

## Conservation Practice Standard Overview

---

### Dry Hydrant (432)

A dry hydrant is a nonpressurized permanent pipe assembly system installed into a water source that permits the withdrawal of water by suction.

#### Practice Information

A dry hydrant may be applied to provide all-weather access to an available water source for fire suppression.

This practice applies where an adequate volume of water is available, where transport vehicles can access the site, and where a source of water is needed for fire suppression.

In rural areas, a lack of water mains and pressurized fire hydrants can sometimes impair a fire department's ability to do its job quickly and efficiently. The success of a fire department's operation hinges on the distance a truck must travel to fill up and return to the fire.

In many cases these fill-up points are often long distances from the fire and the firefighters are unable to maintain an uninterrupted water source at the scene.

A dry hydrant will require maintenance over the expected life of the practice.

#### Common Associated Practices

A Dry Hydrant (432) is commonly applied with conservation practices such as Access Road (560), Pond (378), Dam (402), Access Control (472), and Heavy Use Area Protection (561).
