Site Hydrology Summary

Site: Shiprock, NM

Sampling Period: March 3-7, 2003

SUMMARY CRITERIA

- 1. Did concentrations in water from any domestic wells sampled exceed a ground water standard, a primary drinking water standard, or health advisory?**

Domestic wells were not sampled during this event.

- 2. Were standards exceeded at any point-of-compliance wells?**

No point-of-compliance wells have been established at the Shiprock site.

- 3. As a result of this sampling round, is there any indication of unexpected contaminated ground water movement?**

The distribution and rate of movement of contaminated ground water at the site was assessed in the Final Site Observational Work Plan (SOWP) issued in November 2000. Ground water sampling data from this sampling round did not indicate any unexpected movement of contaminated ground water outside of what was portrayed in the SOWP. Uranium and nitrate continue to be elevated in terrace well 817 just west of the disposal cell. Wells with sample concentrations that exceeded UMTRA ground water standards are listed in Table 1. Graphs that show nitrate, selenium, and uranium concentrations versus time for selected floodplain and terrace wells are included in this report.

- 4. Is there statistical evidence that UMTRA Project related contaminants were detected in a surface body of water in greater concentrations than upstream ambient water quality?**

Yes. Surface water concentrations were compared to statistical benchmark values derived using data from 10 samplings of locations 888 and 898, which are upstream of the site on the San Juan River. Benchmark values for concentrations of nitrate and uranium were exceeded at river location 940, which is adjacent to where the ground water contamination plume discharges to the San Juan River (Table 2). The elevated concentrations generally occur at this location when the San Juan River is at a low stage, resulting in a lower dilution effect. Other locations that exceeded the benchmark values, mostly for concentrations of nitrate, selenium, and uranium, are listed in Table 2.

At location 655, which is a drainage channel on the floodplain, concentrations of nitrate, selenium, and uranium exceeded benchmark values (Table 2). These elevated concentrations reflect contaminated ground water from the terrace system to the south emerging as seeps along the escarpment and flowing down to the floodplain. The final SOWP indicated no unacceptable risks associated with exposure to this surface water.

At locations 887 and 959, which are both on a distributary channel of the San Juan River, concentrations of nitrate, selenium, and uranium exceeded benchmark values. San Juan River water flows through the distributary channel when the river stage is high; however, at the time of this sampling, the river stage was low and no river water was entering the channel. Therefore, the elevated concentrations at 887 and 959 reflect contaminated ground water emerging in seeps from the terrace system to the south. The final SOWP indicated no unacceptable risks associated with exposure to this surface water.

Additional surface water locations where benchmark values were exceeded, listed in Table 2, receive discharge of ground water from the terrace system and elevated concentrations are expected. In addition, the surface water at most of these locations is ponded; therefore, the elevated concentrations may be partly attributed to concentration by evaporation.

DATA ASSESSMENT

SHIPROCK, NEW MEXICO
MARCH 2003 SAMPLING
DATA ASSESSMENT SUMMARY

The DOE-GJO Analytical Laboratory analyzed samples and reported results for this sampling event under requisition number 18328 for the UMTRA ground water project.

METALS AND MAJOR CATIONS ANALYSIS

The determination of calcium, magnesium, manganese, potassium, sodium, and strontium were performed by inductively coupled plasma-atomic emission spectrometry (ICP-AES). Uranium was analyzed by inductively coupled plasma-mass spectrometry (ICP-MS). Selenium was determined by hydride generation atomic absorption spectroscopy (NaBH₄).

Some metal results were qualified with a "U" flag because of continuing calibration blank contamination. Several of the potassium results were qualified with a "J" flag for failing the serial dilution criteria. Qualified results are listed on the *Data Package Assessment* form, and the flags are listed in the data qualifiers column of the database printouts.

INORGANIC ANALYSIS

Chloride, nitrate, and sulfate were determined by ion chromatography (IC). Ammonium was determined by spectrophotometry (colorimetry).

FIELD ANALYSIS/ACTIVITIES

There were no wells with a measured pH greater than 9; therefore, "G" flags indicating potential grout contamination were not required. Two equipment blanks were collected and analyzed for the same constituents as the Shiprock environmental samples. There were no UMTRA related contaminants detected in the equipment blanks in concentrations above the contract required detection limit (CRDL); therefore, equipment blank results are considered acceptable. Three field duplicates were collected during the sampling event. Although there is no established regulatory criteria for the evaluation of field duplicates, the EPA guidance for *laboratory* duplicates was used. Duplicate sample results met these criteria and should be considered acceptable.

Results from wells sampled using the low-flow method were qualified with an "F" flag. Results from some wells were qualified with a "Q" flag because the well did not recover adequately (i.e., water level draw down while purging at less than 100 milliliters per minute) to be sampled with the low-flow method.

SAR

Because of technical constraints, a SAR could not be generated. Instead, data from this sampling event were compared to historical minimum and maximum values. Results that were greater than 150 percent of the historical maximum value or less than 50 percent of the historical minimum value (excluding results with less than 5 historical data points) are listed on the Anomalous Data Review Checksheets.

SUMMARY

All analytical quality control criteria were met except as qualified on the Ground Water Quality Data by Parameter, Surface Water Quality by Parameter, or equipment blank/trip blank database printouts. The meaning of data qualifiers is as defined on the UMTRA database printout or as defined in the USEPA Contract Laboratory Program Statement of Work for Inorganic Analysis, Multi-Media Multi-Concentration, Document Number ILMO2.0, 1991. All data in this package are considered validated and may be treated as final results.

A disk copy of the ground water, surface water, and equipment blank database printouts with the qualifiers incorporated are included in this package.

TRIP REPORT

Memorandum

Control Number N/A

DATE: April 1, 2003

TO: Sam J. Marutzky

FROM: Tony S. Franzone

SUBJECT: UGW Trip Report

Site: Shiprock, New Mexico.**Dates of Sampling Event:** March 3 through March 7, 2003.**Team Members:** Sam Campbell, Tony Franzone, Jeff Price, and Dave Traub.**Number of Locations Sampled:** 22 ground water monitor wells, 20 surface water locations, and 8 extraction wells were sampled.**Locations Not Sampled/Reason:** All wells scheduled for sampling were sampled; surface location 0958, which had no visible water was not sampled.**Field Variance:** None.**Well/Location Specific Information:** Well 1060 and surface location 0936 did not have enough water for field parameters or alkalinity testing. Wells 0615 and 0736 had roots removed from them. The nick point at surface location 0889 was washed out during a rain event, and water was sampled from an area upstream. Well 0734 was found to have roots in it. The water level for well 0832 is below the top of the pump.**Quality Control Sample Cross Reference:** Following are the false identifications assigned to the quality control samples:

False ID	True ID	Sample Type	Associated Matrix	Ticket Number
2000	0942	Duplicate	Surface Water	NDT-245
1090	1079	Duplicate	Ground Water	NDT-790
0616	0614	Duplicate	Ground Water	NDU-556
2001	Equipment Blank	Equipment Blank-Peristaltic	Surface Water	NDU-113
1091	Equipment Blank	Equipment Blank-Peristaltic	Ground Water	NDT-798

Requisition Numbers Assigned: The UGW requisition number is 18328.

Water Level Measurements: Water level measurements were taken on all sampled wells. The site lead also requested water levels be taken at additional wells. The values are recorded in the Shiprock Field Data Book.

Well Inspection Summary: Well inspections were conducted on all sampled wells. Sampled wells were in good condition.

Data Logger Download: 27 dataloggers were downloaded during this event.

Corrective Action: None.

Equipment: None.

Regulatory: None.

Site Issues: The protective netting found over surface location 0425 has a hole in it near the middle support.

Additional Action Required/Taken: None
