3. Discussion. This instruction provides pertinent information describing MESF mission requirements, capabilities and the types and locations of expected operations as described in references (a) through (f). Enclosures (1) through (9) have been prepared per reference (a). These enclosures provide the necessary details to describe the mission areas and operational capabilities for which the MESF was organized. Enclosures (1) through (9) shall also be used to assist with determining specific mission area M-Ratings reported under reference (b). This instruction provides resource agencies with the information they need concerning MESF mission requirements, capabilities and projected operational environments.

4. Definitions

a. MESF. The MESF provides a maritime security force with the capability to effectively and efficiently employ trained and equipped units that provide force protection for designated assets and infrastructure. These units will be task organized designed to meet the operational requirements of the Joint Force maritime component commander (JFMCC)/Navy component commander (NCC) to support existing and evolving missions in major combat operations, maritime security operations (MSO), or maritime homeland security/maritime homeland defense (MHS/MHD). The MESF will be manned, trained, equipped, and capable of defense against level I and II threats. MESF capabilities are complementary to the existing U.S. Marine Corps (USMC) and U.S. Coast Guard (USCG) roles and missions in the maritime environment. Missions such as harbor approach defense (i.e., coastal sea control), and port security/harbor defense (PSHD) are executed both in coastal areas outside the United States in support of national policy, and within the United States as part of this nation's Homeland Defense. Other missions include seaward security during expeditionary warfare (EXW) operations, to ensure uninterrupted flow of strategic cargo and units to the combatant commander (CCDR). MESF operations are also conducted in established terminal facilities and joint logistics-over-the-shores (JLOTS) staging areas to support amphibious warfare (AMW) operations, maritime pre-positioning force (MPF) operations, including assault follow-on echelon (AFOE) offload operations, maritime interception operations (MIO) and designated afloat unit security missions. MESF units can operate as a supporting element to a carrier strike group (CSG), expeditionary strike group (ESG), amphibious task force (ATF), marine air ground task

force (MAGTF), a joint task force (JTF) or a joint rear area commander. In accordance with reference (c), the force is comprised of maritime expeditionary security groups (MESG), maritime expeditionary security squadrons (MSRON), maritime expeditionary command and control divisions (C2DIV), maritime expeditionary boat divisions (BOATDIV), and maritime expeditionary security divisions (SECDIV).

b. MESG. Commissioned, echelon 4 staff comprised of active duty, full time support (FTS), or Reserve U.S. Navy (USN) and USCG personnel responsible for standardization and certification of training, strategic concepts, long range operational planning, exercise support planning, intelligence dissemination, administrative support and general logistics support to SECDIVs and their subordinate units. The MESG certifies subordinate units for deployments, and maintains readiness in support of contingency and surge requirements by ensuring units designated for deployment are task lists. The MESG is organized to provide day-to-day administrative requirements and can deploy as a headquarters when required to form the core of a commander task force (CTF), to exercise control of, or to command Navy Expeditionary Combat Command (NECC) elements including MESF and other forces from across the NECC enterprise. MESG ONE is located in San Diego, CA; MESG TWO is located in Portsmouth, VA.

c. MSRON. Commissioned, echelon 5, operating unit responsible for deploying command, control, communications, and intelligence and operational support detachments and units to form an operations center. MSRONS provide administrative, Reserve management, financial and supply oversight and readiness of their subordinate units. MSRON staffs are comprised of active duty, FTS, or Reserve USN and USCG personnel. MSRONS provide immediate superior in command support for their squadron units (SECDIV, BOATDIV, and C2DIV). Subordinate C2DIVs provide surveillance and reconnaissance capability to an adaptive force package (AFP) to provide an integrated command, control, communications, computers, intelligence, surveillance and reconnaissance (C4ISR) asset capable of self-sustained mission support. Subordinate BOATDIVs provide armed small boats to provide quick reacting interdiction support. Subordinate SECDIVs provide security, interdiction, and point defense of designated assets. An entire MSRON is normally the largest MESF unit to deploy and may operate independently or in support of other security forces. Two or more MSRONS may be combined to

27 Jan 2010

form a large AFP under a single MESF task group commander. The squadron is responsible for maintaining individual unit readiness. This includes the responsibility to deploy trained individuals, teams, detachments, or divisions for security missions globally, or deploy and employ the entire squadron in support of CCDR requirements. A typical MSRON will consist of a headquarters staff that includes logistics support, consolidated maintenance, and support services; a C2DIV that provides communication and sensor support capabilities; a BOATDIV that provides waterborne defense; and a SECDIV that provides ground defense and embarked vessel security teams.

d. C2DIV. Commissioned, echelon 6, deployable operating unit equipped with the sensor systems (e.g., various ground sensors, unmanned vehicles, etc.), communications, and other associated support equipment. C2DIVs provide command, control, surveillance, and reconnaissance capabilities for an integrated C4ISR asset capable of self-sustained support to the units. C2DIVs routinely operate with BOATDIV and SECDIV assets to provide a force package with command, control, communications, and surveillance capability. A C2DIV normally consists of one communications detachment (COMMSDET) and one sensor detachment (SENSORDET).

e. BOATDIV. Commissioned, echelon 6, deployable operating unit equipped with armed patrol craft and associated supporting equipment. BOATDIVs routinely operate with other MESF assets such as C2DIV and SECDIV detachments to provide an enhanced force package for conducting small craft security and support for MESF operations in harbors, harbor approaches and near shore littoral areas. A BOATDIV consists of at least two maritime expeditionary boat detachments (BOATDETs).

f. SECDIV. Commissioned, echelon 6, deployable operating unit that provides high-end security, interdiction, and point defense of designated assets. SECDIVs provide security for designated afloat assets as embarked security teams (ESTs), designated ground protection, e.g., entry control points (ECPs), convoy, etc., and military air assets at inland airfields. SECDIVs may operate independently, in close coordination with other naval security assets or with other MESF assets in the inshore harbor environment. A SECDIV consists of at least two maritime expeditionary security detachments (SECDETs).

5. Action. Request Commander, NECC, periodically review enclosures (1) through (9) and recommend changes to the Chief of Naval Operations (Attn: Navy Expeditionary Combat Branch (N857)) when mission or capabilities of the MESF are significantly altered. Change recommendations should include comments on the expected activity manning document impact.

6. Records Management. Records created as a result of this instruction, regardless of media and format, shall be managed in accordance with Secretary of the Navy Manual 5210.1.

**OPERATIONAL MISSION AREAS
FOR
MARITIME EXPEDITIONARY SECURITY FORCES**

1. MESHG provide centralized planning, control, coordination and integration of MESF assets for force protection of strategic shipping and units operating in the inshore/coastal area, anchorages and harbors. The MESHG is organized to provide administrative support, operational planning, movement planning, intelligence dissemination, organizational and training oversight and certification for subordinate units.

2. MSRONs have the capability to deploy C4ISR, security and boat assets in support of EXW operations worldwide. MSRONs function as the security/antiterrorism (AT) officer, seaward security officer (SSO) or harbor defense commander (HDC) in expeditionary operations. The MSRON may exercise operational authorities, as delegated by higher authority, over MESF forces assigned within the unified and/or allied command structure. In addition, MSRONs are structured to function within larger joint or allied ATF, MAGTF or JTF staffs. MSRONs provide fleet commanders and NCC planning, administration, direction and training of highly mobile, fully capable and equipped active and reserve detachments to perform intra-theater security and protection of maritime units: USN, Military Sealift Command (MSC) or commercial contract vessels, in transit, in ports or harbors, and at anchorage. The following primary (P) and secondary (S) warfare mission areas are assigned:

MARITIME EXPEDITIONARY SECURITY SQUADRON (MSRON)												
AMW	CCC	EXW	FHP	FSO	INT	IO	MIW	MOB	MOS	NCO	NSW	SUW
S	P	P	S	S	P	S	S	P	S	P	S	S

AMW = Amphibious Warfare; CCC = Command Control Communications; EXW = Expeditionary Warfare; FHP = Force Health Protection; FSO = Fleet Support Operations; INT = Intelligence Operations; IO = Information Operations; MIW = Mine Warfare; MOB = Mobility; MOS = Missions of State; NCO = Non-Combat Operations; NSW = Naval Special Warfare; SUW = Surface Warfare

3. C2DIVs are capable of maintaining the operational picture in support of large expeditionary operations, asset protection, and

PSHD in the littoral environment through the use of associated communications equipment. This provides a MSRON with the capability to provide operational planning, logistics coordination, intelligence and surveillance support to joint operational commanders exercising overall control of MESF assets. This is accomplished through the employment of various ground, surface, and subsurface sensors and unmanned vehicles, providing a comprehensive tactical picture in the near shore littoral environment. The following primary and secondary warfare mission areas are assigned:

MARITIME EXPEDITIONARY COMMAND AND CONTROL DIVISION (C2DIV)														
AMW	ASW	AW	CCC	EXW	FHP	FSO	INT	IO	MIW	MOB	MOS	NCO	NSW	SUW
S	S	S	P	P	S	S	S	S	S	P	S	P	S	P

AW = Air Warfare; ASW = Antisubmarine Warfare

4. BOATDIVs have the capability to deploy armed patrol craft in support of worldwide EXW operations in harbors, harbor approaches, and near shore littoral areas. BOATDIVs provide waterborne interdiction and surveillance assets to the security/AT officer, SSO or HDC in expeditionary operations. They routinely operate with other MESF assets, e.g., C2DIVs and SECDIVs, and other USN, joint, coalition and host nation forces. BOATDIVs may be assigned within the unified and/or allied command structure. The following primary and secondary warfare mission areas are assigned:

MARITIME EXPEDITIONARY BOAT DIVISION (BOATDIV)													
AMW	ASW	CCC	EXW	FHP	FSO	INT	IO	MIW	MOB	MOS	NCO	NSW	SUW
S	S	S	P	S	S	S	S	S	P	S	P	S	P

5. SECDIVs provide intra/inter-theater security and protection of Navy assets (USN, MSC or commercial contract vessels) in transit, in ports or harbors, and at anchorage. SECDIVs are capable of providing or augmenting landward security in support of USN and MSC ships, and can also provide security for air assets on inland airfields or as an embarked aircraft security team. SECDIVs provide layered defensive protective functions to the security/AT officer or landward security officer (LSO) and may operate with other MESF assets. SECDIVs may be assigned

within the unified and/or allied command structure. The following primary and secondary warfare mission areas are assigned:

MARITIME EXPEDITIONARY SECURITY DIVISIONS (SEC DIV)													
AMW	AW	CCC	EXW	FHP	FSO	INT	IO	MIW	MOB	MOS	NCO	NSW	SUW
S	S	S	P	S	S	S	S	S	P	P	P	S	P

6. ROC symbols are used to specify the desired level of achievement of readiness or other work for or during a particular readiness condition. Readiness normally applies to operations and/or evolutions, while other work refers to non-watch activity such as performing maintenance or training.

CAPABILITIES

"F" = "Full" The capability is to be fully achieved. For operational functions (watches), this means that installed equipment or systems will be fully manned to design capability.

"L" = "Limited" The capability is to be only partially realized. Even though only limited capability is realized, it is to be sustained. A limiting statement specifying the limitation must support every "L".

**PROJECTED OPERATIONAL ENVIRONMENT
FOR
MARITIME EXPEDITIONARY SECURITY SQUADRONS**

1. MSRONS are multi-service (Navy/Coast Guard) hardware-equipped, deployable assets that provide centralized planning, control, coordination and integration of MESF assets for protection of strategic shipping and naval vessels operating in the inshore/coastal area, anchorages and harbors, from bare beach to sophisticated port facilities. MSRONS function as the security/AT officer, SSO or HDC during EXW operations with tactical control of assigned MESF units to ensure the uninterrupted flow of cargo and units to the CCCR. MSRONS ensure established terminal facilities and JLOTS staging areas are protected from waterborne threats. MSRONS can operate as a supporting element to an ESG, ATF, MAGTF, or a JTF. When operating independently or with other MESF assets, the MSRONS, through the use of fused sensors and intelligence feeds, can anticipate and defeat level I and level II threats, to include asymmetric terrorist attacks. The MSRONS has the ability to operate day and night, in climate extremes ranging from cold to tropical to desert environments.
2. MSRONS are routinely exercised under the operational authorities of an expeditionary echelon commander or a specific task force commander. The MSRONS will typically exercise tactical control over its C2DIVs, SECDIVs and BOATDIVs, as well as other assigned MESF or assigned/attached assets.
3. The MSRONS is the largest MESF unit to deploy and may operate independently or in support of other security forces. A deployed MSRONS will normally consist of a squadron staff that includes logistics support, consolidated maintenance, and support services; one C2DIV consisting of one COMMSDET and one SENSORDET; one BOATDIV that consists of two or more BOATDETs; and a SECDIV that consists of two or more SECDETs. Two or more MSRONS may be combined to form a large AFP under a single MESF echelon commander. The squadron is responsible for maintaining individual unit readiness. This includes the responsibility to deploy trained individuals, teams, detachments, or divisions for security missions globally, or deploy and employ the entire squadron in support of CCCR and Navy requirements.

27 Jan 2010

4. The most demanding operating environment anticipated for the MSRON is an operation from a sea base to shore areas in wartime with designated joint and/or combined forces, while exercising control over assigned units. Operations in this expeditionary environment will require the establishment of a self-sustaining base camp that can support MESF operations around the clock for not less than 30 days. The MSRON will operate where designated assets are vulnerable to attack from land, seaward, air, and inland waterway approaches in ports, at anchorages, in harbors or other near shore littoral areas.

5. Peacetime operations in near shore littoral areas are also very demanding. These operations are frequently characterized by confined and congested air, land and maritime space occupied by friends, unknowns and neutrals. This environment makes identification and coordination profoundly difficult and reaction time critical. The MSRON commander will coordinate the assets assigned to ensure protection of shipping and vessels in the near shore littoral environment. Additionally, the MSRON will provide logistical support to all assigned units. Most operations in the littoral environment will be conducted in a joint, allied, combined, or multi-national scenario.

6. The MSRON will be task organized as part of an AFP designed to meet the operational requirements of the CCDR, JFMCC/NCC. It will support existing and evolving missions in major operations, MSO, or MHS/MHD.

7. In the role of SSO or HDC, the MSRON is capable of maintaining situational awareness in support of large expeditionary operations or more limited PSHD. This may include host nation coordination, logistics and intelligence support, deliberate and crisis response operational planning, and support to joint operational commanders exercising overall control of MESF or other assets. The MSRON, with an assigned C2DIV, can also exercise control over MESF or other units assigned; in this case, the MSRON concentrates on coordination issues while time-sensitive decisions are made by subordinate assigned units.

**PROJECTED OPERATIONAL ENVIRONMENT
FOR
MARITIME EXPEDITIONARY COMMAND AND CONTROL DIVISIONS**

1. C2DIVs consist of one or more COMMSDETs and one or more SENSORDETs. The COMMSDET is responsible for the maintenance, operability and set-up of all communications and intelligence equipment that the C2DIV will use. The SENSORDET is responsible for the maintenance, operability and set-up of expeditionary sensors, including unmanned vehicles, and will maintain a 24-hour tactical operations center. The C2DIV is capable of maintaining the common operational picture (COP) in support of large expeditionary operations, security and PSHD in the near shore littoral environment through the use of associated communications and surveillance equipment. The C2DIV through the use of fused sensors and intelligence feeds can anticipate and identify level I and level II threats, to include asymmetric terrorist attacks. The C2DIV will have the ability to operate day and night, in climate extremes ranging from cold weather to tropical to desert environments. The C2DIV are routinely exercised under the control of the MSRON to which it is assigned. The C2DIV will exercise control over its assigned/attached units or detachments.

2. The most demanding operating environment anticipated for the C2DIV is an operation from a sea base to shore areas in wartime with designated joint and/or combined forces, while exercising with other assigned units. Operations in this environment will require the establishment of a self-sustaining base camp that can support MESF operations around the clock for not less than 30 days. The COMMSDET shall be capable of operating its communications and command and control systems with technical and tactical watch standers including a supervisor. The C2DIV will provide command-level watch standers, such as the force security officer. The SENSORDET shall be capable of operating its assigned sensor and communications suite with technical and tactical watch standers including a supervisor, who may serve as either LSO or SSO. Assignment of both of these functions to the SENSORDET simultaneously may require staff augmentation from the C2DIV staff. C2DIVs will operate where designated assets are vulnerable to attack from land, seaward, air, and inland waterway approaches in ports, at anchorages, in harbors or other near shore littoral areas.

27 Jan 2010

3. Peacetime operations in near shore littoral areas are also very demanding. These operations are frequently characterized by confined and congested water and air space occupied by friendly, unknown and potentially hostile forces. This environment makes identification and coordination profoundly difficult and reaction time critical. Additionally, the C2DIV can operationally support other activities as the communications and surveillance element of an AFP, providing essential communications and surveillance when required. The C2DIV will maintain the ability to conduct operations in a joint, allied, combined, or multi-national peacetime operations. The C2DIV must be able to operate in conjunction with the littoral combat ship (LCS)/joint high speed vessel (JHSV)/global fleet station (GFS) to facilitate TSC initiatives, as well as to provide off-shore critical infrastructure protection support.

4. The C2DIV will be task organized as part of AFPs, designed to meet the operational requirements of the CCDR, JFMCC or NCC to support existing and evolving missions in major operations, MSO, or MHS/MHD.

5. The C2DIV provides command, control, communications, and surveillance support for operational commanders, providing a comprehensive COP in the near shore littoral environment. It can assist the AFP or MSRON commander with operational planning for deliberate or crisis response, and is a key component for the overall control of MESF assets.

**PROJECTED OPERATIONAL ENVIRONMENT
FOR
MARITIME EXPEDITIONARY BOAT DIVISIONS**

1. BOATDIVs consist of two or more BOATDETs. BOATDIVs are hardware-equipped, deployable assets which provide waterborne interdiction and surveillance patrol craft for protection of shipping, naval vessels, and other designated assets in the inshore/coastal area, anchorages and harbors, from bare beach to sophisticated port facilities. In addition, BOATDIVs can provide limited CCC and surveillance support to the security officer, AT officer, SSO or HDC during operations to support uninterrupted flow of cargo and units. BOATDIVs operate near established terminal facilities and JLOTS staging areas to assist in the protection of HVAs from waterborne threats. BOATDIVs provide MESF asset support for re (MIW) missions, AMW missions, MPF missions (including JLOTS and AFOE offload operations), Harbor Approach Defense and Harbor Defense Port Security missions, and designated asset escort security missions. BOATDIVs can operate as a supporting element to the ATF, MAGTF, CTF/Commander Task Group or a JTF. When operating independently or with other MESF assets, the BOATDIV through the use of fused sensors and intelligence feeds can anticipate and defeat level I and Level II threats, to include asymmetric terrorist attacks. The BOATDIV will have the ability to operate day and night, in climate extremes ranging from cold weather to tropical to desert environments, in the near coast, inshore, and harbor/port environments.

2. BOATDIVs are routinely exercised under the control of an assigned MSRON. The BOATDIV is capable of exercising control over its organic detachments and limited control over other waterborne craft assigned in support of interdiction and surveillance operations (e.g., USCG Port Security Unit or host nation patrol craft).

3. The most demanding operational environment anticipated for the BOATDIV is an operation from a sea base to shore areas in wartime with designated joint and/or combined forces, while exercising control over assigned AFP units. Operations in this expeditionary environment will require establishing a self-sustaining base camp that can support MESF operations for not less than 30 days. The BOATDIV will operate where designated assets are vulnerable to attack from land, maritime, air, and

27 Jan 2010

inland waterway approaches in ports, at anchorages, in harbors or other near shore littoral areas. Each BOATDET shall be capable of operating around the clock with at least four fully-manned craft deployed simultaneously. The four craft may be called upon to operate together under a single patrol leader (as may be appropriate during an HVA transit mission) or divided into two craft patrols, each operating independently under separate patrol leaders (as may be required in a PSHD or harbor approach defense mission). Patrol leaders shall likewise be able to sustain operations for not less than 30 days. The boats shall be capable of sustained around the clock operation, rotating crews periodically as necessary to maintain operational efficiency. Combatant craft will likely be required to return pier side or to a sea base for periodic fueling, provisioning, and routine maintenance. Each BOATDET shall be equipped with sufficient boats to allow for continuous four boat operation, with additional boats available as necessary to support phased maintenance availabilities and crew rotation without loss of protective capability.

4. Peacetime operations in near shore littoral areas may be equally demanding. These operations are frequently characterized by confined and congested air, land and maritime space occupied by friends, unknowns and neutrals. This environment makes identification and coordination profoundly difficult and reaction time critical. The BOATDIV will serve as a waterborne interdiction and surveillance asset to ensure seaward protection of shipping and vessels in the near shore littoral environment. Most operations in the near shore littoral environment will be conducted in a joint, allied, combined, or multi-national scenario. BOATDIVs are capable of augmenting existing Navy security forces during elevated threat levels to provide port security and general waterborne security and may also be deployed in support of USCG MHS missions either as detachments or as individual augmentees. This force will, in coordination with USCG, provide protection for Navy units within the continental United States (CONUS) when directed by higher authority or in conjunction with host/tenant agreements. Additionally, the BOATDIV can operationally support other units as the waterborne security element of an AFP, providing essential security and protection when required.

27 Jan 2010

5. The BOATDIV will be task organized as part of an AFP, designed to meet the operational requirements of the CCDR, JFMCC NCC to support existing and evolving missions in major operations, MSO, or MHS/MHD.

6. The BOATDIV provides the expeditionary community with waterborne interdiction and surveillance through the use of shallow draft, high speed, armed patrol craft. Depending on the operational tempo, all patrol craft require daily refueling. The craft are designed to operate in conditions up to NATO Sea State 4 and have an on-station endurance of approximately 13 hours (limited by fuel and operational speed). The craft has navigational radar, secure and non-secure UHF/VHF communications, Global Positioning System (GPS), hand-held night observation devices, crew-served weapons, small arms, and concussion grenades. BOATDIVs routinely conduct layered defense operations to protect HVAs within the protected waters of a port or harbor, anchorages and approaches. However, the operating area may be extended to open ocean coastal waters when environmental conditions permit.

**PROJECTED OPERATIONAL ENVIRONMENT
FOR
MARITIME EXPEDITIONARY SECURITY DIVISIONS**

1. SECDIVs consist of two or more SECDETs. SECDIVs have the capability to conduct security operations worldwide. SECDIVs will conduct high-end protection and security for designated assets, providing layered defense in an integrated coastal and landward security environment. They provide integrated maritime expeditionary security capabilities, including mobile and fixed defensive operations, robust security in support of operations across the spectrum of engagement from major operations phase 0 through phase V and support NCC TSC operations including training capability for partnering with other nations and support for host nation security, stabilization and reconstruction operations. SECDIVs provide security operations in support of logistics force flow from the sea in a JLOTS, MPF or an amphibious objective area - AFOE environment. SECDIVs support Riverine forces by providing additional security (e.g. pier, facility or afloat base). SECDIVs may provide security for MCM assets and shore staging areas in the joint operating area/AO. SECDIVs through the use of fused sensors and intelligence feeds can anticipate and defeat level I and level II threats, to include asymmetric terrorist attacks. They will have the ability to operate day and night, in climate extremes ranging from cold weather to tropical to desert environments, in the near coast, inshore, and harbor/port environments. SECDIVs are routinely exercised under control of an assigned MSRON. The SECDIV will exercise control over its organic detachments, as well as other assigned MESF and/or unit assets.

2. The most demanding operating environment anticipated for the SECDIV is an operation from a sea base to shore areas in wartime with designated joint and/or combined forces, while exercising control over assigned AFP units. Operations in this expeditionary environment will require establishing a self-sustaining base camp that can support MESF operations for up to 30 days. SECDIVs will operate where designated assets are vulnerable to attack from land, maritime, air, and inland waterway approaches in ports, at anchorages, in harbors or other near shore littoral areas. Operations could include SECDET personnel serving as ESTs in support of MSC units. A SECDET would require the manning to support up to four large (15 person) and one small/medium (5-10 person) sized ship on a

27 Jan 2010

standard deployment. Further operations could include gas/oil platform (GOPLAT) or critical infrastructure defense. A SECDET requires the manning to adequately defend up to two GOPLATS simultaneously for a standard deployment.

3. Peacetime operations in near shore littoral areas are also very demanding. These operations are frequently characterized by confined and congested air, land and maritime space occupied by friends, unknowns and neutrals. This environment makes identification and coordination profoundly difficult and reaction time critical. Additionally, the SECDIV can operationally support other units as the security element of an AFP providing essential security and protection when required. The SECDIV will maintain the ability to conduct operations in a joint, allied, combined, or multi-national peacetime operations. The SECDIV must be able to operate in conjunction with the LCS/JHSV/GFS to facilitate TSC initiatives, as well as provide off-shore critical infrastructure protection. SECDIVs may be used to provide protection for MSC assets and Navy assets in non-Navy ports. SECDIVs are capable of augmenting existing Navy security forces during elevated threat levels to provide AT expertise, port security and general security and may also be deployed in support of USCG MHS missions either as detachments or as individual augmentees. This force will provide, in coordination with USCG, protection for Navy units within CONUS when directed by higher authority or in conjunction with host/tenant agreements. Also, SECDIVs may be called upon to support other law enforcement agencies by providing DSCA, which incorporates aspects of MSCA, military support to civilian law enforcement agencies, and MACDIS.
