NATIONAL INTERAGENCY COORDINATION
CENTER

Intelligence

The principle mission of the Intelligence Section of the National Interagency Coordination Center is to collect, consolidate and disseminate fire and other natural disaster information to the Washington Office, field units of the wildland fire agencies and the public. This information is gathered from the Geographical Coordination Centers from all governmental agencies both state and federal. The information gathered is used for decision support and planning purposes, which is especially critical during Preparedness Levels 3 through 4 when resource availability becomes limited.

2000 WILDLAND FIRE SEASON OVERVIEW NARRATIVE

Fire season 2000 was unusually active with above average numbers of fires and acres occurring. Mobilization of firefighters and equipment started early in late April in the Southwest and escalated through the rest of the summer with record fire activity occurring in the Northern Rockies and in the Eastern Great Basin. A predominant weather feature, La Nina had a strong influence on the weather patterns in the United States resulting in a wet winter in the Pacific Northwest and dry conditions in the southern tier states ranging from California to Florida. The combination of dry fuel conditions, active dry lightning storms and persistent hot weather in July and August culminated in a very busy fire season.

January began with a ridge of high pressure dominating the eastern third of the country and a low-level trough in the west. Dominant high pressure over the southwestern part of the country provided warmer than normal temperatures from the central plains westward. Near normal temperatures were observed in the eastern portions of the country. A prevalent onshore flow brought ample precipitation for the Northwest while the Southwest, central Plains and South were drier than normal. The rest of the country received normal precipitation. January 2000 was the tenth warmest on record while precipitation ranked near the long-term mean. Fire activity was moderate in the South, Southern California and the Southwest.

February saw an upper-level ridge in the central portions of the country with warmer than normal temperatures coast to coast. The prevalent onshore flow in the Northwest provided above normal precipitation while the most of the eastern portion was drier than normal. Weather data for February indicated that the mean temperature across the United States was the third warmest ever recorded and precipitation was above normal in the Northern Rockies, Great Basin, California, north central Texas and the northern Plains. Drier than normal conditions persisted from the Southwest to Southeast and the Great Lakes region. Fire activity was reported in the South, Southern California, Eastern Area and Southwest. Large grass fires were reported in New Mexico during the middle of the month with an increase in initial attack activity.

High pressure over the eastern half of the country provided warmer than normal temperatures from coast to coast in March, with much warmer temperatures noted from the Northern Rockies to the mid-Atlantic. The dominant eastern high pressure provided for drier than normal conditions in central Texas northeastward through the Mississippi and Ohio Valleys. Less than average surface wetness was seen in the northern Plains due to an absence of snowmelt. March was the fourth warmest month on record and precipitation ranked near the long-term mean. An increase in fire activity occurred during the first week of the month in the Southern and Eastern Areas with continued activity reported in the Southwest. A Type I Incident Management Team was assigned to the Kisatchie Wilderness fire in Louisiana and large fires were reported in Missouri as well. Most large fires were contained by the third and fourth weeks of the month.

April saw several deep storm-producing troughs cross the country from west to east. An upper level ridge dominated the western half of the country with warmer than normal temperatures reported in the Northern Rockies, Western High Plains to the Pacific Coast. Temperatures were cooler than normal in the Southeast and near normal from the central Plains through the Northeast. Recorded precipitation amounts remained near the long-term mean. At the start of the month, another Type I Incident Management Team was committed to a large fire in Northern California and a second Type I Incident Management Team was mobilized for a large fire in Arizona during the last week of April. Large fire activity was reported in Missouri, Minnesota, Wisconsin, Mississippi, New Mexico, Kentucky, Florida, North Carolina, North Dakota and Colorado.

May saw an upper-level ridge over most of the country that provided much warmer than normal temperatures with drier than normal conditions from the Southwest through the Carolinas and in the interior of Alaska. May ranked as the second warmest on record and was the 29th driest for the last 100 years. Significant fire activity continued as a prescribed fire in northern New Mexico escaped due to strong and erratic winds. The fire at Los Alamos destroyed 235 homes and 47,650 acres of land. Florida also reported a large fire during the first week of the month. By mid-month an Area Command Team had been ordered to help manage the fires in the Southwest and four Type I Incidents were burning, while the Eastern Area began to report some large fire activity. During the last half of May, fire activity increased in the Southern Area, Rocky Mountains, Great Basin and Southern California. In the Southwest, Cerro Grande was contained while northern Arizona reported an increase in large fire activity.

June weather patterns continued with warmer than normal conditions in the west and the Atlantic coast with cooler conditions in the central part of the country. A weak preview of the southwest monsoon provided wetter than normal conditions throughout the Southwest and significant rainfall in the Ohio Valley, mid-Mississippi Valley and mid-Atlantic regions.

June was only the 33rd warmest on record and the 14th driest in the last 100 years. Long-term drought (Palmer) area coverage decreased slightly from May. At the time, the drought area coverage was the worst since the late 1980's with extreme drought conditions persisting in much of the country. Seasonal thunderstorm activity began in the west and fires were reported in Nevada, Idaho, Colorado, Wyoming and Montana.

A dominant high-pressure ridge over the western United States brought warmer than normal conditions for the Rocky Mountain and the Southern states during July. Cooler than normal temperatures existed in the Ohio Valley north-eastward to the Appalachians and Mid-Atlantic States. Drier than normal conditions continued in the inter-mountain West and portions of the South and Southwest. Temperatures averaged throughout the United States were near the long-term mean and precipitation was below normal in the West and Southern states. July started out very busy with large fires being reported in Northwest, Great Basin, Alaska, Southern California, and as a precursor of activity to follow: large fires in the Eastern Great Basin and one on the Clearwater in the Northern Rockies. Accompanying gusty winds associated with the thunderstorms contributed to large fire growth and by July 15th the National Preparedness Level was raised to three. One week later, the National MAC Coordinator changed the National Preparedness Level to four and in the last week of the month, it was raised to the highest-level possible, Preparedness Level five. Multi-Agency Coordinating Groups were established to set priorities for suppression and protection activities at the National Level, in the West and East Great Basin and in the Northern Rockies. By the end of the month, approximately 48 large fires were reported as burning in the United States and the first Military Battalion had been mobilized to the Burgdorf Incident in Idaho.

August began with dominant high pressure established over the West, bring above normal temperatures for most of the region. A trough over the Eastern third of the country allowed for much cooler temperatures, especially for the central Appalachians and the mid-Atlantic regions. August 2000 mean monthly temperature averaged across the contiguous United States was the fifth warmest in 100 years. Precipitation was wetter than normal throughout the Great Basin, near normal in the Eastern United States, and drier in the inter-mountain West, extreme Southwest and California. August was the 3rd driest month since recording began in 1895. This was the first August since 1976 with much below normal precipitation received. The Northern Rockies saw a dry lightning storm go through the Bitterroot Valley and 70 to 100 new fires a day were being reported. By the end of the month, four Area Command Teams were established in Montana, a total of 6 Military Battalions, firefighters and equipment from Canada, Australia, and New Zealand and aerial suppression support from the National Guard Mobile Airborne Fire Fighting aircraft. At this time, an estimated 30,000 firefighters and support personnel were deployed to suppress the fires in the western United States. On August 21, a total of 98 large fires were reported burning to the National Interagency Coordination Center in Boise, Idaho.

During September, the upper-level ridge in the west continued to bring record warm temperatures while much of the east remained cooler than normal. Above normal precipitation was observed in the Great Lake states through the Ohio Valley and into the Mid-Atlantic States. Due to tropical storms, Florida and the Carolinas were also wetter than normal. A mid-continent ridge provided dry conditions to the northern Great Plains, Texas and into the Great Basin. Portions of northern California, Oregon and Washington saw wetter than normal conditions. The significant event during September was the cold frontal passage during the first week that brought much needed relief to the Northern Rockies, Northwest, and the Great Basin Areas. Firefighters daily continued to gain an upper hand on the fires as cooler nights and high relative humidity diminished fire behavior and activity. By the end of September all of the military battalions and the international firefighters had been demobilized.

October began with continuing rehabilitation on two of the largest wildfires complexes from the 2000 fire season, the Valley Complex and Clear Creek Complex. Warm and dry conditions continued in the Southern Area and fire were being reported in Texas and Oklahoma and by mid-month the Eastern Area mobilized resources to Minnesota to help fire efforts there.

November saw continued high fire danger and numerous large fires occurring in South Carolina, Virginia, Tennessee and Kentucky. By the second week of the month, a cold front passed through much of the area, bringing some precipitation and higher relative humidity, which aided firefighters towards containment of many of the large fires there. By the end of the month, large fire activity was being reported in the California, Eastern and Southern Areas with no significant problems meeting containment objectives. Much below normal temperatures dominated the country from the central Plains to the Pacific coast while below normal temperatures dominated the rest of the country. In general, the country was cooler than normal except for areas around the central and western Great Lakes and portions of northern New England. Based on preliminary precipitation data, November of 2000 was the 26th wettest such month since records began in 1985.

Above normal precipitation occurred over portions of central and western Alaska, while Hawaii was drier than normal in much of islands.

December saw extreme cold temperatures recorded throughout the southern region of the United States and with an average temperature of 28.9F degrees, the U.S. experienced the seventh coldest December since 1895. Drought conditions were offset in Texas and the much of the Gulf States with above normal rainfall recorded and cold temperatures continuing in the south. While precipitation amounts were normal to above normal throughout the central and eastern U.S., the West and Northwest regions recorded the fourth driest November – December since records began. December began with initial attack activity being reported in the Eastern and Southern Areas. During the last week of December, minimal large fire activity was reported with fires occurring in the Southern and Southern California areas.

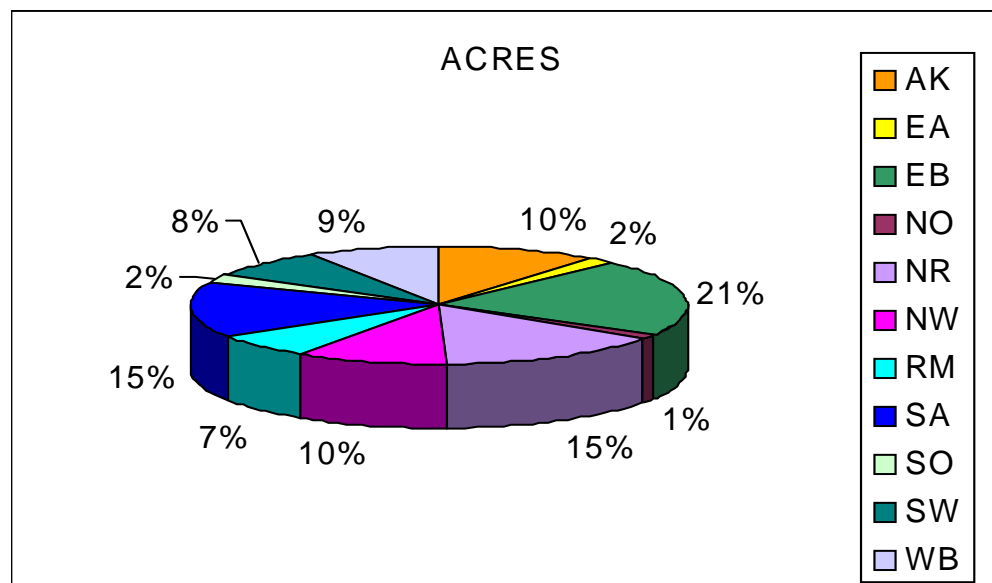

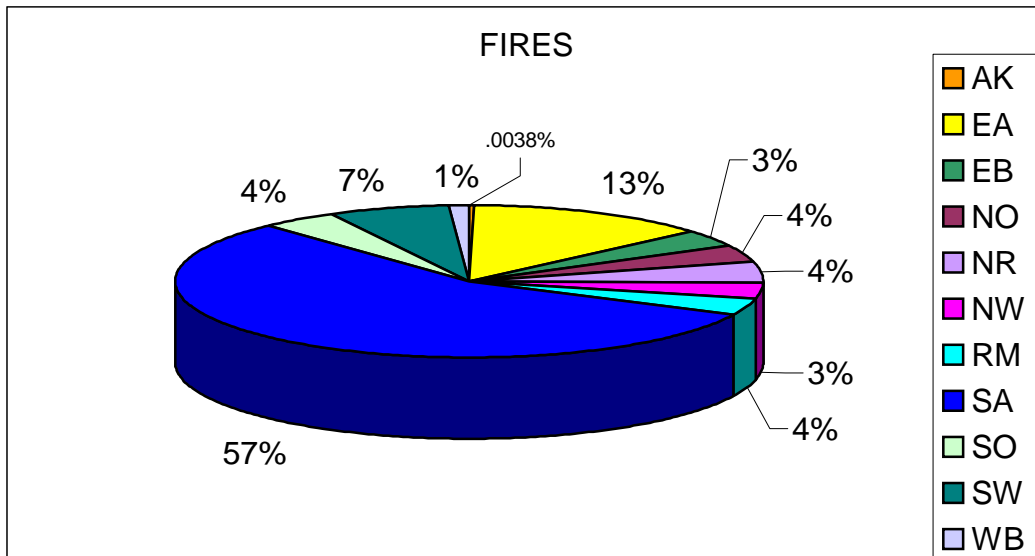

Fires Reported to NICC

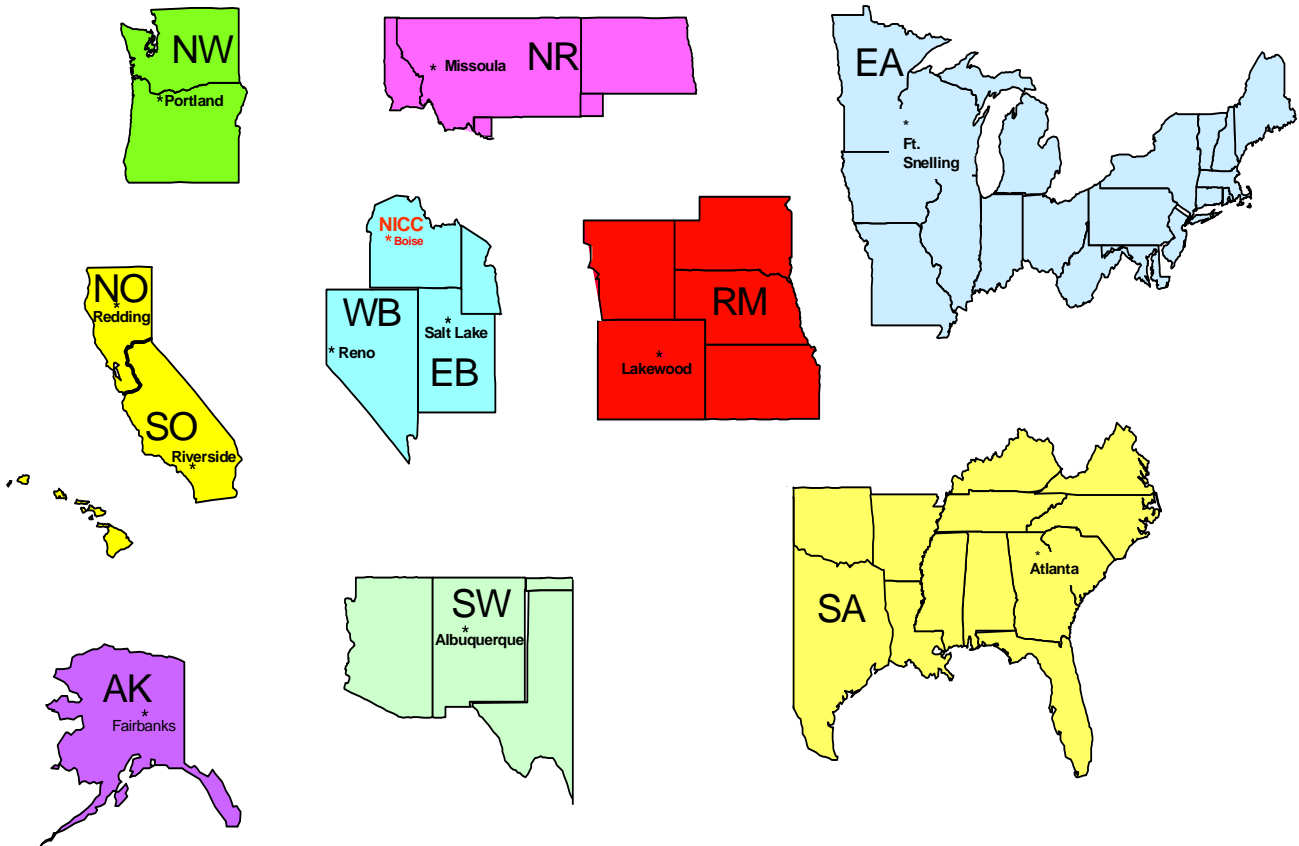

Acres Reported to NICC

Fires and Acres reported to the National Coordination Center by the Geographical Area Coordination Centers

GEOGRAPHIC AREA COORDINATION CENTERS

Wildfire occurrence and acres as reported to NICC by agency for 2000

Fires and acres are reported to the National Coordination Center by the local units through the Geographical Area Coordination Centers via a internet based program. This is not the final fire and acreage totals that are entered into the fire statistic databases for each agency.

Prescribed fire projects reported to the National Coordination Center by agency

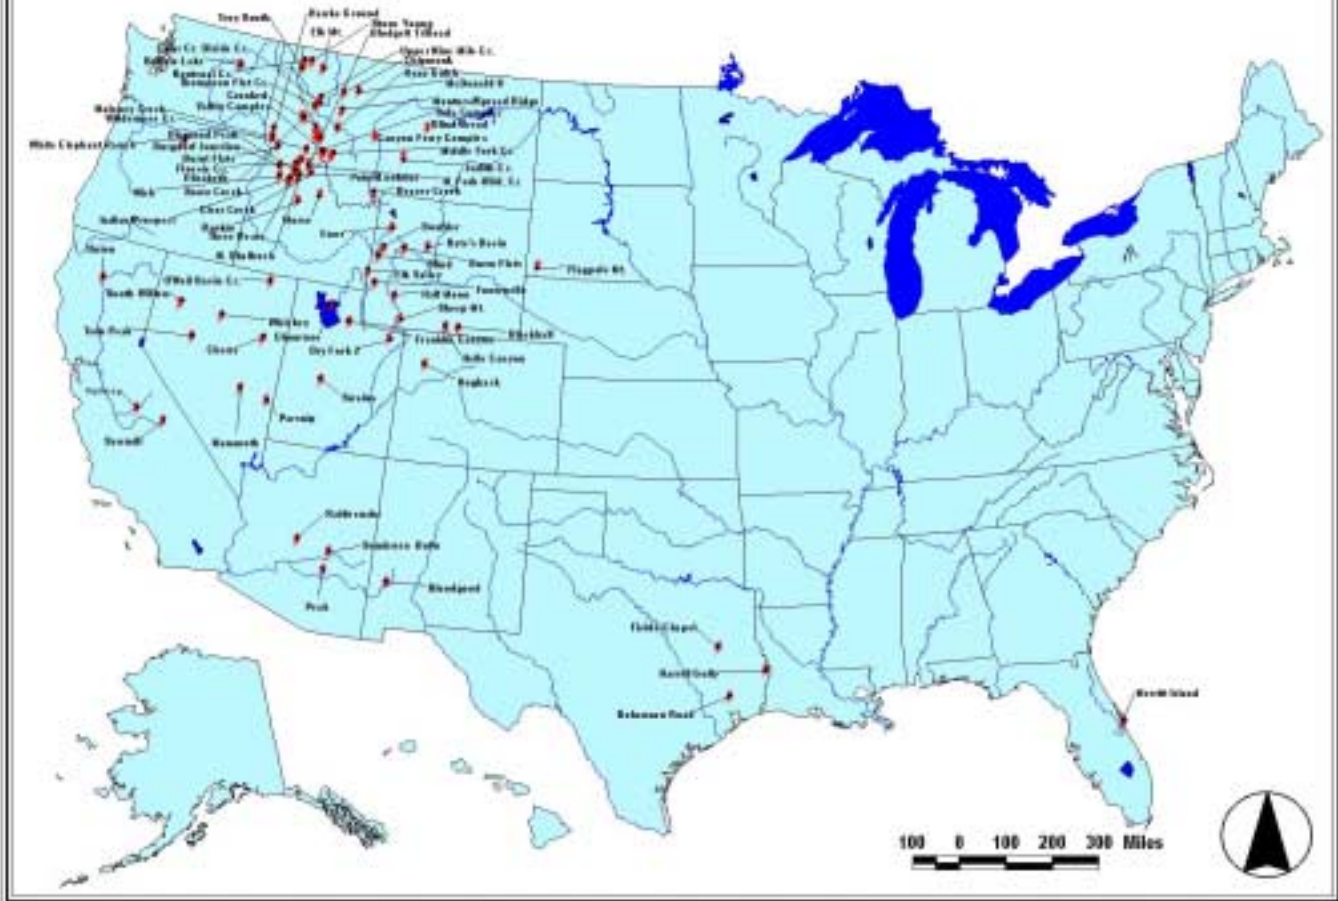

Prescribed fire acres accomplished as reported to the National Coordination Center by agency

Prescribed fire is a tool utilized by the government agencies to accomplish resource management objectives such as reducing fuel loading on the ground to reduce fire hazard and potential for catastrophic fire events. Prescribed fire also improves forest health by releasing nutrients into the soil. A total of 4,697 prescribed fire projects and 1,192,220 treated acres were accomplished in the year 2000.

Large Incident Locations 8/15/2000

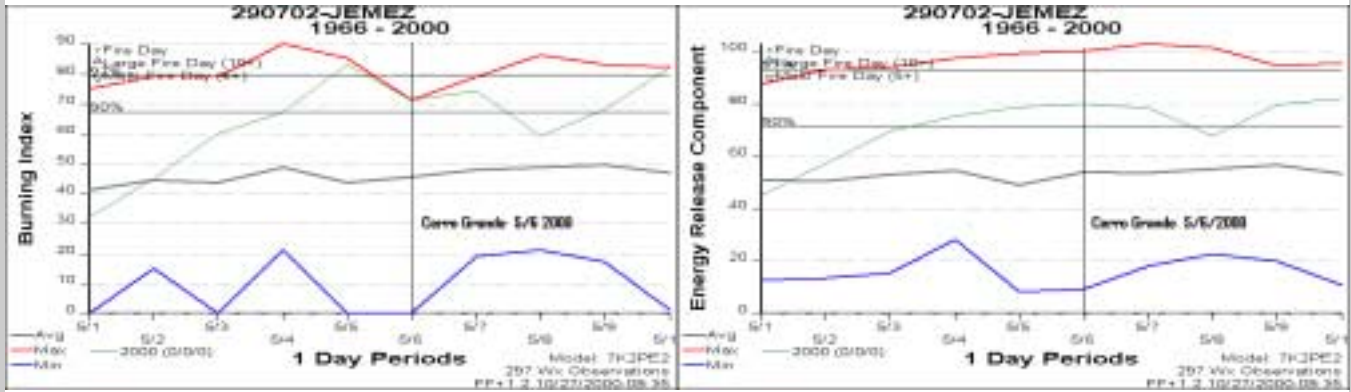

A map of one of the large fire days during Fire Season 2000. Below is a chart of large fires as they occurred during Preparedness Levels 4 and 5. The highest number of large fires reported to the National Coordination Center nationwide was 98, which occurred on August 21, 2000. A large fire is defined as 100 acres in timber fuel types and 300 acres in the grass and brush fuels.

Number of large Fires Reported

Preparedness Levels

Days at level 4 and 5

Satellite imagery of large fires in eastern Idaho and western Montana on August 22, 2000. Some of the visible fires in Idaho include Trail Creek, Rankin, Morse, Clear Creek, Burgdorf Junction and Wilderness Complex. Visible in western Montana is Valley Complex, Middle Fork Complex and Maudlow/Toston.

2000

NATIONAL INTERAGENCY COORDINATION
CENTER

Incident Support

The principle mission of the National Interagency Coordination Center is the cost effective and timely coordination of land management agency response to support wildland fires and other natural disasters. This is accomplished through planning, situation monitoring and expediting resource orders between federal agencies and other cooperating agencies.

Large Jet Transport

The National Interagency Coordination Center processed 299 orders for large jets used in the transportation of crews and overhead.

USFS-NIFC maintains on contract a B737 jet provided by Sierra Pacific Airlines with a seating capacity of 101. During the busiest portion of the season a second ship was put on contract and was also provided by Sierra Pacific Airlines.

The National Interagency Coordination Center processed requests for 299 flights. A total of 29,315 passengers were transported for an average seat cost per passenger for all flights of 335.73. The total cost for large transport was 9,841,929.00 of which 9,186,429.00 were flight costs and 655,500.00 for daily availability costs.
