25 wt% P<sub>14</sub> coated silica

25 wt% P<sub>14</sub>-KMnO<sub>4</sub> coated MPTS-silica

## Summary

- $P_{14}$  and  $P_{14}$ - $KMnO_4$  are promising ionic liquids for  $Hg^0$  capture
- $P_{14}$  and  $P_{14}$ - $KMnO_4$  are stable up to  $300^\circ C$
- High  $Hg^0$  uptake at  $160^\circ C$ , several times higher than that of activated carbon
- Very rapid  $Hg^0$  uptake, 0.04 seconds empty bed gas residence time
- The MPTS (3-mercaptopropyltrimethoxy-silane) chelating ligand was found to be the most effective than APTS-MBT (mercaptobenzo-thiazole)

## Summary

- Remarkable mercury capacity was observed at 200 °C and inert atmosphere
- $\text{MnO}_2/\text{TiO}_2$  catalysts are water tolerant.  $\text{SO}_2$  has a negative effect on mercury capture
- Manganese loading and bed temperature were found to be important factor for mercury capture
- XPS results indicate that  $\text{MnO}_2/\text{TiO}_2$  are covered with mercury
