² Less than 5,000.

formed a relatively small proportion—only one-sixth—of the 3.5 million widows under age 65. Fewer than 1 in 25 were under age 35. More than half were aged 55-64.

Orphans also are much more heavily concentrated at the older than at the younger ages, as shown in table 2. Moreover, the younger the child is, the more frequent the insurance benefits, as shown by the following figures on the proportion of paternal orphans with old-age and survivors insurance benefits in current-payment status at the end of December 1954:

A ge Per	cent
Under 5	64
5-9	60
10–14	57
15-17	41

The higher beneficiary rates for younger children mean that benefits are most likely to go to those for whom income support is most urgent. when the mother should be in the home to care for a young child instead of being away at work. This difference, however-at least below the age when children may start work—is likely to disappear in the future because it reflects the fact that the older the orphan the more likely it is that his father had died at a time when the coverage of the old-age and survivors insurance program was more restricted.

Old-Age Insurance Benefit Awards, January-June 1955

During the first half of 1955, oldage benefits were awarded to nearly 511,000 persons, a record number. The previous high, established in the first 6 months of 1951, was due primarily to the liberalized insured-status provisions of the 1950 amendments. The sharp increase in January-June 1955 was due mainly to the liberalization in the retirement test under the 1954 amendments. These later provisions, which became effec-

tive in January 1955, changed the earnings test for wage earners from a monthly to an annual basis, raised to \$1,200 the amount that beneficiaries can earn in a year before any benefits are withheld, and lowered from 75 to 72 the age at which beneficiaries can receive benefits regardless of the amount of their earnings. Thus, many persons between age 72 and age 75 and others under age 72 with moderate earnings, who had delayed filing for benefits because they were working in covered employment, filed and began receiving monthly benefits.

² Less than 0.5 percent.

About 84 percent of the beneficiaries awarded old-age benefits in the first half of 1955 were eligible for the dropout-that is, up to 5 years of lowest earnings could be excluded in the calculation of their average monthly wage (table 1). A worker is eligible for the dropout if he has 6 quarters of coverage after June 1953, or if he first becomes eligible (that is, fully insured and aged 65 or over) for old-age benefits after August 1954. Of the awards made in 1954 under the 1954 amendments, only 24 percent were eligible for the dropout-a percentage that is understandably low since (1) awards in this period included a large proportion made to beneficiaries first eligible for benefits before September 1954, and (2) the fourth quarter of 1954 marked the first time beneficiaries could qualify for the dropout on the basis of 6 quarters of coverage after June 1953.

It was recognized that the percentage eligible for the dropout would increase rapidly, leaving ineligible only a small group—those who have been eligible for benefits since August 1954 or earlier and who do not have sufficient work after June 1953. The figure for the first half of 1955 also showed the effect of the liberalized retirement test; virtually all workers filing because of that provision qualify for the dropout.

Awards to persons whose benefits were based on earnings after 1950 and who were eligible for the dropout are likely to be typical of future awards; this group made up 69 percent of all old-age benefit awards made in January-June. In 1954, only 16 percent of the old-age benefits awarded under the 1954 amendments

average monthly wage.

² Less than 0.5 percent.

were based on earnings after 1950 and awarded to persons eligible for the dropout.

For some workers, the dropout of years with low earnings does not produce a significant increase in the average monthly wage. If the worker had low earnings, it is often more advantageous to him to apply the 1952 benefit formula to the average monthly wage, calculated without the dropout, and to increase the resulting amount by means of the 1954 conversion table. Of those workers eligible for a benefit computation based on earnings after 1950 with the dropout, about 5 percent were awarded higher old-age insurance benefits under this alternative method of computation (for men, 3 percent; for women, 10 percent).

In some instances, workers eligible for a benefit computation based on earnings after 1950 were awarded higher benefits when the computation was based on earnings after 1936. Among workers eligible for a benefit computation based on earnings after 1950 with the dropout, about 7 percent were awarded higher old-age benefits based on earnings after 1936 (for men, 6 percent; for women, 9 percent).

In all, about 23 percent of the oldage benefits awarded in the first 6 months of 1955 were based on earnings after 1936; this percentage varied from 18 percent among persons eligible for the dropout to 48 percent among those not eligible.

Age distribution.—Awards to persons benefited by the liberalization in the retirement test had a significant effect on the age distribution. Of all workers aged 65-74 who filed for benefits as a result of these liberalizations, it is estimated that about half were aged 72-74. Consequently, old-age benefit awards to persons aged 70-74 made up 26 percent of the total in the first half of 1955 (table 2), compared with 17 percent

in 1954. As in previous years, awards of benefits based on earnings after 1936 were concentrated at age 65; many persons in this group had no current earnings and filed for benefits as soon as they reached the retirement age.

Average monthly benefit.—The average old-age benefit awarded in January-June 1955 was \$70.91, an increase of \$4.55 from the average monthly amount awarded in 1954 under the 1954 amendments. The higher average benefit was due chiefly to the increase in the proportion of beneficiaries eligible for a benefit computation with the dropout. The average monthly amount awarded on the basis of earnings after 1950 to persons eligible for the dropout was \$79.83 (for men, \$84.98; for women, \$65.01) (tables 3 and 4).

Distribution by size of benefit.—A provision of the 1954 amendments raised the maximum taxable annual earnings from \$3,600 to \$4,200, beginning in 1955. The maximum old-age benefit award in 1954 was \$98.50. based on an average monthly wage of \$300; the maximum possible in the first half of 1955 was \$103.50, based on an average monthly wage of \$325. For old-age benefit awards in the first 6 months of 1955, minimum benefits of \$30 were payable in 11 percent of the cases (table 5), while benefits of \$90 or more were payable in 30 percent of the cases. The corresponding figures for 1954 awards under the 1954 amendments were 15 percent and 27 percent, respectively. The shift toward higher benefits was due chiefly to the larger proportion of beneficiaries eligible for the dropout who were awarded benefits based on earnings after 1950; only 3 percent of them received the minimum amount and 42 percent received \$90 or more (table 6).

Life Insurance In Force As Survivor Benefits Under OASI, 1955 *

Estimates have recently been made of the amount of life insurance that would have to be in force under

^{*} Prepared in the Division of the Actuary, Social Security Administration.
