Summary

- Good agreement between MFM and micromagnetics for $Ni_{80}Fe_{20}$ ring elements.
- Single-vortex head-to-head walls observed in 40 nm elements.
- Double-vortex head-to-head walls observed in 65 nm elements.
- Micromagnetics indicate double-vortex wall has lower energy in 40 nm element, but is inaccessible.
- Nucleation event evident in micromagnetic simulations as spike in exchange energy.
