMIT -
SUBSURFACE INVESTIGATIONS - SINGLETON LABORATORIES PROPOSAL No.
94-309

samples from identified locations within the pond for laboratory testing. Ground water will be measured if encountered 1-hr and 24-hr after completion of boring. All borings will be backfilled with natural soils and survey of all borings investigated will be performed after completion of investigation.

2. Survey

Perform survey to determine locations and elevations of all borings investigated based on data of existing piezometers after completion of the investigation.

3. Laboratory Testing

Laboratory testing will be performed in accordance with standardized procedures as specified in the request for geotechnical investigation. Specific testing to be performed for each type of sample is summarized in the following tabulations.

SPT Samples (180 each)

Moisture	180 each
Classification	18 each
Atterberg Limit	18 each
Grain Size	18 each
Specific Gravity	18 each

Shelby Tubes (25 each)

Moisture	25 each
Classification	25 each
Atterberg Limit	25 each
Grain Size	25 each
Specific Gravity	25 each
Unit Weight	25 each
Unconsolidated-undrained triaxial (Q) test	5 each
Consolidated-undrained triaxial (R) test	5 each
Tube Extractions	25 each

TVA KINGSTON FOSSIL PLANT - DREDGE CELLS/CLOSURE PERMIT -
SUBSURFACE INVESTIGATIONS - SINGLETON LABORATORIES PROPOSAL No.
94-309

Bag Samples (5 each)

Moisture	5 each
Classification	5 each
Atterberg Limit	5 each
Specific Gravity	5 each
Compaction	5 each
Unconsolidated-undrained triaxial (Q) test	3 each
Consolidated-undrained triaxial (R) test	3 each

4. Final Report

A final report will be prepared to include a brief review of general subsurface soil conditions; a detailed description of field exploration and laboratory test procedures used in this investigation; computerized field logs; boring location plan; soil profiles; tabulations of SPT and undisturbed sample test data, and a family of compaction curves.

PERSONNEL AND SCHEDULE

Singleton Laboratories could commence the testing program after receiving written authorization. Mr. Yung Chung will be designated as the Project Manager and, as such, will be responsible for coordinating the Singleton effort on the execution of this test program. Completion of this scope of work is anticipated to take 8 weeks from the date of authorization to proceed. Interim test data will be submitted as available, with earliest lab results expected in early to mid-August, 1994.

COMPENSATION

The lump sum charge to perform this testing project and to submit a final test report will be **\$45,870.00** including **\$21,000.00** for the subsurface exploration and **\$24,870.00** for the laboratory and final report for the Dredge Cells Area investigation. All approved out-of-scope work will be billed in accordance with our existing contract on a time and materials basis. If additional costs are anticipated due to unforeseen difficulties of drilling or work scope changes, such costs will be incurred only after written mutual agreement between authorized representatives of Singleton and Gilbert Commonwealth, Inc..

TVA KINGSTON FOSSIL PLANT - DREDGE CELLS/CLOSURE PERMIT -
SUBSURFACE INVESTIGATIONS - SINGLETON LABORATORIES PROPOSAL No.
94-309

TERMS AND CONDITIONS

Terms and conditions applicable to Singleton's services hereunder are as set forth in Contract No. TV-FH-SL-001. We welcome this opportunity to be of service to TVA and would welcome the receipt of your authorization to proceed. We trust that the scope of work as proposed accurately represents the project requirements. Should you have any questions, please call Mr. Yung Chung or the undersigned at (615) 970-2299. This proposal is valid for sixty (60) days from the date of the proposal.

Sincerely,

J. F. Best, P.E.
Division Manager

Initial:

Moisture(%) = 25.4

Void Ratio = 0.769

Density(pcf)= 79.8

Saturation(%)= 74.7

After Saturation:

Moisture(%) = 34.0

Void Ratio = 0.710

Minor Prin. Stress(tsf) = 2.02

Major Prin. Stress(tsf) = 4.51(2.74)

Eff. Minor Prin. Stress(tsf)=0.92(0.01) Eff. Major Prin. Stress(tsf)= 3.42(0.73)

**NOTE: Figures in parenthesis are based on the failure criteria of
 Maximum Effective Principal Stress Ratio.**

Singleton Laboratories
CONSOLIDATED UNDRAINED TRIAXIAL COMPRESSION (R) TEST

Project: TVA/KINGSTON	File : 19
Feature: DREDGE CELLS	Tested By : TAL
Station:	Computed By: MHD
Range :	Checked By : <u> </u>
Boring :	Report Date: 09-29-94

Moisture Content	Trimming	Initial	Final
Wet Wt. and Tare(gm)=	121.1	127.3	174.8
Dry Wt. and Tare(gm)=	104.6	101.5	137.6
Wt. of Tare(gm) =	39.7	0.0	37.9
Moisture(%) =	25.4	25.4	37.3

Test Conditions and Constants:

Proving Ring No. = 2515	Tube No. = 1
Proving Ring Constant:	Sample Volume (cc) = 79.445
Slope Const. = 1	Sample Height(in.) = 3.136
Intercept = 0	Specific Gravity = 2.26
Confining Pres.(psi) = 42	Consolidation(in.) = .04
Initial Pore Pre(psi)= 100	Initial P.R. Rdg = 113
