1. Module Overview

The MNR S6000 router, also referred to as the S6000, is a multi-chip standalone cryptographic module encased in a commercial grade metal case made of cold rolled steel. The module cryptographic boundary is the routers enclosure which includes all components, including the encryption module which is a separate part. Figure 1 illustrates the cryptographic boundary of the MNR S6000 router. In the photo, blank plates cover slots that can hold optional network interface cards. The FIPS validated firmware versions are PS-15.1.0.75, GS-15.1.0.75, PS-15.1.0.76, GS-15.1.0.76, PS-15.2.0.20, GS-15.2.0.20, PS-15.4.0.60, GS-15.4.0.60, PS-15.6.0.27, and GS-15.6.0.27.

Configurations	S6000 Base Unit			S6000 Encryption Module			FW Version
	P/N	Tanapa Number	Revision	P/N	Tanapa Number	Revision

2. Security Level

The cryptographic module meets the overall requirements applicable to Level 1 security of FIPS 140-2.

Security Requirements Section	Level
Cryptographic Module Specification	1
Module Ports and Interfaces	1
Roles, Services and Authentication	1
Finite State Model	1
Physical Security	1
Operational Environment	N/A
Cryptographic Key Management	1
EMI/EMC	1
Self-Tests	1
Design Assurance	1
Mitigation of Other Attacks	N/A

Table 2 – Module Security Level Specification

3. Modes of Operation

Approved mode of operation

In FIPS mode, the cryptographic module supports the following FIPS-Approved algorithms as follows:

Hardware Implementations

- a. Triple-DES – CBC mode (168 bit) for IPsec and FRF.17 encryption (Cert. #275)
- b. AES - CBC mode (128, 192, 256 bit) for IPsec and FRF.17 encryption (Cert. #173)
- c. HMAC-SHA-1 for IPsec and FRF.17 authentication (Cert. #39)
- d. SHA-1 for message hash (Cert. #258)

Firmware Implementations

- a. Triple-DES – CBC mode (112 and 168 bit) for IKE and SSHv2 encryption (Cert. #580)
- b. AES – CBC (128, 192, 256 bit), ECB, (128), and CFB (128) modes for IKE and SSHv2 encryption (Cert. #609)
- c. HMAC-SHA-1 for IKE and SSHv2 authentication (Cert # 323)
- d. SHA-1 for message hash (Cert # 658)
- e. RSA v1.5 1024 bit – for public/private key pair generation and digital signatures (Cert. #282)
- f. DSA 1024 bit – for public/private key pair generation and digital signatures (Cert. #236)
- g. ANSI X9.31 Deterministic Random Number Generator (DRNG) (Cert. #348)

The MNR S6000 router supports the commercially available IKE and Diffie-Hellman protocols for key establishment; IPsec (ESP) and FRF.17 protocols to provide data confidentiality using FIPS-approved encryption and authentication algorithms; and SSHv2 for secure remote access.

Allowed Algorithms

- Diffie-Hellman: (allowed for key agreement per Annex D, key agreement methodology provides 80 to 112 bits of encryption strength)
- Hardware non-deterministic RNG: Provides seed for approved deterministic RNG
- MD5: for hashing (Provides interoperability within supported protocols)
- HMAC-MD5

Non-FIPS approved algorithms

In a Non FIPS mode of operation, the cryptographic module provides non-FIPS Approved algorithms as follows:

- DES for encryption/decryption
- Non approved SW RNG
- Diffie-Hellman (Group 1 - 768 bit)

Entering FIPS Mode

To enter FIPS mode, the Crypto Officer must follow the procedure outlined in Table 3 below. For details on individual router commands, use the online help facility or review the *Enterprise OS Software User Guide*, version 15.4 and the *Enterprise OS Software Reference Guide*, version 15.4.

Step	Description
1.	Configure the parameters for the IKE negotiations using the IKEProfile command. For FIPS mode, only the following values are allowed: Diffie-Hellman Group (Group 2 or Group 5), Encryption Algorithm (AES or 3DES), Hash Algorithm (SHA), and Authentication Method (PreSharedKey).
2.	Manually establish via the local console port the pre-shared key (PSK) to be used for the IKE protocol using: ADD -CRYPTO FipsPreSharedKey <peer_ID> <pre-shared_key> <pre-shared_key> The PSK must be at least 80 bits in length with at least 80 bits of entropy.
3.	Configure Isec and FRF.17 selector lists using the command ADD -CRYPTO SelectorList For FIPS mode, the selector list must be configured to encrypt all packets on an encrypted port, e.g. ADD -CRYPTO SelectorList s1 1 Include ANY 0.0.0.0/0 0.0.0.0/0
4.	If Isec is used, configure Isec transform lists using the ADD -CRYPTO TransformList command. For FIPS mode, only the following values are allowed: Encryption Transform (ESP-3DES, or ESP-AES) and Authentication Transform (ESP-SHA).
5.	If FRF.17 is used, configure FRF.17 transform lists using the ADD -CRYPTO TransformList command. For FIPS mode, only the following values are allowed: Encryption Transform (FRF-3DES, or FRF-AES) and Authentication Transform (FRF-SHA).
6.	For each port for which encrypted is required, bind a dynamic policy to the ports using ADD [!<portlist>] -CRYPTO DynamicPOLicy <policy_name> <priority> <mode> <selcrlst_name> <xfrmlst_name> [<pfs>] [<lifetime>] [<preconnect>] To be in FIPS mode, the selector list and transform list names must be defined as in previous steps.
7.	For each port for which encryption is required, enable encryption on that port using SETDefault [!<portlist>] -CRYPTO CONTROL = Enabled
8.	FIPS-140-2 mode achieved

Table 3 – FIPS Approved mode configuration

To review the cryptographic configuration of the router, use the following command:

SHOW –CRYPTO CONFIguration

This command shows a detailed summary of the cryptographic configuration and allows a user to verify that encryption is enabled on user-determined ports and that only FIPS-Approved algorithms are used for encryption and authentication.

4. Ports and Interfaces

Table 4 below provides a listing of the physical ports and logical interfaces for the MNR S6000 router.

The S6000 base system consists of a motherboard, supporting three Ethernet interfaces, mounted in an enclosure with a power supply. The base system also includes a console port and may be configured with any combination of one or two optional LAN or WAN I/O modules.

Physical Port	Qty	Logical interface definition	Interface Card	Comments
Ethernet	3	Data input, data output, status output, control input	Part of the S6000 Base system	LAN port that provides connection to Ethernet LANs using either 10BASE-T or 100BASE-TX Ethernet
Console	1	Status output, control input	Part of the S6000 Base system	RS-232 interface
LAN/WAN Interface	0, 1 or 2	Data input, data output, status output, control input, power output	Optional Ethernet and WAN modules	
Power Plug	1	Power input	N/A	

Table 4 – S6000 physical ports and logical interfaces

5. Identification and Authentication Policy

Assumption of roles

The MNR S6000 router supports five distinct operator roles: Crypto Officer (SuperUser), Admin, Network Manager, User and Maintenance. The first four roles require user authentication via user name and password when accessing the router via any interface. The unauthenticated maintenance role is entered only via the router console port.

The MNR S6000 router enforces the separation of roles by providing specific services only to users who have been authenticated to a role with the required privilege to access those services. The role-based authentication capabilities will be described here, although the role based-authentication is not required to comply with Level 1 requirements.

An operator must enter a username and its password to log in. Passwords are alphanumeric strings consisting of 7 to 15 characters chosen from the 94 standard keyboard characters. Upon correct authentication, the role is selected based on the username of the operator. At the end of a session, the operator must log-out.

When a router power cycles, sessions are terminated. A user must reauthenticate to access the router.

Multiple concurrent operators. Each operator has an independent session with the router, either through Telnet, SSH, or via the console. Once authenticated to a role, each operator can access only those services for that role. In this way, separation is maintained between the role and services allowed for each operator.

The definition of all supported roles is shown in Table 5 below.

Role	Type of Authentication	Authentication Data	Description
Crypto Officer (Super User)	Role-based operator authentication.	Username and Password. The module stores user identity information internally or if configured,	The owner of the cryptographic module with full access to services of the module.
Network Manager	Role-based operator authentication.	Username and Password. The module stores user identity information internally.	A user of the cryptographic module with almost full access to services of the module.
Admin	Role-based operator authentication	Username and Password. The module stores user identity information internally.	An assistant to the Crypto Officer that has read only access to a subset of module configuration and status indications.
User	Role-based operator authentication	Username and Password. The module stores user identity information internally.	A user of the cryptographic module that has read only access to a subset of module configuration and status indications.
Maintenance	None (see comment)	N/A	Maintenance role can be entered via the external console port (unauthenticated) or via EOS software command (requires Network Manager authentication)

Table 5 – Roles and Required Identification and Authentication

Authentication Mechanism	Strength of Mechanism
Username and Password	The probability that a random attempt will succeed or a false acceptance will occur is $1/94^7$ which is less than $1/1,000,000$.

Table 6 – Strengths of Authentication Mechanisms

6. Access Control Policy

Authenticated Services

- Firmware Update: load firmware images digitally signed by RSA (1024 bit) algorithm.
- Key Entry: Enter Pre-Shared Keys (PSK)

- User Management: Add/Delete and manage passwords operators
- Reboot: force the module to power cycle via a command
- Zeroization: actively destroy all plaintext CSPs and keys
- Crypto Configuration: Configure IPsec and FRF.17 services
- IKE: Key establishment utilizing the IKE protocol
- IPsec tunnel establishment: IPsec protocol
- FRF.17 tunnel establishment: Frame Relay Privacy Protocol
- SSHv2 for remote access to the router
- Network configuration: Configure networking capabilities
- Enable Ports: Apply a security policy to a port
- File System: Access file system
- Authenticated Show status: Provide status to an authenticated operator
- Access Control: Provide access control for all operators

Unauthenticated Services:

- Unauthenticated Show status: provide the status of the cryptographic module – the status is shown using the LEDs on the front panel.
- Power-up Self-tests: execute the suite of self-tests required by FIPS 140-2 during power-up not requiring operator intervention.
- Monitor: Perform various hardware support services

Roles and Services

Service	Crypto Officer (SuperUser)	Network Manager	User	Admin	Maintenance
Firmware Update	X	X			
Key Entry	X	X			
User Management	X	X			
IKE	X	X			
IPsec Tunnel Establishment	X	X			
FRF.17 Tunnel Establishment	X	X			
SSHv2	X	X			
Reboot	X	X			
Zeroization	X	X			
Crypto Configuration	X	X			
Network Configuration	X	X			
Enable Ports	X	X			
File System	X	X			
Authenticated Show Status	X	X	X	X	
Unauthenticated Show Status	X	X	X	X	X
Power-up Self-Tests	X	X	X	X	
Monitor	X				X
Access Control	X	X			

Table 7 – Services to Roles mapping

Definition of Critical Security Parameters (CSPs)

The following CSPs are contained within the module:

Key	Description/Usage
KEK	This is the master key that encrypts persistent CSPs stored within the module. KEK-protected keys include PSK and passwords. Encryption of keys uses AES128ECB
IKE Preshared Keys	Used to authenticate peer to peer during IKE session
SKEYID	Generated for IKE Phase 1 by hashing preshared keys with responder/receiver nonce
SKEYID_d	Phase 1 key used to derive keying material for IKE SAs
SKEYID_a	Key used for integrity and authentication of the phase 1 exchange
SKEYID_e	Key used for TDES or AES data encryption of phase 1 exchange
Ephemeral DH Phase-1 private key (a)	Generated for IKE Phase 1 key establishment
Ephemeral DH Phase-2 private key (a)	Phase 2 Diffie Hellman private keys used in PFS for key renewal
IPSEC Session keys	128/192/256-bit AES-CBC and 168-bit TDES keys are used to encrypt and authenticate IPSEC ESP packets
FRF.17 Session Keys	168-bit TDES-CBC and 128/192/256-bit AES-CBC keys are used to encrypt and authenticate FRF.17 Mode 2
SSH-RSA Private Key	Key used to authenticate oneself to peer
SSH-DSA Private Key	Key used to authenticate oneself to peer
SSH Session Keys	168-bit TDES-CBC and 128/192/256-bit AES-CBC keys are used to encrypt and authenticate SSH packets
SSH DH Private Key	Generated for SSH key establishment
RNG Seed	<i>Initial seed for FIPS-approved deterministic RNG</i>
Network Manager Password (Root)	7 (to 15) character password used to authenticate to the CO Role (Crypto Officer)
User(Admin)	7 (to 15) character password used to authenticate to the User Role
User Accounts	7 (to 15) character password used to authenticate accounts created on the module

Table 8 – Critical Security Parameters (CSPs)

Definition of Public Keys:

The following public keys are contained within the module:

Key	Description/Usage
RSA Firmware Load Key	Distributed to module, for firmware authentication
SSH-RSA Key	Distributed to peer, used for SSH authentication
SSH-DSA Key	Distributed to peer, used for SSH authentication
SSH Known Host Keys	Distributed to module, used to authenticate peer
IKE DH public key (g^a)	Generated for IKE Phase 1 key establishment
IKE DH phase-2 public (g^a) key	Phase 2 Diffie Hellman public keys used in PFS for key renewal (if configured)
SSH DH Key	Generated for SSH key establishment

Table 9 – Public Keys

Definition of CSPs Modes of Access

Table 10 defines the relationship between access to CSPs and the different module services. The modes of access shown in the table are defined as follows:

- Read: the data item is read from memory.
- Write: the data item is written into memory.
- Zeroize: the data item is actively overwritten.

CSP	Firmware Update	Key entry	User Management	IKE	Ipssec tunnel establishment	FRF.17 tunnel establishment	SSH	Reboot	Zeroization	Crypto Configuration	Network Configuration	Enable Ports	File System	Authenticated Show Status	Access Control
KEK			R					R	Z	R					
IKE Pre-shared Key		W		R					Z	W			RW	R	
SKEYID				RW				Z	Z						
SKEYID_d				RW					Z						
SKEYID_a				RW					Z						
SKEYID_e				RW					Z						
Ephemeral DH Phase-1 private key				RW					Z						
Ephemeral Phase-2 DH private key				RW					Z						
IPSEC Session Keys				RW	R				Z						
FRF.17 Session Keys				RW		R			Z						
SSH-RSA Private Key							RW		Z	RW					
SSH-DSA Private Key							RW		Z	RW					
SSH Session Keys							RW		Z						
SSH DH Private Key							RW		Z						
Root Password			RW						Z						
User(Admin)			RW						Z						
User Accounts			RW						Z						
RNG Seed				RW					Z						

Table 10 – Services to CSP Access mapping

7. Operational Environment

The FIPS 140-2 Area 6 Operational Environment requirements are not applicable because the MNR S6000 router does not contain a modifiable operational environment.

8. Security Rules

The example cryptographic module's design corresponds to the example cryptographic module's security rules. This section documents the security rules enforced by the cryptographic module to implement the security requirements of this FIPS 140-2 Level 1 module.

1. The MNR S6000 router provides five distinct operator roles: Crypto Officer (SuperUser), Admin, Network Manager, User, and Maintenance. The Crypto Officer role uses the root account.
2. The MNR S6000 router encrypts message traffic using the AES or TDES algorithm.
3. The MNR S6000 router performs the following tests:

A. Power up Self-Tests:

1. Cryptographic algorithm tests:

Hardware Implementation:

- a. AES-CBC Known Answer Test
- b. TDES-CBC Known Answer Test
- c. HMAC-SHA-1 Known Answer Test (Includes SHA-1 KAT)

Firmware Implementation

- a. AES-CBC Known Answer Test
- b. TDES-CBC Known Answer Test
- c. HMAC -SHA-1 Known Answer Test (Includes SHA-1 KAT)
- d. ANSI X9.31 DRNG Known Answer Test
- e. RSA Known Answer Test
- f. DSA Known Answer Test

2. Firmware Integrity Test (16 bit CRC)

B. Conditional Self-Tests:

- a. Continuous Random Number Generator (RNG) test on FIPS-approved deterministic RNG and Hardware NDRNG.
 - b. Firmware load test – RSA signature verification of externally loaded code.
 - c. Alternating bypass tests – when enabling FRF.17 and IPsec encryption.
 - d. Pair-wise consistency test for public and private key establishment (RSA and DSA)
 - e. Manual key entry test
4. At any time the MNR S6000 router is in an idle state, the operator can command the router to perform the power-up self-test by power-cycling or rebooting the router.
 5. Data output is inhibited during key generation, self-tests, zeroization, and error states.
 6. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
 7. The operator shall not modify any IPsec selector lists.

9. Crypto Officer Guidance

On initial installation, perform the following steps:

1. Power on the module and verify successful completion of power-up self tests from console port or inspection of log file.
2. Authenticate to the module using the default user acting as the Crypto Officer with the default password and username.
3. Verify that the Hardware and Firmware P/Ns and version numbers of the module are the FIPS approved versions.
4. Change the Network Manager (Crypto Officer) and User passwords using the **SysPassWord** command.
5. Initialize the Key Encryption Key (KEK) with the **KEKGenerate** command. Account passwords and certain keys are persistent across reboots and are encrypted with the Key Encryption Key (KEK). This key can be reinitialized at any time.

The module supports a minimum password length of 7 characters and a maximum length of 15 characters. The Crypto Officer controls the minimum password length through the

PwMinLength parameter:

SETDefault -SYS PwMinLength = <length>, where **<length>** specifies the minimum length.

Before entering or exiting the Maintenance Role or non-FIPS mode, the operator shall use the Zeroization Service to zeroize all CSPs. The Zeroization Service should also be invoked prior to removing a router from service for repair.

10. Physical Security Policy

Physical Security Mechanisms

The MNR S6000 router is composed of industry standard production-grade components.

11. Mitigation of Other Attacks Policy

The module has not been designed to mitigate against other attacks outside the scope of FIPS 140-2.

12. Definitions and Acronyms

AES – Advanced Encryption Standard

CBC – Cipher Block Chaining

CLI – Command Line Interface

CSP – Critical Security Parameter

DH – Diffie-Hellman

DRNG – Deterministic Random Number Generator

FRF – Frame Relay Forum

FRF.17 – Frame Relay Privacy Implementation Agreement

FRPP – Frame Relay Privacy Protocol

HMAC – Hash Message Authentication Code

IKE – Internet Key Exchange

IP – Internet Protocol

IPsec – Internet Protocol Security

KAT – Known Answer Test

KDF – Key Derivation Function

KEK – Key Encrypting Key

MNR – Motorola Network Router

OSPF – Open Shortest Path First

PFS – Perfect Forward Secrecy

RNG – Random Number Generator

SHA – Secure Hash Algorithm

SSH – Secure Shell

SNMP – Simple Network Management Protocol

Tanapa - The part number that is built and stocked for customer orders.
