Part 1

National Vehicle Miles Travelled by Roadway Functional Class and Vehicle Type

Background

Prior to the publication of the 2009 Highway Statistics, vehicle miles travelled (VMT) related data elements in table VM-1 were based on a modeling procedure with initial inputs from the Highway Performance and Monitoring System (HPMS) data and constrains established from the Vehicle Inventory and Use Survey (VIUS) data. It has been noticed that VMT by vehicle type and roadway functional class data under this historical procedure were drifting away from what is being directly reported through the HPMS system. When the original historical method was developed (early 90s), the modeling logic was necessary due to potential traffic data quality issues and the availability of the Vehicle Inventory and Use Survey (VIUS) data. With the advancements in traffic data collection instruments, implementation of institutionalized processes and procedures by State highway agencies in data collection, the gaining of practical experience in traffic data collection, and the discontinuation of the VIUS (last one was carried out in 2002), the data modeling method is deemed no longer appropriate. In addition, in order to reflect rapid changes in economic conditions, and goods movement and passenger travel pattern changes, State highway agency directly reported data without being further modeled will be more logical and timely. The proposed new procedure is to retire the original methodology and adopt State direct reporting results.

Method

Step 1

Obtain both VM-4 and VM-2 data from the HPMS data (sample attached). These data should have already passed HPMS's data quality review.

Step 2

A: Conduct independent data quality review on both data sets in areas of growth rate and percentages (%) changes from past years by using growth trend data from both HPMS and the Travel Monitoring and Analysis System (TMAS system). 5% or higher changes from past year shall serve as an indicator that more in-depth analysis shall be conducted in order to determine data quality issue.

B: Both roadway centerline and lane lengths by functional classes shall be reviewed, compared and contrasted with the VMT data at the State level geography. In the event that issues are identified, inquiries to responsible State highway agencies shall be made in coordination through HPMS division.

C: Attempts must be made to secure any missing value from State highway agencies first. When such an attempt is determined to be not feasible for timeliness, simple arithmetic average for a particular parameter from neighboring States can be used in place of the missing value. However, actual value shall be obtained from State highway agencies within 6 months from issue discovery and appropriate modification shall be made to any published data accordingly to various data release schedules.

Step 3

For a given State, once the VM-4 and VM-2 data have been passes the data quality check, the VM-2 data can be split further by multiplying all corresponding cells from VM-4. Final VMT by the five roadway functional classes (rural interstate, other rural arterial, other rural, urban interstate and other urban) and six vehicle classes (light duty vehicle - Short Wheelbase, motorcycles, buses, light duty vehicle - Long Wheelbase, single unit truck, and combination truck) can be computed by simply aggregating the multiplication results.

Step 4

Once data from all States and the District of Columbia are processed through Step 3, simple addition of all corresponding VMT categories for all States will be the national VMT by roadway functional class and vehicle types.

Sample VM-2 Data Table from HPMS

Part 2

An Enhanced Vehicle Classification Method for Counting Numbers of Vehicles in Various Vehicle Groups

Background

Currently, all HPMS VMT by vehicle type data collected by State highway agencies are based on FHWA's 13 vehicle wheel base (axle spacing) and the number of axles criteria. However, the number of registered vehicles under various State registration laws and regulations may not necessary match the FHWA's wheel base and axle criteria. In the past, the split of the number of registered vehicles to FHWA's vehicle classification was primarily based on the Vehicle Inventory and Use Survey (VIUS). However, the discontinuation of the VIUS after the 2002 edition hampered the continued usage of such information. A new data source is needed to replace the information used to be provided by VIUS

The R. L. Polk Vehicle Registration data provides a national administrative data for all registered vehicles with information on both body type and wheelbase. This dual character of the registration data provides the mechanism to align the axle-spacing vehicle classification with vehicle body type information.

Method

The proposed method is to utilize the R. L. Polk Vehicle Registration's axle spacing (wheelbase), body type, and gross vehicle weight rating (GVWR) data to establish vehicle split percentage data for Light Duty Vehicle – Short Wheelbase, Light Duty Vehicle – Long Wheelbase, Single Unit Truck and Combination Truck. This Polk based percentage data are then applied to State supplied total registered vehicle data to obtain final count of each of the four vehicles.

Step 1

To obtain numbers of vehicles for both "Light Duty Vehicles – Short Wheelbase" and the "Light Duty Vehicles – Long Wheelbase" vehicles from *Polk's Car (both Domestic and Import) Database*

"Light Duty Vehicles – Short Wheelbase" are defined as all light duty vehicles with a wheelbase (axle spacing) less than or equal to 121 inches; The "Light

Duty Vehicles – Long Wheelbase" vehicles are defined as all light duty vehicles having an axle spacing greater than 121 inches.

Step 2

To obtain numbers of vehicles for both "Light Duty Vehicles – Short Wheelbase" and the "Light Duty Vehicles – Long Wheelbase" vehicles from *Polk's Light Truck Database*

The *Light Truck Database* includes vehicles with GVWR up to 13,000 lbs. It covers body types ranging from pickup, van, SUV and other light duty commercial vehicles.

Vehicles contained in *Polk's Light Truck Database* with wheel base less than or equal to 121 inches are all counted as "Light Duty Vehicles – Short Wheelbase;" Vehicles with wheelbase greater than 121 inches are counted as "Light Duty Vehicles – long wheel" vehicles.

Step 3

To obtain "Single Unit Truck" and "Combination Truck" Counts from *Polk's Heavy Truck Database*

Polk's Heavy Truck Database contains trucks with GVWR greater than 10,000 lbs. It is further divided into subgroups based on both body type and GVWR information (see Table below for example). The subgroup "Class 3" vehicle in the database overlaps with the Light Truck "Class 3". Consequently "Class 3" in the Light Truck database is removed from being considered as light truck.

Combination trucks are these registered as "Tractors" and the remaining ones are considered as "Single Unit Trucks"

Step 4

To Obtain the Percentage Split Data among "Light Duty Vehicles – Short Wheelbase", "Light Duty Vehicles – Long Wheelbase", "Single Unit Truck" and "Combination Truck"

Sum up all vehicle counts data obtained from Steps 1, 2 and 3; and compute percentages of each vehicle types accordingly.

Step 5

To Obtain Bus and Motorcycle Data

Bus and motorcycle data are obtained directly from MV-1

Step 6

To Obtain Final Vehicle Counts Data for All Six Vehicle Types

Use Bus and Motorcycle data directly from Step 5

Multiply the percentage data obtained in Step 4 with the difference between MV-1 total and motorcycle and bus combined to obtain final counts for the remaining four types of vehicles.

End of Part 2

Part 3

Vehicle Stock Model and Reconciliation Model for Fuel Economy

The FHWA has adopted the method developed by Oak Ridge
National Laboratory in computing vehicle fuel efficiency for the
six vehicle groups at the national level

Vehicle Stock Model and Reconciliation Model for Fuel Economy (MPG)

Prepared by Oak Ridge National Laboratory

Background

Vehicle Stock Models utilize historical data to establish fuel economy of different vehicle categories. The Reconciliation Model utilizes optimization techniques to further enhance the stock models and ensures that fuel consumptions match VMT, total fuel consumed, and continuity from previous years in VM-1 table. The sensitivity analysis shows that the sensitivities of the model are within reasonable ranges and solutions are stable.

The vehicle stock models (Sheets: "Light Duty Vehicle – Short Wheelbase", "Light Duty Vehicle – Long Wheelbase", "Motorcycle", "Bus", and "Truck") are used to estimate preliminary fuel consumption and fuel efficiency by vehicle type. Vehicle stock models use various data sources of different agencies and organizations to estimate the fleet fuel efficiency. Organizations and agencies publish their data once every 1 to 5 years. Here is a brief summary of updating procedures of vehicle stock models.

Light Duty Vehicle – Short Wheelbase and Light Duty Vehicle – Long Wheelbase share the same data source. EPA annually publishes MPG data by model year for cars and light trucks in *Light Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends: 1975-2009*¹. The vehicle population data is from Polk's National Vehicle Population Profile, and this data is available annually. The VMT data is from the NHTS (National Household Travel Survey) program²,

¹ More information and data can be found at http://www.epa.gov/otaq/fetrends.htm.

² More information on National Household Transportation Survey can be found at http://nhts.ornl.gov/ or http://www.bts.gov/programs/national_household_travel_survey/ or http://www.fhwa.dot.gov/policy/ohpi/nhts/index.cfm.

and it is only available for 2001 and 2009. The VMT data for years other than 2001 and 2009 is estimated using linear interpolation of 2001 and 2009. This method will be used for future updating when the NHTS is not available.

The stock model for buses is divided into three categories: transit bus, school bus, and motor coach. The data for transit buses is obtained from the American Public Transit Association's Transit Fact Book, Appendix A³. Specifically, the sources are as follows: VMT - from Table 6, population - from Table 17, Fuel Type % - from Table 26, Fuel consumed - from Table 32. VMT and population data for school buses is available from the School Bus Fleet website⁴ for 1999, 2002, 2003, 2004, 2005, and 2007. Missing VMT and population data is estimated using linear interpolation. MPG data for school buses is from the DOE report Economic Analysis of Alternative Fuel School Buses. This report gives MPG by type of school bus: type A, type C, type D. The School Bus Fleet website also gives data on the total number of school buses by type. This population data is used to find a weighted average of MPG for all school buses using the MPG data from the DOE report. Motor coach data is from the *Motorcoach Censu*⁵s published in 2009, 2008, 2006, and 2005. For years, during which the Motorcoach Census is not published, the VMT, population, and fuel consumption data is estimated using linear interpolation of available years. All calculation methods are in excel files, and further explanation of the data estimating procedure is given in these excel files.

Motorcycles are divided into 5 categories based on the engine size. These engine size categories are defined as: 0-124cc, 125-349cc, 350-449cc, 450-749cc, and 750cc or greater. The MPG data comes from the Total Motorcycle Fuel Economy Guide. VMT and population are from the NHTS. The motorcycle data from the NHTS should be handled the same as the Light Duty Vehicle – Short Wheelbase and Light Duty Vehicle – Long Wheelbase data from the NHTS.

All heavy truck data is from VIUS (Vehicle Inventory and Use Survey)⁶⁷. The file includes both 2002 and 2007 data. The missing data is estimated using linear interpolation of these two years. For data by fuel type, fuel type 01 is gasoline and fuel types 02-15 are included in special fuels.

Some of data sources require a fee or membership to download. Updating the stock model requires approximately 40 FTE (full time equivalent). All models can be updated every year if new data is available.

The Reconciliation Model

³ An electronic copy of the annual Transit Fact Book can be found at http://www.apta.com/resources/statistics/Pages/transitstats.aspx.

⁴ More information can be found at http://www.schoolbusfleet.com/.

⁵ More information can be found at http://www.buses.org/foundationresearch.

⁶ Electronic copies of the Vehicle Inventory and Use Survey results by survey year can be found at http://www.census.gov/svsd/www/vius/products.html.

⁷ Estimation of 2007 VIUS Variables, Battelle Memorial Institute, Columbus Ohio, October 2009.

The VMT and MPG reconciliation model (Sheet "VM-1") uses the results of the Vehicle Stock Model and data from Table VM-1 of the previous year, and VMT data from HPMS for the current year to provide fuel efficiency estimates for the current year. The VMT and MPG reconciliation model is implemented using the Excel Solver. The output is fuel efficiency estimates for the current year. The fuel consumed is calculated using VMT data of VM-1 for the current year and the fuel efficiency estimates (MPG, output of this model) for the current year.

The Excel Solver is set up to minimize the deviations of fuel efficiency from the previous year's estimates (published in Table VM-1) and from the results of the vehicle stock model The model is subject to the constraint that fuel consumption estimates must sum to the current year's fuel consumption. The model comes with current year as 2008 and previous year 2007.

The input parameters include results of vehicle stock model (green cells), light green represents output from stock model, and is considered as recommended value. The total fuel consumed from table MF-21 (orange cells) is also an important parameter. The reconciliation model (MPG estimates) is highly sensitive to stock model results. Therefore, it is important to have a set of well-estimated fuel efficiency data from stock model for each vehicle category. Another set of important parameters are MPG from the previous year from MV-1 table.

Other data in VM-1 table that may not have effects on MPG, however, they affect the total fuel consumed. These data are total VMT for each vehicle categories.

The optima solver is programmed into two buttons: solve and reset.

The solve button will start optima procedure, a message pops up to show if a solution has been found. It is possible that solution cannot be achieved after thousands of iterations. This indicates that model is not set up properly. The reset button turns the numbers back to its original values.
