UNITED STATES OF AMERICA FEDERAL ENERGY REGULATORY COMMISSION

Increasing Market and Planning Efficiency through Docket No. AD10-12-003 Improved Software

NOTICE OF TECHNICAL CONFERENCE: INCREASING REAL-TIME AND DAY-AHEAD MARKET EFFICIENCY THROUGH IMPROVED SOFTWARE

(March 26, 2012)

Take notice that Commission staff will convene a technical conference on June 25, 26, and 27, 2012 to discuss opportunities for increasing real-time and day-ahead market efficiency through improved software. A detailed agenda with the list of and times for the selected speakers will be published on the Commission's Increasing Market and Planning Efficiency website¹ after May 14, 2012.

This conference will bring together diverse experts from ISOs/RTOs, non-market utilities, the software industry, government, research centers and academia for the purposes of stimulating discussion and sharing of information about the technical aspects of these issues and identifying fruitful avenues for research. This conference is intended to build on the discussions initiated in the Commission's June 2010 and June 2011 staff technical conferences on increasing market and planning efficiency through improved software.

The conferences held in June 2010 and June 2011 produced presentations on several advanced approaches to market modeling which appear to have significant promise for potential efficiency improvements: stochastic modeling; optimal transmission switching; AC optimal power flow modeling; and use of active and dynamic transmission ratings. Significant computational impediments to efficiently and reliably implement these approaches must be understood and overcome before benefits can be realized. In this conference, we seek to explore research and technical steps that would be needed to implement these and other advanced technologies in the future.

¹<u>http://www.ferc.gov/industries/electric/indus-act/market-planning.asp.</u>

In particular we solicit proposals for presentations on topics and questions such as the following:

- 1) <u>Stochastic modeling for unit commitment and operating reserves</u>: Given the difficulty in formulating and solving full-scale stochastic unitcommitment problems, what interim steps might be taken to more intelligently incorporate information about uncertainty into unitcommitment and dispatch? Specifically:
 - How can uncertainty be described in a manageable set of scenarios or constraints that improve unit-commitment and dispatch while allowing good solutions to be achieved in the required timeframe?
 - If a stochastic unit-commitment model is used, how should dayahead prices be calculated, given that the stochastic formulation no longer produces as part of its solution a single set of deterministic shadow prices for power at each location?
 - How would a stochastic day-ahead unit commitment mechanism alter current market software for other processes (for example, reliability unit-commitment processes)?
 - What steps toward better incorporation of uncertainty into unitcommitment might be taken over the next 5 to 10 years?
 - What methods can be used to calculate requirements for contingency reserves and regulating reserves?
 - How can reserves calculations more completely capture the uncertainty and variability of the system, including forecast error?
 - How can outage probability be captured in contingency reserve calculations, and how good is the available data?
 - What methods can be used to determine reserve zones?
- 2) Optimal transmission switching:
 - Simple optimal DC transmission switching appears to represent a
 potentially solvable technical problem using existing computational
 resources if transmission operators optimize only a small number of
 transmission switch positions. It is less clear whether transmission
 switching model formulations that include realistic representations
 of reliability requirements are solvable. What is the performance of
 these more complex model formulations?

- What additional computational impediments, if any, exist to implementing optimal transmission switching over a small number of switches while maintaining reliability?
- What steps toward optimal transmission switching might be taken over the next 5 to 10 years?

3) <u>AC optimal power flow modeling</u>:

- What is the current state of computational capability with respect to dependably solving AC optimal power flow problems, including analysis of power system reliability?
- Discussions during previous conferences have centered on concerns that current system data quality might not allow for an AC optimal power flow model to be properly formulated and solved. What are the specific data concerns, and what needs to be done to address them?
- What steps toward use of AC optimal power flow modeling might be taken over the next 5 to 10 years?
- 4) Adaptive and dynamic transmission ratings:
 - Previous presentations examined the use of post-contingency analysis when determining transmission ratings, including consideration of availability of ramping capability. How can (or have) adaptive transmission ratings been implemented?
 - Previous presentations also examined how transmission ratings might be updated in real time in response to ambient conditions. How have such dynamic transmission ratings been implemented?
 - What are the data or computational challenges associated with implementing adaptive or dynamic transmission ratings?

While the topics suggested above are largely forward-looking, we also encourage proposals for presentations on best practices and other analyses of current operations with respect to these and related topics.

The technical conference will be held in the Commission Meeting Room at the Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426. All interested participants are invited to attend, and participants with ideas for relevant presentations are invited to nominate themselves to speak at the conference.

Speaker nominations must be submitted on or before April 27, 2012 through the Commission's website² by providing the proposed speaker's contact information along with a title, abstract, and list of contributing authors for the proposed presentation. Proposed presentations should be closely related to the topics discussed above. Speakers and presentations will be selected to ensure relevant topics and to accommodate time constraints.

Although registration is not required for general attendance by U.S. citizens, we encourage those planning to attend the conference to register through the Commission's website.³ We will provide printed nametags for those who register on or before June 20, 2012.

Due to new security procedures, we strongly encourage attendees who are not citizens of the United States to register for the conference by June 1, 2012, in order to avoid any delay associated with being processed by FERC security.

Following the conferences, a comment date will be set for the filing of postconference comments.

There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email <u>FERCOnlineSupport@ferc.gov</u>, or call 866 208-3676 (toll free). For TTY, call 202 502-8659.

A free webcast of this event will be available through the FERC website. Webcast viewers will not be able to participate during the technical conference. Anyone with Internet access interested in viewing the webcast of this conference can do so by navigating to Calendar of Events at <u>www.ferc.gov</u>. The events will contain a link to the webcast. The Capitol Connection provides technical support for the webcasts and offers the option of listening to the conferences via phone-bridge for a fee. If you have any questions, visit <u>www.CapitolConnection.org</u> or call (703) 993-3100.

FERC conferences are accessible under section 508 of the Rehabilitation Act of 1973. For accessibility accommodations please send an email to <u>accessibility@ferc.gov</u> or call toll free (866) 208-3372 (voice) or (202) 502-8659 (TTY), or send a fax to (202) 208-2106 with the required accommodations.
