Subject: GMG290000 Permit –Water Based Drilling Mud Characterization Study  
Deep Gulf Energy III, LLC – GMG290573

Dear Mr. Chen:

Per the permit requirements in Part I.B.1.d – Water Based Drilling Mud Characterization Study Deep Gulf Energy III, LLC (DGE III) has conducted an individual study and has collected one sample from each lease block for which they are the designated operator and conducted drilling operations within the 3-year study time frame - one at Mississippi Canyon 521 Well #001 and one at Mississippi Canyon 563 Well #001.

The water based mud (WBM) samples were analyzed for the required metals, including: arsenic, cadmium, chromium (VI), copper, free cyanide, lead, mercury, nickel, selenium, silver, and zinc. As noted on the summary of analytical data, the WBM sample results are provided as total metals, not dissolved as requested in Part 1.B.1.d, for the reasons described below.

As discussed in detail in Appendix D of the Sampling and Analysis Plan for the Mud and Produced Water Characterization Study (MPWCS) prepared for the Offshore Operator Committee (OOC) Joint Study Group, numerous group locations had issues with WBM samples not yielding enough water for dissolved phase metals analyses. Attempts to dilute the drilling mud and then extract water raised concerns about the interpretation of the results. The use of alternate methods for separating more water from the water based mud was studied and rejected. Per an agreement at a February 15, 2014 meeting between OOC representatives and EPA Region 6, the Sampling and Analysis Plan was revised (March 24, 2014) to allow samples that do not yield adequate water to perform analysis of dissolved metals and cyanide to instead analyze for total metals, hexavalent chromium, and cyanide. Samples that do yield enough water will also be analyzed for dissolved constituents, in order of priority: (1) metals; (2) hexavalent chromium; (3) cyanide.

The samples collected at MC521 and MC563 did not yield enough water to conduct dissolved phase metals analyses. As an individual study participant, DGE III is following the same protocol approved for the joint study operators and is reporting total metals, hexavalent chromium and cyanide for that location.

The results are compared to provide minimum, maximum and average concentrations. This comparison is requested for dissolved phase concentrations, so it was provided for the total metals in a solids phase as well.

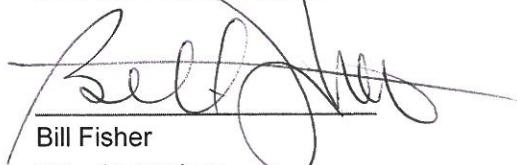

A summary of the analytical results are presented in the attached Excel table and summary page of the laboratory report. This report is being submitted via hard copy, as well as by email to chen.isaac@epa.gov. The emailed report also contains the Electronic Data Deliverable (EDD) from ALS Laboratory which is an Excel table that is not easy to follow in a printed, hard copy format. The Excel table attached herein provides a more readable summary of the EDD. The complete analytical report from the laboratory can be provided upon request.

Excel table that is not easy to follow in a printed, hard copy format. The Excel table attached herein provides a more readable summary of the EDD. The complete analytical report from the laboratory can be provided upon request.

Should you have any questions, please call me or our consultant, Ms. Marsha Lutz, of J. Connor Consulting, Inc. at 281-698-8557.
