**Remark:** Eptesicus Prospect, company-integrated foram and nanno report, 14820=Lower Oligocene Subbotina angiporoides, based on the benthic foraminiferal assemblages, the depositional environment is interpreted as Lower to middle slope since the early Oligocene, abundance variations of planktic forams and nannofossils indicate the entire Oligocene and Lower to middle Miocene section is very condensed, with a predominant pelagic influence, the Upper Miocene to the Pleistocene section displays reduced planktic abundance and increased rate of sediment accumulation, suggesting an expanded section
