### **Statement of Purpose**

The purpose of the Installation Action Plan (IAP) is to outline the total multiyear cleanup program for an installation. The plan identifies environmental cleanup requirements at each site or area of concern (AOC) and proposes a comprehensive, installation-wide approach, along with the costs and schedules associated with conducting investigations and taking the necessary remedial actions (RA).

In an effort to coordinate planning information between the restoration manager, the US Army Environmental Command (USAEC), Watervliet Arsenal (WVA), the executing agencies, regulatory agencies, and the public, an IAP was completed. The IAP is used to track requirements, schedules, and tentative budgets for all major Army installation cleanup programs.

All site-specific funding and schedule information has been prepared according to projected overall Army funding levels and is, therefore, subject to change.

### **Installation Information**

#### **Installation Locale**

Installation Size (Acreage): 140

City: Watervliet County: Albany State: New York

#### Other Locale Information

The WVA is located on approximately 140 acres of land in the city of Watervliet and in the town of Colonie, in Albany County, New York. The city of Albany is approximately 3.5 miles south of the WVA. To the east, the WVA is separated from the Hudson River by Route 32 (Broadway) and a six-lane highway (I-787). To the west, the WVA extends beyond the city limits of Watervliet into the town of Colonie. Residential areas border the WVA to the south and north.

#### **Installation Mission**

The mission of the WVA is to perform manufacturing (industrial) engineering, procurement, fabrication, and product assurance of assigned material, and to provide administrative and logistical support services to tenant activities. Assigned material includes mortars, recoil-less rifles, cannon for tanks, towed and self-propelled artillery, and components of these items. Also included are: special tools, tool sets, test, measurement and diagnostic equipment, training equipment, devices and simulators relating to assigned material, and other equipment or material as assigned.

#### **Lead Organization**

Army Materiel Command (AMC)

#### **Lead Executing Agencies for Installation**

US Army Corps Engineers (USACE), Baltimore District

USACE, New York District

#### **Regulator Participation**

Federal US Environmental Protection Agency (USEPA), Region II

State New York State Department of Environmental Conservation (NYSDEC)

New York State Department of Health (NYSDOH)

#### **National Priorities List (NPL) Status**

WATERVLIET ARSENAL is not on the NPL

### Installation Restoration Advisory Board (RAB)/Technical Review Committee (TRC)/Technical Assistance for Public Participation (TAPP) Status

Installation at RIP/RC.

#### **Installation Program Summaries**

#### IRP

Primary Contaminants of Concern: Metals, Petroleum, Oil and Lubricants (POL), Polycyclic Aromatic Hydrocarbons

(PAH), Volatiles (VOC)

Affected Media of Concern: Groundwater, Other (Soil Vapor and Indoor Air), Soil

### 5-Year / Periodic Review Summary

#### 5-Year / Periodic Review Summary

Status	Start Date	End Date	End FY
Complete	201003	201009	2010
Planned	201503	201509	2015

#### Last Completed 5-Year / Periodic Review Details

Associated ROD/DD Name	Sites
WVA-25 Siberia(includes SWMU#3,18,22-24)	WVAA-25

Results The 5 year review was completed by the Baltimore corp of Engineers.

**Actions** No findings in this review.

Plans Continue to do monitoring in the Siberia Area.

#### Recommendations and Implementation Plans:

The five year review was completed for both sites WVA-25 and WVA-32 (Main Manufacturing Area). Watervliet has completed a site-wide vapor intrusion survey back in 2007 which resulted in installing sub-slab ventilation systems in seven buildings in the Main Manufacturing Area. These Sub Slab Depressurization Systems (SSDS) are monitored daily and monthly reports are kept. We send a report to NYSDOH annually. This will be kept up until the State sees progress in the reports. The next five year review will be in fiscal year (FY)15 at which time we will be evaluating the effectiveness of these systems.

### Land Use Control (LUC) Summary

LUC Title: Monitor Air and water

Site(s): WVAA-32

ROD/DD Title: Statement of Basis for WVAA-32

Location of LUC

Site WVAA-32 Will continue to do air monitoring and well sampling-sending reports to the NYSDEC

Land Use Restriction: None specified

Types of Engineering Controls: Fences, Guards, Signs

Types of Institutional Controls: None

**Date in Place:** 201210 **Modification Date:** N/A **Date Terminated:** N/A

**Inspecting Organization:** State

Record of LUC: Master Plan or Equivalent

**Documentation Date: 201210** 

**LUC Enforcement:** Annual Inspections

Contaminants: INORGANICS, ORGANICS, PAH, PETROLEUM HYDROCARBON, VOC

**Additional Information** 

N/A

LUC Title: Restricted Use

Site(s): WVAA-25

ROD/DD Title: STATEMENT OF BASIS/STATE for WVAA-25

**Location of LUC** 

Siberia Area-WaterVliet Arsenal

Land Use Restriction: Restrict land use - Mitigation area(s) protection, Restrict land use - No daycare/hospital/school use,

Restrict land use - No residential use

Types of Engineering Controls: Fences, Guards

Types of Institutional Controls: Restrictions on land use

Date in Place: 200809

Modification Date: N/A

Date Terminated: N/A

**Inspecting Organization:** State

Record of LUC: Master Plan or Equivalent

**Documentation Date: 200809** 

**LUC Enforcement:** Annual Inspections

Contaminants: PAH, PETROLEUM HYDROCARBON, VOC

**Additional Information** 

N/A

### **Cleanup Program Summary**

#### **Installation Historic Activity**

The WVA, a nationally registered historic landmark, was established in 1813 with the purchase of 12 acres of land. The principal mission during the early years of operation included the production of small arms ammunition, gun carriages, and leather goods. Since 1883 the facility has been producing cannons. Peak production periods were reached during World Wars I and II and the Korean and Vietnam Wars.

The area known as the Siberia area is a 15-acre tract that was purchased by the arsenal in May 1942. Located west of the Main Manufacturing Area (MMA), Siberia is used as a staging area for the interim storage of raw and hazardous materials, finished goods, and supplies for the WVA.

### Installation Program Cleanup Progress IRP

**Prior Year Progress:** WVA completed the long-term management (LTM) monitoring report for Siberia and MMA for FY11.

NYSDEC reviewed and approved the report. Sub-slab ventilation systems were installed in MMA buildings. All systems are up and running. A statement of basis (SoB) was completed in October 2012

for the MMA site WVAA-32.

Future Plan of Action: Progress for the next two years is to complete LTM in the Siberia area and MMA. Also, sub-slab

ventilation systems will be monitored daily with a report to the state at the end of each year. Systems

are up and running.

### **WATERVLIET ARSENAL**

Army Defense Environmental Restoration Program Installation Restoration Program

### **IRP Summary**

#### Installation Total Army Environmental Database-Restoration (AEDB-R) Sites/Closeout Sites Count: 31/29

#### Installation Site Types with Future and/or Underway Phases

1 Contaminated Ground Water

(WVAA-32)

1 Maintenance Yard

(WVAA-25)

#### **Most Widespread Contaminants of Concern**

### **IRP Summary**

#### **Duration of IRP**

Date of IRP Inception: 197612

Estimated Date for Remedy-In-Place (RIP)/Response Complete (RC): 200509/204309

Date of IRP completion including Long Term Management (LTM): 204309

### **IRP Contamination Assessment**

#### **Contamination Assessment Overview**

Contamination at the WVA has been identified in the soil, sediment and groundwater. To simplify the investigation and remediation process, the WVA has proposed that the Installation Restoration Program (IRP) be managed as two operable units (OUs) the Siberia area [Army Environmental Database - Restoration (AEDB-R) site WVA-25] and the MMA (AEDB-R sites WVA-01 through WVA-22, WVA-24, and WVA-26 through WVA-33). The distinction also addresses the contamination separately as chlorinated organics and petroleum hydrocarbons.

At the Siberia area metals and chlorinated organic compounds have been detected in the soil above guidelines in localized areas. Petroleum hydrocarbons [total petroleum hydrocarbons(TPH)] and PAHs are present above guidelines in the soil throughout the Siberia area. Sources of the TPH contamination are the result of past practices such as handling waste metal chips saturated with cutting oil, spreading spent oil on the ground surface for dust control, and the use of burn pits. The northeast quadrant has a chlorinated VOC groundwater plume. VOC contamination in the northeast quadrant may have originated from the use of burn pits in this area. TPH are detected in the groundwater throughout the Siberia area. Hexavalent chromium-contaminated groundwater is limited to a portion of the northeast quadrant. This contamination is attributable to Perfection Plating, an adjacent facility. The WVA source of drinking water is city water, so there is no immediate threat to human health.

At the MMA contaminated soil above guidelines was not detected except for a limited area in the former Erie Canal (lead and PAHs). Groundwater in the MMA is contaminated with petroleum hydrocarbons (light non-aqueous phase liquids) and chlorinated organics. The POL products have been and are currently used in machining operations. The WVA also stores POL products for future use and stores waste oils for removal. Chlorinated solvents have been used in vapor degreasing and cleaning operations but have not been used for this purpose at the WVA since 1982.

In lieu of separate solid waste management unit (SWMU) assessments, and considering the relatively small size of the WVA, a site-wide hydrogeologic RCRA facility investigation (RFI) was performed with regulatory approval.

The following is a description of the most noteworthy findings for groundwater and soils.

#### **GROUNDWATER**

With regard to the groundwater, the results of the analytical data indicate that pesticides, metals, and semi-volatile organics (SVOC) are not contaminants of concern (COCs) for the MMA. Free-phase petroleum-derived product has been identified in the groundwater and within the bedrock fractures. Based on the results of water level measurements, the source appears to be located upgradient of Building 35, possibly associated with old spill events and leaking machining equipment foundations. Chlorinated VOCs have been detected in bedrock groundwater, and the contaminant assessment indicates that most chlorinated VOCs are present in the bedrock matrix.

#### **SOILS**

With regard to the soils, analytical data indicates that the soils in the MMA have not been contaminated with pesticides or VOCs (i.e., solvents) above current guidance values. Chromium was found around Building 36 in the area of a reported chromium sludge spill, and lead was found in the former Erie Canal in front of Building 25. Petroleum-derived product has been detected in the soils of the former Erie Canal in front of Buildings 20 and 25. The area is covered with asphalt and, therefore, the contamination is not considered an immediate threat to human health or the environment.

The Government Performance and Results Act (GPRA) established interim goals for the RCRA and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) programs. The GPRA goals are called environmental indicators (EIs). In RCRA, the GPRA goals are called CA 725, Human Exposures Controlled and CA 750, Groundwater Migration Controlled. A positive CA 725 and CA 750 have been achieved.

These GPRA goals are only an interim step; they do not represent the end of the corrective action process. Rather, Els are a measure of near-term success with the ultimate goal being to achieve a completed RCRA cleanup.

Progress on these findings is as follows:

- In FY06, corrective measures (permeable iron reactive walls) for groundwater reached RC at the Siberia area. Corrective measures for soil have been implemented and include landfarming, excavation and disposal, and asphalt capping. The site was made RC in FY07. The LTM will continue. A SoB was publicized in August 2008 and was finalized in September 2008.

### **IRP Contamination Assessment**

#### **Contamination Assessment Overview**

- At the MMA, corrective measures consisting of periodic sodium permanganate injections were implemented at Building 40. In FY07, the third year of a five-year injection plan was completed. An indoor air remediation consisting of indoor air-filtration through carbon was also implemented at Building 40 and was completed in FY07. System operation and indoor air monitoring will continue.
- At Building 25, the hydrogen-releasing compound (HRC) groundwater remedy is completed.
- The LTM of the monitored natural attenuation (MNA) remedy will continue.
- One Military Munitions Response Program (MMRP) site was identified at the WVA in May 2003. Site WVA-001-R-01, the Musket Testing Range, was listed as RC in May 2003.

#### **Cleanup Exit Strategy**

The remedy at Building No. 40 (Degreasers Site) will be completed and LTM will be conducted.

At the Siberia Area, LTM will continue and LUCs will be completed.

### **SITE DESCRIPTION**

The Siberia area is a 15-acre storage plot located to the west of the MMA. The land was purchased in the 1940s. Raw material storage buildings and the Defense Reutilization Marketing Office (DRMO) salvage yard are located in this area. There also is an on-site chip handling facility and a trash/dumpster area. The area is also the location for a newly replaced underground storage tank [(UST) - 1997; SWMU No.7a], an electrical substation, and the site of an old burn pit (last used in the late-1960s).

During substation upgrade work, POL-contaminated soil was discovered in the southwest quadrant. In December 1997, 60 cubic yards (cy) of soil were removed. Soil from the burn pit was determined to be the source of VOC contamination. In October 1999 approximately 1,600 cy were removed and added to the land farming operation.

In December 1998, a permeable reactive wall full-scale pilot system was installed in the northeast quadrant for the dehalogenation of chlorinated solvents in the groundwater. This system has been effective and is being monitored with an upgradient and downgradient well system. In August 2001 pilot studies for oxygen-releasing compound (ORC) and biosparging were initiated. By November 2001 they had proved ineffective. In August 2000 bioremediation land farming was initiated; 14 of the 16 monitored contaminants are already below the technical and administrative guidance memo. The USEPA and New York State have accepted the bioremediation pilot study results as part of a viable final remedy. Also, agreement was reached on corrective action objectives.

In September 2003 the corrective measure study (CMS) was approved. The study recommends land farming and excavation of soil, a permeable iron reactive wall for groundwater, paving and seeding, and long-term monitoring. In October 2002 the excavation of 18,500 cy of soil was initiated and was completed in April 2003. Capping was completed in July 2005. Land farming was completed in the first quarter of 2005. Grading, geotextile and gravel placement was completed in January 2005. Final confirmation sampling was completed in September 2005. The construction certification report was submitted and approved in 2007 and a SoB was completed in September 2008. Corrective measures implementation (operation) (CMI(O)) for this site is continuing in the Siberia area. LUCs limit this area to industrial use only. On Dec. 28, 2011 NYSDEC deleted Siberia from the New York State Registry of Inactive Hazardous Waste Disposal Site Registry.

### **CLEANUP/EXIT STRATEGY**

The LTM will continue on an annual basis.

Site ID: WVAA-32

### Site Name: DEGREASERS (B 20/25/40/110/120/130)

### **SITE DESCRIPTION**

This AEDB-R site-specifically addresses chlorinated solvent groundwater contamination from all vapor degreasers. Vapor degreasers were used to remove protective oil coatings from the surfaces of metal parts. Vapors were exhausted to the outdoors through a vent. These vapor degreasers are no longer part of the manufacturing process and have been removed.

The RFI, accepted in January 2001, defined five distinct and separate sources of groundwater contamination at Building 25, 40, 110, and 121 North and South.

Groundwater sampling results indicated high concentrations of chlorinated VOCs in overburdened and fractured bedrock. A dense non-aqueous phase liquid was detected at the downgradient installation boundary in deep fractured bedrock [monitoring well (MW) 51]. Soil sampling results did not indicate the presence of chlorinated VOCs above guidance values.

The CMS Data Gap Study (June 2001) met the objectives of contaminant distribution, fracture characterization, flow-zone characterization, aquifer parameters, and hydraulic connection.

In 2003 pilot-scale activities for VOCs at Building 40 (chemical oxidation) and Building 25 (enhanced natural attenuation) were completed.

An exposure assessment which included soil, surface water, groundwater and indoor air, was completed to evaluate the plume's risk to human health and the environment. In 2003 the assessment was revised and resubmitted. The exposure assessment concluded that there are no ecological risks. An indoor air exposure pathway at Building 40 was identified and has been mitigated. Concern over vapor intrusion has been raised at several buildings within the MMA. An additional vapor intrusion investigation has been requested by the NYSDEC, the NYSDOH and the USEPA. The WVA has completed additional soil vapor and indoor air sampling in Buildings 20, 22, 25, 115 and 120. Based on the results the state will request the WVA to do additional sampling and, possibly, some sub-slab depressurization in some buildings where the levels of VOCs are over their guidance levels. In February 2008 a full-scale investigation of all buildings and surrounding areas where vapor degreasers were used was initiated.

The Building 40 in situ chemical oxidation program with the consent of NYSDEC/NYSDOH/USEPA has been discontinued based on interim results. Plans are for CMI(O) for that site. The WVA is in the final stage of the vapor intrusion work. Ten sub-slab ventilation systems will be installed in the MMA where the levels of VOCs were above NYSDOH guidance. A Statement of Basis from the NYSDEC on this site is expected late in 2011. Site WVAA-32 is in final remedy with the installations of the sub-slab depressurization units in manufacturing buildings where the levels were above NYSDOH guidance. All units are up and running. Watervliet completed the Statement of Basis (Decision Document (DD)) with NYSDEC in October 2012. The elements of the final corrective measures are: no further action (NFA) with continued long-term monitoring of the ongoing natural attenuation for Building 25 groundwater; NFA for Building 40 groundwater, beyond natural attenuation, documented through long-term groundwater monitoring; NFA with continued operation and monitoring of the subsurface depressurization systems for vapor intrusion in Buildings 20, 21, 22, 25, 114, 120, 121, and 130; and site management and LUCs to protect public health and the

### Site ID: WVAA-32 Site Name: DEGREASERS (B 20/25/40/110/120/130)

environment for contamination remaining at the site after the Interim Corrective Measures. The MMA site WVAA-25 is currently in the CMI(O) phase.

### **CLEANUP/EXIT STRATEGY**

The final remedy for this site is the installation of sub-slab depressurization units in the Manufacturing Buildings 20, 21, 22, 25, 114, 120, 121 and Building 130. All of the systems have been installed and are up and running. LTM will continue at WVAA-32 along with Site WVAA-25. Reports will be completed and sent to the state for approval.

#### **Additional Past Phase Completion Milestones**

2007-WVAA-32-Building #40 Corrective Measures has been discontinued with the approval of NYSDEC, NYSDOH, EPA and AEC based on technical infeasibility. LTM will be conducted.

2007-NYSDEC has mandated that we do additional Vapor Intrusion investigations throughout the Arsenal. WVA completed investigations at several buildings which showed that a much larger-scale investigation will be needed.

#### **Projected Phase Completion Milestones**

### **Community Involvement**

Technical Review Committee (TRC): None

Community Involvement Plan (Date Published): 199804

Restoration Advisory Board (RAB): No

Reason Not Established: Installation at RIP/RC.

#### **Additional Community Involvement Information**

The Army strongly encourages local community involvement during investigations and cleanup actions at all Army sites. In the past, the WVA has conducted interviews with Watervliet citizens and local officials to integrate community issues and concerns with ongoing site investigations, engineering designs, and proposed construction activities. An interview process conducted in August 1992 indicated that there was no community interest in formal involvement in restoration activities. This result was documented in the WVA community relations plan (CRP) dated Oct. 19, 1992.

Since then the WVA has performed community outreach activities in an attempt to gather feedback from the community with regard to their restoration efforts.

In April 1998, the WVA submitted an update to the 1992 CRP to the regulators. The CRP was updated with the following objectives:

- 1. Meet the requirements set forth in the Administrative Order on Consent Docket No. II RCRA-3008(h)-93-0210.
- 2. Include chronological summaries of environmental investigations conducted at the arsenal since 1990.
- 3. Integrate community issues and concerns from Watervliet citizens and local officials.
- 4. Prepare a site-specific program to establish communication and information exchange regarding restoration efforts between Army staff, the civilian work force, community agencies, and the public.

An SoB was provided for public comment and was completed in September 2008.

An second SoB was completed in FY12 for the Main Manufacturing Area. A notice went out for public comment at that time. The public has been notified when any work was done at the arsenal. Thus far there has been no interest in having a RAB at WVA.
