CARDIAC MECHANICS RESEARCH GROUP UCSD Jacobs Bioengineering & The Whitaker Institute

## Systems Biology

1. Choose a biological *model organism* suitable for quantitative study and genome level perturbations: *S. Cerevisiae*, *C. Elegans*, *D. Melanogaster*, mouse
2. Use *high-throughput technologies* to acquire data on biological components, their interactions and integrative functions under the *context of interest*
3. *Reconstruct interaction networks* from their annotated molecular components and interactions: transcriptional, metabolic, signaling, ...
4. *Develop predictive, quantitative models* of systems properties and integrative functions
5. Systematically *perturb components* to validate and refine models. Generate new hypotheses

## 1. Model Organism *Drosophila Melanogaster*

*Drosophila* is the most genetically tractable model organism with a circulatory system. A model for:

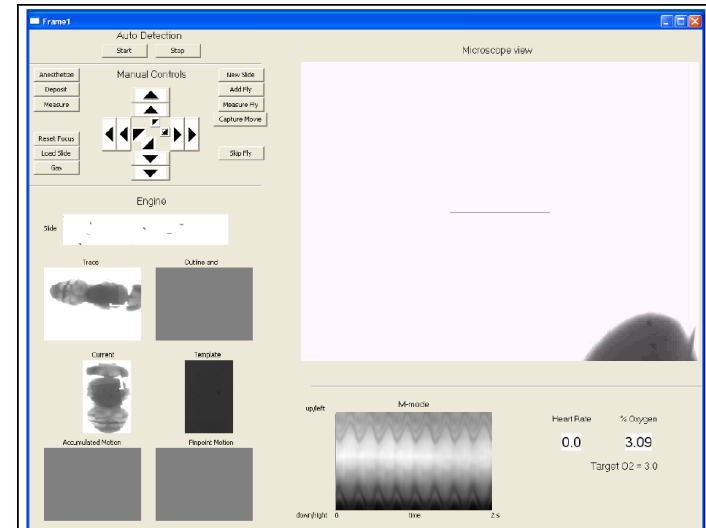

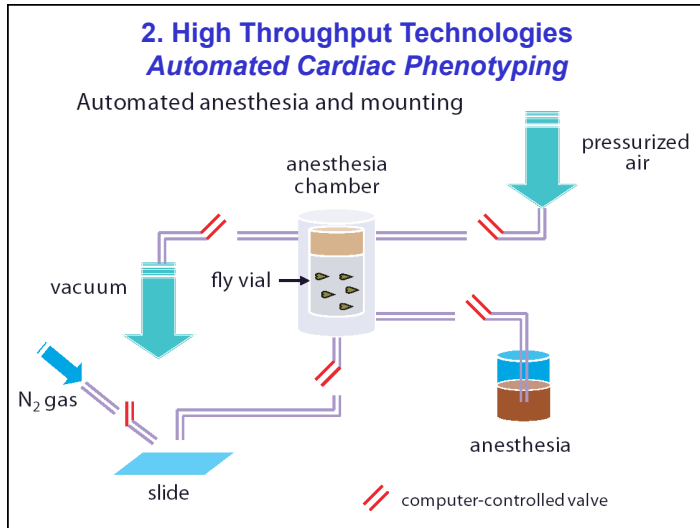

- Development
- Aging
- Nutrition
- Hypoxia tolerance

77% of human disease genes had a *Drosophila* homolog (Reiter, 2001)

Sequence similarity: Flies vs. humans

### 3. Reconstruct Interaction Networks

#### Genome-Scale Model of *Drosophila* Central Metabolism

- 142 genes, 115 reactions (74 associated with genes), 7 pathways
- Glycolysis, TCA cycle, oxidative phosphorylation,  $\beta$ -oxidation, amino acid degradation, glutathione redox cycle, superoxide production and scavenging
- Elementally- and charge-balanced

Metabolic network reconstruction

Gene-protein-reaction associations

*Drosophila* central metabolism

Feala JD et al (2008) *Prog Biophys Molec Biol* 96(1-3):209-225

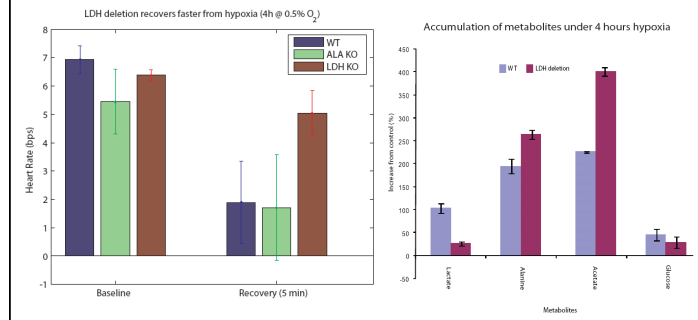

### 5. Analyze Perturbations

### LDH Knockout Heart Rate Recovery and Metabolite Accumulation

Feala J, Coquin L, McCulloch AD, Paternostro G (2007) Flexibility in energy metabolism supports hypoxia tolerance in *Drosophila* flight muscle: metabolomic and computational systems analysis. *Molecular Systems Biology* 17 Apr 2007;3:99

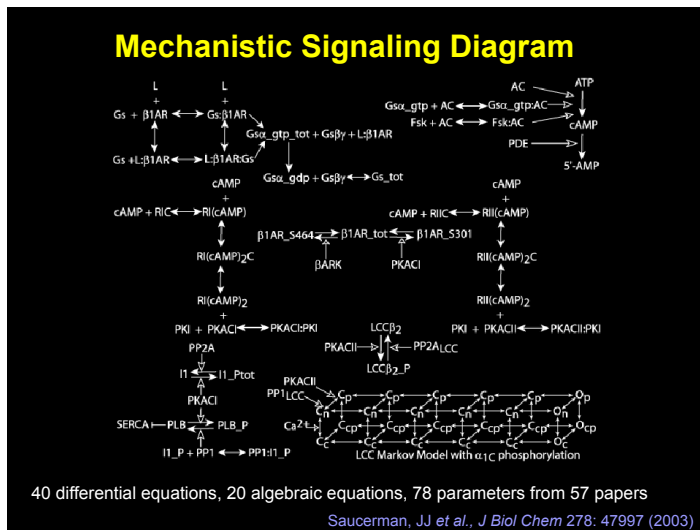

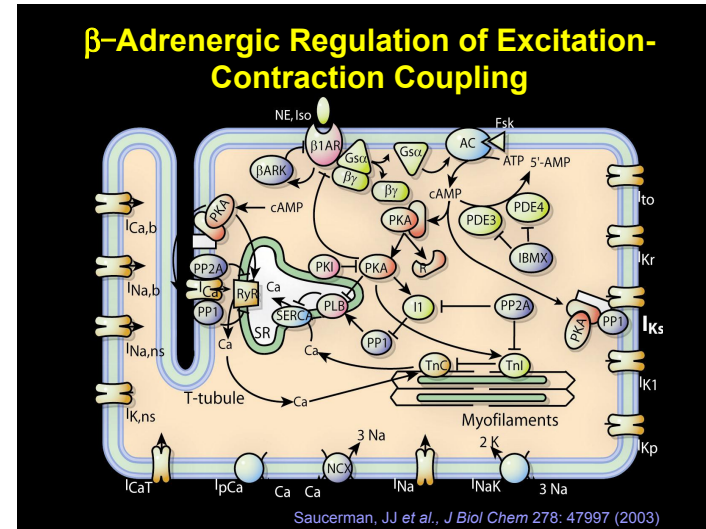

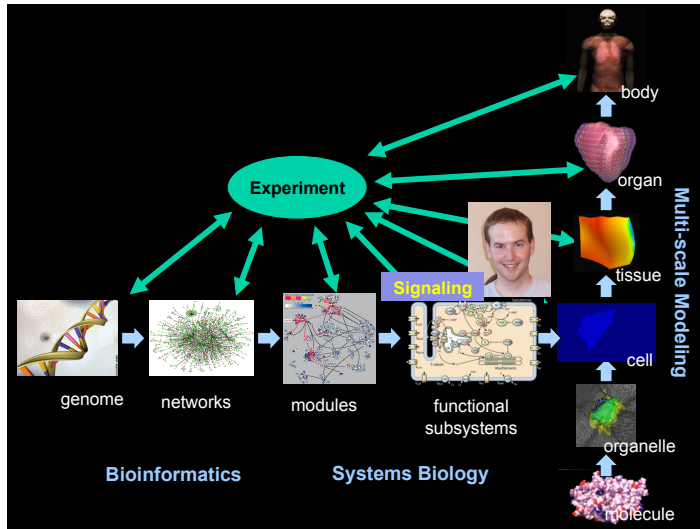

### Flux Balance Analysis of LDH deletion

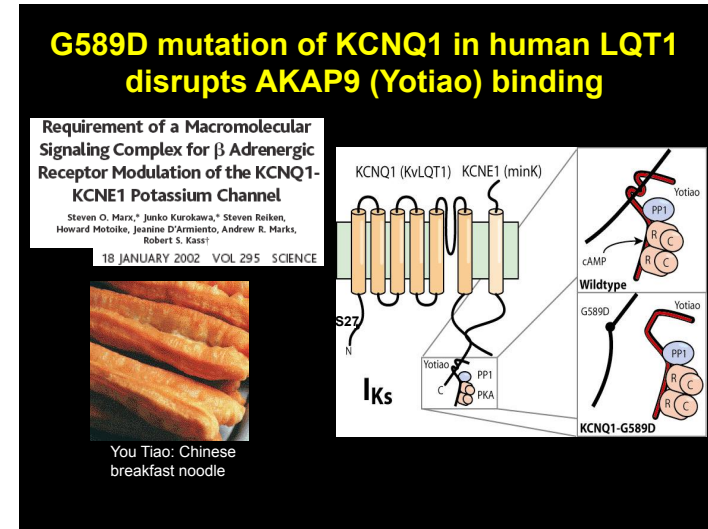

### 6. Generate New Hypotheses Pathway mechanisms of altered hypoxia tolerance

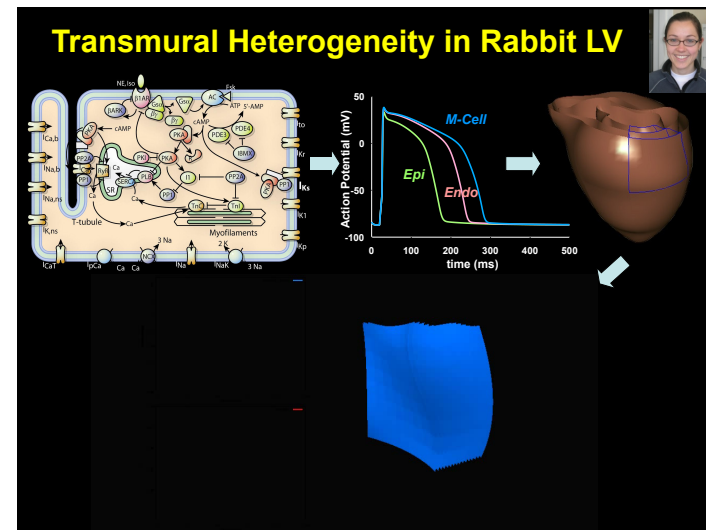

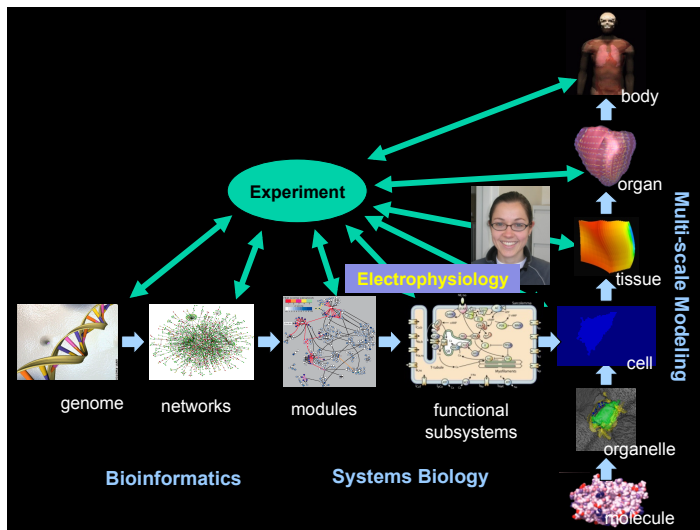

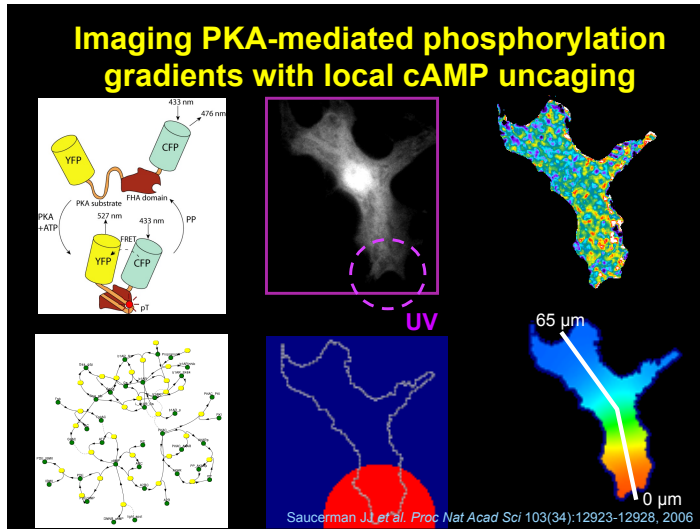

Coquin L, Feala JD, McCulloch AD, Paternostro G (2008) Metabolomic and flux-balance analysis of age-related decline of hypoxia tolerance in *Drosophila* muscle tissue. *Mol Syst Biol* 2008;4:233

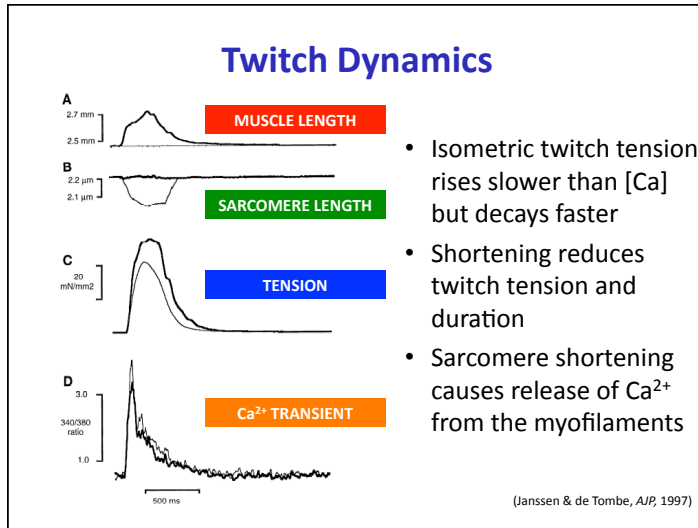

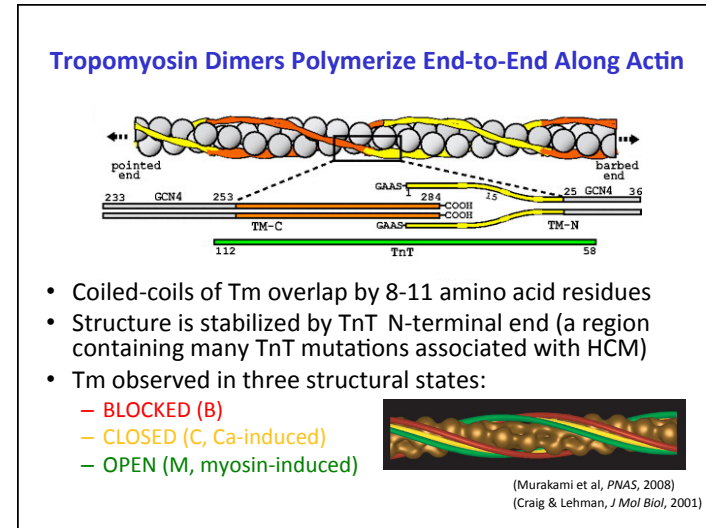

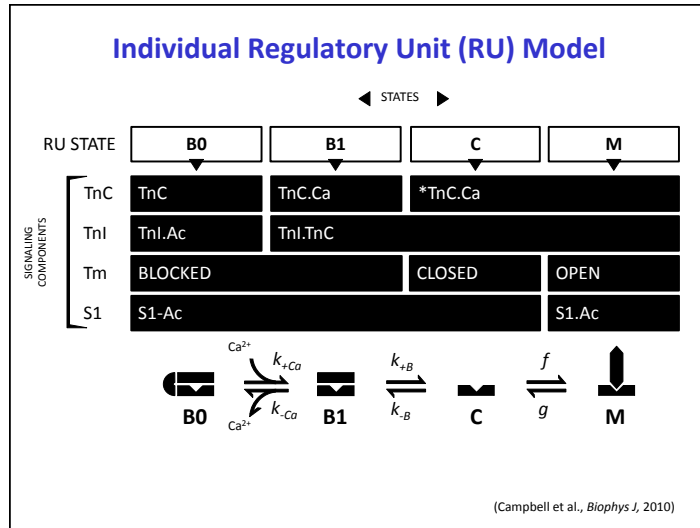

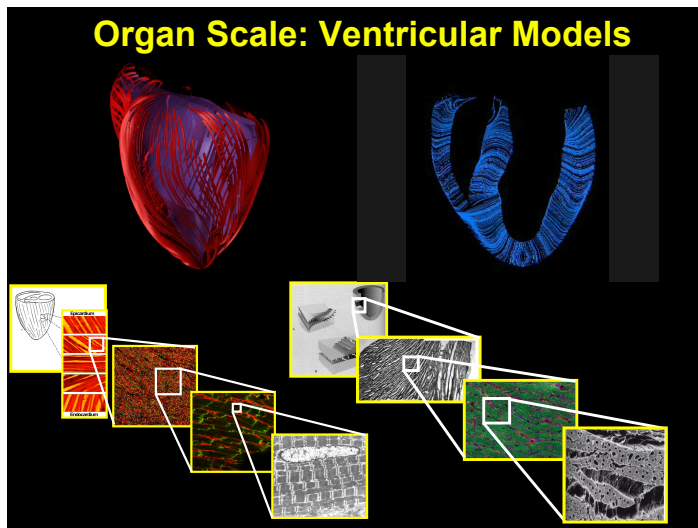

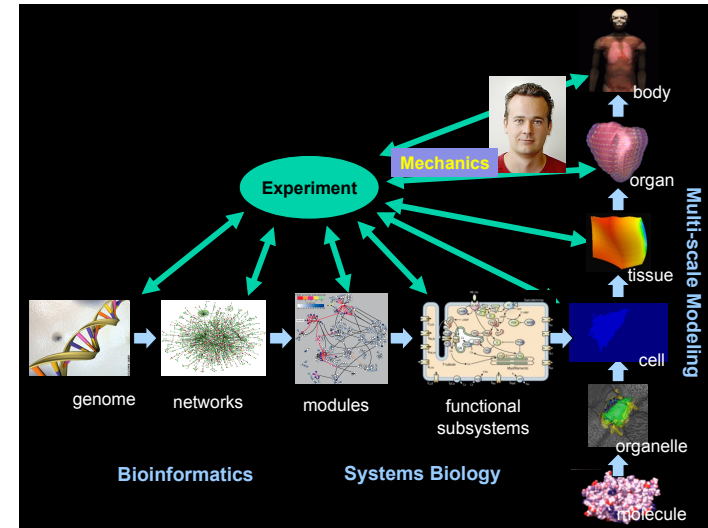

### Cardiac Resynchronization Therapy for Congestive Heart Failure

- Heart failure: 250,000 deaths/year in US alone
- Pump dysfunction frequently associated with electrical dyssynchrony
- Cardiac resynchronization therapy (CRT)
  - improves timing between LV and RV contraction
  - improves quality of life\*
  - reduces mortality\*
- ~30% of patients do not respond to CRT, especially those with myocardial infarcts

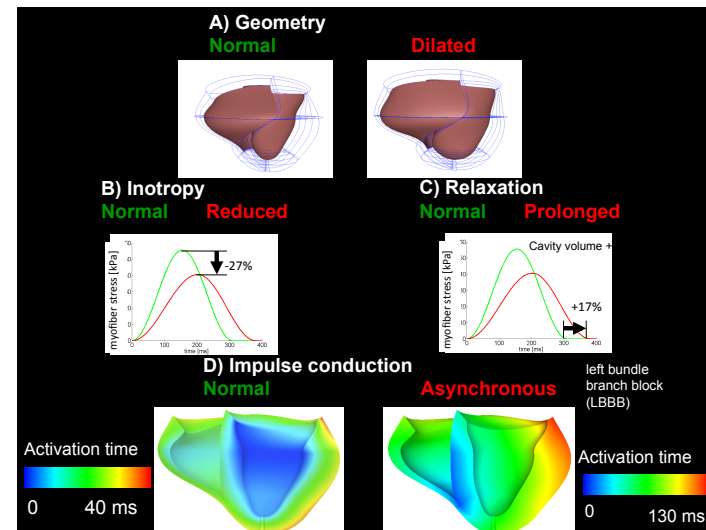

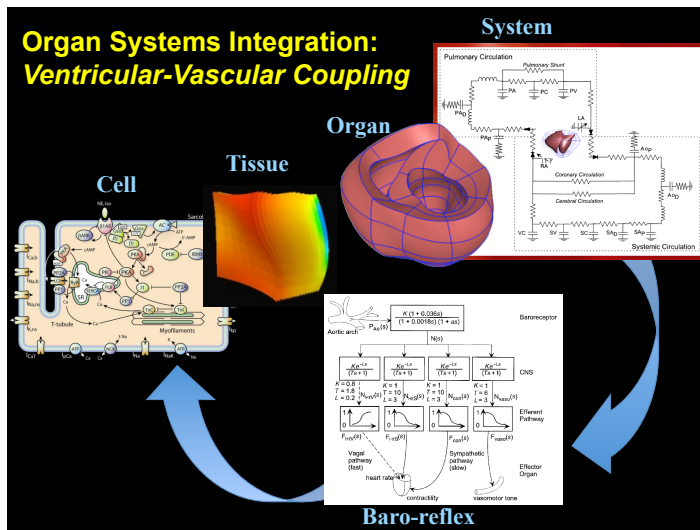

\*Cleland, 2005

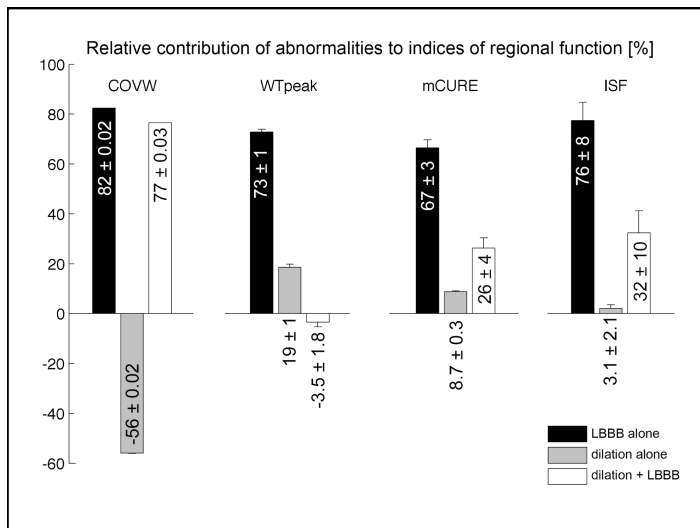

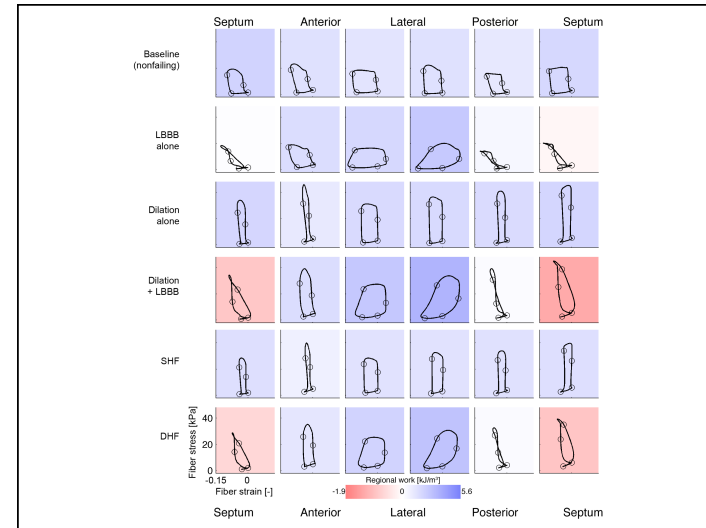

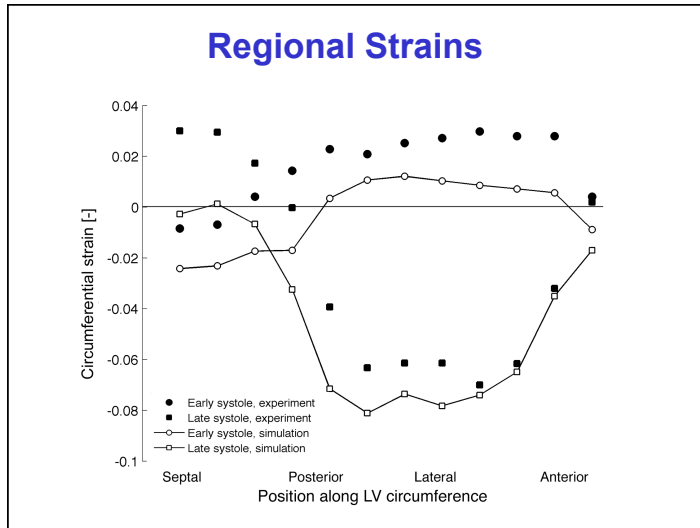

### 3-D Model of CRT Predicts Observed Hemodynamic Improvements

	LBBB		Bi-V pacing		Improvement, %	
	Model	Expt	Model	Expt	Model	Expt
dP/dt <sub>max</sub> mm Hg/s	1230	1048±242	1680	1392 ± 413	36.6	32.8
dP/dt <sub>min</sub> mm Hg/s	-1080	-960±162	-1220	-1152 ± 250	12.0	20.0
EF %	21.2	23.0±12.7	25.6	27.5 ± 16.2	4.4	4.5

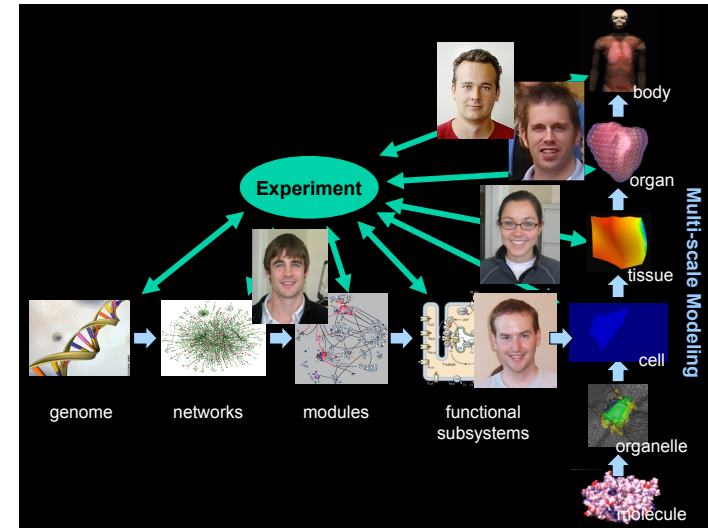

Usyk TP and McCulloch AD (2003) *J Electrocardiol* 36:57-61

### Conclusions

- Dilation and LBBB combined synergistically decreased regional cardiac function.
- CURE and ISF were sensitive to this combination, but not WTpeak.
- CURE and ISF also reflected better than WTpeak the relative non-uniform distribution of regional work.
- These findings might explain why ISF and CURE are better predictors of reverse remodeling in cardiac resynchronization therapy.
