**Remark:** Magnolia Prospect, calcareous nannofossil report, based on the consistent occurrence of Pseudoemiliana ovata in the first few samples and on the general succession of events in the Magnolia area, the Uppermost samples are from below Event 14b (Applied Biostratigraphix Gulf of Mexico biostratigraphy chart, p lacunosa increase), From 19050 to 20790 the samples are essentially barren of in-place nannofossils, The well is still above the Calcidiscus macintyreii top (Event 15) since the last 2 samples contains a few in-place forms similar to those found in the Uppermost samples, nannospecies abundance and diversity chart available, see report for details

**Remark:** Calcareous nannofossil report, at 23970 a well-developed condensed section was noted with an isolated occurrence of Discoaster B, subsequent samples within the same condensed section, which actually may be a floral occurrence on top of a basin floor fan within the transgressive system tract, yielded no additional specimens of Discoaster B, Its occurrence here is considered reworked for lack of continuity in subsequent samples, If Discoaster B is in place, then 23970=basal Pliocene/approaching Robulus E

**Remark:** Calcareous nannofossil report, 25410=Ericsonia fenestrata (reworked?), 25440=Helicosphaera compacta (reworked?), Coccolithus eopelagicus (reworked), still in Lower Miocene at TD - normally the consistent occurrence of Dictyococcites bisectus indicates the top of the global Oligocene, and is somewhat supported by the presence of the Lowermost Miocene LAD of Ericsonia fenestrata - the presence, however, of some reworked Eocene specimens in the sample at 25440 may indicate that the Dictyococcites bisectus specimens are also reworked - the lack of Spheniolithus ciperoensis (with the exception of a single specimen at 25350) and the lack of Dictyococcites bisectus below 25440 support this, nannospecies abundance and diversity chart available, see report for details
