(Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD). To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326W, Whitten Building, 14<sup>th</sup> and Independence Avenue, SW, Washington DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.

Idaho

8 Digit Hydrologic Unit Profile

July 2007

## Introduction

The Middle Bear 8-Digit Hydrologic Unit Code (HUC) subbasin is 819,105 acres. The Idaho portion of the subbasin is 615,458 acres in size. <u>Only the Idaho portion of the subbasin</u> <u>will be described in this document</u>. Approximately sixty six percent of the subbasin is located in Franklin County. Caribou County comprises 19 percent of the Middle Bear subbasin. Bannock County accounts for approximately 11 percent of the subbasin. Three percent of the subbasin is in Oneida County; a few hundred acres are located in Bear Lake County. Sixty six percent of the basin is privately owned and 34 percent is public land.

Seventeen percent of the basin is in forest, 19 percent is cropland, 32 percent is shrubland or rangeland, and 23 percent is grass, pasture or hayland. Approximately 7 percent of the watershed is enrolled in the Conservation Reserve Program (CRP). The remaining two percent is water, wetland, developed or barren.

Elevations range from 4400 feet in the southern portion to over 9000 feet along the south eastern edge of the Idaho side of the subbasin.

Conservation assistance is provided by four Soil and Water Conservation Districts, and two Resource Conservation and Development offices.

#### **Common Resource Area Map**

# CRA Map - areas with a majority are listed below - for descriptions of every class within the HUC, go to: <u>http://ice.id.nrcs.usda.gov/website/cra/viewer.htm</u>

A Common Resource Area (CRA) is defined as a geographical area where resource concerns, problems, or treatment needs are similar. It is considered a subdivision of an existing Major Land Resource Area (MLRA) map delineation or polygon. Landscape conditions, soil, climate, human considerations, and other natural resource information are used to determine the geographic boundaries of a Common Resource Area. (General Manual Title 450 Subpart C 401.21)

Idaho

8 Digit Hydrologic Unit Profile

### **Common Resource Area Descriptions**

The National Coordinated CRA Geographic Database provides:

- A consistent CRA geographic database;
- CRA geographic data compatible with other GIS data digitized from 1:250,000 scale maps, such as landuse/landcover, political boundaries, Digital General Soil Map of the U.S. (updated STATSGO), and ecoregion boundaries;
- A consistent (correlated) geographic index for Conservation System Guides information and the eFOTG
- A geographic linkage with the national MRLA framework

#### <u>13.4 Eastern Idaho Plateaus - Sagebrush Steppe - and Woodland-Covered Hills and</u> Low Mountains

This unit occupies an elevational band between the higher mountains and the lower intermontane valleys. Potential natural vegetation is mostly sagebrush steppe. Cool season grasses are more common than in the adjacent, drier units. Juniper woodland vegetative sites occur on shallow rocky soils. Land use is primarily livestock grazing.

#### 13.5 Eastern Idaho Plateaus - High Elevation Forests and Shrublands

This unit is mountainous and occupies the elevational band above Sagebrush Steppe Valleys and Woodland-Covered Hills and Low Mountains CRA units. It is characterized by a mix of conifers, mountain brush, and sagebrush grassland. North-facing slopes and many flatter areas support open stands of Douglas-fir, aspen and lodgepole pine. Winters are colder and the mean annual precipitation is higher than in lower elevation units.

#### 13.6 Eastern Idaho Plateaus - Sagebrush Steppe Valleys

This valley unit is flanked by hills and mountains. It is dominated by sagebrush grassland and lacks woodlands, open conifer forest, and the saltbush-greasewood vegetation. Perennial bunchgrasses are more abundant than in the Sagebrush Basins and Slopes in Utah. Valleys mostly drain to the Snake River and fish assemblages are unlike those of the internally-drained basins to the south (MLRA 28A). Grazing is the dominant land use but non-irrigated wheat and barley farming is much more common than in MLRA 28A. This unit is less suitable for cropland and has less available water than many parts of the Snake River Plain (MLRA 11).

#### 28A.5 Great Salt Lake Area - Northern Agricultural Valleys

This unit is on gently sloping hills and terraces and some valley basins. Mountain-fed perennial streams and canals supply water to pastureland, towns, and cropland growing hay and small grains. Soils are in a semiarid climate and are usually Xeralfs or Xerolls with a mesic temperature regime. Precipitation ranges from 9 to 16 inches.

#### 47.2 Wasatch and Uinta Mountains - High Mountains

This area is in the higher elevations of the Wasatch and Uinta Mountains. Precipitation ranges from 16 to about 30 inches. Elevations are usually more than 6,000 feet and range to more than 10,000 feet. The mountains are covered in a mixture of mountain big sagebrush, mountain brush, and coniferous forests; with alpine vegetation on the highest mountain summits.

8 Digit Hydrologic Unit Profile

### **Common Resource Area Descriptions** - continued

#### 47.3 Wasatch and Uinta Mountains - Semiarid Foothills, Eastern Idaho

The Semiarid Foothills ecoregion ranges in elevation from about 5,500 to 8,200 feet. Widely spaced junipers occur in a matrix dominated by mountain big sagebrush and bluebunch wheatgrass. Overall, the vegetation is distinct from that of the higher, wetter Wasatch Montane Zone. Livestock grazing is common. Some rangeland has been cleared of trees and reseeded to grasses.

### Streamflow Summary 17, 27, 29

The Idaho portion of the Middle Bear subbasin includes all land that drains to the Bear River from below Alexander Dam to the Utah state line. The Bear River flows from north to south within this stretch. A diversion at Grace Dam delivers water to the Grace Power Plant (USU, 2007). The river continues through the Gem and Gentile Valleys, through Oneida Narrows Reservoir, and crosses the state line into Utah just below Weston Creek. The hydrology of the Middle Bear subbasin is dominated by the Bear River mainstem as it flows through mostly semi-arid canyons, rangeland and irrigated agricultural ground. Major tributaries to the Bear River in the subbasin include Cottonwood Creek, which joins the river from the west above Oneida Narrows Reservoir, and Weston Creek that drains into the river near the Utah state line. The average annual (daily) flow of the Bear River at the Utah stateline is 1,009 cfs; this is based on 30 years of flow data (1976 to 2005).

Peak flows generally occur in April, May or June, but have been recorded during October or November as well. Highest peak flow for the discharge period examined was 4,870 cfs (6/14/84), with the lowest flow estimated at 24 cfs (5/16/04). Flows are highly variable due to irrigation diversions; during the last five years lowest flows at the stateline have occurred anytime from May to August. Summer flows, averaging 1000 cfs, are elevated relative to upstream gaging stations.

|                  |  |                              | Acre-Feet |
|------------------|--|------------------------------|-----------|
|                  |  | Average Annual               | 730,493   |
| Stream Flow Data | USGS #10092700 Bear River At<br>Idaho-Utah State Line, 1976-2005 | Mar-July Average             | 361,439   |
|                  |  | Percent of Average<br>Annual | 49.5%     |

Principal uses of water in the subbasin are hydroelectric power generation and irrigation. Additional uses include domestic, livestock, and industrial purposes.

Idaho

8 Digit Hydrologic Unit Profile

### **Resource Settings**

#### Pasture:

Pasture ranges from low wet meadows to rolling hills along the valley margins. Livestock utilization is during early spring and late fall, with a rest period in the summer. Fencing of property boundaries is generally an existing practice. Soils are deep with variable textures and wetland inclusions with slopes from zero to ten percent. Annual precipitation is 12 inches or less with very hot dry summers. Vegetation ranges from native grass/sedge/rush complexes in the wet meadows to improved forage species such as timothy, bromegrass, orchard grass and clover in the uplands. Occasionally these may be cut once during the summer as wild hay.

#### Cropland:

#### Dry Cropland

Dry cropland is located along the valley margins on slopes ranging from 3 to 12%. Elevations along the valley margins range from 4,000 to 5,500 feet which shortens the growing season to about 90 days. Precipitation ranges from 10 to 14 inches per year, making this very marginal for producing crops with out irrigation. To accommodate for this most landowners have a winter small grain / fallow rotation. Tillage practices are fall disk, spring chisel with sweeps, summer chisel with sweeps, drill in fall and harvest.

Some landowners are trying an annual small grain. This has had mixed results due to the lower yields and increase in weeds. Tillage practices with an annual grain rotation are fall disk, spring disk, drill and harvest.

Typical soils are silt loams with a T rating of 5 and a K factor of 0.43. Sheet and rill erosion are a problem due to the steep slopes. Steeper slopes have ephemeral and classic gully erosion. Some of the areas have installed terraces and water & sediment basins to control the runoff and erosion.

Dry cropland that has been converted to permanent vegetation (CRP) applies to all slopes, soil types and precipitation ranges. Wildlife habitat and gully erosion are still a concern in areas that had very sever erosion before the conversion to permanent cover.

#### Irrigated Cropland

Irrigated cropland is located along the lower valley margins and in the valley bottoms. Slopes range from 0 to 8% with steeper slopes sprinkler irrigated and some of the flatter slopes surface irrigated. Soils are loamy sand and finer with T values 3 to 5. Precipitation ranges from 8 to 12 inches with a growing season of 100 to 120 days. Crops grown are alfalfa, small grain, potato and silage and grain corn. Crop rotations have 5 years alfalfa and 1 to 3 years small grain, corn or potato.

Idaho

8 Digit Hydrologic Unit Profile

### **Resource Settings** - continued

#### Hayland:

#### Dry hayland

Dry hayland is located on 8 to 12 percent slopes. Growing season is 90 days. Soils are deep with variable textures. Annual precipitation is less than 12 inches with hot dry summer months. Fertilizers and/or pesticides are periodically applied. One cutting of introduced grass and alfalfa or clover are typical with rotations lasting up to 10 years. Big game species are present in winter and early spring. Forage harvest management is usually an existing practice.

#### Irrigated hayland

Irrigated hayland on zero to seven percent slopes. Precipitation is 12 inches or less per year and the growing season is approximately 100 to 120 days long. Small grains and alfalfa hay are grown in rotation, with alfalfa typically maintained for four to six years. Grazing of crop aftermath may occur. Nutrient, pest, and/or irrigation water management may be less than desirable.

#### Range:

Rangeland is located along the valley margins above the cropland and adjacent to the public land. Some of the rangeland is managed in conjunction with the public land grazing allotments. Rangeland vegetation consists of native perennial grass and forbs. Some areas have problems with invasive species. Precipitation is 12 to 16 inches most of which falls in winter and early spring out side the growing season with periodic summer thunderstorms. Topography varies from steep slopes to rims and benches. Soils are loamy to gravelly with slopes from 0 to 20 percent. The average frost free period is 80 to100 days. Elevations range from 4,500 feet to 6,000 feet. Temperatures are cold in the winter and very hot in the summer. Boundary fencing is generally an existing condition. The typical planning unit is 640 acres.

Riparian vegetation consists of grasses, sedges, rushes and a variety of woody species. Streams are primarily medium gradient and depend on vegetation for stability. These areas are important habitat for a variety of fish and wildlife. Soils vary from gravelly to loamy. Water quality is often a concern for sediment, temperature and nutrients. Moisture for vegetation growth is primarily from high water tables and stream flows.

Upland Native species such as bluebunch wheatgrass, Idaho fescue, and native shrubs and trees may be found at higher elevations along mountainsides. The majority of grazing animals are cattle, sheep and horses. Big game includes elk, mule deer and moose that utilize rangeland and pasture for early spring and winter grazing.

### **Resource Concerns**

Water erosion on Cropland, Pasture & CRP in this watershed has decreased significantly since 1982. Rates have decreased from about 5.2 tons per acre per year in 1982 to approximately 2.3 tons per acre per year in 1997.

Controlling erosion not only sustains the long-term productivity of the land, but also affects the amount of soil, pesticides, fertilizer, and other substances that move into the nation's waters.

Many of the listed streams are impaired by multiple pollutants, primarily nutrients and sediment; bacteria is a pollutant of concern for the Cub River tributary. Agricultural land uses contribute to water quality impacts. Other pollutant sources include stormwater runoff and land development. Flow and habitat alteration problems exist within the watershed.

Conservation practices that can be used to address these water quality issues include erosion control, grazing management, residue management, and riparian buffers.

Idaho

8 Digit Hydrologic Unit Profile

July 2007

### Resource Concerns - continued

Wind erosion has decreased by slightly more than 0.5 tons per acre per year on cropland, pasture and CRP in this subbasin between 1982 and 1997. Following a spike in wind erosion to approximately 4.4 tons per acre per year in 1987, wind erosion has decreased to approximately 3.3 tons per acre per year in 1997.

Conservation practices that can be used to address wind erosion include: surface wetting, surface roughening, windbreaks, seedbed preparation (delayed seeding), mulching, and pasture and hayland planting.

|  | Inadequate cover/shelter           | X       | X       | X         | X                          | X                            | Х         |                              |  |

**Human considerations**: Implementation of conservation practices and enhancement has the potential for change in management and cost of production. Installation of practices will have an upfront cost and require maintenance. In the short run increased management may be required as new techniques are learned. Land may be taken out of production for installation of practices or conversion to other uses, such as wildlife habitat. Long term benefits should result from increased soil health, benefits to water quality and wildlife habitat.

## Middle Bear - 16010202

8 Digit Hydrologic Unit Profile

July 2007

## Census and Social Data<sup>/26</sup>

Population: 13,416

Number of Farms: 983

Idaho

8 Digit Hydrologic Unit Profile

### Census and Social Data - continued

Forty nine percent of farm operators are farmers by occupation. The remaining operators have off-farm jobs as their primary occupation. The majority of operators are male but women make up 25% of the total. Ninety-six percent of all operators are white. Non-white operators are of Hispanic, American Indian, Asian, Pacific Islander, and mixed racial backgrounds.

Farm size ranges from less than 10 acres to more than 2,000 acres with an average of 440 acres. Agricultural land in the watershed is a mix of woodland, cropland, range, pasture and hayland. Land users in the watershed utilize EQIP, CRP, WHIP,Continuous CRP, CIP, ECC and other programs to implement conservation plans, as well as the state WQPA and 319 programs.

Farm size and market value of production decreased between 1997 and 2002. Government payments to farmers are up over the past several years. Farm sales range from less than \$1,000 to more than \$500,000 per year. Eighty percent of farms reported sales of less than \$50,000 per year.

The Census of Agriculture is authorized under PL 105-113 and uses the definition of a farm as any place from which \$1,000 or more of agricultural products are produced or sold, or normally would have been sold, during the census year.

|        | Number of<br>farms | Average size<br>farm | Market Value of<br>Production<br>(Average Farm) | Government<br>Payments<br>(Average Farm) |
|--------|--------------------|----------------------|---|--|
| 1997   | 897                | 490                  | \$75,600  | \$9,900                                  |
| 2002   | 983                | 440                  | \$63,600  | \$11,600                                 |
| Change | 9.6%               | -10.2%               | -15.9%  | 17.2%                                    |

## Middle Bear - 16010202

8 Digit Hydrologic Unit Profile

July 2007

### Progress / Status - continued

Progress in the last seven years has been focused on:

- ~ erosion control
- ~ irrigation water management
- ~ nutrient management
- ~ water quality
- ~ upland wildlife habitat management

Resource concerns that require ongoing attention:

- ~ erosion control
- ~ nutrient management
- ~ prescribed grazing
- ~ riparian area improvement
- $\sim$  water quality & water quantity
- ~ pest management

#### Lands Removed from Production through Farm Bill Programs

- Conservation Reserve Program (CRP): 43,651
- Wetland Restoration Program (WRP): None

Middle Bear - 16010202

8 Digit Hydrologic Unit Profile

### Footnotes/Bibliography

All data is provided "as is". There are no warranties, express or implied, including warranty of fitness for a particular purpose, accompanying this document. Use for general planning purposes only.

- 1. Ownership Layer Source: This spatial data contains surface management land status (sometimes known as "ownership") and Public Land Survey System (PLSS) information for Idaho. The Bureau of Land Management (BLM) in Idaho creates and maintains these spatial data layers. The primary source of the spatial features is the BLM Geographic Coordinate Database (GCDB), which contains official survey records and corresponding geodetic control information maintained by the BLM Cadastral program. In areas where GCDB records are unavailable, the spatial features are taken from a variety of sources including the BLM Idaho Resource Base Data collection, US Geological Survey Digital Line Graphs (DLGs), and US Forest Service Cartographic Feature Files (CFFs), among others. The source of the attribute information is the BLM Master Title Plats (MTPs) and careful cooperation with other government agencies that own or manage land parcels. The layer is available from the Inside Idaho (Interactive Numeric & Spatial Information Data Engine): <a href="http://inside.uidaho.edu">http://inside.uidaho.edu</a> For current ownership status, consult official records at appropriate federal, state or county offices. Ownership classes grouped to calculate Public Ownership vs. Private Ownership.
- 2. National Land Cover Dataset (NLCD): NLCD 92 (National Land Cover Data 1992) is a 21-category land cover classification scheme that has been applied consistently over the conterminous U.S. It is based primarily on the unsupervised classification of Landsat TM (Thematic Mapper) 1992 imagery. Ancillary data sources included topography, census, agricultural statistics, soil characteristics, other land cover maps, and wetlands data. The NLCD 92 classification is provided as raster data with a spatial resolution of 30 meters. The layer is available from: <u>http://edcwww.cr.usgs.gov/products/landcover/nlcd.html</u> Description: Abstract: These data can be used in a geographic information system (GIS) for any number of purposes such as assessing wildlife habitat, water quality, pesticide runoff, land use change, etc. The State data sets are provided with a 300 meter buffer beyond the State border to facilitate combining the State files into larger regions.
- 3. Farm Services Agency, USDA, 2005. CRP acres from GIS (CLU) database.
- 4. ESTIMATES FROM THE 1997 NRI DATABASE (REVISED DECEMBER 2000) REPLACE ALL PREVIOUS REPORTS AND ESTIMATES. Comparisons made using data published for the 1982, 1987, or 1992 NRI may produce erroneous results. This is due to changes in statistical estimation protocols, and because all data collected prior to 1997 were simultaneously reviewed (edited) as 1997 NRI data were collected. All definitions are available in the glossary. In addition, this December 2000 revision of the 1997 NRI data updates information released in December 1999 and corrects a computer error discovered in March 2000. For more information: <u>http://www.nrcs.usda.gov/technical/NRI/</u>

#### **Future Conservation Needs**

The following Tables are an estimate of the future needs of conservation practices in the watershed.

Estimates of future needs in the watershed are based on the following factors:

- 1. Estimates of total conservation needs based on benchmark conditions in the watershed
- 2. Present level of conservation installation reported in the NRCS web based reporting system
- 3. Local knowledge of the area, past and ongoing project activities and professional judgement
- 4. Practices previously installed which have exceeded their expected life (life span), are no longer accomplishing the conservation objective, and may need to be replaced or upgraded

## 8 Digit Hydrologic Unit Profile

| Current Conditions (Private)      | Total<br>Acres | Riparian<br>Acres |
|-----------------------------------|----------------|-------------------|
| Total Dry Cropland                | 52,326         | 2,524             |

8 Digit Hydrologic Unit Profile

July 2007

#### **Conservation Activities for Headquarters**

Confined Animal Feed Operations (CAFO – 700 Head Dairies or 1,000 Head Feeder Cattle) and Animal feed Operations (AFO 200-700 Head, Dairy of 300 to 1,000 Head Feeder Cattle) are variable in complexity depending on size, number of cows and location of the waste storage facility. Kinds and amounts of component practices required for proper operation are site specific, but typically include the following practices. Note that an AFO can be designated as a CAFO regardless of number of animals if it is found to be a significant polluter.

Anaerobic Digester (366), Composting Facility (317), Acess Road (560), Dikes (356), Diversions (362), Fence (382), Heavy Use Area Protection (561), Irrigation Water Conveyance (430EE) (430DD), Pipeline (516), Pond (378), Pond Sealing or Lining (521), Pump Plant (533), Roof Runoff Structure (558), Separator Structure for Water Control (587), Underground Outlet (620), Waste Treatment Lagoon (359), Watering Facility (614), Well Decommissioning (355) Windbreak/Shelter Establishment (380), Dry Stack Areas and Ramps.

Management practices commonly used include Critical Area Planting (342), Filter Strip (393), Manure Transfer (634), Nutrient Management (590), Pest Management (595) and Waste Utilization (633).

Current conditions and future needs for CAFOs and AFOs reflect the following component practices of Waste Storage Facility (313).

|                                 | Total |
|---------------------------------|-------|
| Current Conditions (Private)    | Acres |
| CAFOs                           | 2     |
| AFOs                            | 317   |
| Total CAFOs and AFOs            | 319   |
| Current Farm Bill Participation | 90    |
