2005 Data

DOT HS 810 627

## State Alcohol Estimates

The following data provide estimates of alcohol involvement in fatal crashes for the United States and individually for the 50 States, the District of Columbia, and Puerto Rico (not included in the national totals). These estimates are based on data from NHTSA's Fatality Analysis Reporting System (FARS). Unfortunately, known blood alcohol concentration (BAC) test results are not available for all drivers and nonoccupants involved in fatal crashes. Missing data can result for a number of reasons, the most frequent of which is that persons are not always tested for alcohol.

To address the missing data issue, NHTSA has developed and employs a statistical model to estimate the likelihood that a fatal crash-involved driver or nonoccupant was sober, had some alcohol, or was intoxicated at the time of the crash. The statistical model is based on important characteristics of the crash including crash factors (e.g., time of day, day of week, type of crash, location), vehicle factors (e.g., vehicle type and role in the crash), and person factors (e.g., age, sex, restraint use, previous driving violations), and whether or not the State had a 21-year-old minimum drinking age law.

The statistical model was developed using all available known data in the aggregate (that is, at the national level) and applied to each individual driver and nonoccupant with an unknown BAC test result. The estimates presented include a mix of both known and estimated BACs.

A motor vehicle crash is considered to be alcohol-related if at least one driver or nonoccupant (such as a pedestrian or pedalcyclist) involved in the crash is determined to have had a BAC of .01 gram per deciliter (g/dL) or higher. Thus, any fatality that occurs in an alcohol-related crash is considered an alcohol-related fatality. The term "alcohol-related" does not indicate that a crash or fatality was caused by the presence of alcohol.

Great caution should be exercised in comparing the levels of alcohol involvement among States. Differences in alcohol involvement can be due to any number of factors not necessarily directly related to a State's alcohol traffic safety program. Factors affecting alcohol involvement in fatal crashes include:

- Population demographics and the economic environment (older drivers and female drivers exhibit lower levels of alcohol involvement, drivers of older vehicles exhibit higher levels of alcohol involvement, pedestrian fatalities as a group exhibit high levels of alcohol involvement);
- Degree of urbanization (alcohol involvement in single- and multi-vehicle crashes tends to be greater in urban fatal crashes, while alcohol involvement in nonoccupant fatal crashes is higher in rural areas);
- Types of vehicles (motorcycle drivers exhibit high levels of alcohol involvement followed by drivers of light trucks/vans; drivers of medium and heavy trucks exhibit the lowest levels of alcohol involvement).

One of the major differences among States is in the degree of testing for driver and nonoccupant BACs. These differences in testing affect the accuracy and reliability of the estimates presented, and for 2005 range from a low of 8 percent known BACs to a high of 82 percent known BACs. States with higher rates of known BACs yield estimates of fatal crash alcohol involvement with greater accuracy and precision.

## **Estimates of Alcohol-Involved Fatalities**

The following tables estimate alcohol involvement for the Nation and on a State-by-State basis for 1982 and 2005 using NHTSA's discriminant function model as applied to the FARS data. This model estimates BACs of drivers and nonoccupants when their BAC is not available. The estimates presented represent the combination of known and estimated BACs.

A driver or nonoccupant involved is considered alcohol-related if he/she is involved in the fatal crash and exhibits a BAC of .01 or greater (the last column on the right in the tables). A fatality is considered alcohol-related if any driver or nonoccupant involved in the crash had a positive BAC. Estimates are presented for four categories:

- (1) BAC of .00
- (2) BAC of .01-.07
- (3) BAC of .08 or greater
- (4) BAC of .01 or greater (the sum of (2) and (3)).

Nationwide in 2005, alcohol was involved in 39 percent of the traffic fatalities (BAC .01-.07, 5 percent; BAC .08 or greater, 33 percent), translating to 16,885 alcohol-related fatalities.

## Estimates of Alcohol-Involved Drivers

The following tables estimate alcohol involvement for the Nation and on a State-by-State basis for 1982 and 2005 using NHTSA's discriminant function model as applied to the FARS data. This model estimates BACs of drivers and nonoccupants when their BAC is not available. The estimates presented represent the combination of known and estimated BACs.

A driver or nonoccupant involved is considered alcohol-related if he/she is involved in the fatal crash and exhibits a BAC of .01 or greater (the last column on the right in the tables). Estimates are presented for four categories:

- (1) BAC of .00
- (2) BAC of .01-.07
- (3) BAC of .08 or greater
- (4) BAC of .01 or greater (the sum of (2) and (3)).

Nationwide in 2005, alcohol was present in 24 percent of the drivers involved in fatal crashes (BAC .01-.07, 4 percent; BAC .08 or greater, 20 percent).

## **Availability of Known BAC Test Results**

The following tables present the percentage of drivers and nonoccupants involved in fatal crashes where a BAC test was given and the results were in the FARS file. Individual tables are presented for all drivers/nonoccupants, fatally injured drivers and surviving drivers.

Nationwide in 2005, a total of 17,581 fatally injured drivers had BAC test results out of a total of 27,472, or 64 percent. For surviving drivers, BAC test results were known on 7,471 out of 31,632 drivers, or 24 percent.

Overall in 2005, FARS contained BAC test results on a total of 25,052 drivers out of 59,104 involved in fatal crashes, or 42 percent. Statistics for the base year 1982 are also presented. Any individual State proportion greater than the national percentage is considered good. The higher the proportion of drivers with known BAC test results, the more reliable the State estimate.

## **State-Level Estimates on a Regional Basis**

For the States in the various NHTSA regions, the following table summarizes the estimated percentages of fatalities that were alcohol-related (BAC of .01 or greater) in 1982 and 2005 and the estimated percentage of drivers involved in fatal crashes with BAC of .08 or greater.

Table 10

**Estimated Percent Alcohol-Related Fatalities and Drivers With BAC .08 or Greater in Fatal Crashes by Region and State, 1982 and 2005**

Region and State		Estimated Percent of Alcohol-Related Fatalities (Driver or Nonoccupant with BAC $\geq .01$ g/dL)		Estimated Percent of Drivers in Fatal Crashes with BAC $\geq .08$ g/dL	
		1982	2005	1982	2005
New England Region	Connecticut	69	44	43	23
	Maine	56	35	35	20
	Massachusetts	62	39	39	22
	New Hampshire	64	36	38	22
	Rhode Island	67	50	43	24
	Vermont	65	40	35	26
Eastern Region	New Jersey	59	35	31	16
	New York	52	37	28	18
	Puerto Rico	56	48	30	23
Mid-Atlantic Region	Delaware	67	49	40	23
	Dist of Columbia	61	55	30	26
	Maryland	56	38	32	17
	Pennsylvania	58	39	34	22
	Virginia	56	37	33	20
	West Virginia	54	34	35	20
Southeast Region	Alabama	58	37	36	21
	Florida	53	42	29	19
	Georgia	61	32	34	15

**For more information:**

Information on State alcohol estimates is available from the National Center for Statistics and Analysis, NPO-101, 400 Seventh Street SW., Washington, DC 20590. NCSA information can also be obtained by telephone or by fax-on-demand at 800-934-8517. Fax messages should be sent to 202-366-7078. General information on highway traffic safety can be accessed by Internet users at [www.nhtsa.dot.gov/people/ncsa](http://www.nhtsa.dot.gov/people/ncsa). To report a safety-related problem or to inquire about motor vehicle safety information, contact the Vehicle Safety Hotline at 888-327-4236.

Other fact sheets available from the National Center for Statistics and Analysis are *Overview, Alcohol, Bicyclists and Other Cyclists* (formerly titled *Pedalcyclists*), *Children, Large Trucks, Motorcycles, Occupant Protection, Older Population, Pedestrians, School Transportation-Related Crashes, Speeding, State Traffic Data, and Young Drivers*. Detailed data on motor vehicle traffic crashes are published annually in *Traffic Safety Facts: A Compilation of Motor Vehicle Crash Data from the Fatality Analysis Reporting System and the General Estimates System*. The fact sheets and annual Traffic Safety Facts report can be accessed online at [www.nhtsa.dot.gov/people/ncsa](http://www.nhtsa.dot.gov/people/ncsa).
