**Remark:** Calcareous nannofossil report, 15470=out of salt - mixed late and middle Miocene, 15950=Discoaster prepentaradiatus - questionably in a normal stratigraphic section - may be part of a mixed allochthonous flora as indicated at 15470, the 15950 to 16160 contains rare but consistent occurrences of Discoaster prepentaradiatus and no older flora, the sidewall core sample at 16300 contains abundant flora with Catinaster mexicanus and discoaster loeblichii - this is the youngest well-defined flora below the salt and may mark the top of a normal age section - the interval above this, below the jumbled zone, appears to be part of a reverse or overturned section that is defined by progressively younger nannos downsection, Catinaster coalitus (15800), Discoaster bollii (15890) and Discoaster prepentaradiatus (15950), 17100=significant reoccurrence of Discoaster prepentaradiatus which should define the 780my maximum flooding surface, nannospecies abundance and diversity chart available, see report for details
