## Use of RAD Mixture Tool in Consequence Assessment

- Consequence assessment phases:
  - Activation
  - Timely Initial Assessment
  - **Ongoing Assessment**
  - **Recovery**

# Why RAD Mixture Tool Was Created

- Hazard Assessments (HA) modeled radiological mixtures by common isotopes
  - Halogens, Noble gases, Actinides, etc.
    - Results presented by mixture of each
  - Final result is from mixtures of mixtures
- Need:
  - Way to rapidly create and modify mixtures of radiological mixtures

## Problems Encountered in Ongoing Assessment

- Two or more containers involved
- Multiple mixtures involved
- 49 isotope limit in HOTSPOT

# RAD Mixture Tool Key Features

- Combines HOTSPOT mixture libraries
- Editing capabilities for mixtures of mixtures
  - Adjust source terms (mixtures and isotopes)
  - Delete isotopes
- Resolves 49 isotope limit

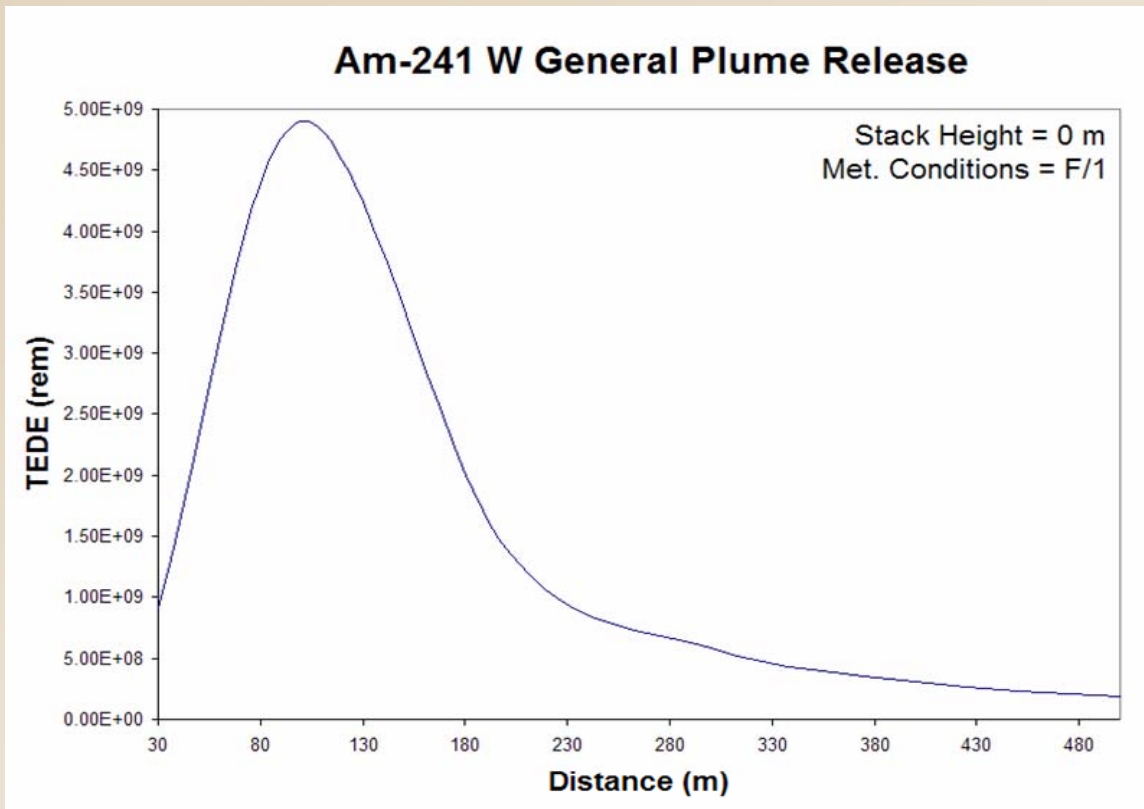

## Resolving 49 Isotope Limit

Question: What isotopes can be discarded from a mixture of over 49 radionuclides without impacting results?

Answer: Those with the smallest *distance-weighted dose*

# Example Dose vs. Distance Curve

Consequences  
Depend on:

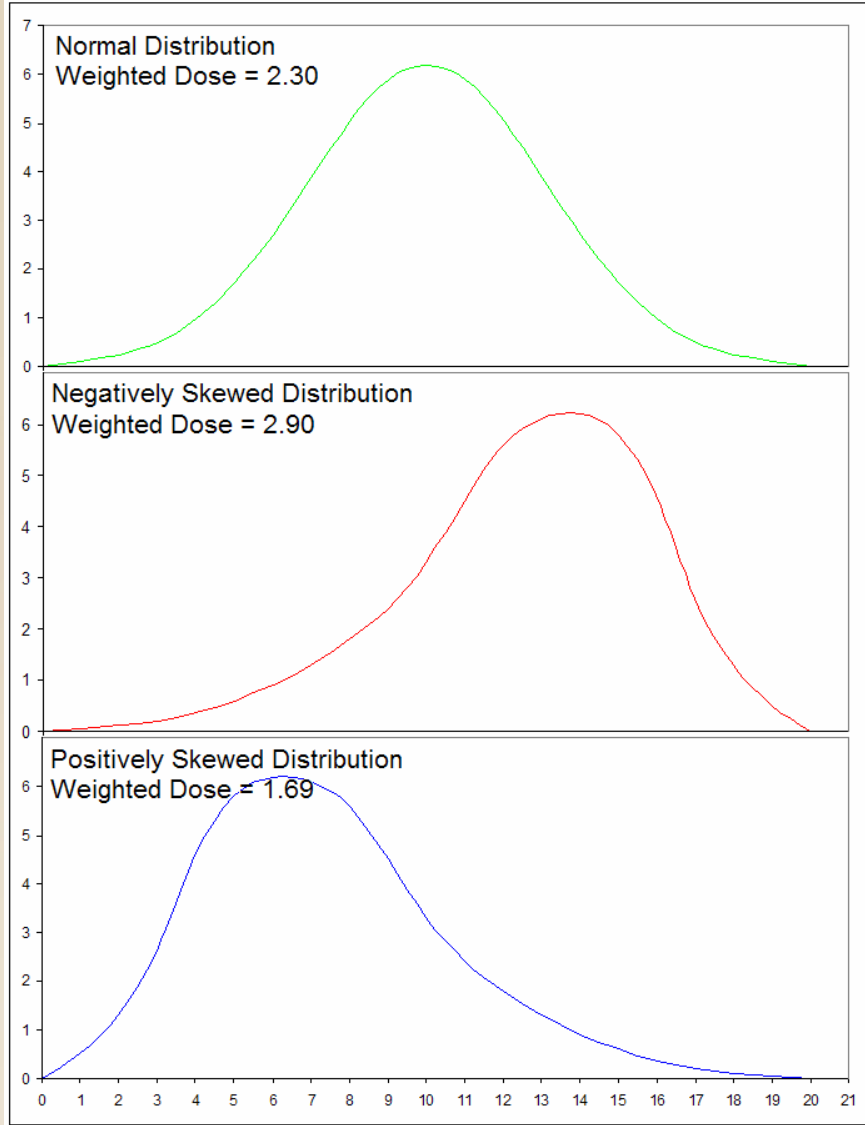

Dose

**AND**

Distance

## Distance- Weighted Dose

## Distance Weighted Dose

- A measure of the significance of a radionuclide in an overall mixture
- Consistent across modeling scenarios
- Easy to calculate

# RAD Mixture Tool Features

- Expanding/collapsing information
- Tracking number of isotopes in mixture of mixtures
  - Total and unique isotopes
  - Total curies of mixture of mixtures
  - Number of mixtures
- Change activity by fraction or total amount
- Easy to add consequence database information
- Filter by desired number of isotopes or by threshold of total distance weighted dose

## Use

- Part of a CAT tool set
- Process for dealing with radiological mixtures:
  - Use pre-defined mixtures
  - Build/modify mixtures from pre-defined mixtures
  - Create mixtures (using HOTSPOT)
  - Use surrogates
    - Defined for radiological facilities
    - Based on hazard category 3 values
