Energy Information Administration

Annual Energy Review 2001

The *Annual Energy Review (AER)* presents the Energy Information Administration's historical energy statistics. For many series, statistics are given for every year from 1949 through 2001. The statistics, expressed in either physical units or British thermal units, cover all major energy activities, including consumption, production, trade, stocks, and prices, for all major energy commodities, including fossil fuels, electricity, and renewable energy sources.

Publication of this report is required under Public Law 95-91 (Department of Energy Organization Act), Section 205(c), and is in keeping with responsibilities given to the Energy Information Administration under Section 205(a)(2), which states:

"The Administrator shall be responsible for carrying out a central, comprehensive, and unified energy data and information program which will collect, evaluate, assemble, analyze, and disseminate data and information...."

The *AER* is intended for use by Members of Congress, Federal and State agencies, energy analysts, and the general public. EIA welcomes suggestions from readers regarding data series in the *AER* and in other EIA publications.

Related Publication: Readers of the *AER* may also be interested in EIA's *Monthly Energy Review*, which presents monthly updates of many of the data in the *AER*. Contact our National Energy Information Center for more information.

Electronic Access

Most of the data in the *AER* are also available electronically. For more information about electronic access to the *AER*, please refer to the inside back cover of this report or contact EIA.

Ordering Information

This and other EIA publications may be purchased from the Superintendent of Documents, U.S. Government Printing Office.

Telephone and fax orders should be directed to:

Superintendent of Documents
U.S. Government Printing Office
Main Order Desk
202-512-1800
Fax: 202-512-2250
7:30 a.m. to 5:00 p.m., Eastern time, M-F

Mail orders should be directed to:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250 7954

Copies of the 2001 edition of the *Annual Energy Review* may be obtained by use of the order form in the back of this publication.

Complimentary subscriptions and single issues are available to certain groups of subscribers, such as public and academic libraries; Federal, State, local, and foreign governments; EIA survey respondents; and the media. For further information and for answers to questions on energy statistics, please contact EIA's National Energy Information Center. Address, telephone numbers, and hours are as follows:

National Energy Information Center, EI-30

Preface

The *Annual Energy Review (AER)* is a statistical history of energy activities in the United States. It documents trends and milestones in U.S. energy production, trade, storage, pricing, and consumption. Each new year of data that is added to the time series—which now reach into 7 decades—extends the story of how Americans have acquired and used energy. It is a story of continual change as the Nation's economy grew, energy requirements expanded, resource availability shifted, and interdependencies developed among nations.

Perhaps the greatest change in U.S. energy markets in recent years is that in the Nation's **electric power sector**. To address those developments and their effects on energy statistics, a team of Energy Information Administration (EIA) analysts conducted a review over the past year of how EIA collects, estimates, and reports electricity-related statistics. In particular, the review addressed how EIA reports fuel consumption for electrical generation. Because power facilities use many types of fuels and operate in all sectors of the economy (e.g., commercial buildings, such as hospitals and college campuses, and industrial facilities, such as paper mills and refineries), changes to the electric power data affected nearly all fuels in the *AER* and caused revisions in many *AER* tables. **Appendix H** of this report, "Estimating and Presenting Power Sector Fuel Use in EIA Publications and Analyses," summarizes EIA's study and its effects on the *AER* and other EIA reports.

Over the decades covered in this report, other energy industries experienced change on a large scale as well. A study of the **petroleum industry** data reveals how the United States gradually moved from a Nation that once met its own requirements for petroleum to one that depends on other nations for well over half its supply. Trend data show that the productivity of U.S. crude oil wells peaked in 1972, and that in 1993, for the first time, the amount of crude oil and natural gas plant liquids produced in the United States fell below the amount of crude oil and petroleum products imported into the country.

An examination of the **natural gas industry** data shows that natural gas well productivity peaked in 1971 and, in recent years, produced at about a third of that peak level. A transition occurred in our use of imported natural gas as well. Net imports stood at a mere 4 percent of natural gas consumption in 1986; 15 years later, the proportion had quadrupled.

Coal industry data show that transportation, residential, and commercial uses of coal essentially disappeared over the decades as consumption for electricity generation soared. While a change was occurring in how the Nation consumed coal, an upheaval was underway in how we got the coal: the Nation's output shifted from predominantly underground mines to surface mines and from mines east of the Mississippi to the West.

The **nuclear power industry**, which got its start in the United States in 1957, grew from an inconsequential contributor to the Nation's electrical output to supply more than one-fifth of the power used in the country.

The consumption of **renewable energy** peaked at 7.5 quadrillion Btu in 1996. The 2001 level was the lowest recorded since 1979. The largest component of the renewable energy total is hydroelectric power, which was adversely affected by drought in 2001 and hit its lowest level since 1968.

Time series provide a broad perspective on the trends and changes in **total energy usage** as well. For example, Americans' average use of energy per person in 1949 was 215 million British thermal units (Btu); that rate grew and reached a peak of 361 million Btu per person in 1978 and 1979; from 1988 on, Americans' energy usage per person was in the 340-to-350 million Btu range. Another broad indicator of energy usage is one that measures how much energy is consumed to produce our economic output. In 1949, the Nation consumed 20.6 thousand Btu for each (1996) dollar's worth of goods and services that was generated by the economy. Through the decades, the economy underwent tremendous growth and change, and the type of energy used and how it was consumed changed as well. By 2001, the measure had dropped to 10.4 thousand Btu per (1996) dollar of economic output.

Remarkable changes such as the ones touched on here could reasonably lead us to conclude that things will not stay as they now are. Anticipating and preparing for how our energy future will unfold is the challenge before us. We hope that this latest edition of the *Annual Energy Review* will help in that mission.

Overview

Figure 1. Energy Overview

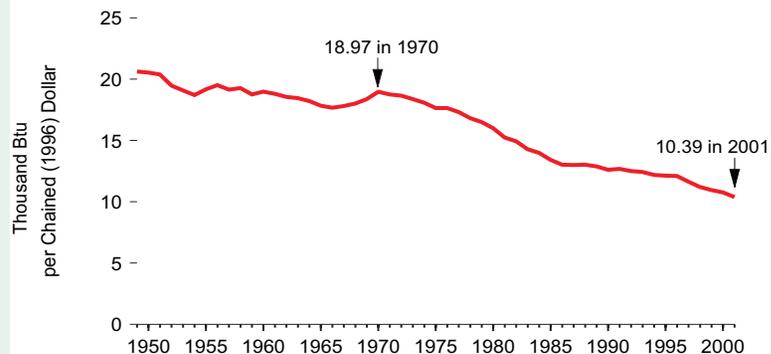

The United States was self-sufficient in energy until the late 1950s when energy consumption began to outpace domestic production. The Nation imported more energy to fill the gap. In 2001, net imported energy accounted for 27 percent of all energy consumed.

Figure 2. Energy Consumption per Person

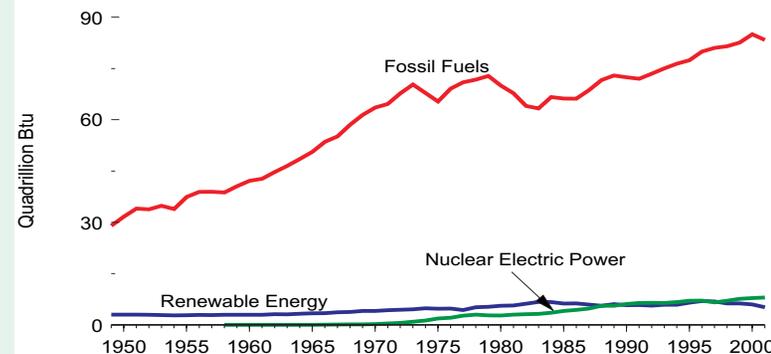

Energy use per person stood at 215 million Btu in 1949. The rate generally increased until the oil price shocks of the mid-1970s and early 1980s caused the pattern to reverse for a few years. After slight increases in the 1990s, the rate fell 4 percent from 2000 to 2001.

Figure 3. Energy Use per Dollar of Gross Domestic Product

Over the second half of the 20th century, the rate at which energy was consumed per dollar of the economy's output of goods and services fell dramatically. By the end of the century, the rate was half of the mid-century level. The rate in 2001 was 45 percent below that in 1970. The decline resulted from efficiency improvements and structural changes in the economy.

Figure 4. Energy Consumption by Source

Most energy consumed in the United States has come from fossil fuels. Renewable energy resources, mostly hydroelectricity and the industrial use of biomass, have supplied a relatively small but steady portion. In the late 1950s, nuclear fuel began to be used to generate electricity, and, by the late 1980s, contributed about the same share as renewable energy.

Consumption by Source

Figure 5. Energy Consumption by Source, 1635-2001

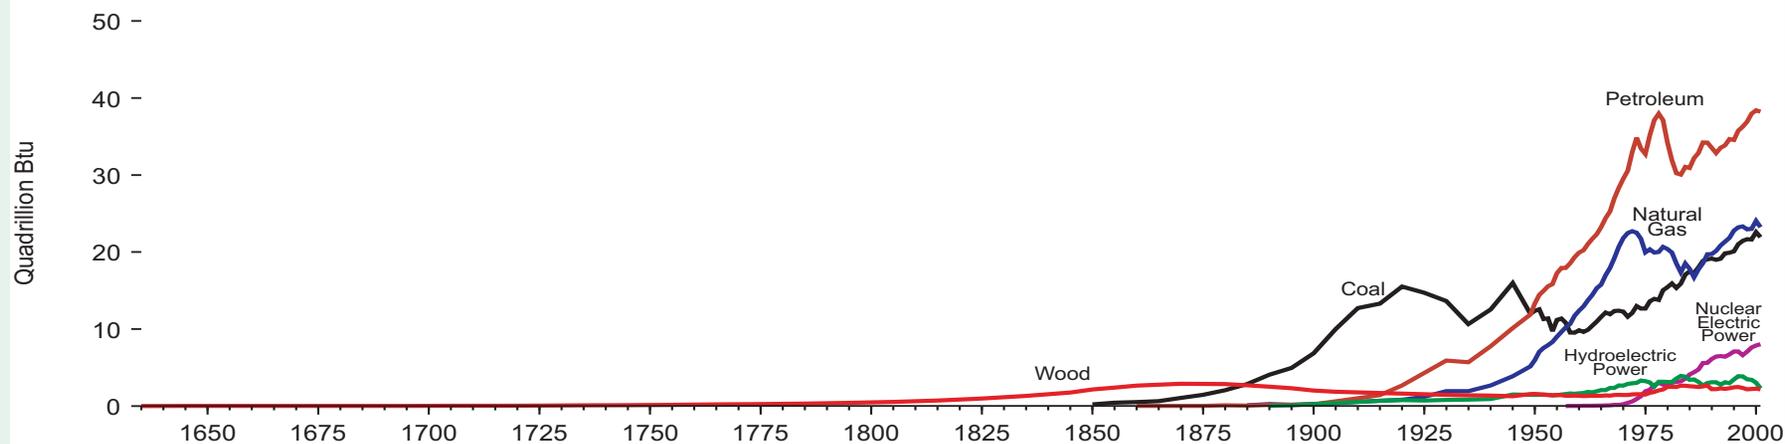

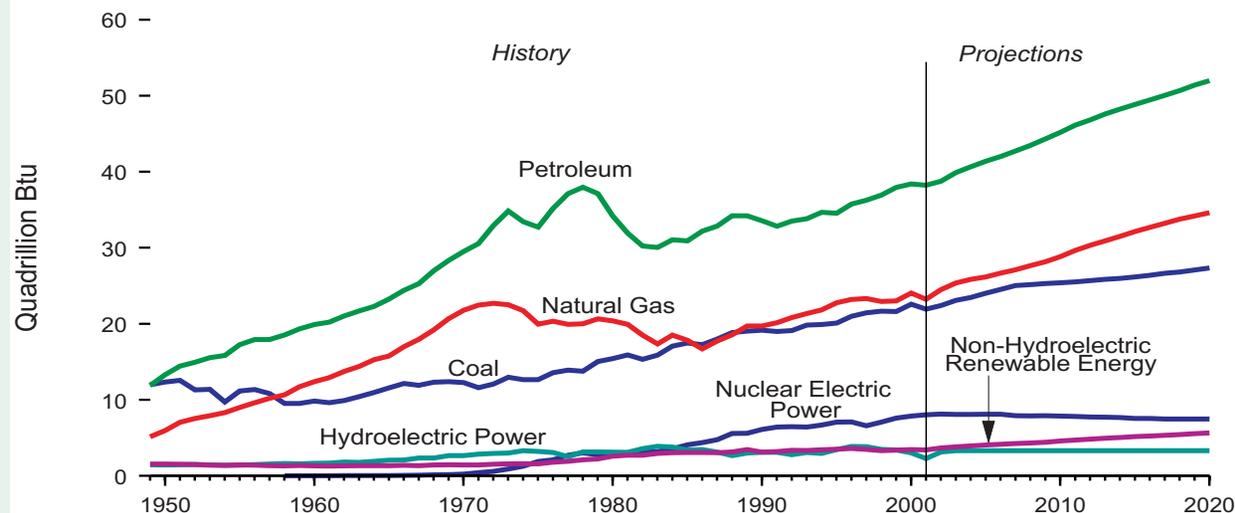

Figure 6. Energy Consumption History and Outlook, 1949-2020

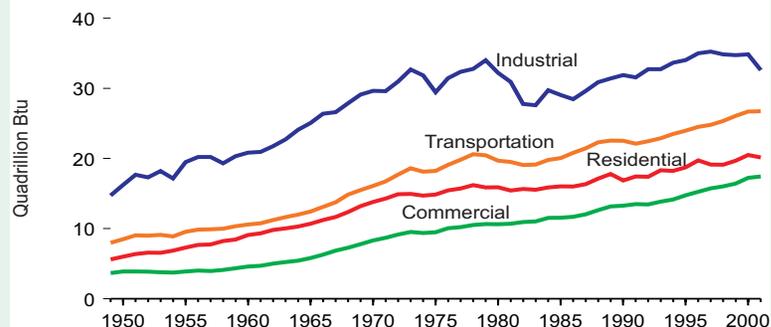

In the long view of American history, wood served as the preeminent form of energy for about half of the Nation’s history. Around 1885, coal surpassed wood’s usage. Despite its tremendous and rapid expansion, coal was, in turn, overtaken by petroleum in the middle of the 20th century. Natural gas, too, experienced rapid development into the second half of the 20th century, and coal began to expand again. Late in the 20th century still another form of energy, nuclear electric power, was developed and made significant contributions.

While the Nation’s energy history is one of large-scale change as new forms of energy were developed, the outlook for the next couple of decades (assuming current laws, regulations, and policies) is for continued growth and reliance on the three major fossil fuels—petroleum, natural gas, and coal—modest expansion in renewable resources, and relatively flat generation from nuclear electric power.

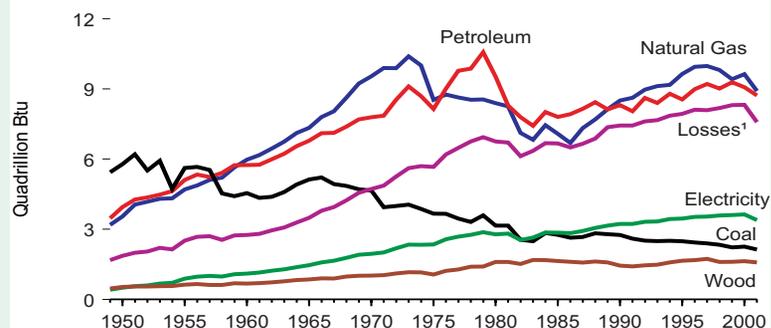

Consumption by Sector

Figure 7. Energy Consumption by End-Use

The industrial sector of the economy used the largest share of energy and showed the greatest volatility. In particular, steep drops occurred in 1975 and 1980-83 in response to high oil prices. Transportation was the next largest energy consuming sector, followed by residential use and commercial use.

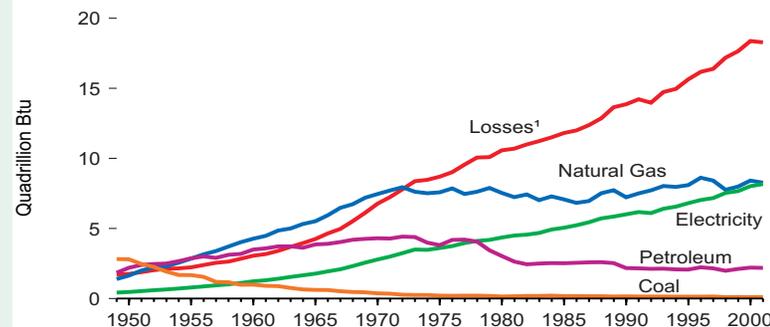

Figure 9. Industrial Energy Consumption

¹ Energy lost during generation, transmission, and distribution of electricity.

Coal, once the prominent form of energy in the industrial sector, gave way to natural gas and petroleum in the late 1950s. Both natural gas and petroleum expanded rapidly until the early 1970s; after that, large swings occurred. All forms of energy used in the industrial sector turned down in 2001.

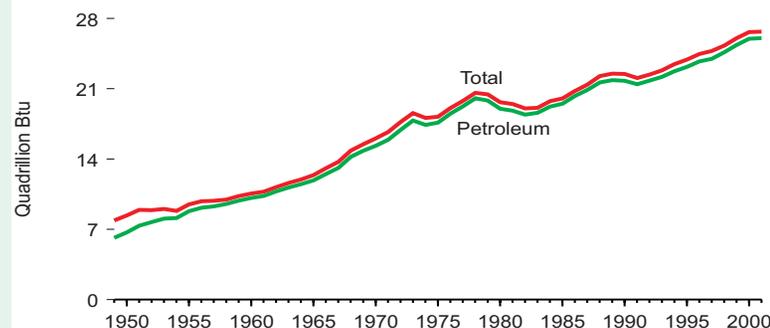

Figure 8. Residential and Commercial Energy Consumption

¹ Energy lost during generation, transmission, and distribution of electricity.

Coal, once important to residential and commercial consumers, was gradually replaced by other forms of energy. Petroleum use peaked in the early 1970s. Natural gas grew fast until the early 1970s and then fluctuated around the 1970 level over the next three decades. Meanwhile, electricity's use (and related losses) expanded dramatically.

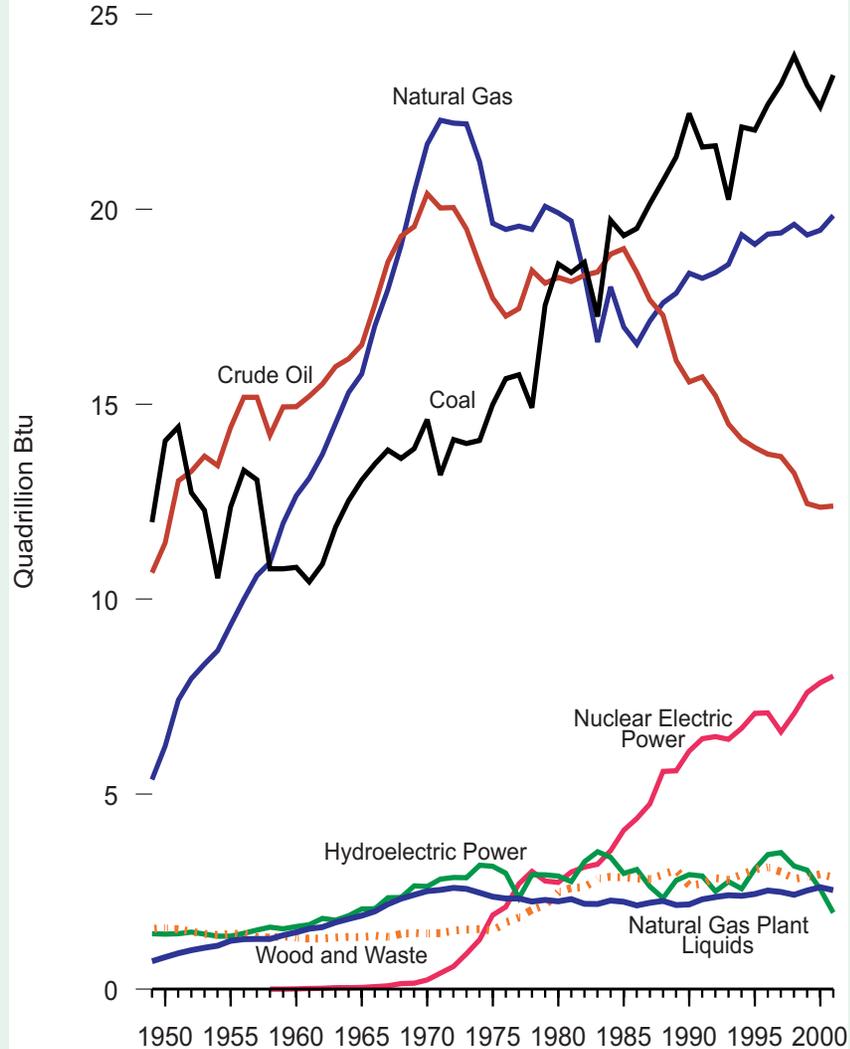

Figure 10. Transportation Energy Consumption

The transportation sector's use of energy, which is overwhelmingly petroleum, more than tripled from 1949 to 2001. Motor gasoline accounts for about two-thirds of the petroleum consumed in the sector. Distillate fuel oil and jet fuel are other important petroleum products used in the sector.

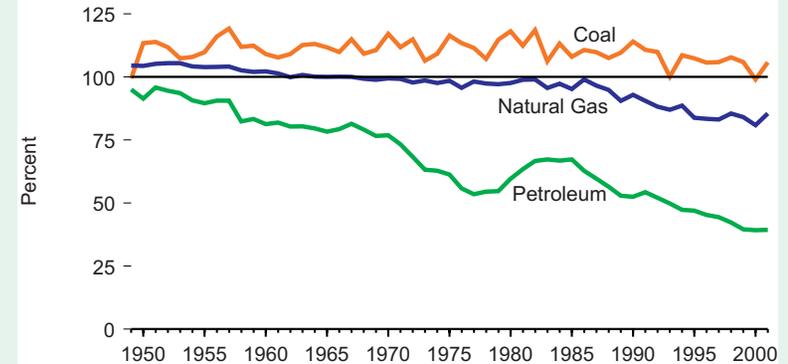

Production and Trade

Figure 11. Energy Production by Major Source

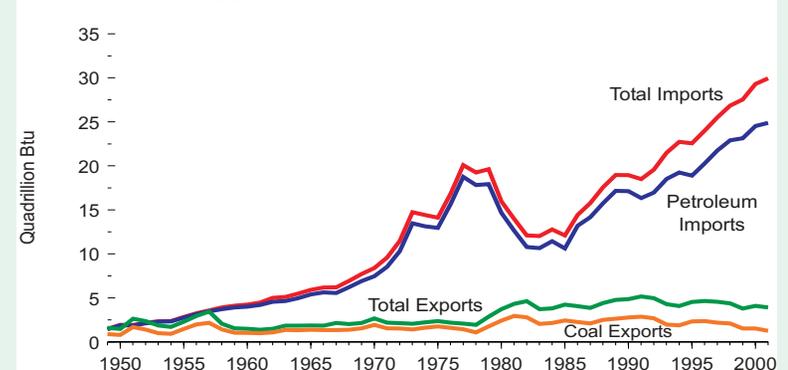

Most energy produced in the United States comes from fossil fuels—coal, natural gas, and crude oil. Coal, the leading source at the middle of the 20th century, was surpassed by crude oil and natural gas for many years, but again became the leading source of energy in the mid-1980s, used primarily for electric generation. Hydroelectric output in 2001 was the lowest level since 1966.

Figure 12. Fossil Fuel Production as Share of Its Consumption

The Nation almost always produced more than enough coal for our own requirements. For many years, we were also self-sufficient in natural gas, but after 1967, we produced less than we consumed each year. Petroleum production fell far short of domestic requirements.

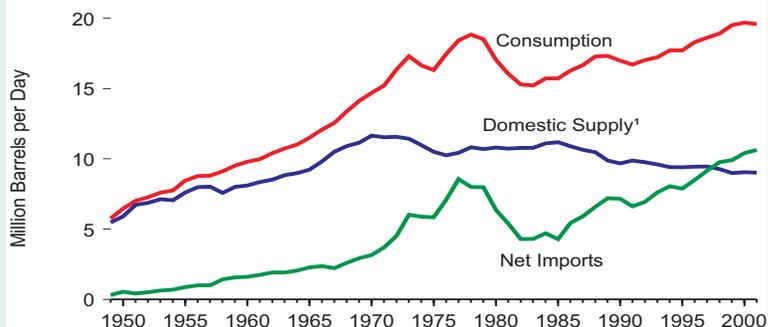

Figure 13. Energy Imports and Exports

Since the late 1950s, the Nation imported more energy than it exported. In 2001, the United States imported 30 quadrillion Btu of energy and exported 4 quadrillion Btu. Most imported energy was in the form of petroleum; in recent years, natural gas imports grew, primarily from Canada. Exported energy was primarily in the form of coal until the late 1970s when petroleum exports expanded, and, in some years, even exceeded coal exports.

Petroleum Overview and Crude Oil Production

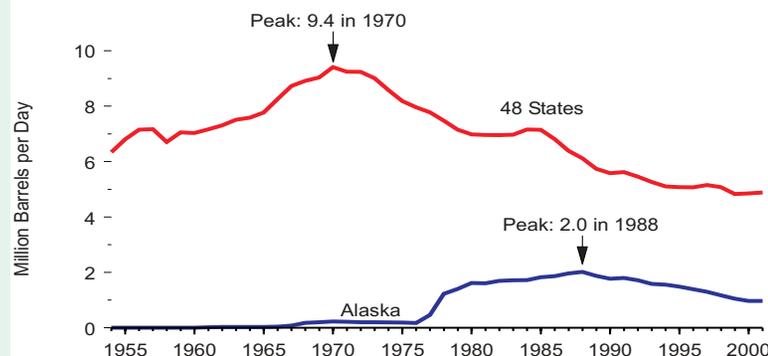

Figure 14. Petroleum Overview

¹ Crude oil and natural gas plant liquids production; refinery gains; and field production of other components.

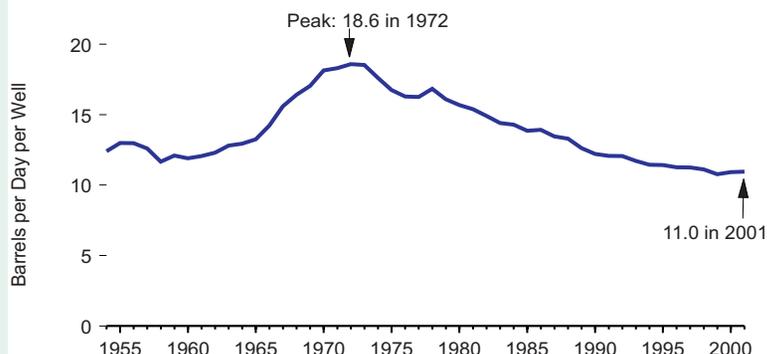

When U.S. domestic supply of petroleum peaked at 11.7 million barrels per day in 1970, net imports stood at 3.2 million barrels per day. As domestic supply declined, consumption grew. In 1998, for the first time, net imports surpassed domestic supply. In 2001, domestic supply was 9.0 million barrels per day and net imports were 10.6 million barrels per day.

Figure 15. 48 States and Alaskan Crude Oil Production

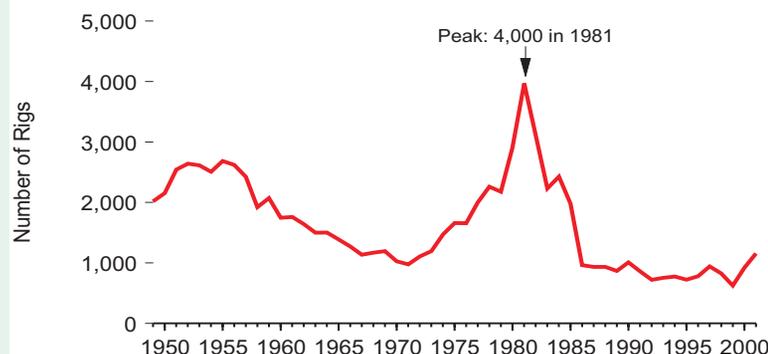

Crude oil production peaked in the U.S. 48 States at 9.4 million barrels per day in 1970. As production fell in the 48 States, Alaska's production came on line and helped supply U.S. needs. Alaskan production peaked at 2.0 million barrels per day in 1988, then fell to less than half the peak rate by 2001.

Figure 16. Crude Oil Well Productivity

The amount of crude oil produced per day per well rose sharply in the 1960s, reached a peak of 18.6 barrels per day per well in 1972, and, except for a brief recovery in 1978, fell through 1999. In 2001, productivity measured 11.0 barrels per day per well, 41 percent below the peak.

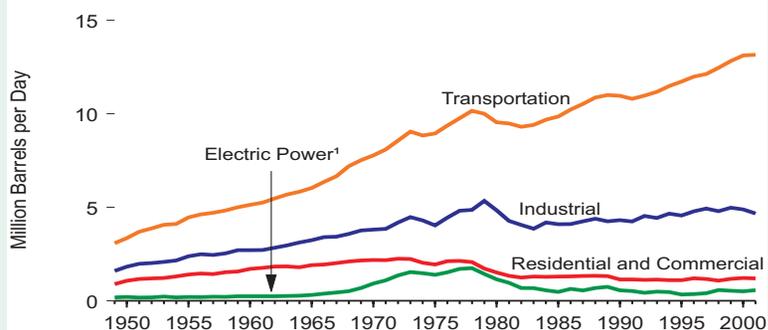

Figure 17. Crude Oil and Natural Gas Rotary Rigs in Operation

Rotary rig activity declined sharply in the period from 1955 to 1971. After 1971, the number of rigs in operation began to climb again, and a peak of 4 thousand rigs in operation was registered in 1981. A sharp decline followed, and the number of rigs in operation in 2001 stood at 71 percent below the peak level in 1981.

Petroleum Consumption and Prices

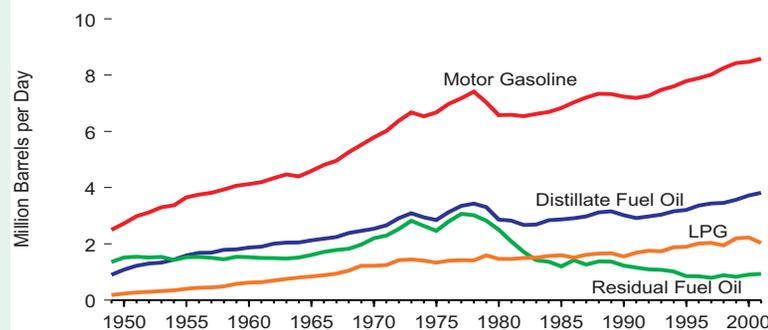

Figure 18. Petroleum Consumption by Sector

¹ Through 1988, electric utilities only; after 1988, includes independent power producers.

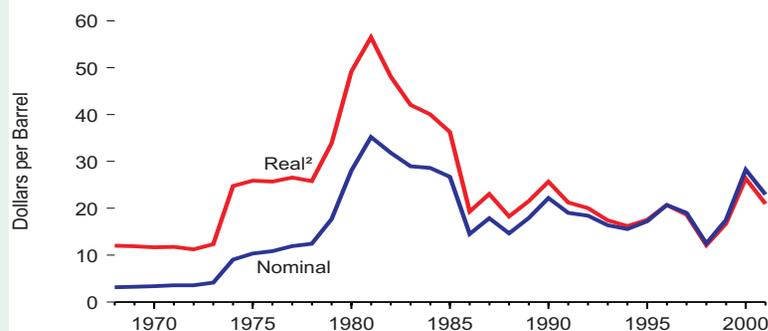

Transportation was the largest consuming sector of petroleum and the one showing the greatest expansion over the second half of the 20th century. In 2001, 13 million barrels per day of petroleum products were consumed for transportation purposes, accounting for 69 percent of all petroleum used.

Figure 19. Petroleum Consumption by Selected Product

Motor gasoline is the single largest petroleum product consumed in the United States. Its consumption stood at 8.6 million barrels per day in 2001, 44 percent of all petroleum consumption. Distillate fuel oil and liquefied petroleum gases (LPG) are other important products. The use of residual fuel oil fell off sharply after 1977.

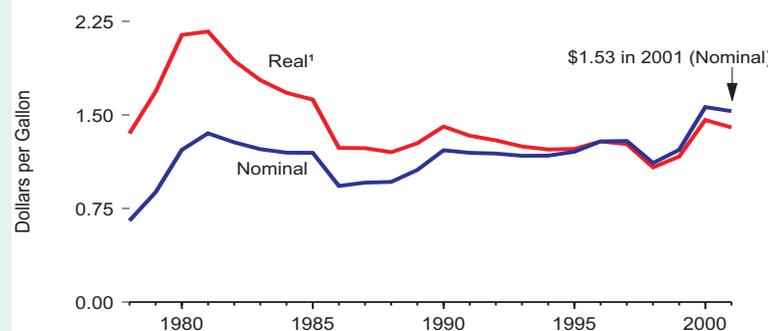

Figure 20. Crude Oil Refiner Acquisition Cost¹

¹ Composite of domestic and imported crude oil. ² In chained (1996) dollars, calculated by using gross domestic product implicit price deflator.

The refiner acquisition composite (domestic and foreign) cost of crude oil in nominal (unadjusted for inflation) dollars peaked at \$35 per barrel in 1981. The price fell dramatically over the years that followed, reaching \$18 per barrel in 1999. It jumped to \$28 per barrel in 2000 and then declined again to \$23 per barrel in 2001.

Figure 21. Price of Motor Gasoline

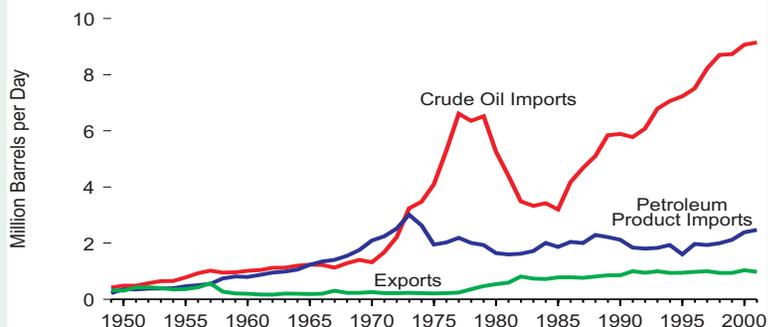

¹ In chained (1996) dollars, calculated by using gross domestic product implicit price deflator.

In nominal (unadjusted for inflation) dollars, Americans paid an average of 65¢ per gallon for motor gasoline in 1978. The 2001 average price of \$1.53 was 135 percent higher than the 1978 rate but, adjusted for inflation, it was 4 percent higher.

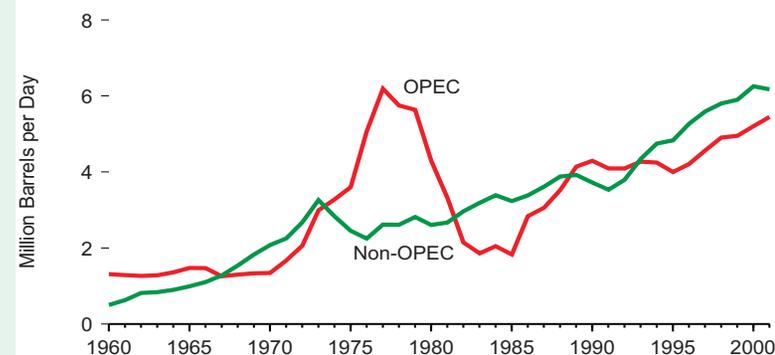

Petroleum Trade

Figure 22. Petroleum Trade

U.S. crude oil imports grew rapidly from mid-century until the late 1970s. From 1979 to 1985, imports fell sharply due to improved efficiency and conservation efforts. After 1985, the upward trend resumed. In 2001, crude oil imports reached a record-high level of 9.1 million barrels per day, and petroleum product imports stood at 2.5 million barrels per day.

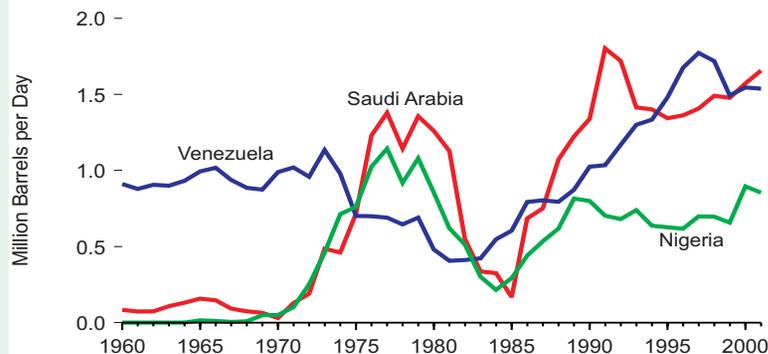

Figure 23. Imports From OPEC and Non-OPEC Countries

OPEC = Organization of Petroleum Exporting Countries.

As U.S. petroleum imports rose sharply in the late 1970s, the Nation's reliance on petroleum from the Organization of Petroleum Exporting Countries (OPEC) grew. In 1977, 70 percent of U.S. petroleum imports came from OPEC countries. After 1992, more petroleum imports came from non-OPEC countries than from OPEC countries.

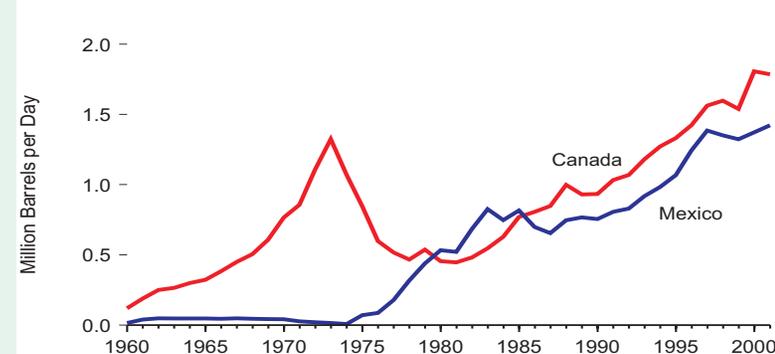

Figure 24. Imports From Selected OPEC Countries

OPEC = Organization of Petroleum Exporting Countries.

Among OPEC countries, Saudi Arabia, Venezuela, and Nigeria—nations from three different continents—were key suppliers of petroleum to the American market. Each experienced wide fluctuation in the amount of petroleum it sold to the United States over the decades. In 2001, the three together accounted for three-fourths of U.S. imports from OPEC countries.

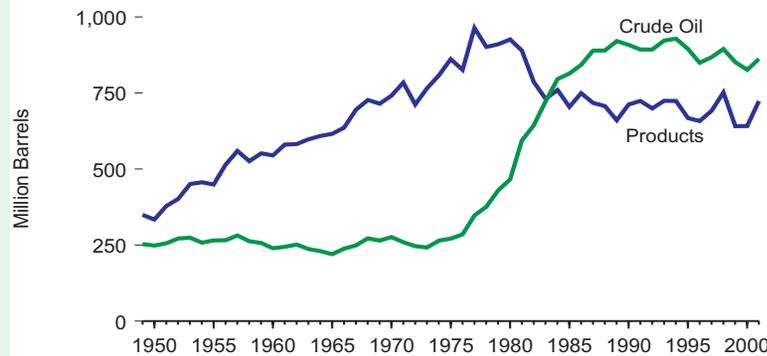

Figure 25. Imports From Canada and Mexico

Canada and Mexico, our national neighbors, supplied the largest quantities of petroleum from non-OPEC countries. Imports from Mexico were insignificant until the mid-1970s when they began to play a key role in U.S. supplies. In 2001, Canada and Mexico together provided over one-fourth of all U.S. petroleum imports.

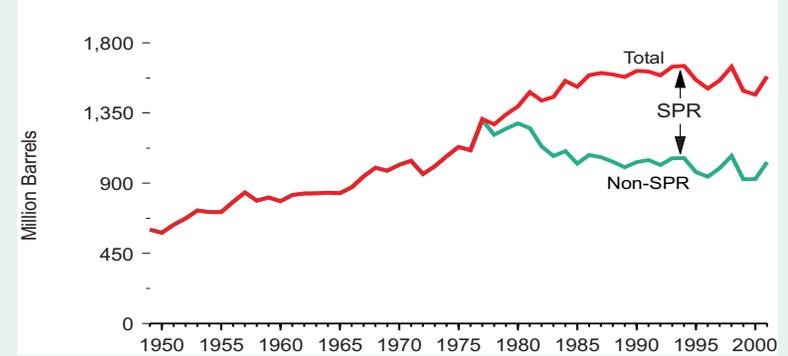

Petroleum Stocks

Figure 26. Stocks of Crude Oil and Products

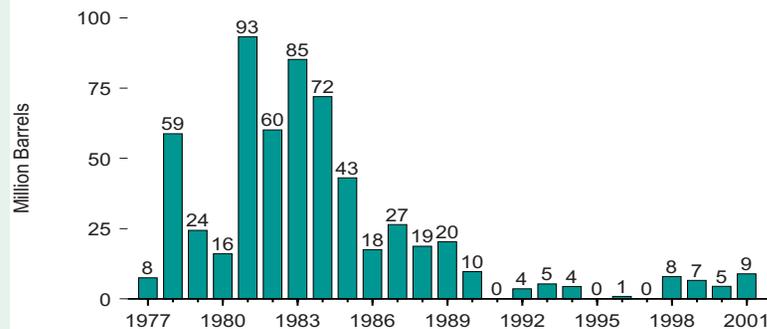

Through 1983, the Nation held most of its petroleum storage in the form of products, which are ready for the market. After that, most petroleum in storage was in the form of crude oil. At the end of 2001, petroleum stocks totaled 1.6 billion barrels, 54 percent crude oil and 46 percent products.

Figure 27. Strategic Petroleum Reserve (SPR) Stocks

In 1977, the United States began building a national reserve of petroleum stocks in case of emergency. The amount of crude oil held in the Strategic Petroleum Reserve (SPR) peaked at 592 million barrels in 1994 and 1995. The level at the end of 2001 was 550 million barrels. As SPR stocks were built, non-SPR stocks were reduced slightly.

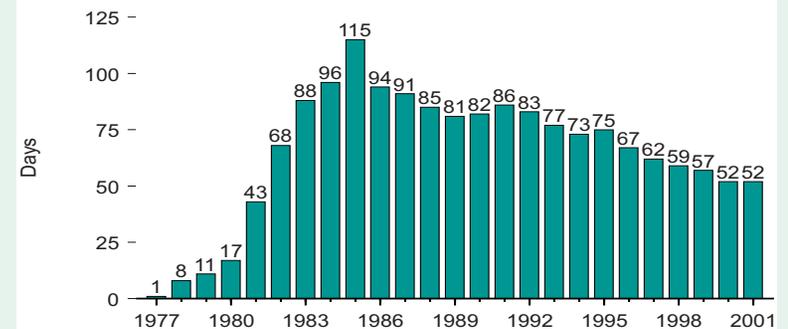

Figure 28. Crude Oil Imports for SPR¹

¹Imported by SPR and imported by others for SPR.

Most of the crude oil in SPR is imported oil, and most of it came in during the early 1980s. In fact, from 1991 through 1997, only 14 million barrels were imported for the reserve, and in 3 of those years, no oil at all was imported for the reserve. In 2001, 9 million barrels of crude oil were imported for SPR.

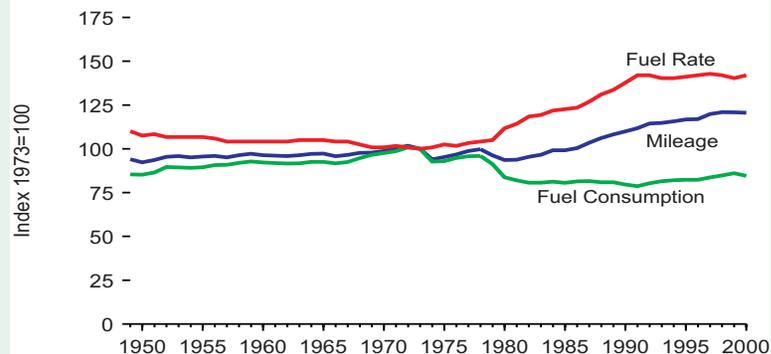

Figure 29. SPR Stocks as Days' Worth of Net Imports

An important SPR measure is the number of days' worth of total net imports of petroleum that could be met by the reserve in an emergency. The peak level occurred in 1985 when the reserve could have supplied 115 days of petroleum net imports, at the 1985 level. The rate trended down since then and stood at 52 days at the end of 2001.

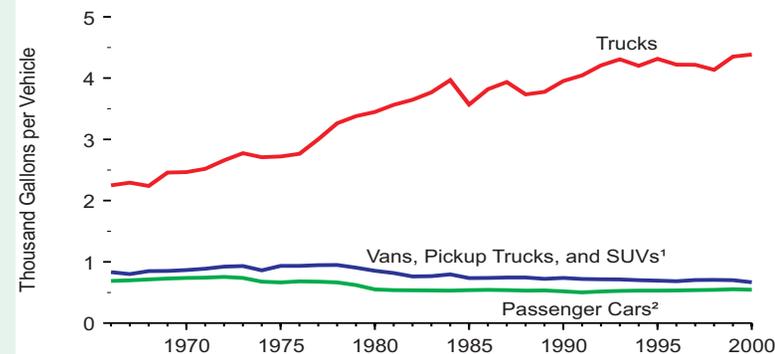

Motor Vehicles

Figure 30. Motor Vehicle Indicators

The composite motor vehicle fuel rate (miles per gallon) soared 42 percent from 1973 to 1991 but remained nearly flat over succeeding years. Mileage (miles driven per vehicle) grew steadily from 1980 to 1998, but declined slightly in 1999 and 2000. Fuel consumption per vehicle fell 21 percent from 1973 to 1991, but rebounded 7 percent by 2000.

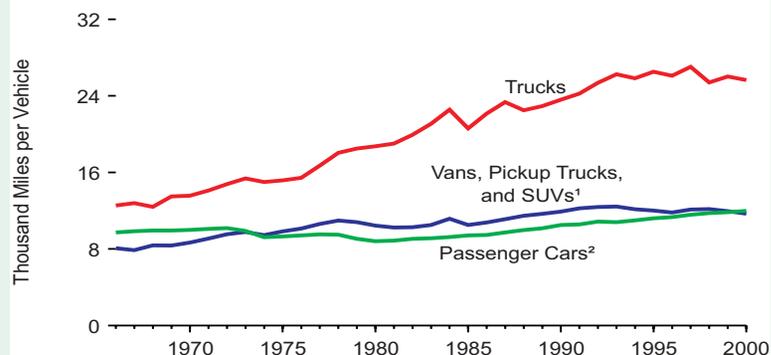

Figure 31. Motor Vehicle Fuel Consumption

¹ Sport-utility vehicle. ² Motorcycles are included through 1989.

From 1966 to 2000, truck fuel consumption rates rose 95 percent from 2.3 thousand gallons per truck to 4.4 thousand gallons per truck. Fuel consumption rates of other vehicle types fell: passenger cars down 21 percent and other vehicles down 20 percent.

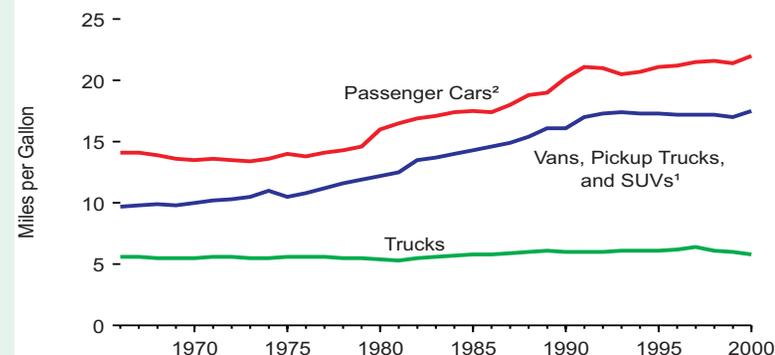

Figure 32. Motor Vehicle Mileage

¹ Sport-utility vehicle. ² Motorcycles are included through 1989.

Truck miles traveled per year greatly exceeded that of other vehicle types and grew sharply from 1966 to 2000, up 105 percent. In 2000, trucks averaged 26 thousand miles per vehicle per year, while passenger cars, vans, pickup trucks, and sport utility vehicles averaged just under 12 thousand miles per year.

Figure 33. Motor Vehicle Fuel Rates

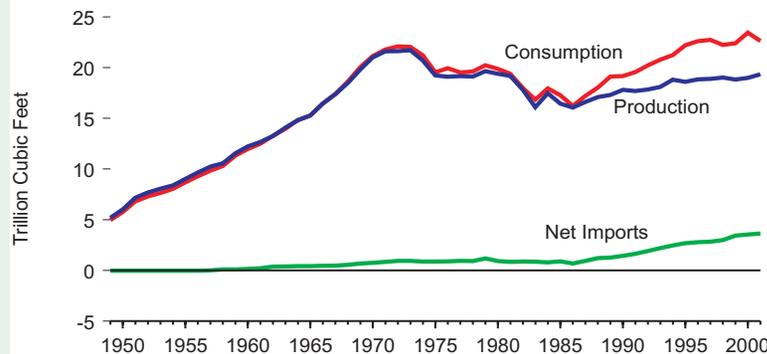

¹ Sport-utility vehicle. ² Motorcycles are included through 1989.

Since 1976, the average fuel rates (miles per gallon) of passenger cars and vans, pickup trucks, and sport utility vehicles trended upward, starting the new century with much better rates than they had a quarter century earlier. The truck fuel rate, however, declined each year from 1998 through 2000.

Note: Motor vehicles include passenger cars, motorcycles, vans, pickup trucks, sport utility vehicles, trucks, and buses.

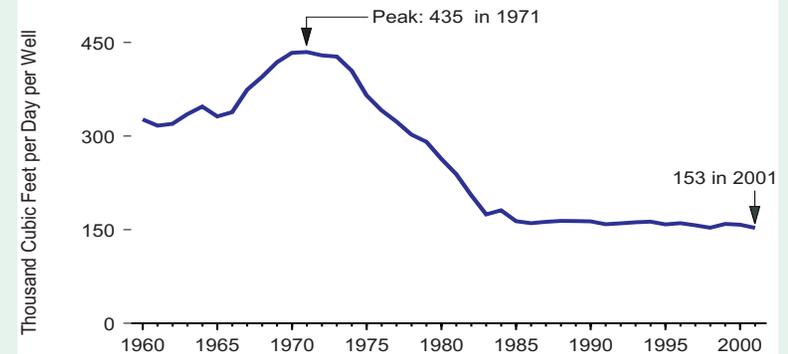

Natural Gas

Figure 34. Natural Gas Overview

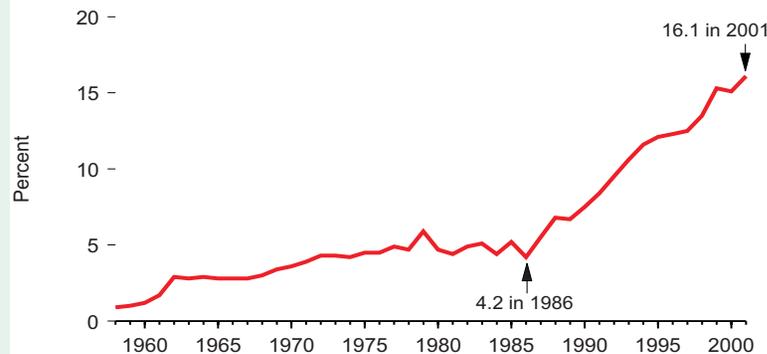

U.S. natural gas production and consumption were nearly in balance through 1986. When consumption began to outpace production, imports of natural gas rose to meet U.S. requirements for the fuel. In 2001, consumption stood at 22.6 trillion cubic feet (Tcf), production at 19.4 Tcf, and net imports at 3.6 Tcf.

Figure 35. Natural Gas Well Productivity

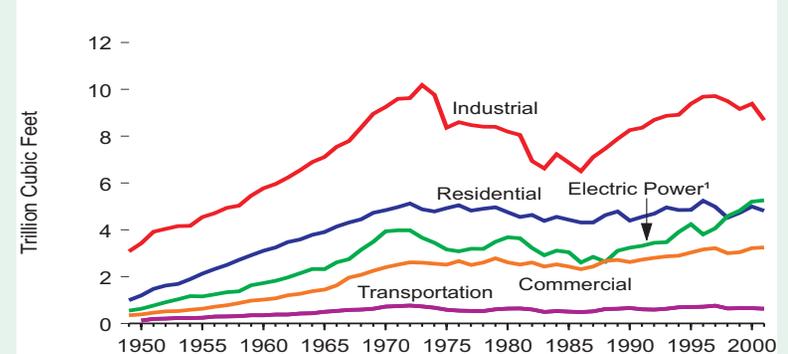

Gas well productivity, measured as gross withdrawals per day per well, grew rapidly in the late 1960s, peaked in 1971, and then fell sharply until the mid-1980s. Productivity remained nearly steady after 1985. The 2001 rate of 153 thousand cubic feet per day per well was 65 percent below the 1971 peak level.

Figure 36. Net Imports as Share of Consumption

Net imports as a share of consumption registered in the 4-to-5 percent range in the 1970s and early 1980s. Net imports measured 4.2 percent of consumption in 1986, which was followed by consumption increases that outpaced production growth. Net imports expanded, and in 2001 accounted for 16.1 percent of consumption.

Figure 37. Natural Gas Consumption by Sector

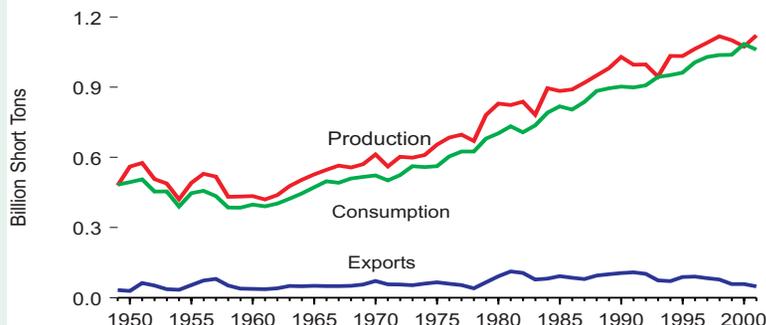

¹ Through 1988, electric utilities only; after 1988, includes independent power producers.

The industrial sector was both the largest consuming sector of natural gas and the sector with the greatest volatility over the years due to variability in industrial output. The electric power sector accounted for nearly one-fourth of all natural gas consumption in 2001.

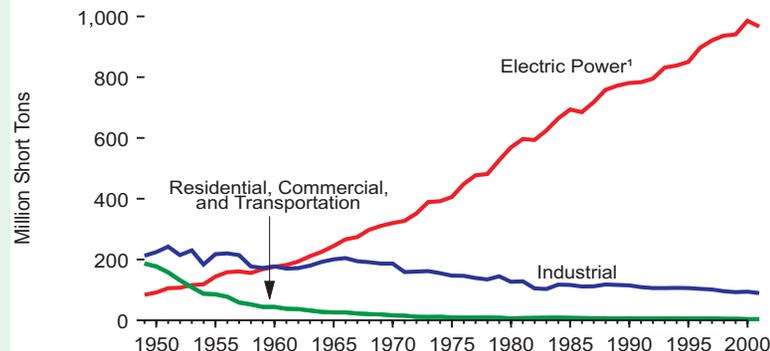

Coal

Figure 38. Coal Overview

Unlike petroleum or natural gas, domestic supplies of coal nearly always outpaced U.S. consumption of the resource. Coal exports peaked at 113 million short tons in 1981. In 2001, the United States exported 49 million short tons, over a third of it to Canada.

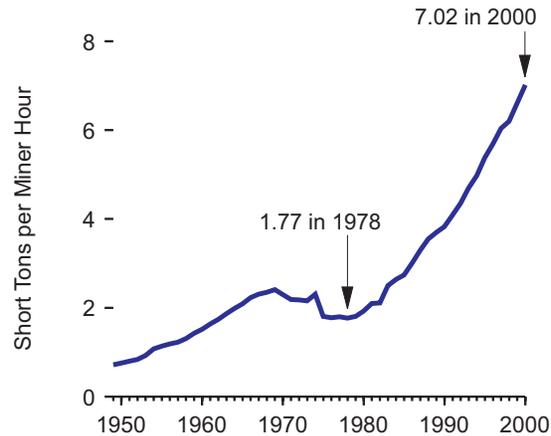

Figure 39. Coal Consumption by Sector

¹ Through 1988, electric utilities only; after 1988, includes independent power producers.

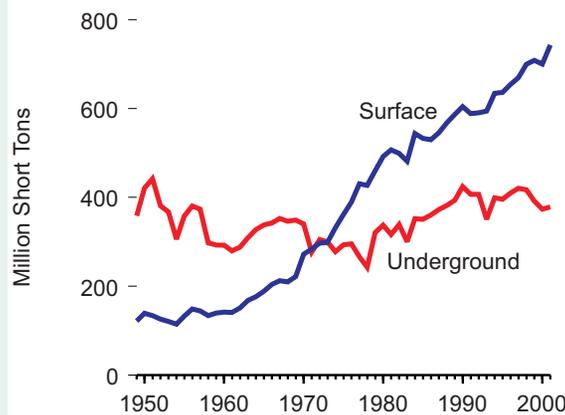

In the 1950s, most coal was consumed in the industrial sector, many homes were still heated by coal, and the transportation sector consumed coal in steam-driven trains and ships. By the 1960s, most coal was used for generating electricity and by 2001 the electric power sector's share stood at 91 percent of all coal consumption.

Figure 40. Coal Mining Productivity

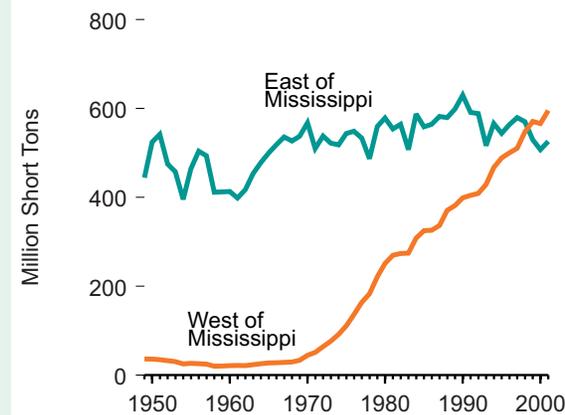

Improved mining technology and the shift toward more surface-mined coal promoted increased productivity from the Nation's mines after 1978.

Figure 41. Production by Mining Method

Most growth of coal production came from surface mines, which surpassed underground production after 1973.

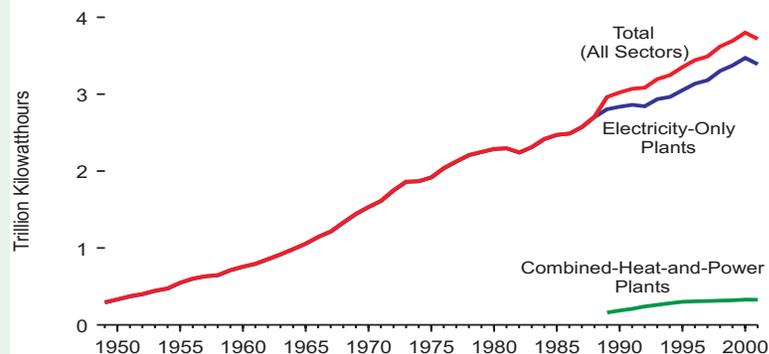

Figure 42. Production by Location

Western coal production expanded tremendously after 1969 and exceeded production from the East beginning in 1999.

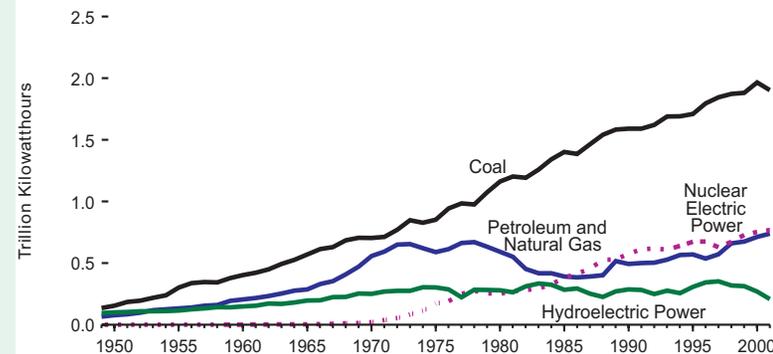

Electricity Generation and Useful Thermal Output

Figure 43. Electric Power Net Generation

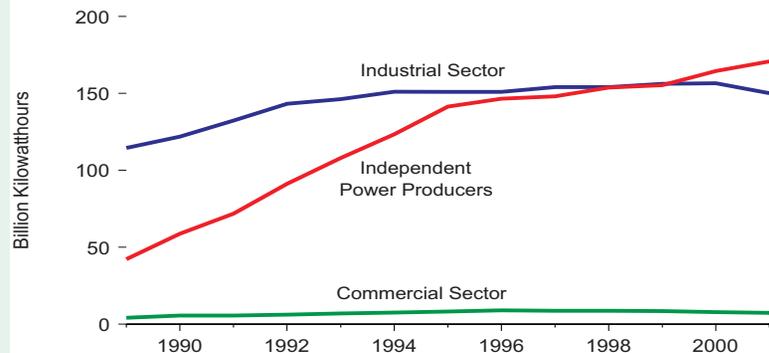

Electric power generation grew from 0.3 trillion kilowatthours in 1949 to 3.7 trillion kilowatthours in 2001. Over the entire span, electricity net generation failed to increase in only two recession-affected years, 1982 and 2001, when 2-percent decreases were recorded.

Figure 44. Major Sources of Net Generation

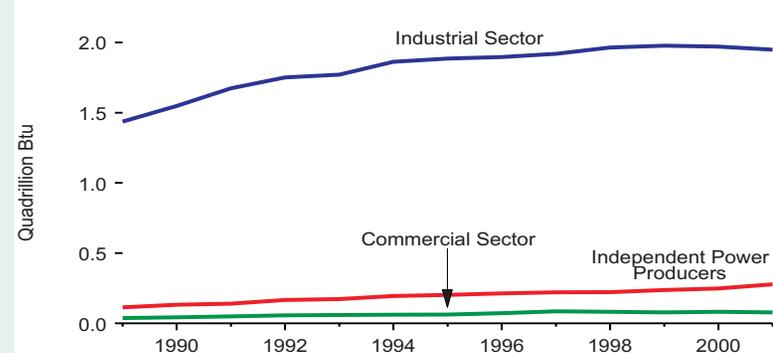

Most net generation of electricity came from coal. In fact, in 2001, fossil fuels (coal, petroleum, and natural gas) accounted for 71 percent of all net generation, while nuclear electric power contributed 21 percent, and renewable energy resources 8 percent. Most net generation from renewable energy resources was derived from hydroelectric power.

Figure 45. Net Generation at Combined-Heat-and- Power Plants

Some facilities exist to produce only electricity; others function as combined-heat-and-power (CHP) plants that produce both electricity and heat from a single heat source. Some paper mills and refineries, which are part of the industrial sector, operate as CHP plants, and some commercial sector facilities, such as hospitals and college campuses, are CHP facilities.

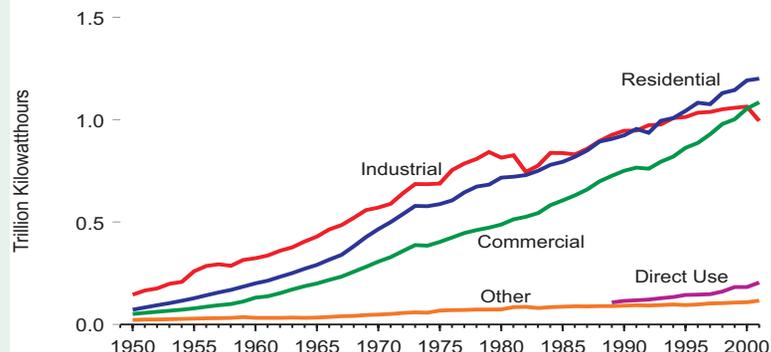

Figure 46. Useful Thermal Output at Combined-Heat- and- Power Plants

The non-electrical output at a combined-heat-and-power (CHP) plant is called useful thermal output. Useful thermal output is thermal energy that is available from the plant for use in industrial or commercial processes or heating or cooling applications. In 2001, nearly 2 quadrillion Btu of useful thermal output was created by the industrial sector.

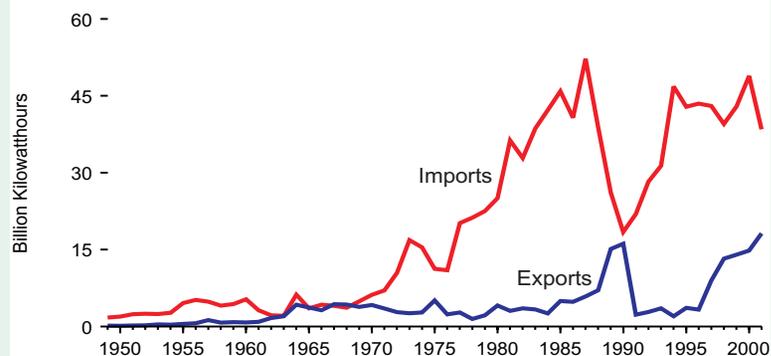

Electricity Sales, Prices, and Trade

Figure 47. Retail Sales by Sector

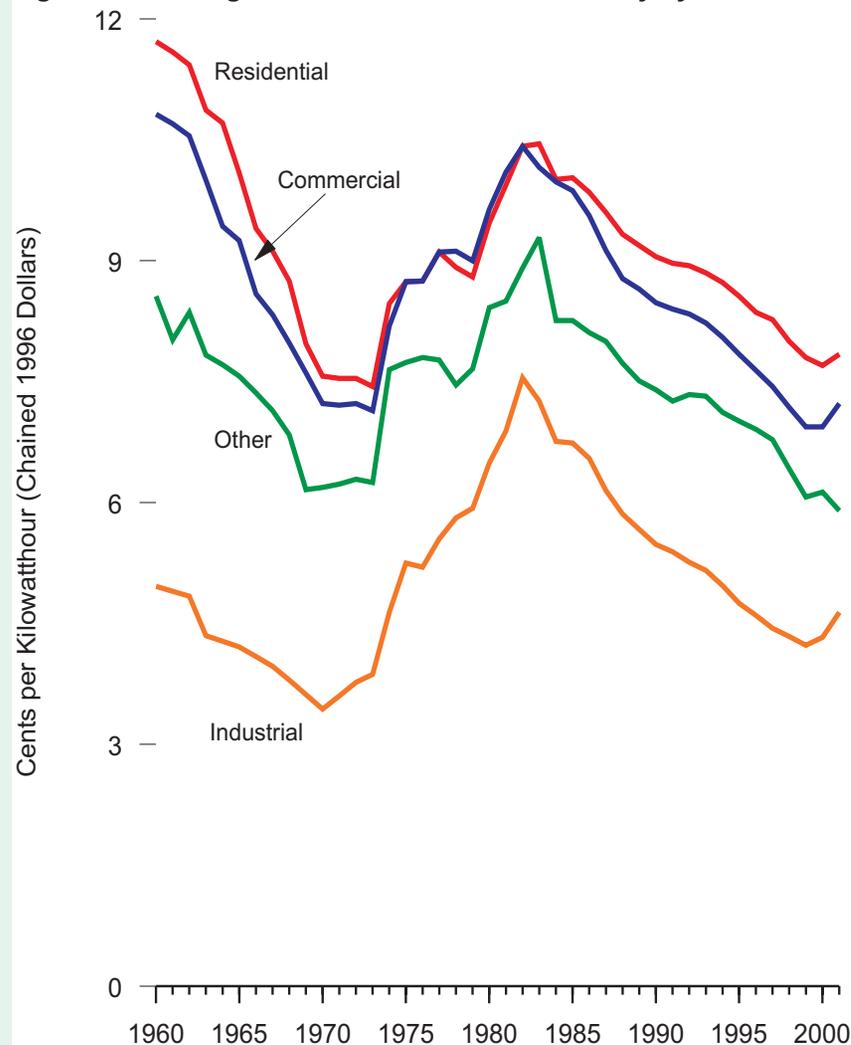

After mid-century, enormous growth occurred in electricity sales in all three major sectors—residential, industrial, and commercial. Beginning in 1993, residential sales surpassed industrial sales. The industrial sector’s use of electricity showed the greatest volatility, especially from the late 1970s through the mid 1980s.

Figure 49. Electricity Trade

Except for a few years in the 1960s when imported and exported electricity were nearly equal, the United States imported more electricity than it exported. Most electricity trade occurred with Canada, with smaller exchanges between the United States and Mexico. In 2001, net imported electricity was less than 1 percent of all electricity used in the United States.

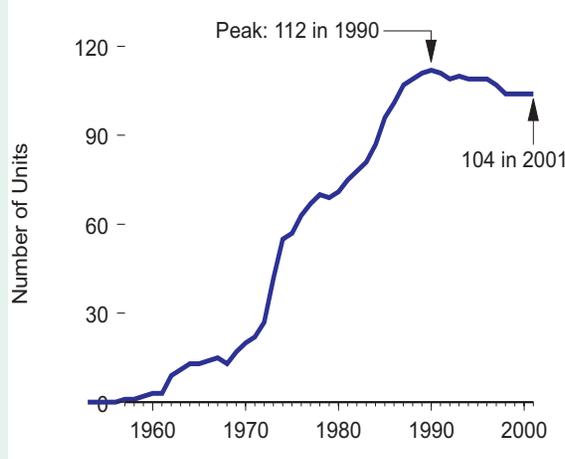

Figure 48. Average Real Retail Prices of Electricity by Sector

In inflation-adjusted terms, most electricity sector prices fell steeply in the 1960s, reversed course around 1970 to rise sharply through the early 1980s, and then recorded a pattern of steady decline until 2001, when prices turned up again. Over the decades, industrial consumers paid the lowest rates for electricity; residential customers usually paid the highest prices. In 2001, all sectors paid lower rates than they had in 1960, when adjusted for inflation.

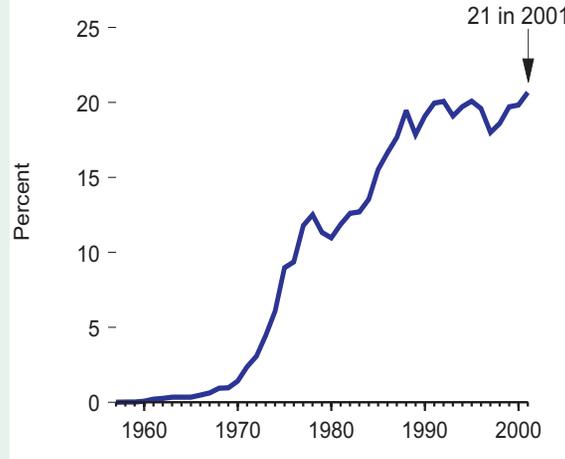

Nuclear Electric Power

Figure 50. Number of Operable Units

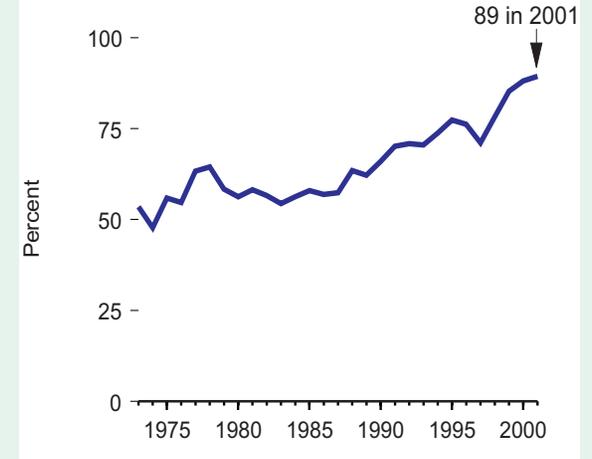

In 1957, a new plant in Shippingport, Pennsylvania, became the first operable nuclear electric plant in the United States. Many new units became operable in the 1970s and 1980s.

Figure 51. Nuclear's Share of Electricity

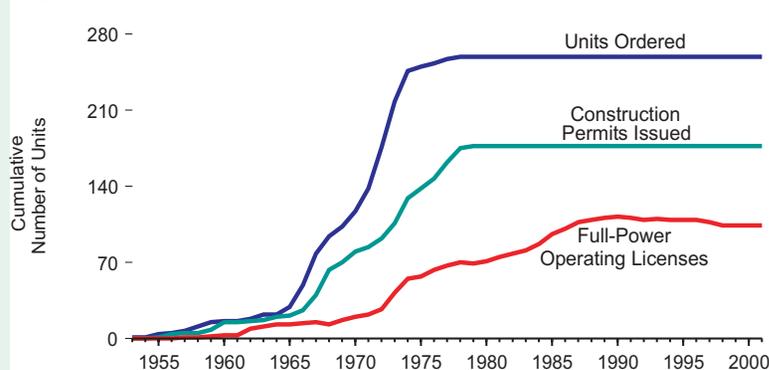

Over the latter part of the last century, nuclear electric power played a key role in meeting the Nation's rapidly growing electricity requirement. In 2001, 21 percent of all U.S. electricity came from nuclear electric

Figure 52. Capacity Factors

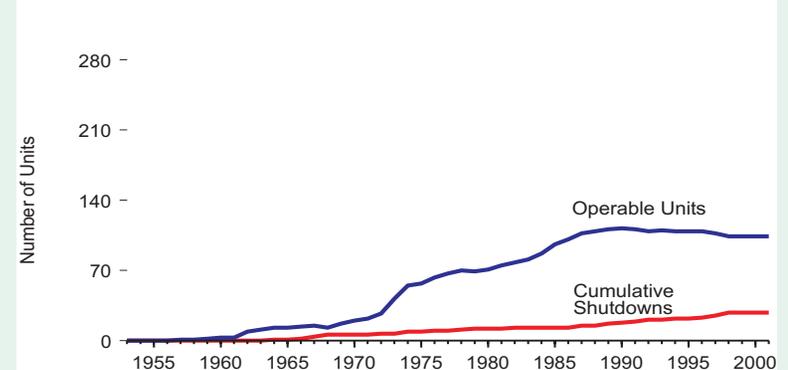

Capacity factors measure actual power generation as a share of maximum possible output. Factors for the industry were in the 50-to-60 percent range through the 1980s, but improved to 89 percent by 2001.

Figure 53. Cumulative Unit Orders, Permits, and Licenses

A total of 259 nuclear electric power units have been ordered over the history of the industry in the United States. The last new orders were placed in 1978. Of the 259 orders, 177 advanced to the issuance of construction permits and, of those, 132 gained full-power operating licenses.

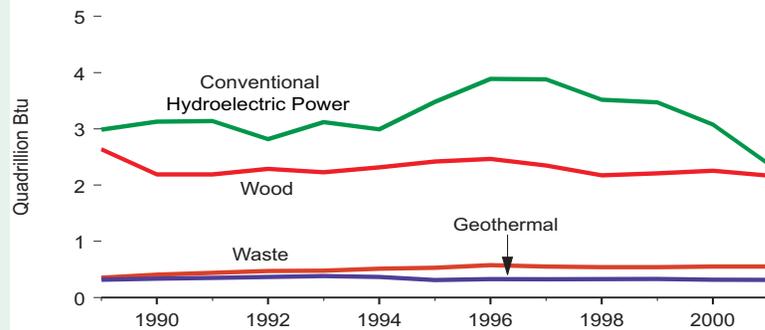

Figure 54. Operable Units and Cumulative Shutdowns

Out of the 132 units that were granted full-power operating licenses, over time 28 were shut down permanently. The largest number of units ever operable in the United States was 112 in 1990. From 1998 through 2001, 104 units were operable.

Renewable Energy

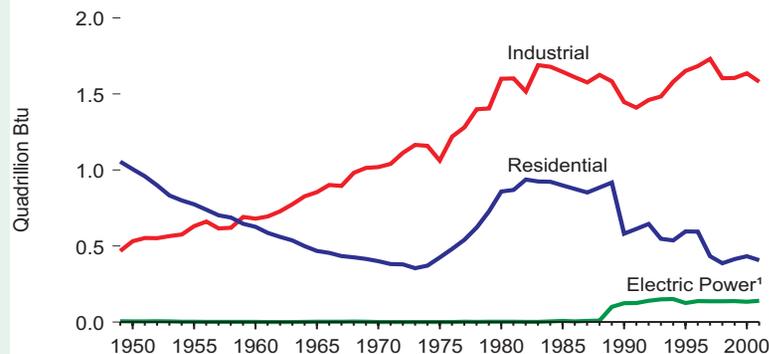

Figure 55. Renewable Energy Consumption by Source

Note: Wood includes wood, black liquor, and other wood waste.

Total U.S. renewable energy consumption, which stood at about 7 quadrillion Btu per year from 1995 to 1999, fell in 2000 and 2001. Conventional hydroelectric power, which accounted for about half of the total, declined steeply in 2000 and 2001. Wood was the next largest source of renewable energy, followed by waste and geothermal. Smaller quantities came from alcohol fuels, solar, and wind.

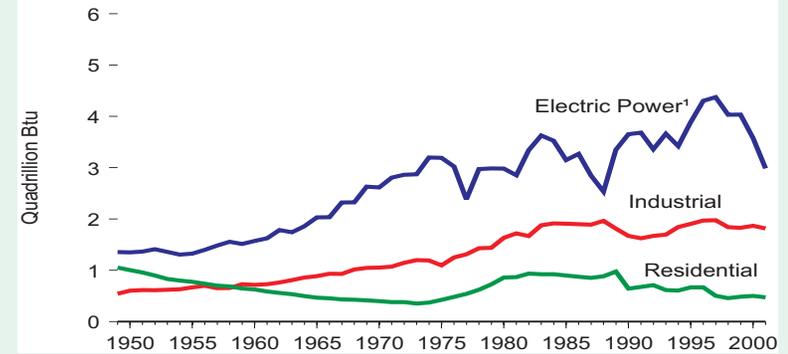

Figure 57. Wood Consumption by Selected Sector

¹ Through 1988, electric utilities only; after 1988, includes independent power producers.

Except for the period from 1974 through 1982, residential use of wood generally declined over the second half of the 20th century, while the industrial sector's use of wood, mainly black liquor, expanded. Twenty-two percent of all wood consumed in 2001 was used to generate electricity. Commercial use of wood was very small.

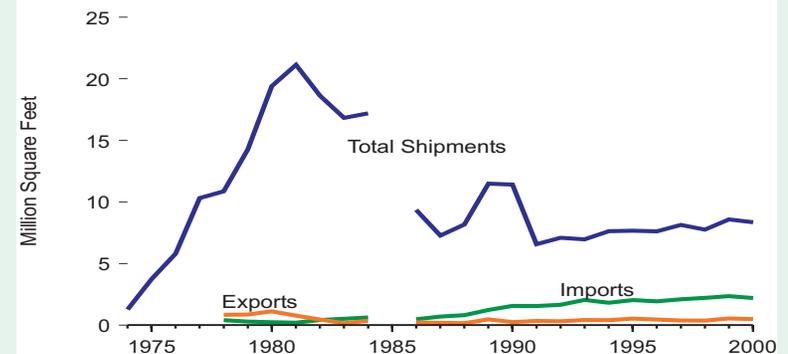

Figure 56. Renewable Energy Consumption by Sector

¹ Through 1988, electric utilities only; after 1988, includes independent power producers.

Most renewable energy was consumed by the electric power sector to generate electricity. After 1958, the industrial sector was the second largest consuming sector of renewable energy, mostly black liquor, a by-product of paper production. Residential sector usage of renewable energy (mostly wood) was the third largest consuming sector.

Figure 58. Solar Collector Shipments and Trade

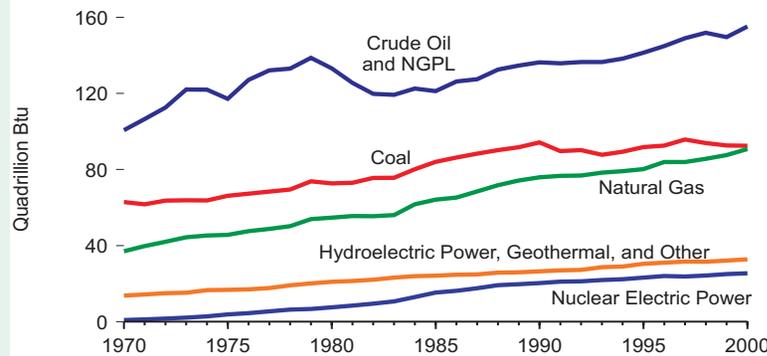

Note: Data were not collected for 1985. Shipments include all domestically manufactured collectors plus imports.

Solar collector total shipments peaked in 1981 at 21 million square feet. From 1991 through 2000, the level of shipments was about 7 to 8 million square feet per year. Since 1983, imports of solar collectors exceeded exports, and the imports trend was generally increasing.

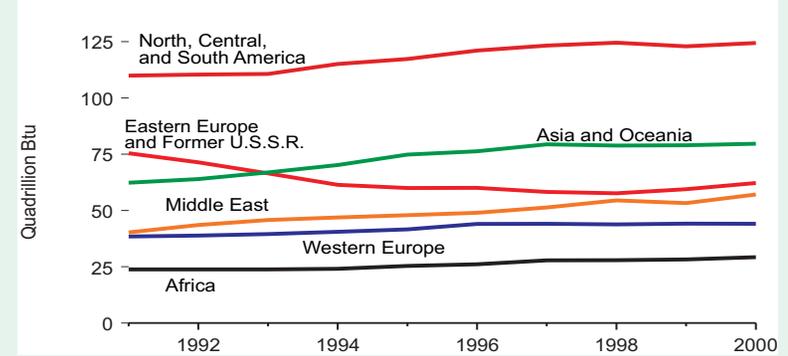

International Energy

Figure 59. World Primary Energy Production by Source

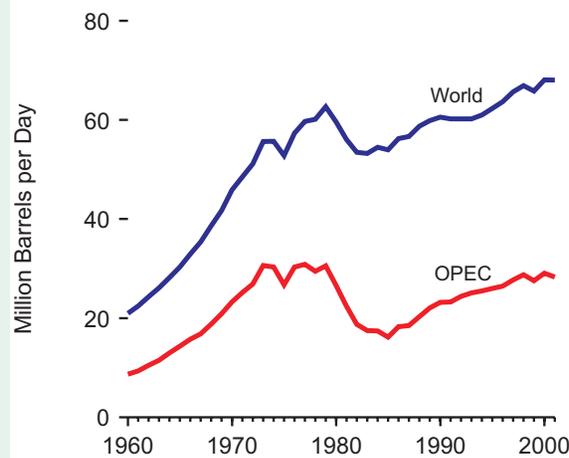

From 1970 to 2000, world primary energy production grew by 84 percent. Growth occurred in all types of energy. In 2000, fossil fuels accounted for 85 percent of all energy produced worldwide, renewable energy 8 percent, and nuclear power 6 percent.

Figure 60. World Primary Energy Production by Region

One-third of the 397 quadrillion Btu of energy produced worldwide in 2000 came from North, Central, and South America. Between 1991 and 2000, total primary energy production grew in all major regions of the world except Eastern Europe and the Former U.S.S.R., where production fell by 18 percent.

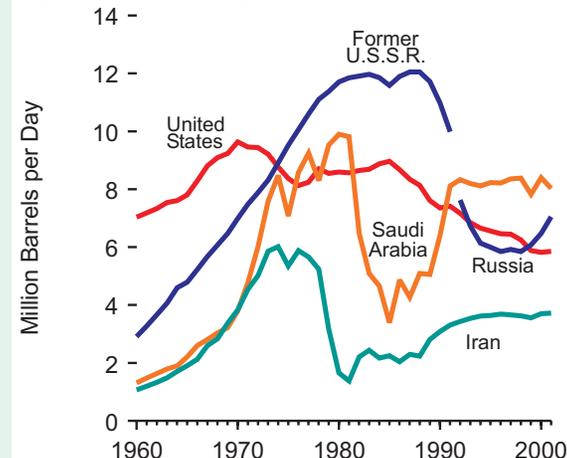

Figure 61. World Crude Oil Production

OPEC = Organization of Petroleum Exporting Countries.

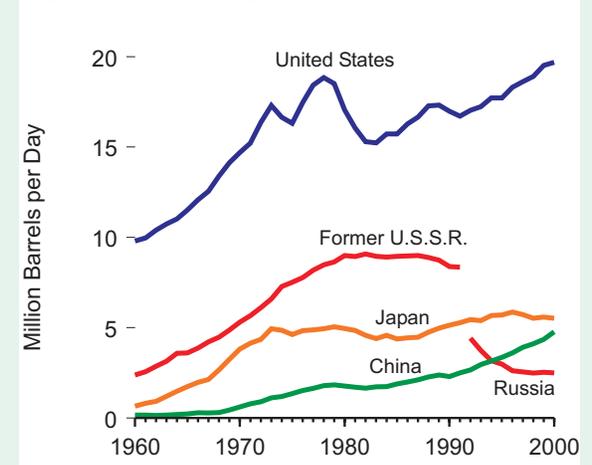

World crude oil production was 68 million barrels per day in 2000 and 2001. OPEC's share fell from 55 percent in 1973 to 42 percent in 2001.

Figure 62. Leading Crude Oil Producers

After 1991, Saudi Arabia was the largest producer. U.S. production peaked in 1970. After 1998, Russia's production surpassed U.S. output.

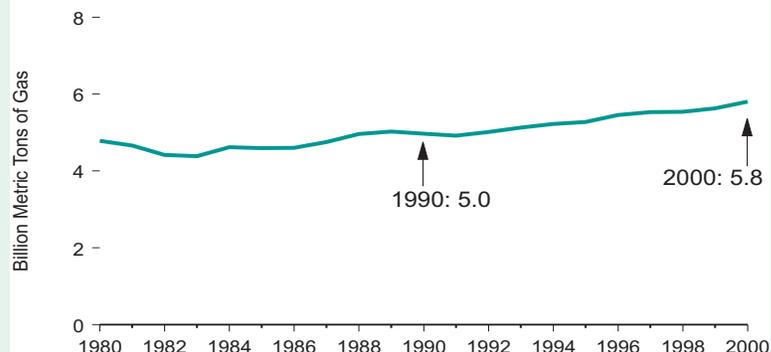

Figure 63. Leading Petroleum Consumers

The United States accounted for 26 percent of world consumption of petroleum in 2000. Japan and China accounted for 7 and 6 percent, respectively.

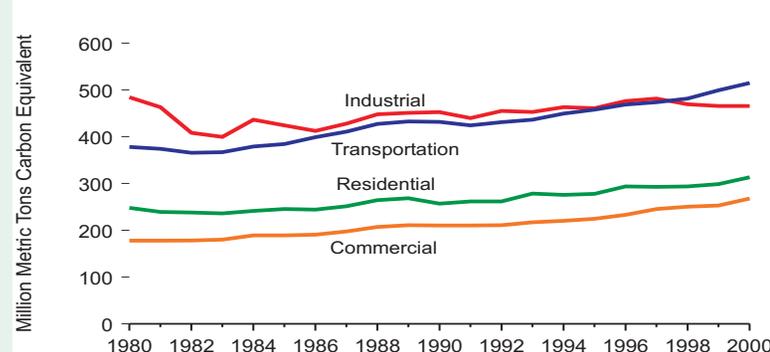

Carbon Dioxide Emissions

Figure 64. Carbon Dioxide Emissions

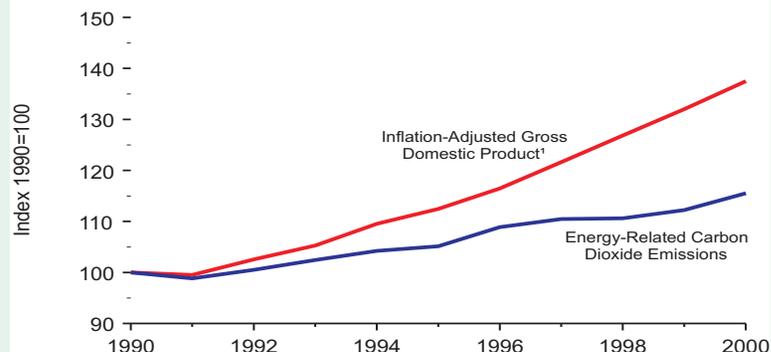

In the United States, fossil fuel combustion is responsible for 98 percent of all emissions from carbon dioxide, which is the most significant greenhouse gas. Total carbon dioxide emissions reached 5.8 billion metric tons of gas in 2000, 17 percent higher than the 1990 level.

Figure 65. Carbon Dioxide Emissions From Energy Use

The level of carbon dioxide emissions generated by the industrial sector exceeded other sector levels until 1998 when it was surpassed by transportation emissions. Commercial sector emissions, the smallest of the four sectors, registered the largest percentage gain, 27, from 1990 to 2000.

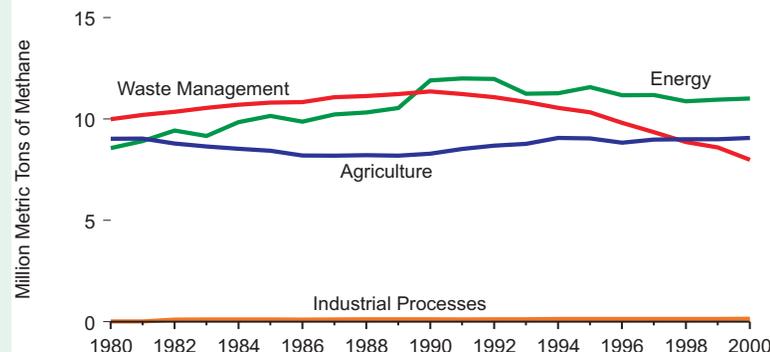

Figure 66. GDP Growth and Carbon Dioxide Emissions

¹ Based on chained (1996) dollars.

While gross domestic product (GDP) grew by 38 percent from 1990 to 2000, energy-related carbon dioxide emissions grew by 16 percent. It was primarily the use of less energy per unit of economic output, rather than the use of low-carbon fuels, that held the rate of carbon dioxide emissions growth below that of the inflation-adjusted gross domestic product.

Figure 67. Methane Emissions by Sector

In 2000, methane emissions accounted for 9 percent of total U.S. greenhouse gas emissions, weighted by global warming potential. Most methane emissions come from energy, agricultural activities, and waste management. The production, processing, and distribution of natural gas accounted for two-thirds of all energy-related methane emissions in 2000.

Energy Overview

The United States at night from orbit. Source: National Oceanographic and Atmospheric Administration satellite imagery; mosaic provided by U.S. Geological Survey.

Diagram 1. Energy Flow, 2001
(Quadrillion Btu)

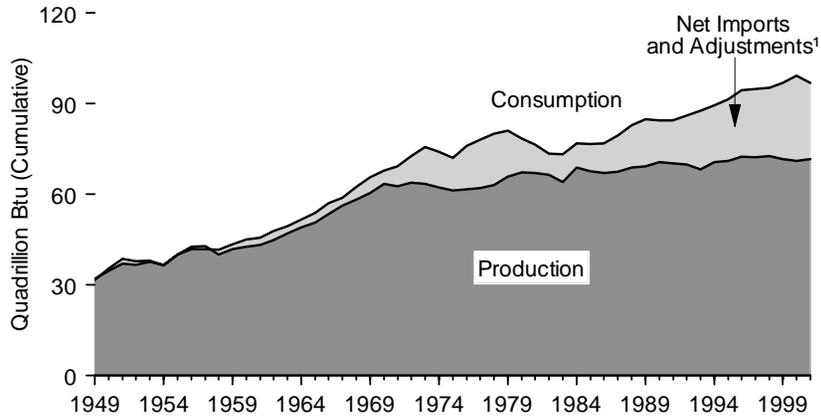

^a Includes lease condensate.
^b Natural gas plant liquids.
^c Conventional hydroelectric power, wood, waste, ethanol blended into motor gasoline, geothermal, solar, and wind.
^d Includes -0.09 quadrillion Btu hydroelectric pumped storage.
^e Natural gas, coal, coal coke, and electricity.
^f Stock changes, losses, gains, miscellaneous blending components, and unaccounted-for supply.
^g Crude oil, petroleum products, natural gas, electricity, and coal coke.
^h Includes supplemental gaseous fuels.
ⁱ Petroleum products, including natural gas plant liquids.

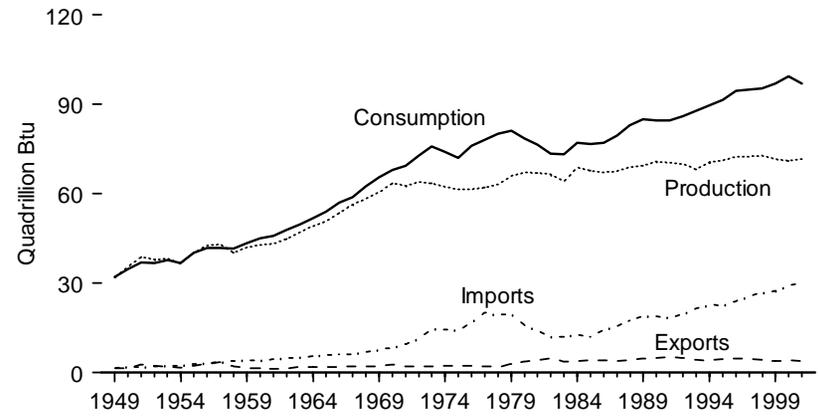

^j Includes, in quadrillion Btu, 0.04 coal coke net imports and 0.05 electricity net imports from fossil fuels.
^k Includes, in quadrillion Btu, -0.09 hydroelectric pumped storage and -0.15 ethanol blended into motor gasoline, which is accounted for in both fossil fuels and renewable energy but counted only once in total consumption.
^l Primary consumption, electricity retail sales, and electrical system energy losses, which are allocated to the end-use sectors in proportion to each sector's share of total electricity retail sales. See Note 1 at end of Electricity section.
 Notes: • Data are preliminary. • Totals may not equal sum of components due to independent rounding.

¹ Coal, natural gas (dry), crude oil, and natural gas plant liquids.

² See Note 1 at end of section.

³ End-use consumption and electricity net generation.

⁴ Also includes hydroelectric pumped storage.

⁵ Crude oil and petroleum products. Includes imports into the Strategic Petroleum Reserve.

⁶ Also includes natural gas, coal, coal coke, and electricity.

⁷ Also includes natural gas, petroleum, coal coke, and electricity.

⁸ A balancing item. Includes stock changes, losses, gains, miscellaneous blending components, and unaccounted-for supply.

⁹ Coal, coal coke net imports, natural gas, petroleum, and electricity net imports derived from fossil fuels.

¹⁰ End-use consumption, electricity net generation, and electricity net imports derived from renewable energy.

¹¹ Alcohol (ethanol blended into motor gasoline) is included in consumption values for both "Fossil Fuels" and "Renewable Energy," but is counted only once in total energy consumption.

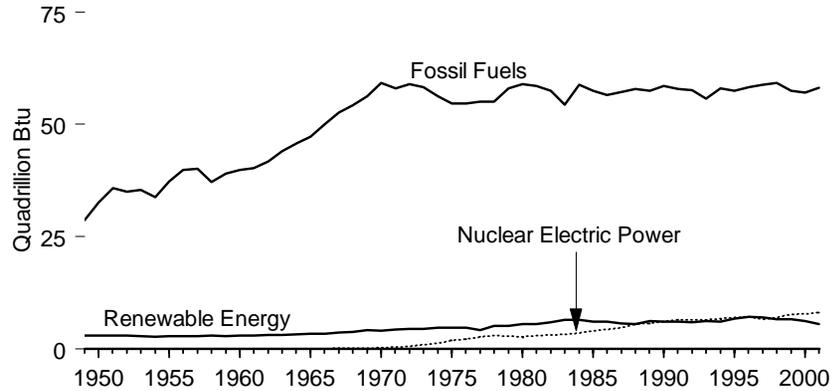

R=Revised. P=Preliminary. (s)=Less than 0.005 quadrillion Btu.

Note: Totals may not equal sum of components due to independent rounding.

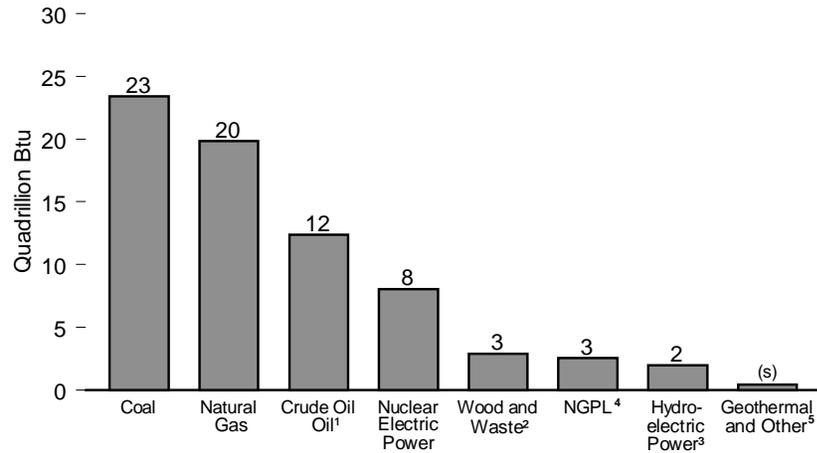

Sources: Tables 1.2, 1.3, and 1.4.

Figure 1.2 Energy Production by Source

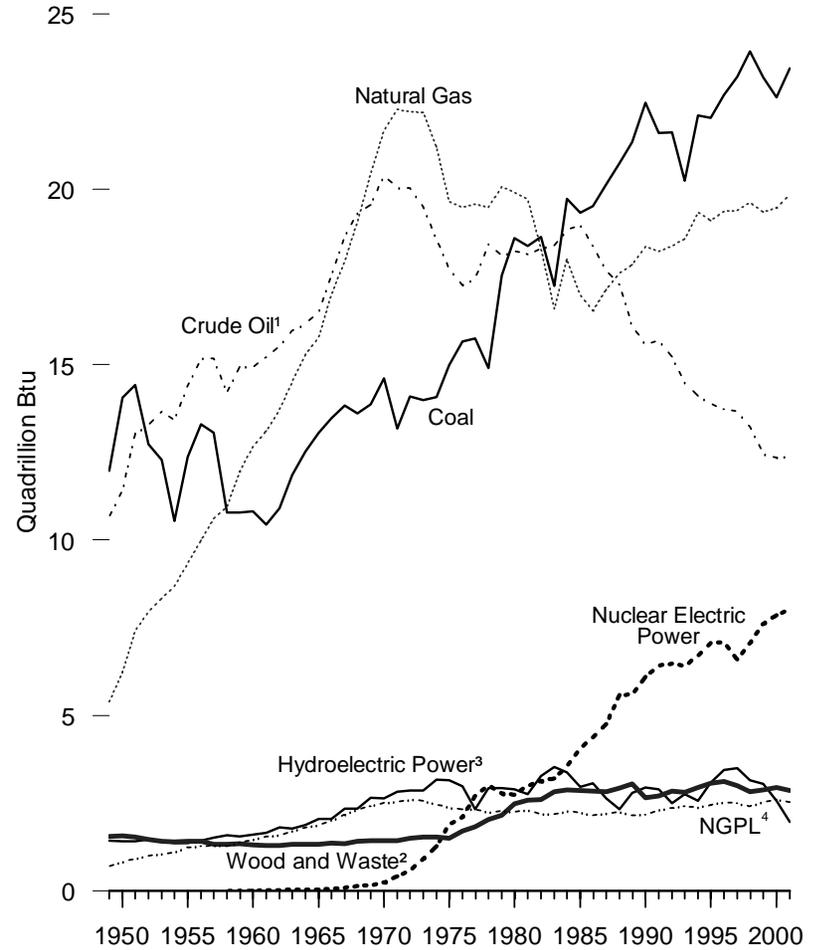

By Fossil Fuels, Nuclear Electric Power, and Renewable Energy, 1949-2001

By Source, 2001

By Major Source, 1949-2001

¹ Includes lease condensate.

² Includes ethanol blended into motor gasoline.

³ Conventional and pumped-storage hydroelectric power.

⁴ Natural gas plant liquids.

⁵ Solar and wind.

(s)=Less than 0.5 quadrillion Btu.

Note: Because vertical scales differ, graphs should not be compared.

Source: Table 1.2.

Table 1.2 Energy Production by Source, 1949-2001
(Quadrillion Btu)

Year	Fossil Fuels					Nuclear Electric Power ³	Hydro-electric Pumped Storage ⁴	Renewable Energy ¹					Total	
	Coal	Natural Gas (Dry)	Crude Oil ²	Natural Gas Plant Liquids	Total			Conventional Hydroelectric Power	Wood, Waste, Alcohol ⁵	Geothermal	Solar	Wind		Total

¹ End-use consumption and electricity net generation.

² Includes lease condensate.

³ See Note 1 at end of section.

⁴ Pumped storage facility production minus energy used for pumping.

⁵ Alcohol is ethanol blended into motor gasoline.

⁶ Included in conventional hydroelectric power.

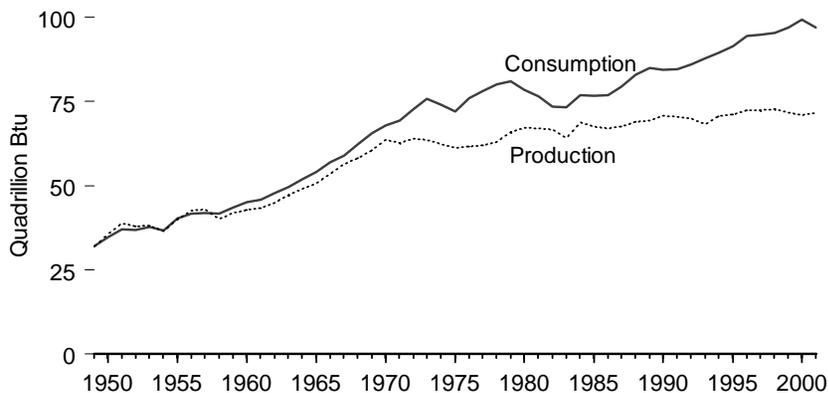

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.0005 quadrillion Btu.

Note: Totals may not equal sum of components due to independent rounding.

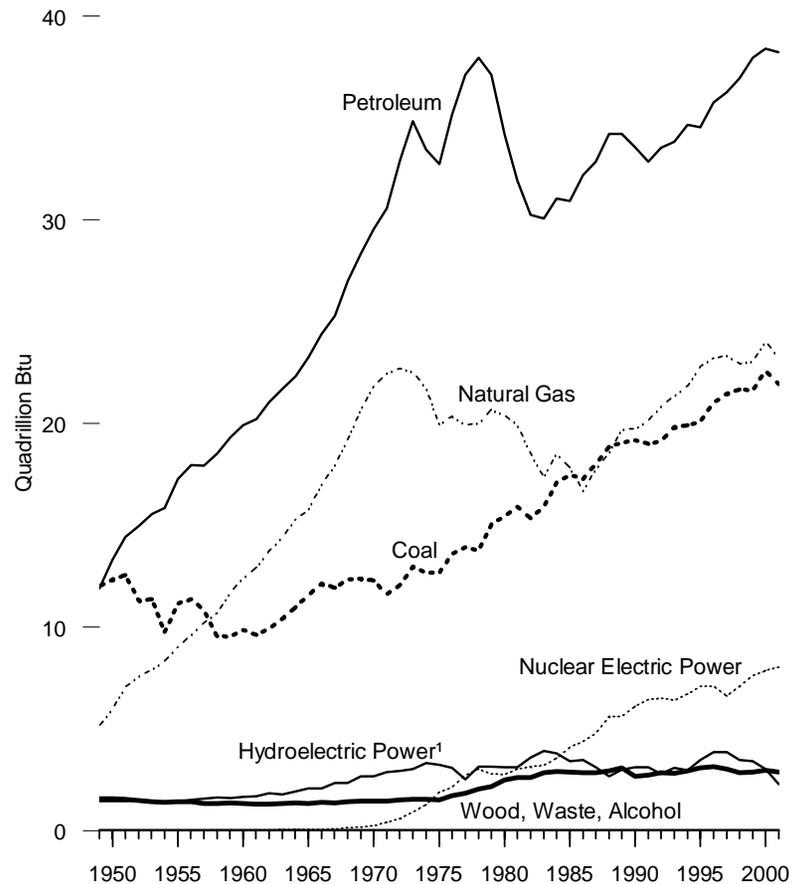

Sources: Tables 5.1, 6.1, 7.1, 8.2a, 10.2a, 10.2b, and A2-A6.

Figure 1.3 Energy Consumption by Source

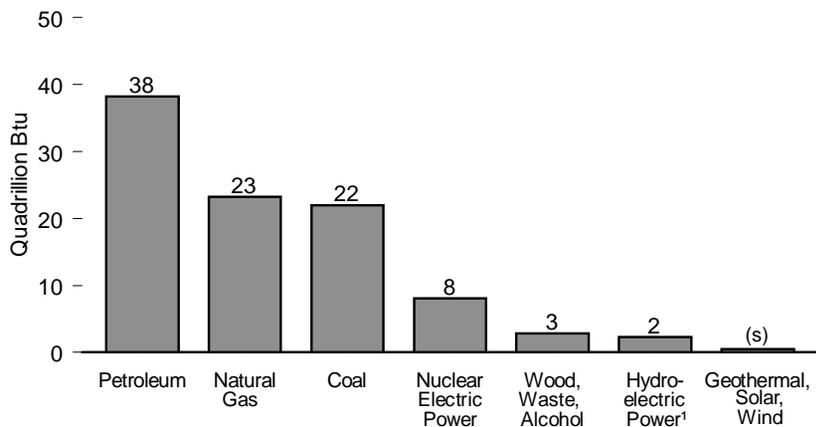

Production and Consumption, 1949-2001

By Major Source, 1949-2001

By Source, 2001

¹ Conventional and pumped-storage hydroelectric power.
 (s)=Less than 0.5 quadrillion Btu.

Note: Because vertical scales differ, graphs should not be compared.
 Sources: Tables 1.2 and 1.3.

¹ End-use consumption, electricity net generation, and net imports of electricity from renewable energy.
² Includes supplemental gaseous fuels.
³ Petroleum products supplied, including natural gas plant liquids and crude oil burned as fuel.
⁴ Electricity net imports from fossil fuels. May include some nuclear-generated electricity.
⁵ Pumped storage facility production minus energy used for pumping.
⁶ Through 1988, includes all electricity net imports. From 1989, includes only electricity net imports derived from hydroelectric power.
⁷ Alcohol (ethanol blended into motor gasoline) is included in both "Petroleum" and "Alcohol," but is

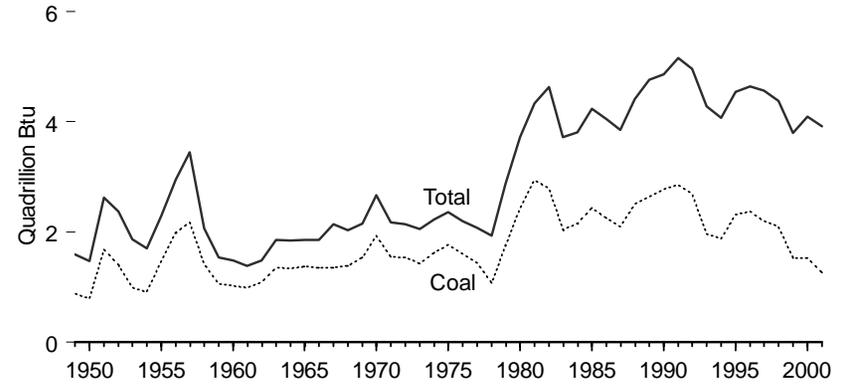

counted only once in total energy consumption.
⁸ From 1989, includes electricity imports from Mexico that are derived from geothermal energy.
⁹ Included in conventional hydroelectric power.
 R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.0005 and greater than -0.0005 quadrillion Btu.
 Note: Totals may not equal sum of components due to independent rounding.

¹ Includes imports into the Strategic Petroleum Reserve, which began in 1977.

² Coal coke and small amounts of electricity transmitted across U.S. borders with Canada and Mexico.

R=Revised. P=Preliminary. (s)=Less than 0.005 quadrillion Btu and greater than -0.005 quadrillion Btu.

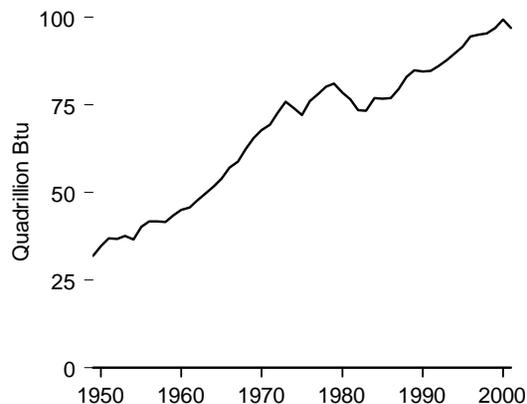

Notes: Includes trade between the United States (50 States and the District of Columbia) and its

territories and possessions. Totals or net import items may not equal sum of components due to independent rounding.

¹ Includes 57.7 trillion Btu of coal coke net imports, which are not allocated to the States. Does not include 1,042 trillion Btu of coal consumed by nonutility wholesale power producers and cogeneration plants and not reported in the end-use sectors.

² Includes \$140 million for coal coke net imports, which are not allocated to the States.

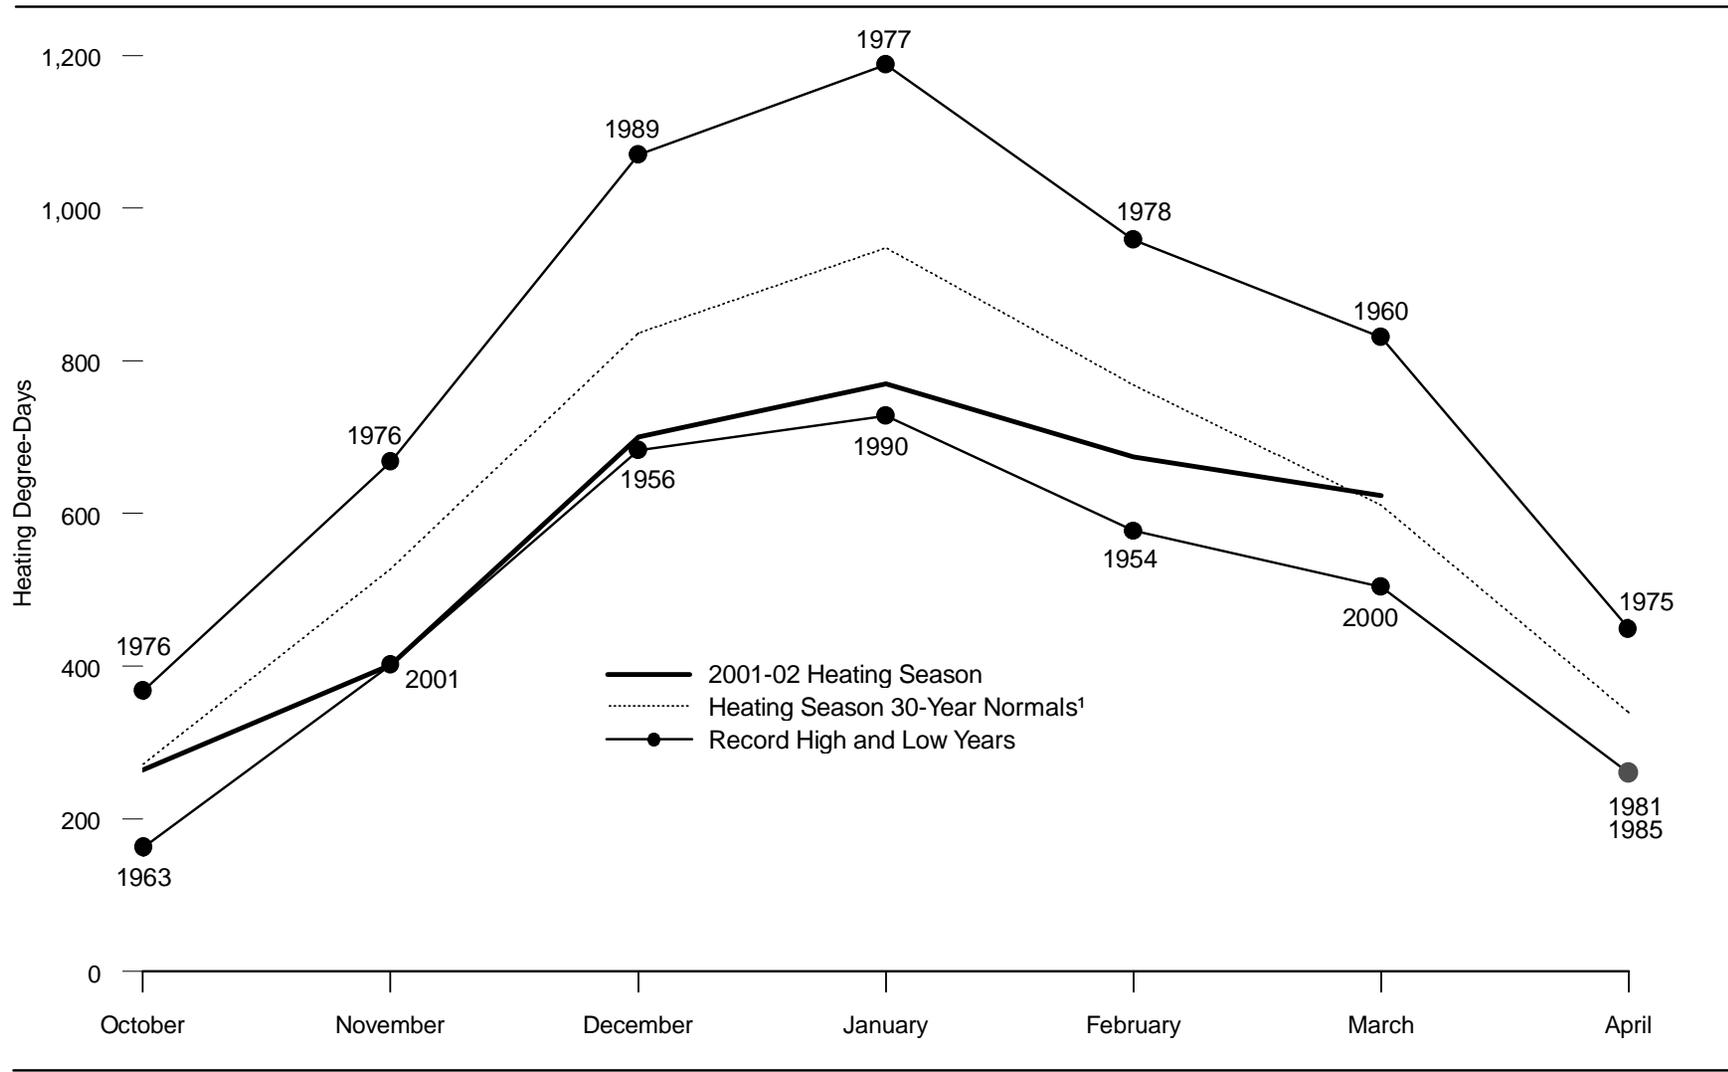

Note: Rankings based on unrounded data.

Web Page: http://www.eia.doe.gov/emeu/states/_states.html.

Sources: **Consumption:** Energy Information Administration (EIA), *State Energy Data Report 1999, Consumption Estimates* (May 2001), Tables 9 and 10. **Expenditures and Prices:** EIA, *State Energy Price and Expenditure Report 1999* (November 2001), Table 1.

Both publications include State-level data by end-use sector and type of energy. Consumption estimates are annual 1960 through 1999, and price and expenditures estimates are annual 1970 through 1999.

¹ Based on calculations of data from 1961 through 1990.

R=Revised. P=Preliminary. NA=Not available.

Notes: This table excludes Alaska and Hawaii. Degree-days are relative measurements of outdoor air temperature. Heating degree-days are deviations below the mean daily temperature of 65 F. For example, a weather station recording a mean daily temperature of 40 F would report 25 heating degree-days. Temperature information recorded by weather stations is used to calculate State-wide degree-day averages based on resident State population estimated for 1990. The population-weighted

State figures are aggregated into Census divisions and the national average.

Notes: Degree-days are relative measurements of outdoor air temperature. Heating degree-days are deviations below the mean daily temperature of 65 F. For example, a weather station recording a mean daily temperature of 40 F would report 25 heating degree-days. Temperature information recorded by weather stations is used to calculate State-wide degree-day averages based on resident State population estimated for 1990. The population-weighted State figures are aggregated into Census divisions and the

national average. See Appendix D for Census divisions.

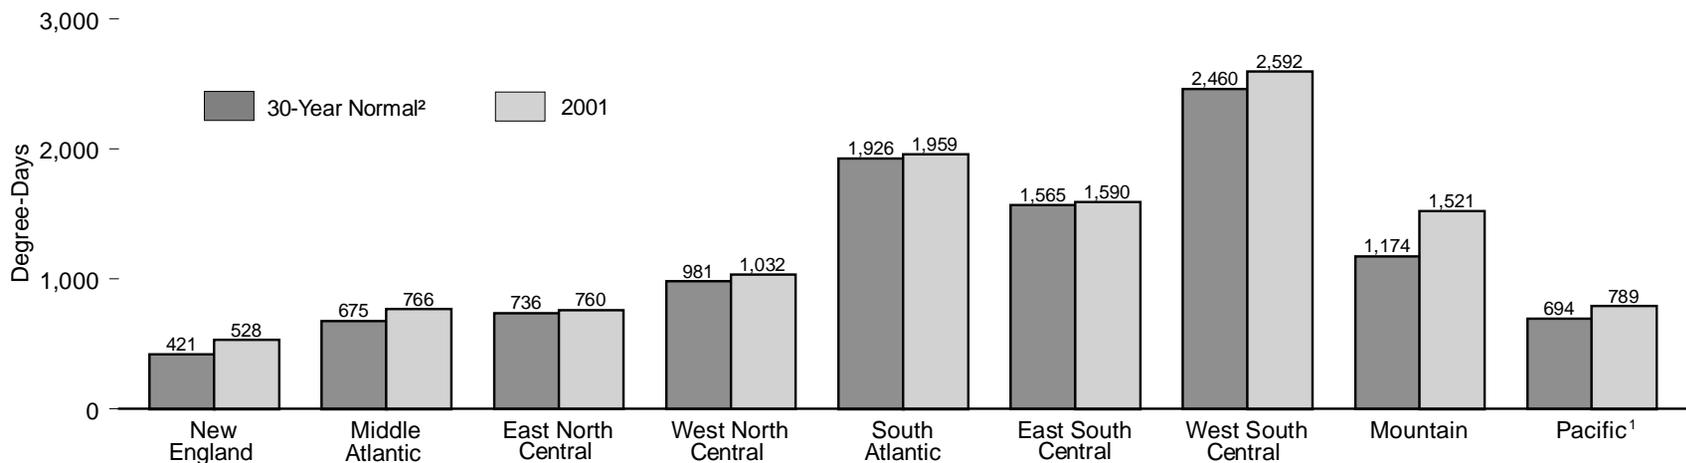

Sources: 1949-2000 and Normals—U.S. Department of Commerce, National Oceanic and Atmospheric Administration (NOAA), National Climatic Data Center, Asheville, North Carolina. Historical Climatology Series 5-1. 2001—Energy Information Administration, *Monthly Energy Review (MER)*, February 2001-January 2002 issues, Table 1.11, which reports data from NOAA, National Weather Service Climate Analysis Center, Camp Springs, Maryland. Census Division data for 2001 are the sums of the current year monthly statistics shown in the cited issues of the *MER*. The U.S. total comes from Table 1.7.

¹ Liquefied petroleum gases.

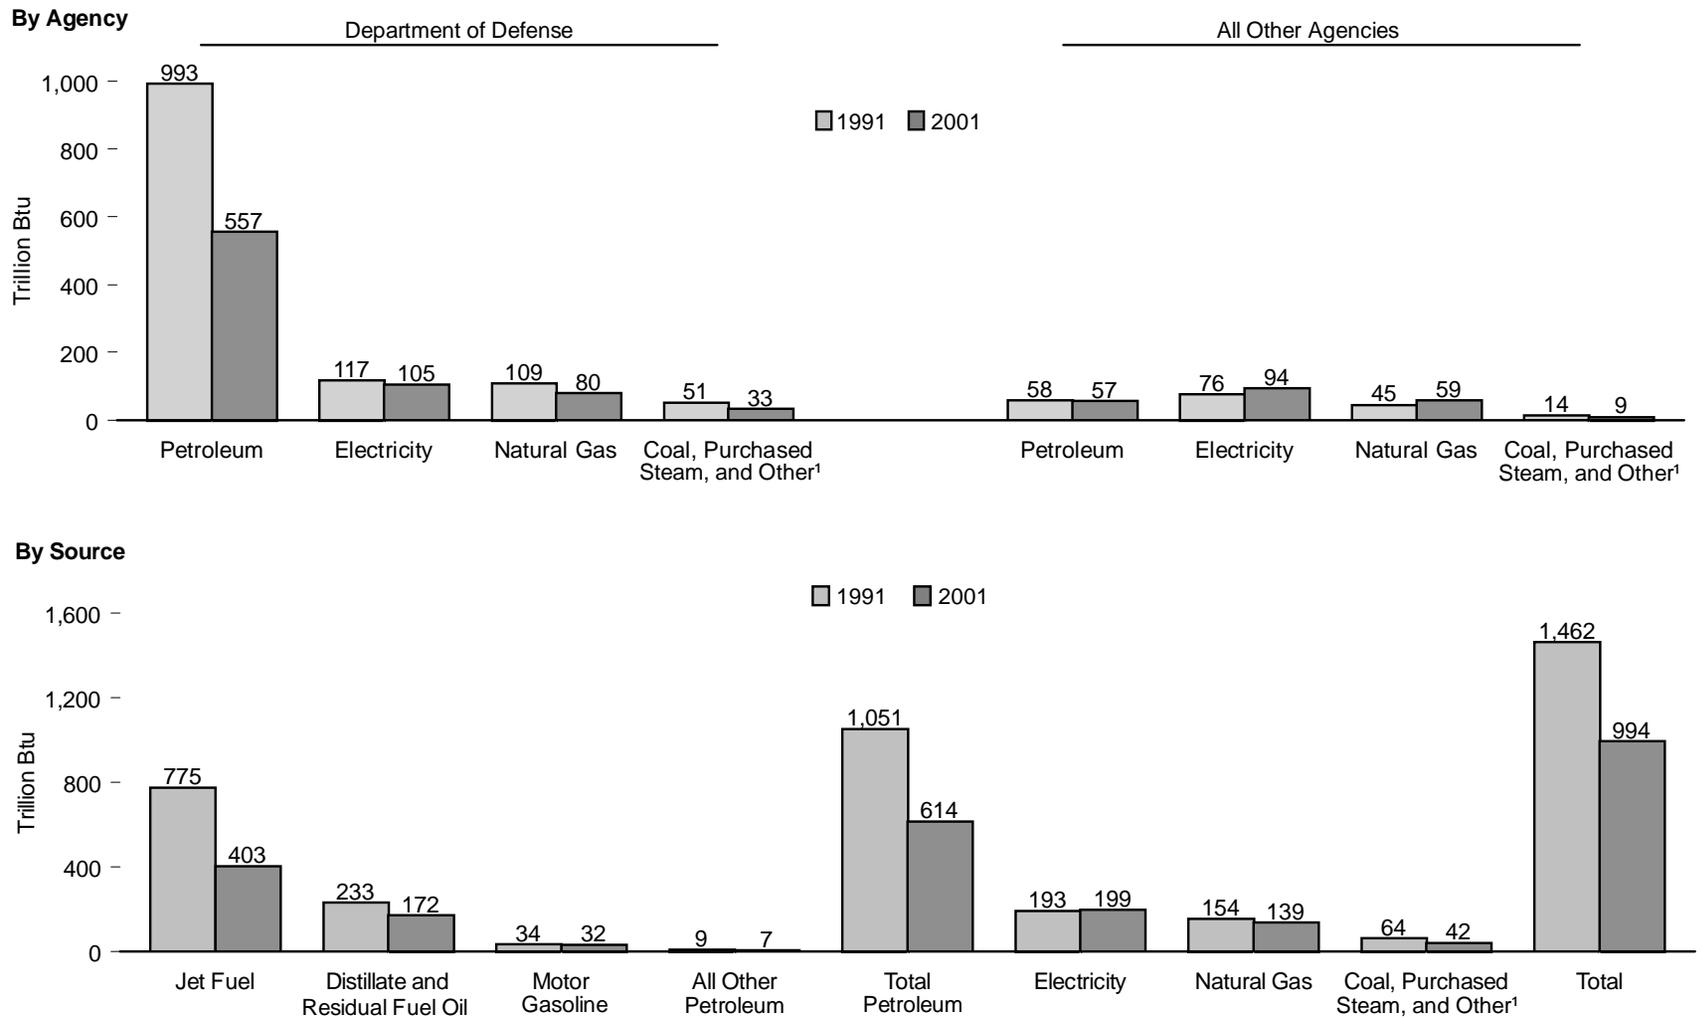

R = Revised. P = Preliminary.

Notes: The U.S. Government's fiscal year was October 1 through September 30, except in 1975 and 1976, when it was July 1 through June 30. This table uses a conversion factor for electricity of 3,412 Btu per kilowatt-hour and a conversion factor for purchased steam of 1,000 Btu per pound. Data include

energy consumed at foreign installations and in foreign operations, including aviation and ocean bunkering, primarily by the U.S. Department of Defense. U.S. Government energy use for electricity generation and uranium enrichment is excluded. Totals may not equal sum of components due to independent rounding.

Source: U.S. Department of Energy, Energy Efficiency and Renewable Energy, Office of Federal Energy Management Programs.

¹ Production from Naval Petroleum Reserve No. 1 for 1974 and earlier years is for fiscal years (July through June).

² Includes only those quantities for which the royalties were paid on the basis of the value of the natural gas plant liquids produced. Additional quantities of natural gas plant liquids were produced; however, the royalties paid were based on the value of natural gas processed. These latter quantities are included with natural gas.

³ Includes some quantities of natural gas processed into liquids at natural gas processing plants and fractionators.

⁴ Converted to British thermal units (Btu) on the basis of an estimated heat content of coal produced on Federally administered lands of 21.0 million Btu per short ton.

⁵ Based on physical units.

⁶ There is a discontinuity in this time series between 1997 and 1998 due to the sale of "Elk Hills," Naval Petroleum Reserve No. 1.

⁷ There is a discontinuity in this time series between 1998 and 1999; beginning in 1999 Naval Petroleum Reserve data have become insignificant and are no longer included.

⁸ Fiscal-year data: October 2000-September 2001.

R=Revised.

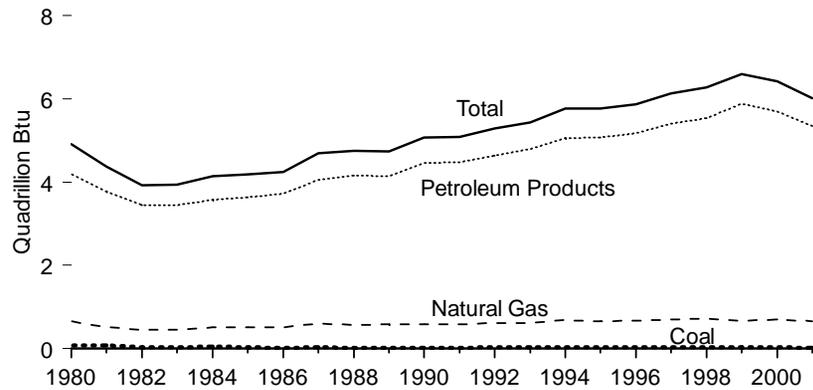

Note: Federally Administered Lands include all classes of land owned by the Federal Government, including acquired military, Outer Continental Shelf, and public lands.

Web Page: <http://www.mrm.mms.gov>.

¹ Distillate fuel oil, residual fuel oil, waxes, and miscellaneous products.

² Petroleum - million barrels; natural gas - billion cubic feet; and coal - million short tons.

³ Included in liquefied petroleum gases.

R=Revised. P=Preliminary. — = Not applicable.

Notes: See Note 2 at end of section for a discussion of "Nonfuel Use." Because of changes in methodology, data series may be revised annually. See Energy Information Administration (EIA), *Emissions of Greenhouse Gases in the United States 2000* (November 2001), Appendix A, on the Web Page, for a discussion of the estimates in the table. Totals may not equal sum of components due to independent rounding.

Web Page: <http://www.eia.doe.gov/environment.html>.

Sources: **Petroleum Products:** 1980—EIA, Energy Data Reports, *Petroleum Statement, Annual and Sales of Liquefied Petroleum Gases and Ethane in 1980*. 1981-2000—EIA, *Petroleum Supply Annual*, annual reports, and unpublished data. 2001—EIA, *Petroleum Supply Monthly* (February 2002), and EIA estimates. **Natural Gas:** 1980—Bureau of the Census, 1980 Survey of Manufactures, *Hydrocarbon, Coal, and Coke Materials Consumed*. 1981 forward—U.S. Department of Commerce. **Coal:** 1960-1995—U.S. International Trade Commission, *Synthetic Organic Chemicals, United States Production and Sales, 1995* (January 1997). 1996 forward—Estimated because the data series has been discontinued. **Percent of Total Energy Consumption:** Derived by dividing total by total consumption on Table 1.3.

Energy Overview

Note 1. Data on the generation of electricity in the United States represent net generation, which is gross output of electricity (measured at the generator terminals) minus power plant use. Nuclear electricity generation data identified by individual countries in Section 11 are gross outputs of electricity.

Note 2. Most fossil fuels consumed in the United States and elsewhere are combusted to produce heat and power. However, some are used directly for nonfuel use as construction materials, lubricants, chemical feedstocks, solvents, and waxes. For example, asphalt and road oil are used for roofing and paving; liquefied petroleum gases are used to create intermediate products that are used in making plastics; lubricants, including motor oil and greases, are used in vehicles and various industrial processes; petrochemical feedstocks are used to make plastics, synthetic fabrics, and related products; and natural gas is used to make nitrogenous fertilizers and as feedstock in the chemical industry.

¹ Commercial sector fuel use, including that at commercial combined-heat-and-power (CHP) and commercial electricity-only plants. See Appendix G for commercial sector NAICS codes.

² Industrial sector fuel use, including that at industrial combined-heat-and-power (CHP) and industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.

³ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

⁴ Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

⁵ A balancing item. The sum of primary consumption in the five energy-use sectors equals the sum of total consumption in the four end-use sectors. However, total energy consumption does not equal the sum of the sectoral components due to the use of sector-specific conversion factors for natural gas and coal.

R=Revised. P=Preliminary. (s)=Less than 0.5 trillion Btu.

Notes: Primary consumption includes coal, natural gas, petroleum, nuclear electric power, hydroelectric power, wood, waste, alcohol fuels, geothermal, solar, wind, net imports of coal coke, and net imports of electricity. Total consumption includes primary consumption, electricity retail sales, and electrical system energy losses. Totals may not equal sum of components due to independent rounding.

Sources: Tables 2.1b-2.1f.

¹ Includes supplemental gaseous fuels.

² Geothermal heat pump and direct use energy.

³ Solar thermal direct use and photovoltaic electricity generation. Includes small amounts of commercial sector use.

⁴ Electricity retail sales to ultimate customers reported by electric utilities and other energy service providers.

⁵ Total losses are calculated as the primary energy consumed by the electric power sector minus the energy content of electricity retail sales. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity retail sales.

R=Revised, P=Preliminary, NA=Not available.

Note: Totals may not equal sum of components due to independent rounding.

¹ Includes supplemental gaseous fuels.

² Conventional hydroelectric power.

³ Geothermal heat pump and direct use energy.

⁴ Electricity retail sales to ultimate customers reported by electric utilities and other energy service providers.

⁵ Total losses are calculated as the primary energy consumed by the electric power sector minus the energy content of electricity retail sales. Total losses are allocated to the end-use sectors in proportion to

each sector's share of total electricity retail sales.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than +0.5 trillion Btu and greater than -0.5 trillion Btu.

Notes: The industrial sector includes industrial combined-heat-and-power (CHP) and industrial electricity-only plants. See Appendix G for industrial sector NAICS codes. Totals may not equal sum of components due to independent rounding.

¹ Natural gas consumed in the operation of pipelines (primarily in compressors) and small amounts consumed as vehicle fuel. See Table 6.5.

² Alcohol (ethanol blended into motor gasoline) is included in both "Petroleum" and "Alcohol Fuels," but is counted only once in both total primary consumption and total consumption.

³ Electricity retail sales to ultimate customers reported by electric utilities and other energy service providers.

⁴ Total losses are calculated as the primary energy consumed by the electric power sector minus the

energy content of electricity retail sales. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity retail sales.

⁵ Since 1978, the small amounts of coal consumed for transportation are reported as industrial sector consumption.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.5 trillion Btu.

Note: Totals may not equal sum of components due to independent rounding.

¹ Includes supplemental gaseous fuels.

² Electricity net imports from fossil fuels; may include some nuclear-generated electricity.

³ Pumped storage facility production minus energy used for pumping.

⁴ Through 1988, includes all electricity net imports. Beginning in 1989, includes electricity net imports derived from hydroelectric power only.

⁵ Beginning in 1989, includes electricity imports from Mexico that are derived from geothermal energy.

⁶ Included in "Conventional Hydroelectric Power."

⁷ Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include

consumption at independent power producers.

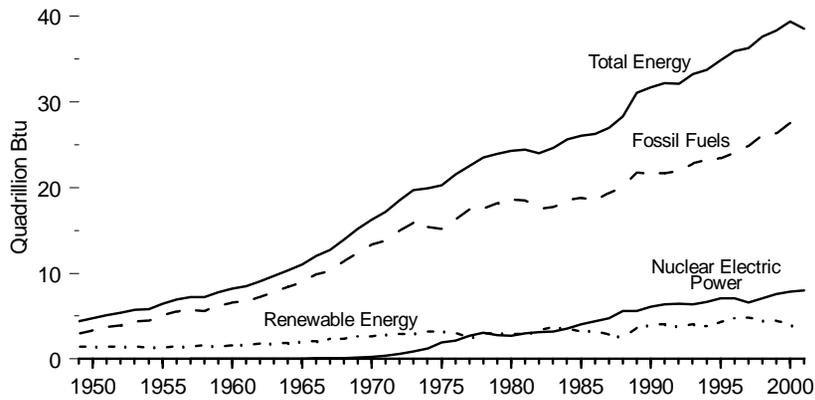

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.5 trillion Btu.

Notes: Data are for fuels consumed to produce electricity and useful thermal output. The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Totals may not equal sum of components due to independent rounding.

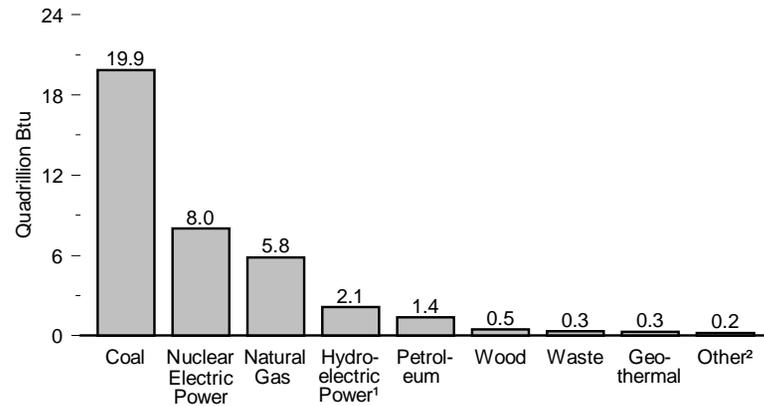

Sources: Tables 5.12d, 6.5, 7.3, 10.2b, A1, and A4-A6.

Figure 2.2 Consumption for Electricity Generation

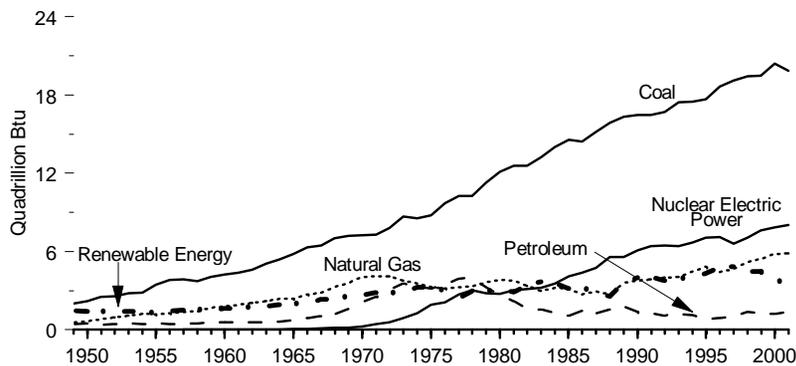

Total and Energy Categories, 1949-2001

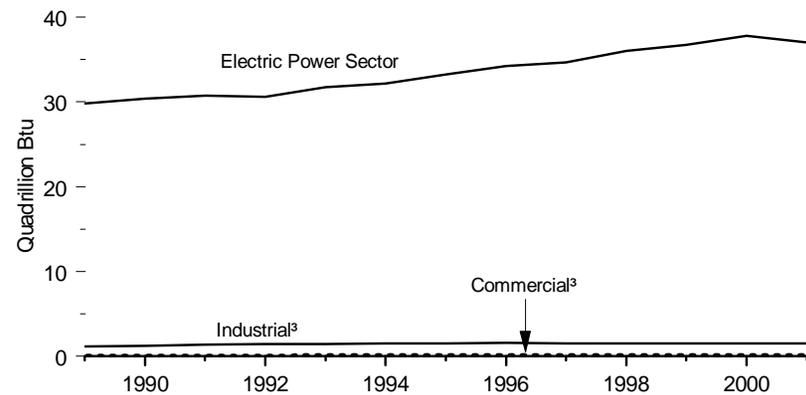

By Major Fuel, 2001

By Major Fuel, 1949-2001

By Sector, 1989-2001

¹ Conventional hydroelectric power and pumped storage.
² Other gases, solar, wind, batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
³ Combined-heat-and-power plants and a small number of electricity-only plants.

Note: Because vertical scales differ, graphs should not be compared.
 Sources: Tables 2.2a, 2.2b, and 2.2c.

Table 2.2a Consumption for Electricity Generation: Total (All Sectors), 1949-2001
(Trillion Btu)

1 Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.
2 Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.
3 Natural gas, including a small amount of supplemental gaseous fuels.
4 Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.
5 Pumped storage facility production minus energy used for pumping.
6 Wood, black liquor, and other wood waste.
7 Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.
8 Solar thermal and photovoltaic energy.
9 Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
10 Included in "Conventional Hydroelectric Power."

11 Hydroelectric data through 1988 are for consumption at electric utilities and industrial plants only; beginning in 1989, data also include consumption at independent power producers and commercial plants. For all other series, data through 1988 are for consumption at electric utilities only; beginning in 1989, data also include consumption at independent power producers, commercial plants, and industrial plants.
R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.5 trillion Btu.
Notes: Data are for fuels consumed to produce electricity; they exclude fuels consumed to produce useful thermal output. Consumption for electricity generation at combined-heat-and-power (CHP) plants is estimated. Totals may not equal sum of components due to independent rounding.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.
² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.
³ Natural gas, including a small amount of supplemental gaseous fuels.
⁴ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.
⁵ Pumped storage facility production minus energy used for pumping.
⁶ Wood, black liquor, and other wood waste.
⁷ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.
⁸ Solar thermal and photovoltaic energy.
⁹ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
¹⁰ Included in "Conventional Hydroelectric Power."

¹¹ Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.
R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.5 trillion Btu.
Notes: Data are for fuels consumed to produce electricity; they exclude fuels consumed to produce useful thermal output. Consumption for electricity generation at combined-heat-and-power (CHP) plants is estimated. The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Totals may not equal sum of components due to independent rounding.
Sources: See sources for Tables 8.2b, 8.2c, 8.3b, 8.3c, and A3-A6.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.

² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.

³ Natural gas, including a small amount of supplemental gaseous fuels.

⁴ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

⁵ Wood, black liquor, and other wood waste.

⁶ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁷ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

⁸ Commercial combined-heat-and-power (CHP) and commercial electricity-only plants. See Appendix G

for commercial sector NAICS codes.

⁹ Industrial combined-heat-and-power (CHP) and industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.

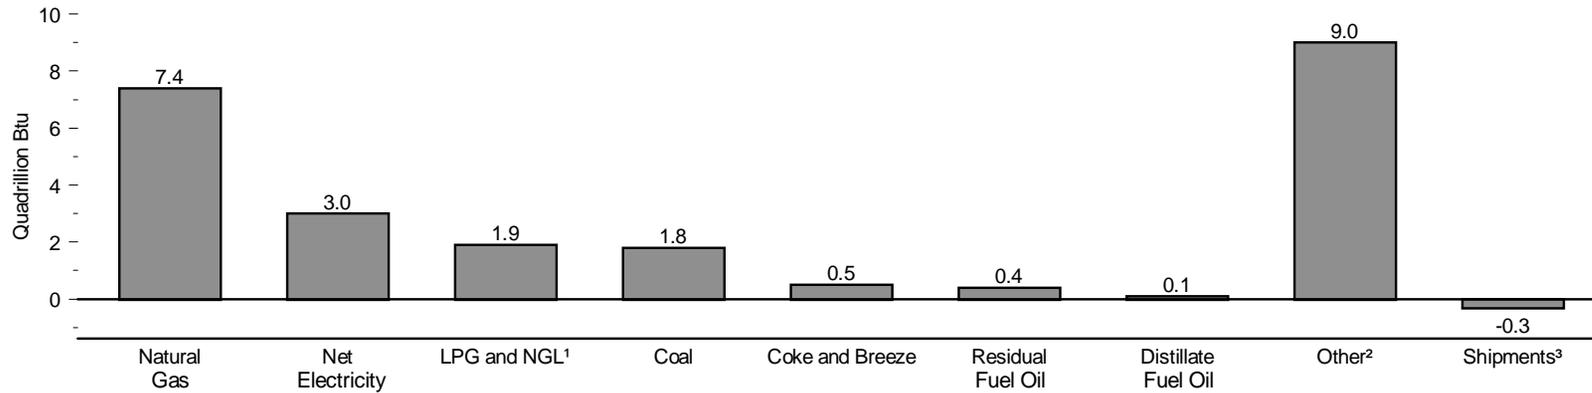

R=Revised. P=Preliminary. E=Estimate. (s)=Less than 0.5 trillion Btu.

Notes: Data are for fuels consumed to produce electricity; they exclude fuels consumed to produce useful thermal output. Consumption for electricity generation at combined-heat-and-power (CHP) plants is estimated. Totals may not equal sum of components due to independent rounding.

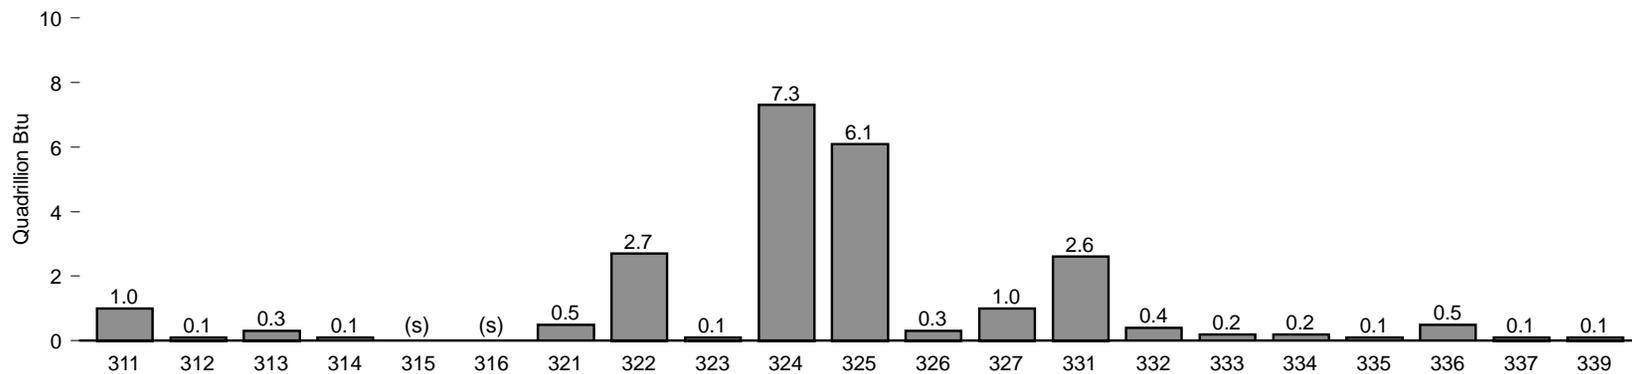

Sources: See sources for Tables 8.2c and 8.3c.

Figure 2.3 Manufacturing Total First Use of Energy for All Purposes, 1998

By Energy Source

By North American Industry Classification System (NAICS) ⁴

¹ Liquefied petroleum gas and natural gas liquids.

² Includes all other types of energy that respondents indicated were consumed.

³ Energy sources produced onsite from the use of other energy sources but sold to another entity.

⁴ See Table 2.3 for Major Group titles of industries that correspond to the 3-digit NAICS codes.

(s) = Less than 0.5 quadrillion Btu.

Source: Table 2.3.

¹ The Standard Industrial Classification (SIC) system has been replaced by the North American Industry Classification System (NAICS).

² Liquefied petroleum gases and natural gas liquids.

³ "Net Electricity" is obtained by summing purchases, transfers in, and generation from noncombustible renewable resources, minus quantities sold and transferred out. It excludes electricity generated from combustible fuels.

⁴ Includes all other types of energy that respondents indicated were consumed.

⁵ Energy sources produced onsite from the use of other energy sources but sold or transferred to another entity.

⁶ The sum of net electricity, residual and distillate fuel oil, natural gas, liquefied petroleum gas, natural gas liquids, coal, coke and breeze, and other, minus shipments of energy sources.

(s)=Less than 0.5 trillion Btu. Q=Data withheld because the relative standard error was greater than 50 percent.

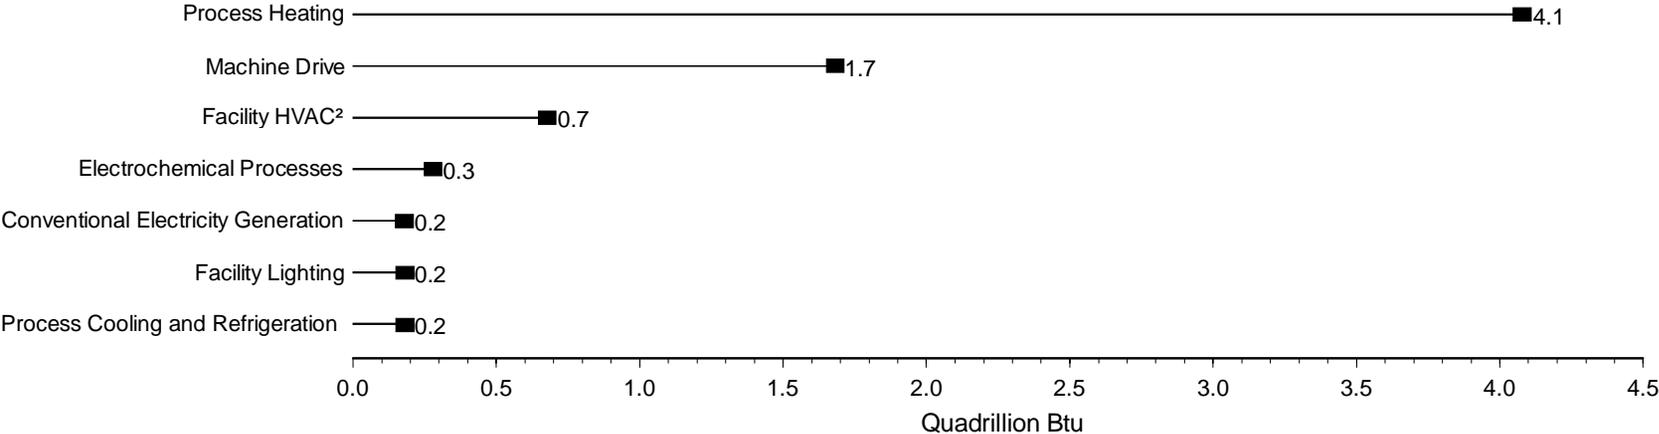

Notes: "First Use" was "Primary Consumption" in previous releases of this table. The estimates are for the first use of energy for heat and power and as feedstocks or raw material inputs. First use is defined as the consumption of the energy that was originally produced offsite or was produced onsite from input materials not classified as energy. Totals may not equal sum of components due to independent rounding.

Figure 2.4 Manufacturing Inputs for Heat, Power, and Electricity Generation, 1998

By Selected End Use¹

By Energy Source

¹ Excludes inputs of unallocated energy sources (6,248 trillion Btu).

² Heating, ventilation, and air conditioning.

³ Excluding coal coke and breeze.

⁴ Liquefied petroleum gases and natural gas liquids.

¹ "Net Electricity" is obtained by summing purchases, transfers in, and generation from noncombustible renewable resources, minus quantities sold and transferred out.

² Total of listed energy sources. Excludes inputs of unallocated energy sources (6,248 trillion Btu). The top half of the "Total" column is blank because different physical units cannot be added.

³ Excludes steam and hot water.

— = Not applicable. (s)=Estimate less than 0.5. Q=Withheld because relative standard error is greater than 50 percent.

Notes: Totals may not equal sum of components due to independent rounding. The estimates presented in this table are for the total consumption of energy for the production of heat, power, and

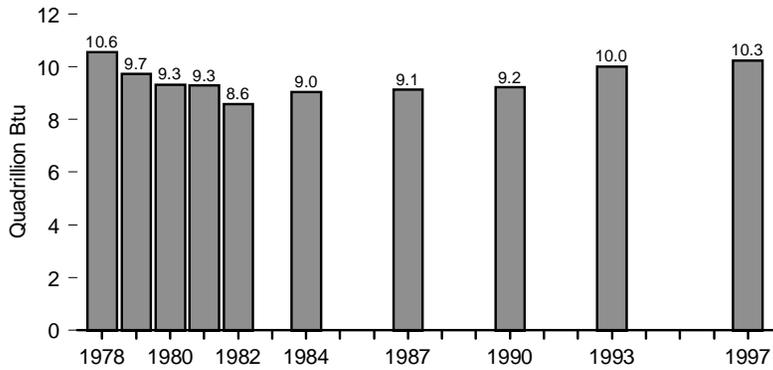

electricity generation, regardless of where the energy was produced. Specifically, the estimates include the quantities of energy that were originally produced offsite and purchased by or transferred to the establishment, plus those that were produced onsite from other energy or input materials not classified as energy, or were extracted from captive (onsite) mines or wells. Allocations to end uses are made on the basis of reasonable approximations by respondents.

¹ All reported swimming pools were assumed to have an electric pump for filtering and circulating the water, except for 1993 and 1997, when a filtering system was made explicit.

² Includes natural gas or liquefied petroleum gases.

³ In 1984 and 1987, also includes heaters for jacuzzis and hot tubs.

⁴ Fewer than 0.5 percent of the households do not have a refrigerator.

⁵ Households with both central and individual room units are counted only under "Central."

P=Preliminary. NA=Not available. (s)=Less than 0.5 percent.

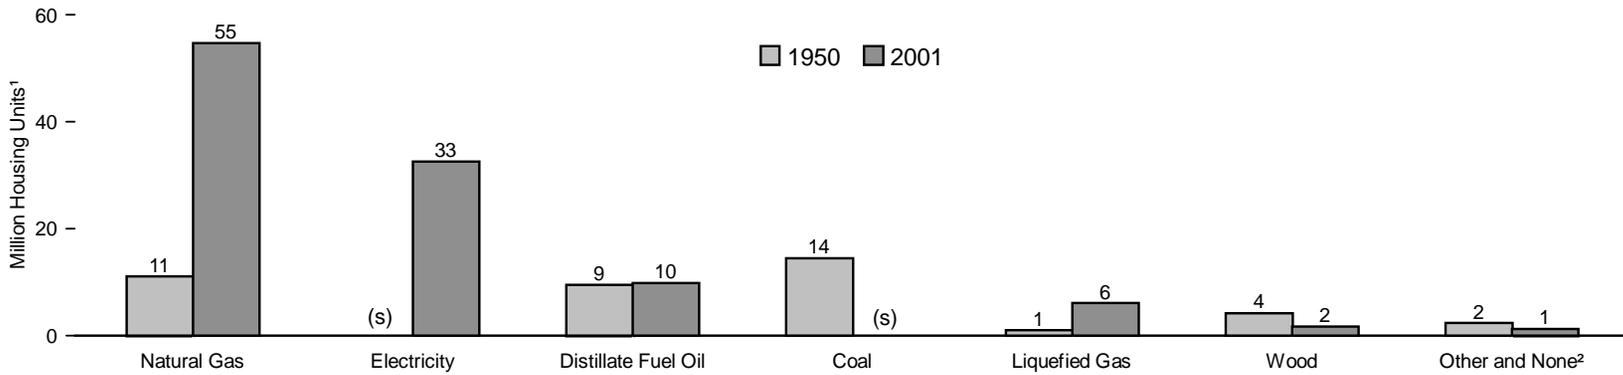

Note: No data are available for years not shown.

¹ Includes coal coke.

² Includes nonreporting units in 1950 and 1960, which totaled 997 and 2,000 units, respectively.

³ Included in distillate fuel oil.

⁴ Since 1983, the *American Housing Survey for the United States* has been a biennial survey.

NA=Not available. (s)=Less than 0.05 percent.

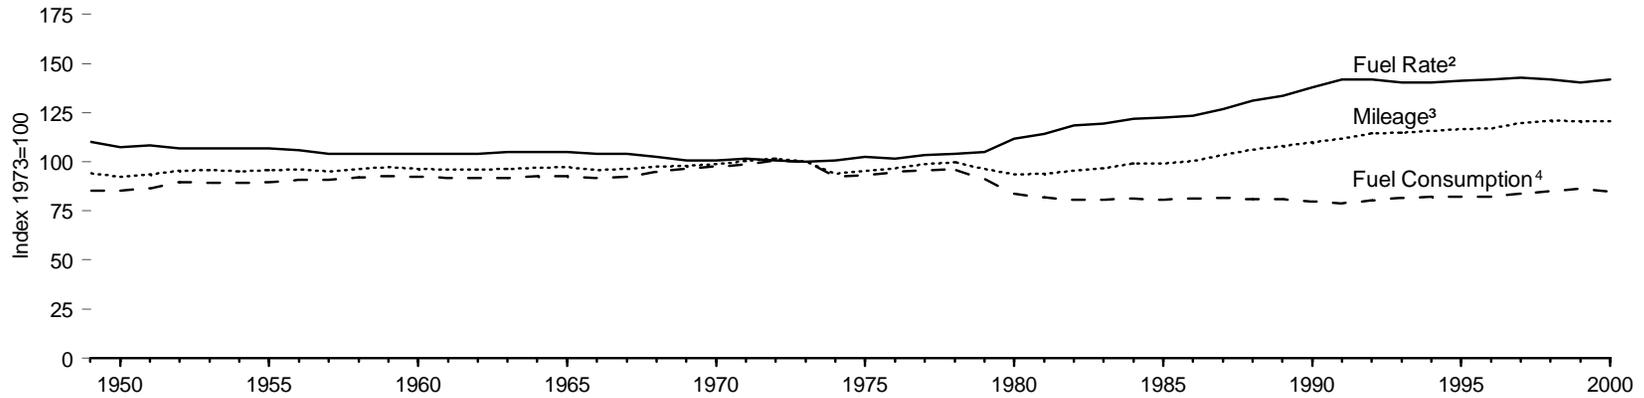

Notes: Includes mobile homes and individual housing units in apartment buildings. Housing units with

more than one type of heating system are classified according to the principal type of heating system. Totals may not equal sum of components due to independent rounding.

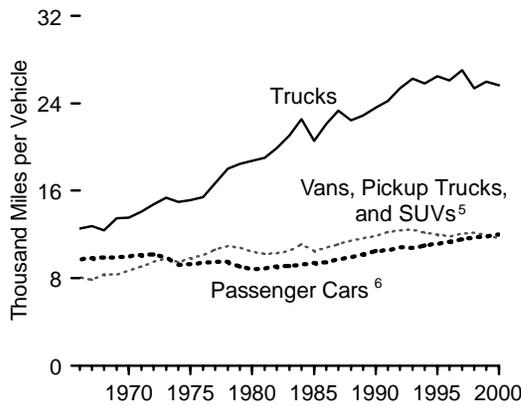

Sources: 1950, 1960, and 1970—Bureau of the Census, *Census of Population and Housing*. 1973 forward—Bureau of the Census, *American Housing Survey for the United States*, biennial surveys, Table 2-5.

¹ See Appendix D for Census regions.

² Includes electricity, natural gas, fuel oil, and district heat. Propane consumption statistics were collected in 1979, 1983, and 1986 but are not included in the Major Sources.

³ Included in Food Service.

⁴ Beginning with the 1995 survey, commercial buildings on multibuilding manufacturing facilities, and parking garages were excluded.

⁵ Distillate fuel oil, residual fuel oil, and kerosene.

⁶ For 1979 and 1983, includes only purchased steam. Beginning with the 1986 survey, includes purchased and nonpurchased steam and purchased and nonpurchased hot water.

Q=Data withheld because either the relative standard error was greater than 50 percent or fewer than 20 buildings were sampled. NC=No cases in the sample.

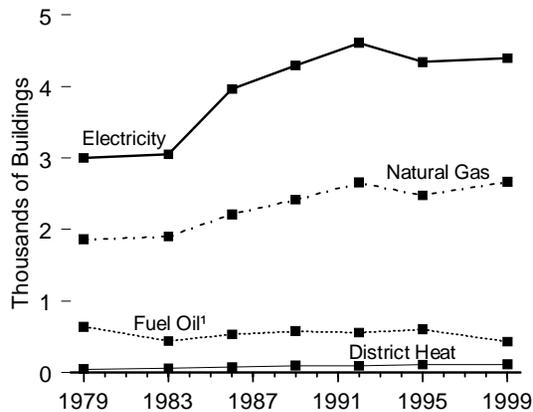

Note: Statistics for individual fuels are for all buildings using each fuel. Statistics for major sources are for the sum of electricity, natural gas, fuel oil, and district heat, across all buildings using any of those fuels.

¹ Bituminous coal, subbituminous coal, and lignite prices are based on the value of coal produced at free-on-board (f.o.b.) mines; anthracite prices through 1978 are f.o.b. preparation plants and for 1979 forward are f.o.b. mines.

² Wellhead prices.

³ Domestic first purchase prices.

⁴ Derived by multiplying the price per Btu of each fossil fuel by the total Btu content of the production of each fossil fuel and dividing this accumulated value of total fossil fuel production by the accumulated Btu

content of total fossil fuel production.

⁵ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

⁶ Based on real values.

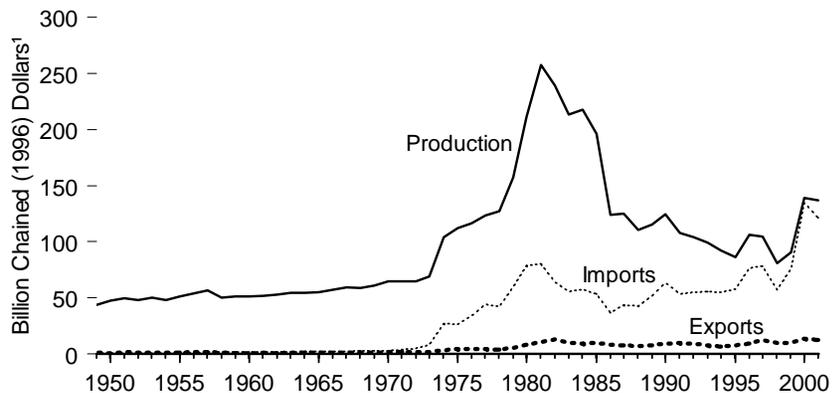

⁷ Calculated using the 2000 coal price for the 2001 value.

R=Revised. P=Preliminary. — = Not applicable.

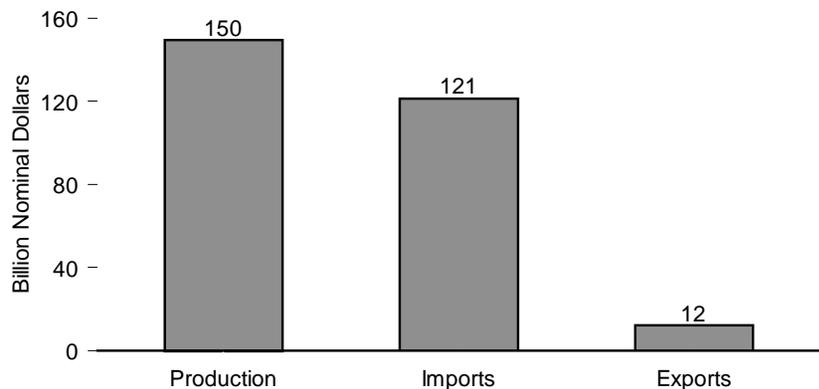

Sources: Tables 5.16, 6.7, 7.8, A2, A4, and A5.

Figure 3.2 Value of Fossil Fuel Production

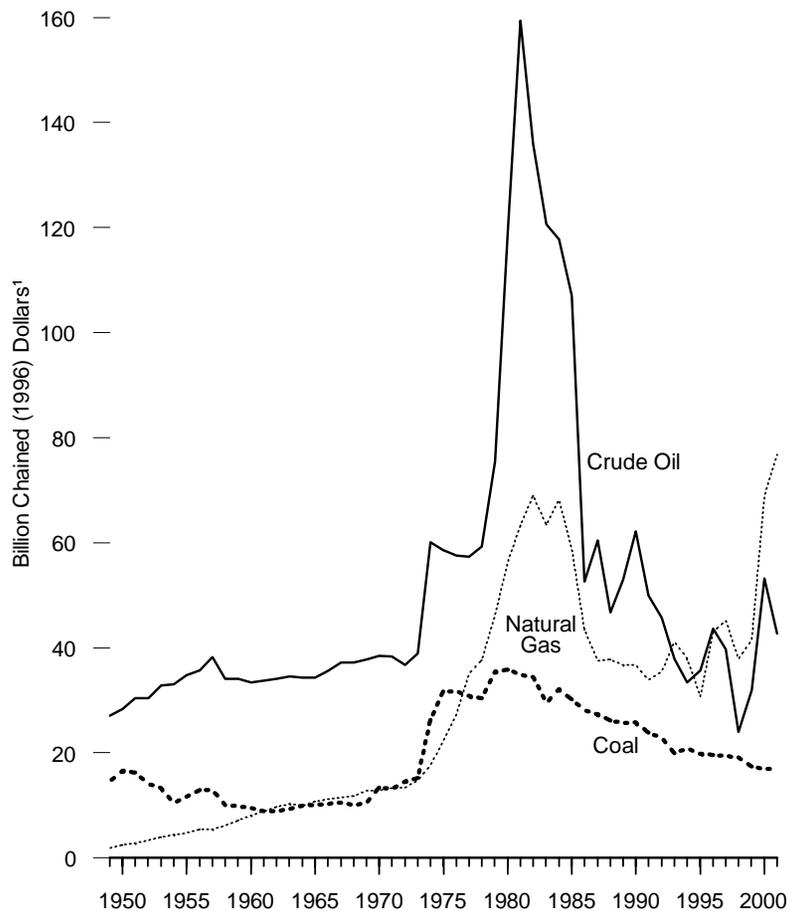

Overview, 1949-2001

Overview, 2001

Production by Fuel, 1949-2001

¹ Prices are in chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

Note: Because vertical scales differ, graphs should not be compared.

Sources: Tables 3.2, 3.5, and 3.6.

¹ Marketed production.

² Includes lease condensate.

³ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

⁴ Calculated using the 2000 coal price for the 2001 value.

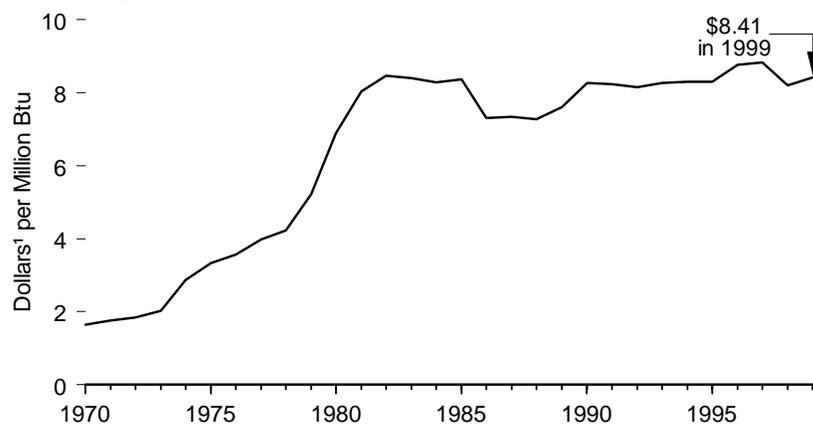

R=Revised. P=Preliminary.

Note: Value is based on fuel prices taken as closely as possible to the point of production.

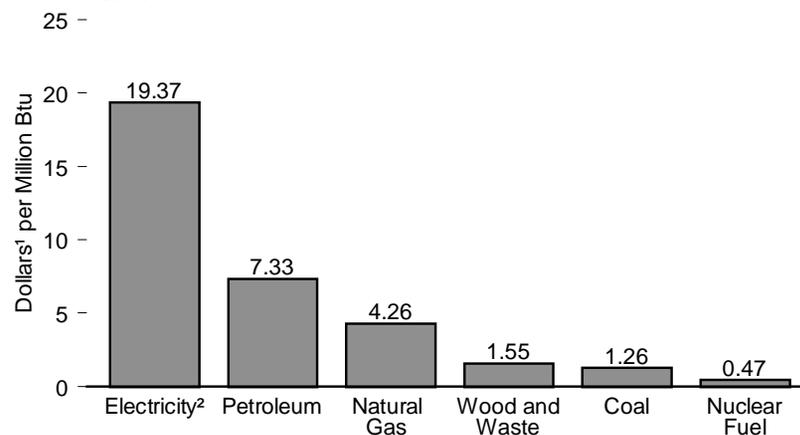

Sources: Tables 5.1, 5.16, 6.2, 6.7, 7.2, and 7.8.

Figure 3.3 Consumer Price Estimates for Energy

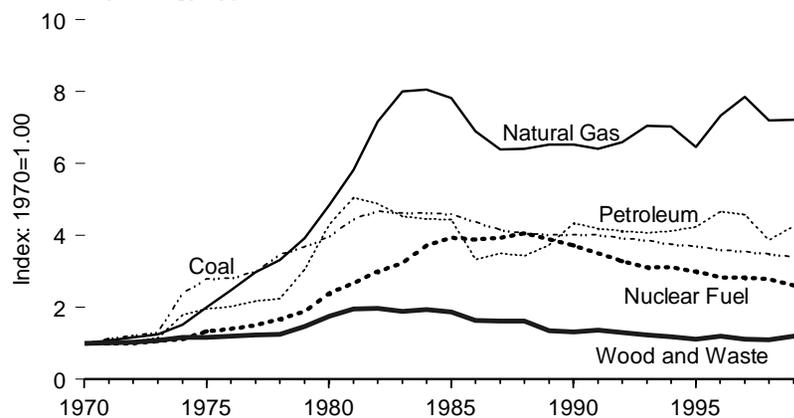

Total Energy, 1970-1999

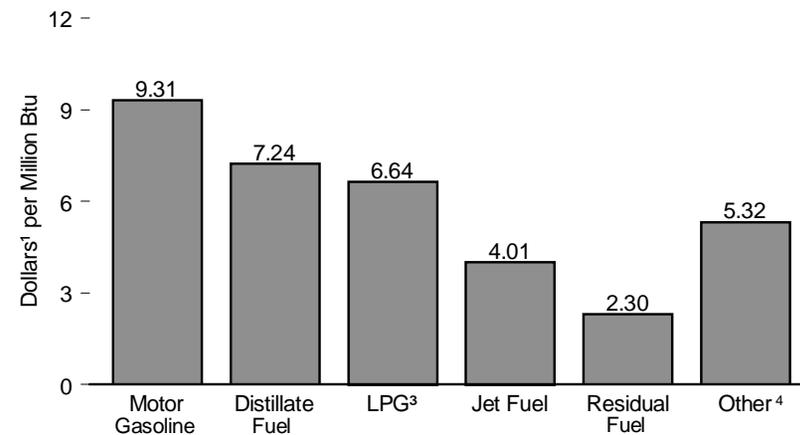

By Energy Type, 1999

Prices¹ by Energy Type, Indexed, 1970-1999

By Petroleum Product, 1999

¹ Nominal dollars.

² Electricity purchased by end users.

³ Liquefied petroleum gases.

⁴ Consumption-weighted average price for asphalt and road oil, aviation gasoline, kerosene, lubricants, petrochemical feedstocks, petroleum coke, special naphthas, waxes, and miscellaneous petroleum products.

Note: Because vertical scales differ, graphs should not be compared.

¹ Primary energy is all energy, including that consumed to produce electricity but excluding the electricity produced.

² Liquefied petroleum gases.

³ Consumption-weighted average price for asphalt and road oil, aviation gasoline, kerosene, lubricants, petrochemical feedstocks, petroleum coke, special naphthas, waxes, and miscellaneous petroleum products.

⁴ The "Primary Energy Total" and "Total Energy" prices include consumption-weighted average prices

for coal coke imports and coal coke exports that are not shown in the other columns. In 1999, coal coke imports averaged 2.83 dollars per million Btu and coal coke exports averaged 3.88 dollars per million Btu.

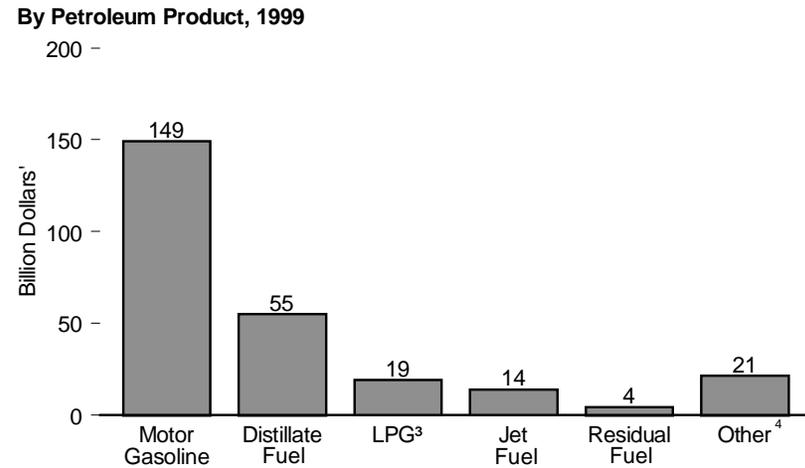

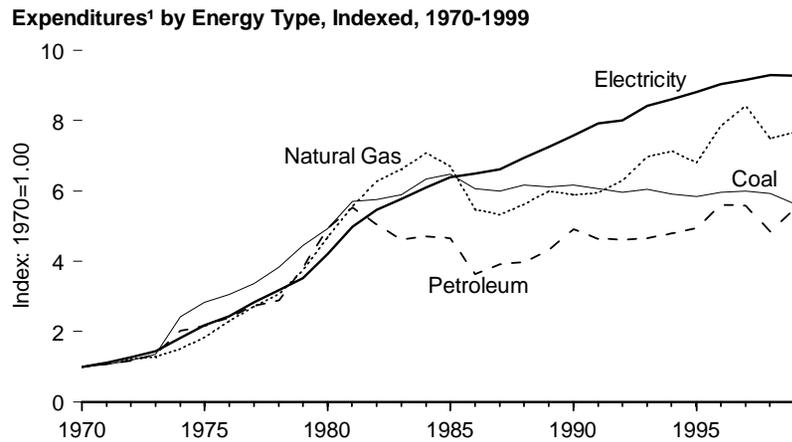

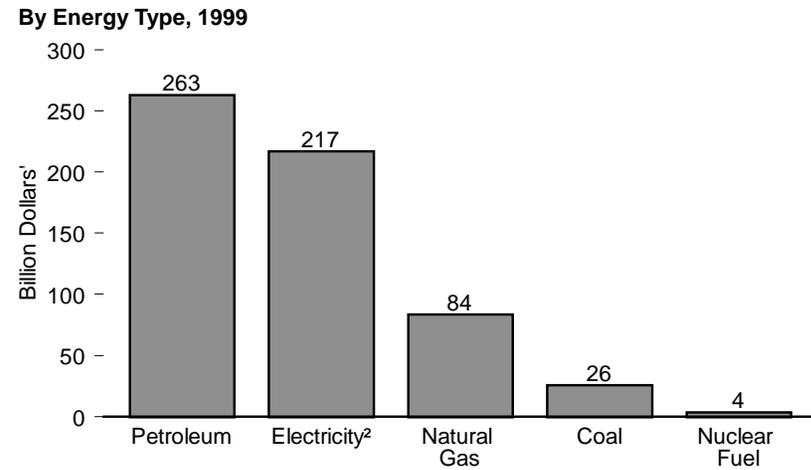

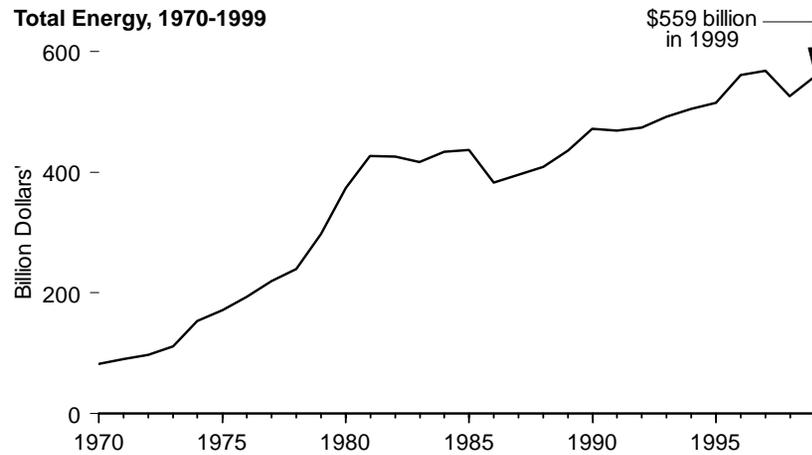

R=Revised.

Note: There are no direct fuel costs for hydroelectric, geothermal, wind, or solar energy.

¹ Primary energy is all energy, including that consumed to produce electricity but excluding the electricity produced.

² Values derive from U.S. Department of Commerce, Bureau of the Census, "Monthly Report IM-145" and "Monthly Report IM-545," and may differ slightly from those shown on Table 3.7, which derive from Bureau of the Census, *U.S. International Trade in Goods and Services*. FT600 series.

³ Liquefied petroleum gases.

⁴ Asphalt and road oil, aviation gasoline, kerosene, lubricants, petrochemical feedstocks, petroleum

coke, special naphthas, waxes, and miscellaneous petroleum products.

R=Revised.

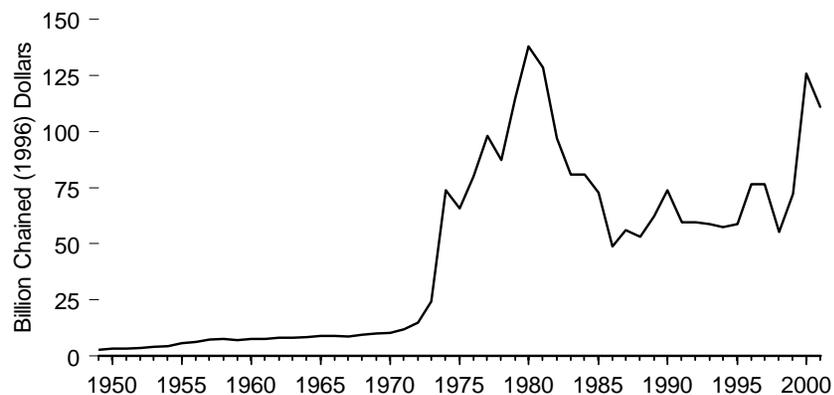

Notes: There are no direct fuel costs for hydroelectric, geothermal, wind, or solar energy. Totals may not equal the sum of components due to independent rounding.

¹ Includes imports into the Strategic Petroleum Reserve, which began in 1977.

² Includes petroleum preparations; liquefied propane; and butane; and since 1997 other mineral fuels.

³ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

⁴ There is a discontinuity in this time series between 1996 and 1997 due to the addition of the commodity category "other mineral fuels."

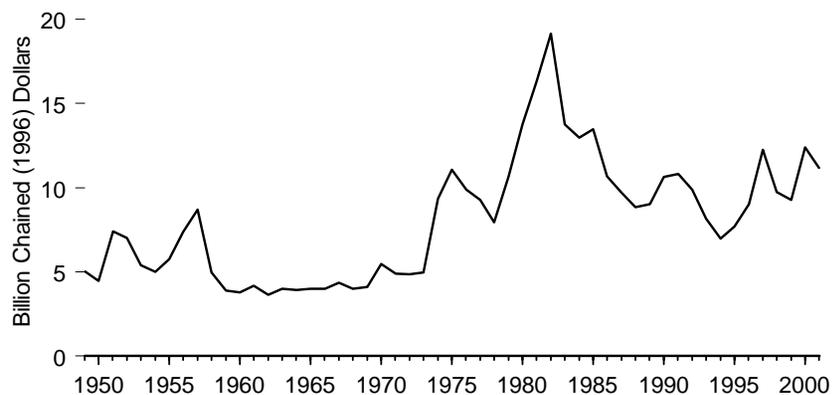

R=Revised. P=Preliminary. (s)=Less than 0.005 billion.

Notes: Includes value of imports into Puerto Rico from foreign countries; excludes receipts into the 50 States and the District of Columbia from the Virgin Islands and Puerto Rico. Totals may not equal sum of components due to independent rounding.

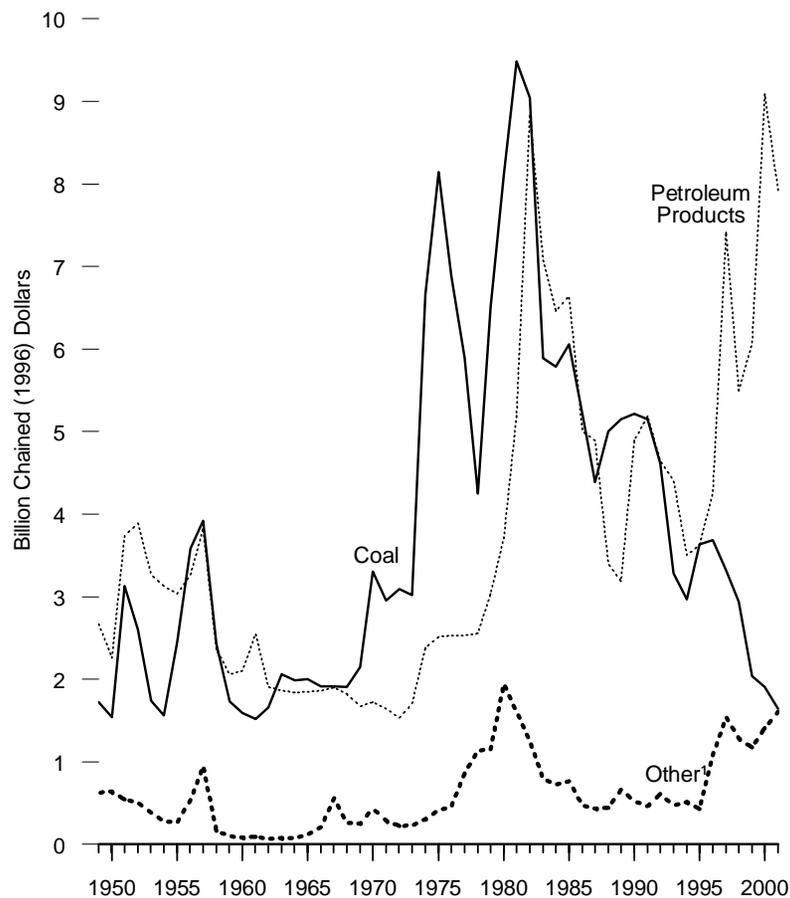

Sources: See end of section.

Figure 3.6 Value of Fossil Fuel Exports

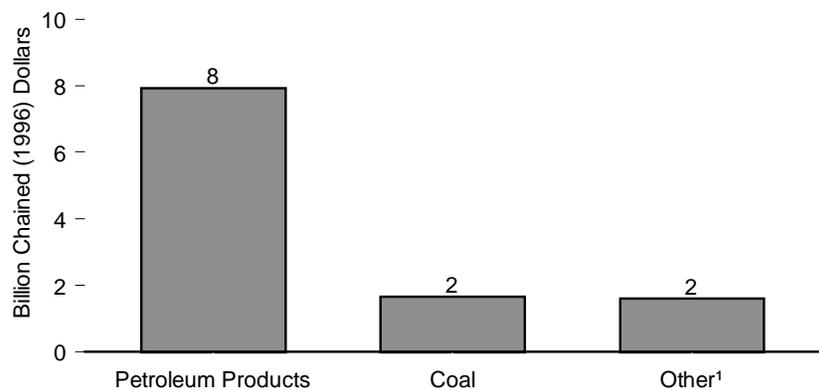

Total, 1949-2001

By Fuel, 1949-2001

By Fuel, 2001

¹ Natural gas, crude oil, and coal coke.

Notes: Prices are in chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1. Because vertical scales differ, graphs should not be compared.

Source: Table 3.6.

¹ Includes petroleum preparations, liquefied propane and butane and since 1997 other mineral fuels.

² In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

³ There is a discontinuity in this time series between 1996 and 1997 due to the addition of the commodity category "other mineral fuels."

R=Revised. P=Preliminary. (s)=Less than 0.005 billion.

Notes: Net imports = imports minus exports. Totals may not equal sum of components due to independent rounding. Data on this table may not equal data on Table 3.5 minus data on Table 3.6 due to independent rounding.

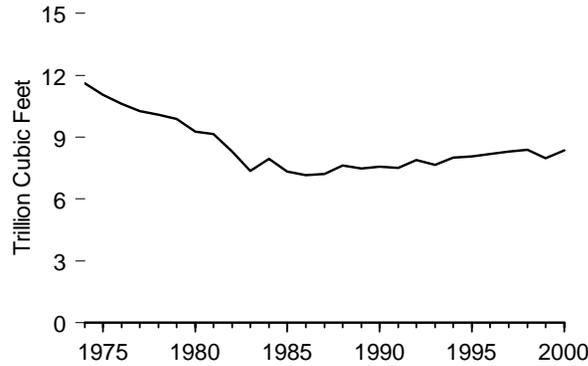

Sources: Tables 3.5 and 3.6.

Footnotes for Table 3.12

¹American Petrofina, Inc. changed its name to Fina, Inc., effective April 17, 1991.

²Ashland was dropped from the Financial Reporting System (FRS) for 1998 after spinning off downstream and coal operations and disposing of upstream operations.

³Amoco merged with British Petroleum plc and became BP Amoco plc on December 31, 1998. BP America was renamed BP Amoco, Inc. The companies reported separately for 1998.

⁴In 1987, British Petroleum acquired all shares in Standard Oil Company (Ohio) that it did not already control and renamed its U.S. affiliate, BP America, Inc.

⁵Formerly Standard Oil Company (Indiana).

⁶Burlington Resources was added to the FRS and Burlington Northern was dropped for 1988. Data for Burlington Resources covers the full year 1988 even though that company was not created until May of that year.

⁷Formerly Standard Oil Company of California.

⁸Chevron acquired Gulf Oil in 1984, but separate data for Gulf continued to be available for the full 1984 year.

⁹Occidental acquired Cities Service in 1982. Separate financial reports were available for 1982, so each company continued to be treated separately until 1983.

¹⁰DuPont acquired Conoco in 1981. Separate data for Conoco were available for 1981; DuPont was included in the FRS in 1982.

¹¹Dupont was dropped from the FRS when Conoco was spun-off in 1998. Conoco began reporting separately again in 1998.

¹²Equilon is a joint venture combining Shell's and Texaco's western and midwestern U.S. refining and marketing businesses and nationwide trading transportation and lubricants businesses. Net income is duplicated in the FRS system since Shell and Texaco account for this investment using the equity method.

¹³In December 1998, Exxon and Mobil agreed to merge. Both companies reported separately for 1998.

¹⁴Texaco acquired Getty in 1984; however, Getty was treated as a separate FRS company for that year.

¹⁵In 1998, Kerr-McGee and Oryx merged. The financial reporting for both was consolidated under Kerr-McGee for 1998.

¹⁶LYONDELL-CITGO is a limited partnership owned by Lyondell Chemical Company and Citgo. There will be some duplication of net income since Citgo accounts for its investment using the equity method.

¹⁷U.S. Steel (now USX) acquired Marathon in 1982.

¹⁸Mobil acquired Superior in 1984, but both companies were treated separately for that year.

¹⁹Motiva is a joint venture approximately equally owned by Shell, Texaco and Saudi Refining, Inc. The joint venture combines the company's Gulf and east coast refining and marketing businesses. Duplication exists for the net income related to Shell's and Texaco's interests, which are accounted for under the equity method.

²⁰RTZ America acquired the common stock of Nerco, Inc., on Feb. 17, 1994. In Sept. 1993, Nerco, Inc. sold Nerco Oil & Gas, Inc., its subsidiary. Nerco's 1993 submission includes operations of Nerco Oil & Gas, Inc., through Sept. 28, 1993.

²¹Sun Company spun off Sun Exploration and Development Company (later renamed Oryx Energy Company) during 1988. Both companies were included in the FRS for 1988; therefore, some degree of duplication exists for that year.

²²In May 2000 Clark Refining and Marketing, Inc. changed its name to Premcor Refining Group.

²³Sun company withdrew from oil and gas exploration and production in 1996. Sun's 1996 submission includes oil and gas exploration and production activities through September 30, 1996. Refining/marketing activities are included for the entire 1996 calendar year.

²⁴Tenneco sold its worldwide oil and gas assets and its refining and marketing assets in 1988. Other FRS companies purchased approximately 70 percent of Tenneco's assets.

²⁵Effective June 1, 1991, Total's exploration, production, and marketing operations in Canada were spun off to Total Oil & Gas, a new public entity.

²⁶Effective October 15, 1996, Union Pacific Corporation distributed its ownership in the Union Pacific Resources Group, Inc. to its shareholders. Prior to 1996, the FRS included Union Pacific Corporation. The FRS includes only Union Pacific Resources Group, Inc. for 1996.

¹ Lands owned or under the jurisdiction of the Federal government.

² Proved Reserves are excluded from these estimates.

— = Not applicable.

Notes: See Note 1 at end of section. Resource estimates are as of the latest estimates generated by the U.S. Department of the Interior, U.S. Geological Survey (USGS) and the Minerals Management Service (MMS). They were not necessarily generated in the current year. Onshore indicates estimates for all Onshore plus State Offshore waters (near-shore, shallow-water areas under State jurisdiction).

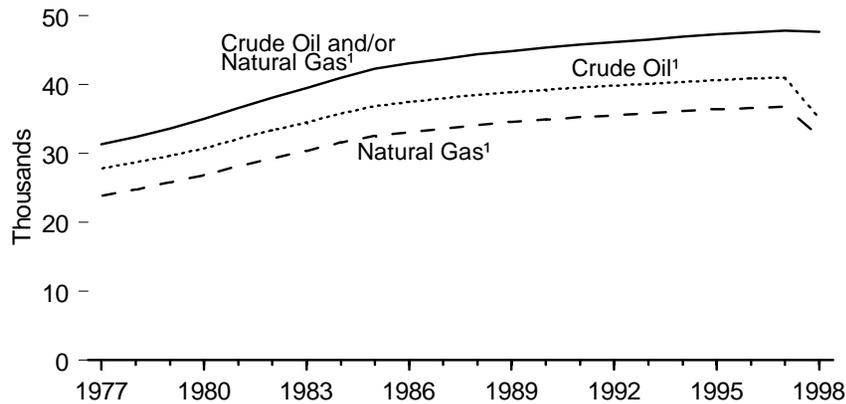

Federal Onshore excludes Indian and Native lands even when Federally managed in trust. The estimates of ultimate recovery appreciation for Onshore and State Offshore lands were imputed by

assuming that the total estimates reported by the USGS could be apportioned according to the ratio of 1996 production from onshore Federal lands to total U.S. production. Federal Offshore indicates MMS estimates for Federal Offshore jurisdictions (Outer Continental Shelf and deeper water areas seaward of State Offshore). A value of zero indicates either that none exists in this area or that no estimate of this resource has been made for this area.

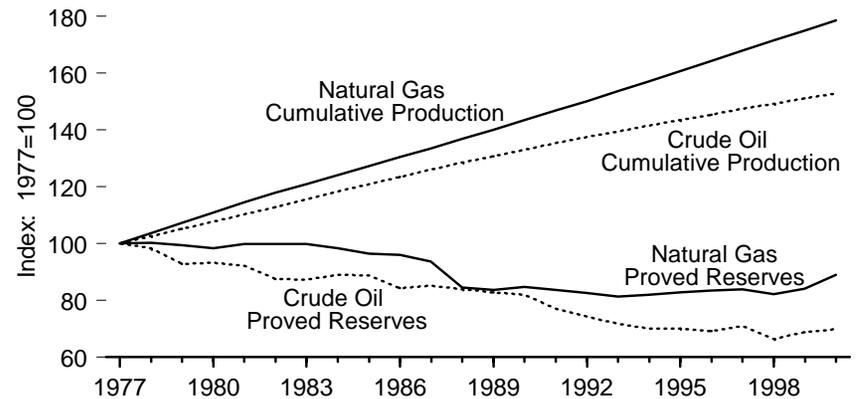

Source: Energy Information Administration, *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves 2000 Annual Report* (December 2001), Table G1, which in turn is based on the latest resource estimates generated by the U.S. Department of the Interior, U.S. Geological Survey and the Minerals Management Service.

Figure 4.2 Crude Oil and Natural Gas Field Counts, Cumulative Production, Proved Reserves, and Ultimate Recovery

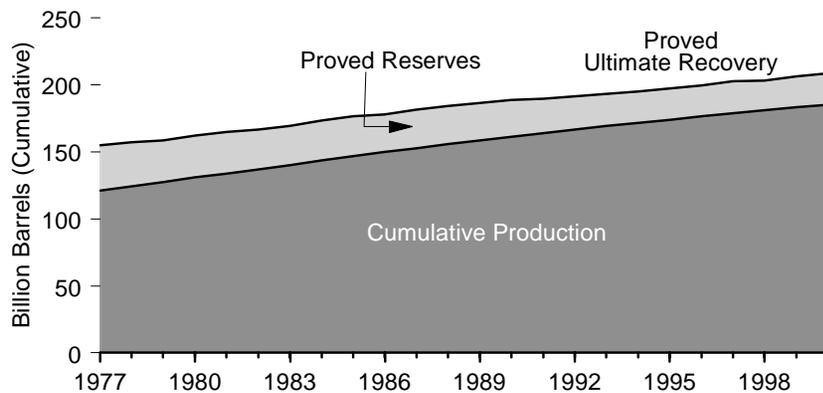

Cumulative Number of Fields, 1977-1998

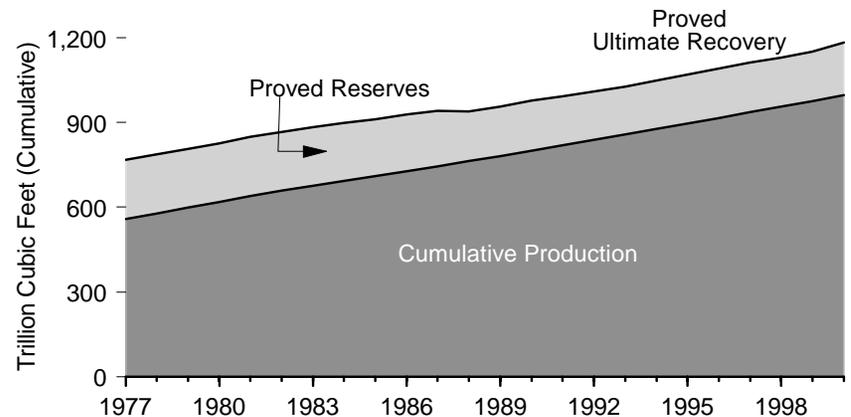

Cumulative Production and Proved Reserves, Indexed, 1977-2000

Crude Oil, 1977-2000

Natural Gas, 1977-2000

¹ There is a discontinuity in this time series between 1997 and 1998 due to the absence of updates for a subset of the data used in the past.

Notes: Data are at end of year. Crude oil includes lease condensate. Natural gas is wet, after lease separation.

¹ Wet, after lease separation.

² There is a discontinuity in this time series between 1997 and 1998 due to the absence of updates for a subset of the data used in the past.

NA=Not available.

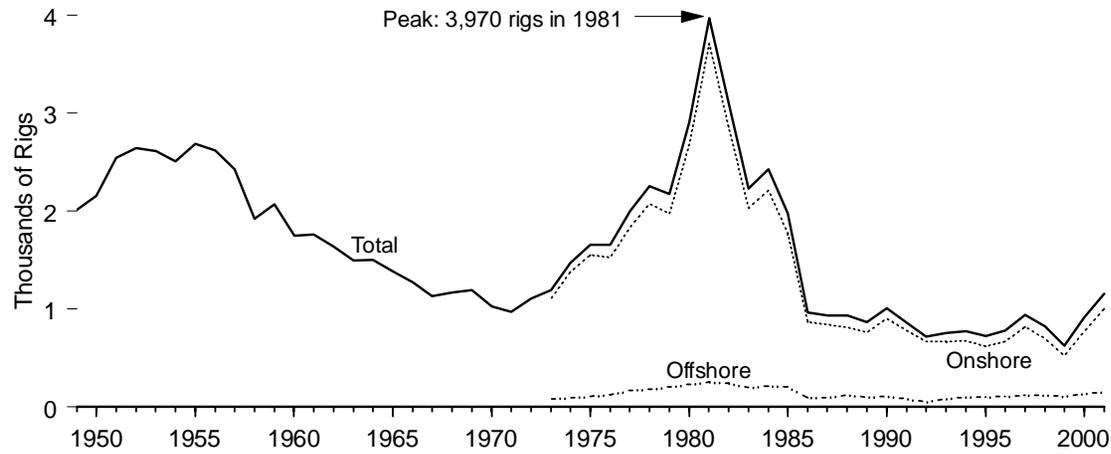

Note: Data are at end of year.

¹ Sum of rigs drilling for crude oil, rigs drilling for natural gas, and other rigs (not shown) drilling for miscellaneous purposes such as service wells, injection wells, and stratigraphic tests.

NA=Not available.

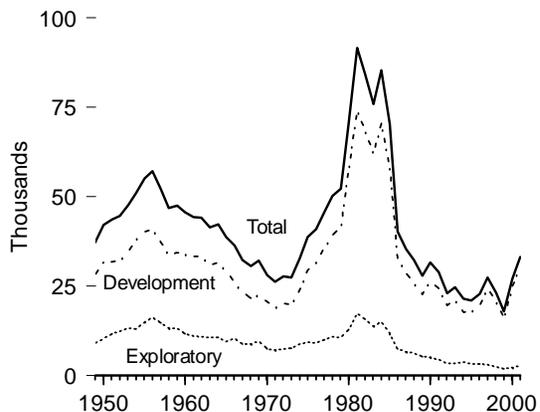

Notes: Data are not for the exact calendar year but are an average for the 52 or 53 consecutive whole

weeks that most nearly coincide with the calendar year. Geographic coverage is the 50 States and the District of Columbia. Totals may not equal sum of components due to independent rounding.

R=Revised, E=Estimate.

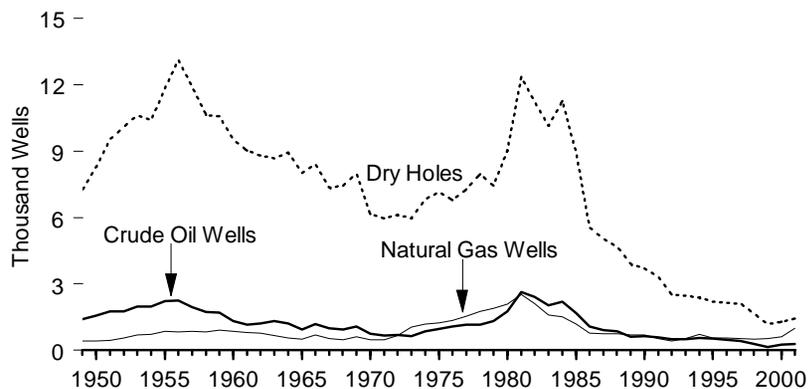

Notes: This table depicts all wells; see Table 4.5 for exploratory wells and Table 4.6 for development wells. Service wells, stratigraphic tests, and core tests are excluded. For 1949-1959, data represent wells completed in a given year. For 1960-1969, data are for well completion reports received by the American Petroleum Institute during the reporting year. For 1970 forward, the data represent wells completed in a given year. See Note 2 at end of section. Totals may not equal sum of components due to independent rounding. Average depth may not equal average of components due to independent rounding.

rounding.

R=Revised. E=Estimate.

Notes: This table depicts development wells only; see Table 4.4 for all wells and Table 4.5 for exploratory wells only. Service wells, stratigraphic tests, and core tests are excluded. For 1949-1959, data represent wells completed in a given year. For 1960-1969, data are for well completion reports received by the American Petroleum Institute during the reporting year. For 1970 forward, the data represent wells completed in a given year. See Note 2 at end of section. Totals may not equal sum of components due to independent rounding. Average depth may not equal average of components due to

independent rounding.

¹ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

R=Revised.

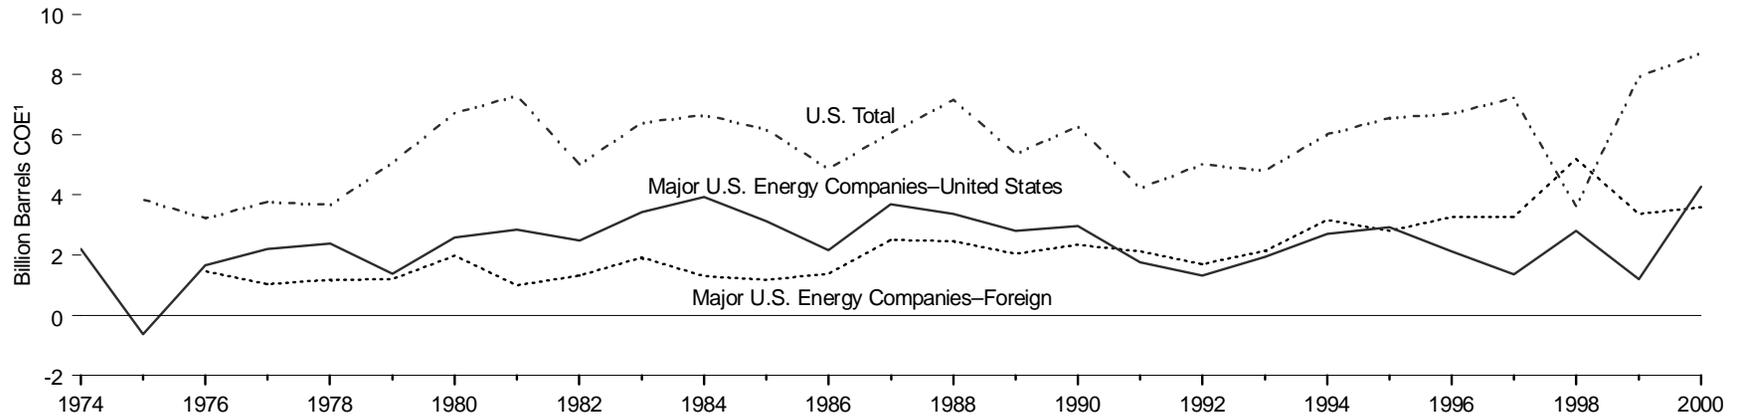

Notes: The information reported for 1965 and prior years is not strictly comparable to that in the more recent surveys. Average cost is the arithmetic mean and includes all costs for drilling and equipping

wells and for surface-producing facilities. Wells drilled include exploratory and development wells; excludes service wells, stratigraphic tests, and core tests.

¹ Gross additions to proved reserves equal annual change in proved reserves plus annual production.

² Liquid and gaseous hydrocarbons include crude oil, natural gas liquids, and natural gas.

³ Crude oil equivalent: converted to Btu on the basis of annual average conversion factors. See Appendix A.

⁴ Nominal dollars.

⁵ Major U.S. Energy Companies are the top publicly-owned, U.S.-based crude oil and natural gas producers and petroleum refiners that form the Financial Reporting System (FRS) (see Table 3.12).

⁶ Data for 1979 exclude downward revisions of 1,225 million barrels COE due to Iranian policies. Data for 1986 exclude downward revisions due to Libyan sanctions.

⁷ Data for 1982 and 1984 are adjusted to exclude purchases of proved reserves associated with mergers among the Financial Reporting System companies.

⁸ Data for 1985 and 1987 exclude downward revisions of 1,477 million barrels COE and 2,396 million

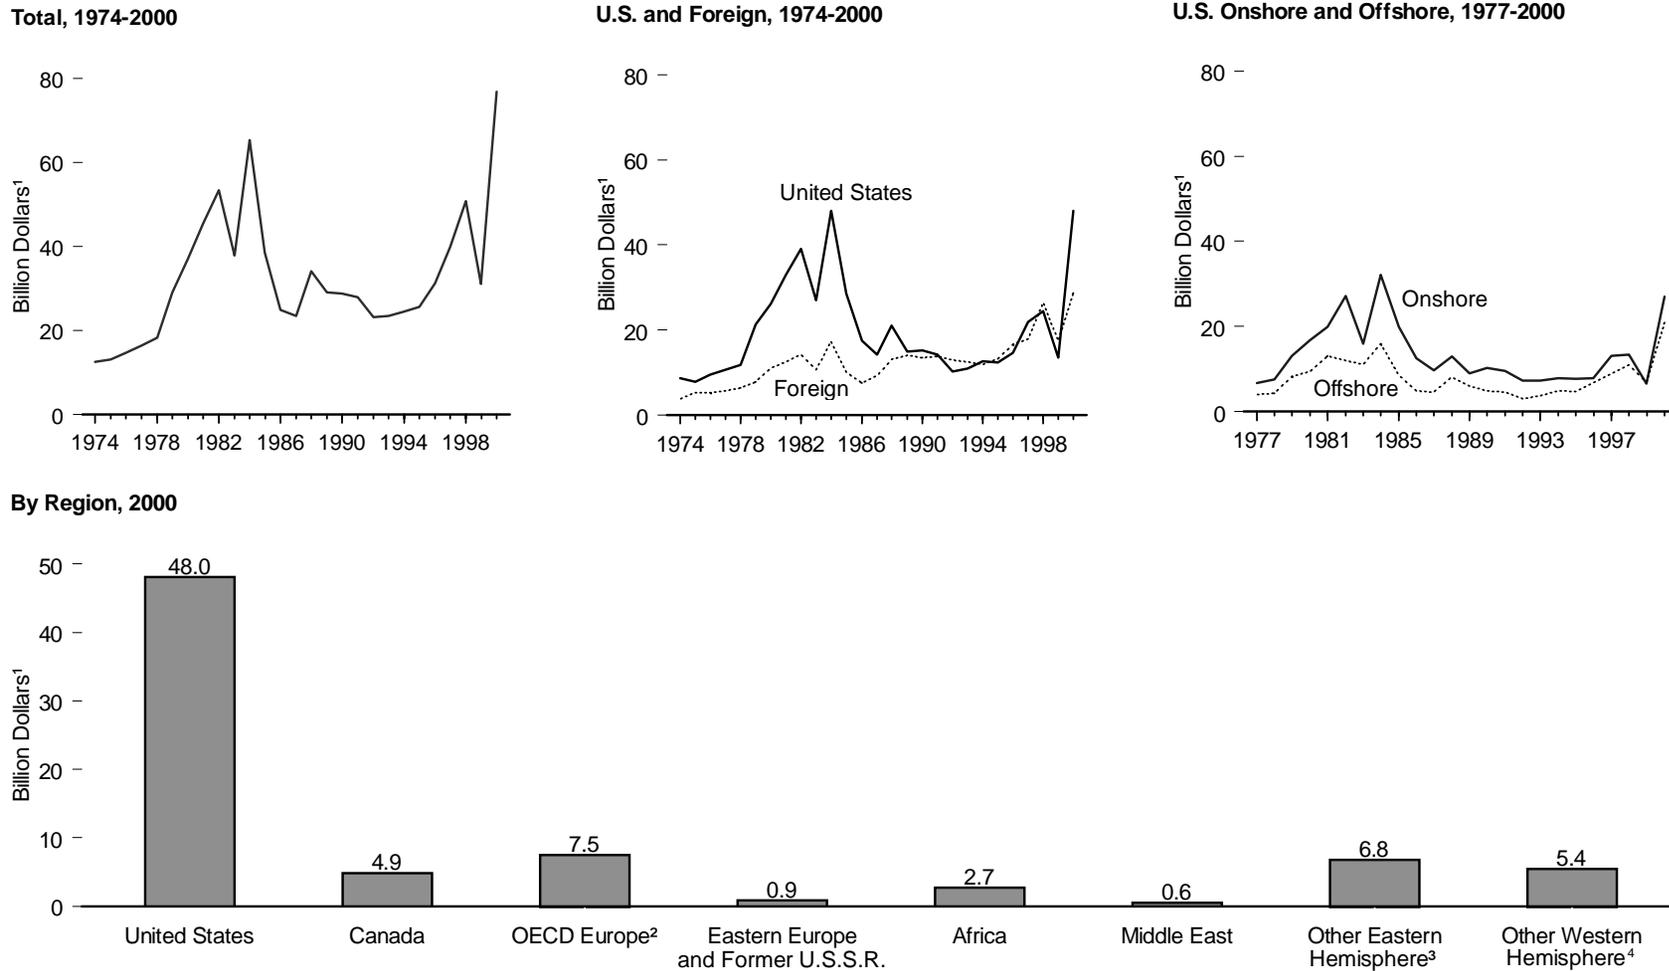

barrels COE, respectively, of Alaska North Slope natural gas reserves.

¹ Lignite resources are not mined underground in the United States.

² Georgia, Maryland, North Carolina, and Tennessee.

³ Arkansas, Kansas, Louisiana, and Michigan.

⁴ Arizona, Idaho, Oregon, and South Dakota.

(s)=Less than 0.05 billion short tons.

Notes: See *U.S. Coal Reserves: 1997 Update* on the Web Page for a description of the methodology used to produce these data. Data represent known measured and indicated coal resources meeting

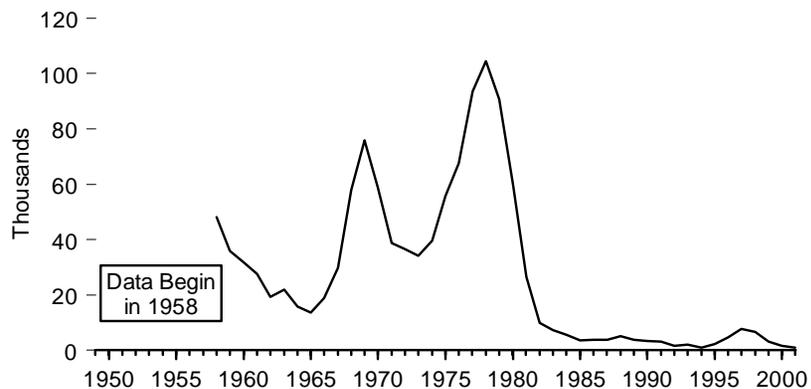

minimum seam and depth criteria, in the ground as of January 1, 2001. These coal resources are not totally recoverable. Net recoverability ranges from 0 percent to more than 90 percent. Fifty-four percent of the demonstrated reserve base of coal in the United States is estimated to be recoverable. Totals may not equal sum of components due to independent rounding.

¹ Includes surface drilling in search of new ore deposits or extensions of known deposits and drilling at the location of a discovery up to the time the company decides sufficient ore reserves are present to justify commercial exploitation.

² Includes all surface drilling on an ore deposit to determine more precisely size, grade, and configuration subsequent to the time that commercial exploitation is deemed feasible.

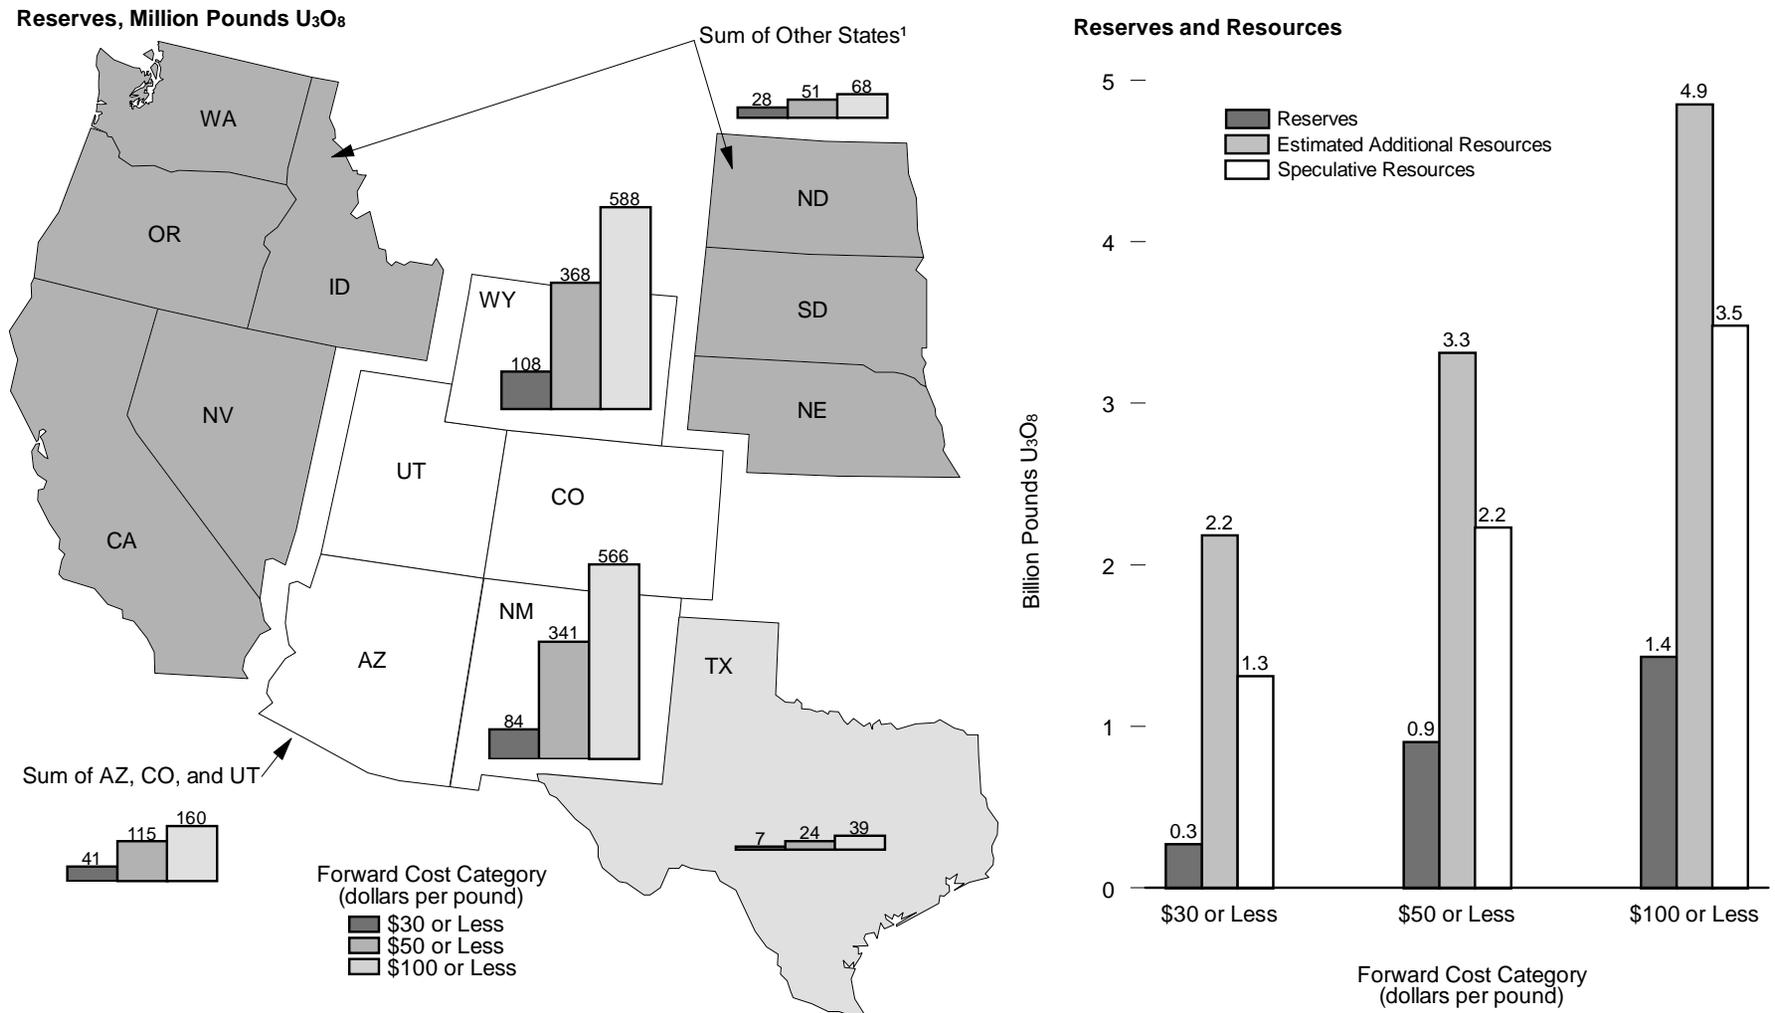

NA=Not available. W=Value withheld to avoid disclosure of individual company data.

Note: Totals may not equal sum of components due to independent rounding.

(Million Pounds U₃O₈)

Resource Category and State	Forward Cost Category (dollars per pound) ¹		
	\$30 or Less	\$50 or Less	\$100 or Less
Reserves ²	268	899	1,422
New Mexico	84	341	566
Wyoming	108	368	588
Texas	7	24	39
Arizona, Colorado, Utah	41	115	160
Others ³	28	51	68
Potential Resources ⁴			
Estimated Additional Resources	2,180	3,310	4,850
Speculative Resources	1,310	2,230	3,480

¹ Forward costs are all operating and capital costs (in current dollars) yet to be incurred in the production of uranium from estimated resources. Excluded are previous expenditures (such as exploration and land acquisitions), taxes, profit, and the cost of money. Generally, forward costs are lower than market prices. Resource values in forward-cost categories are cumulative; that is, the quantity at each level of forward-cost includes all reserves/resources at the lower cost in that category.

² The Energy Information Administration category of uranium reserves is equivalent to the internationally reported category of Reasonably Assured Resources (RAR).

³ California, Idaho, Nebraska, Nevada, North Dakota, Oregon, South Dakota, Washington, and

undisclosed.

⁴ Shown are the mean values for the distribution of estimates for each forward-cost category, rounded to the nearest million pounds U₃O₈.

Note: Data are at end of year.

Web Page: <http://www.eia.doe.gov/fuelnuclear.html>.

Sources: Forward Costs \$30 or Less and \$50 or Less—Energy Information Administration (EIA), *Uranium Industry Annual 2001* (May 2002), Tables B1 and B4. Forward Costs \$100 or Less—EIA, Office of Coal, Nuclear, Electric and Alternate Fuels database as of December 31, 2001.

Energy Resources

Note 1. These volumes are the sum of the respective mean estimates in United States Geological Survey, *1995 National Assessment of United States Oil and Gas Resources*, Circular 1118 (Washington DC, 1995), pp. 2 and 17-19, for the onshore United States and State jurisdiction offshore waters, and in Minerals Management Services, *Outer Continental Shelf Petroleum Assessment, 2000* (Washington DC, 2001), for the Federal jurisdiction offshore (<http://www.mms.gov/revaldiv/RedNatAssessment.htm>).

Conventionally reservoired deposits are discrete subsurface accumulations of crude oil or natural gas usually defined, controlled, or limited by hydrocarbon/water contacts. Unconventionally reservoired deposits (continuous-type accumulations) are geographically extensive subsurface accumulations of crude oil or natural gas that generally lack well-defined hydrocarbon/water contacts. Examples include coalbed methane, “tight gas,” and auto-sourced oil- and gas-shale reservoirs. Ultimate recovery appreciation (reserve growth) is the volume by which the estimate of total recovery from a known oil or gas reservoir or aggregation of such reservoirs

is expected to increase during the time between discovery and permanent abandonment.

For purposes of comparison, the Potential Gas Committee, an industry-sponsored group of experts, biennially provides another geologically-based estimate of the Nation’s natural gas resources. The latest mean estimate, published in “Potential Supply of Natural Gas in the United States,” December 31, 2000, is 1,091 trillion cubic feet. This volume includes undiscovered conventionally reservoired deposits, expected ultimate recovery appreciation, coalbed methane, and tight gas where it is believed to be technically recoverable and marketable at reasonable costs.

Note 2. For 1970 forward, annual well completions are estimated by EIA based on individual well reports submitted to the American Petroleum Institute (1970-1994) and to Petroleum Information/Dwights LLC (1995 forward). The as-received well completion data for recent years are incomplete due to delays in the reporting of wells drilled. EIA therefore statistically imputes the missing data to provided estimates of total well completions and footage where necessary.

¹ United States excluding Alaska and Hawaii.

² As of December 31.

³ For 1954-1976, average productivity is based on the average number of producing wells. For 1977 forward, average productivity is based on the number of wells producing at end of year.

⁴ Included in crude oil.

R=Revised. P=Preliminary. E=Estimate.

Note: Totals may not equal sum of components due to independent rounding.

¹ Includes any imports for the Strategic Petroleum Reserve, which began in 1977.

² Prior to 1965, imports of kerosene-type jet fuel were included with kerosene, which is listed under "Other Products."

³ Includes propylene.

⁴ Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphthas. After 1980, excludes motor gasoline blending components.

⁵ Aviation gasoline, aviation gasoline blending components, other hydrocarbons/oxygenates (ethers and alcohols), kerosene, lubricants, pentanes plus, petrochemical feedstocks, petroleum coke, special naphthas, wax, and miscellaneous products.

⁶ Included in motor gasoline.

⁷ If applicable, included in motor gasoline.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 500 barrels per day.

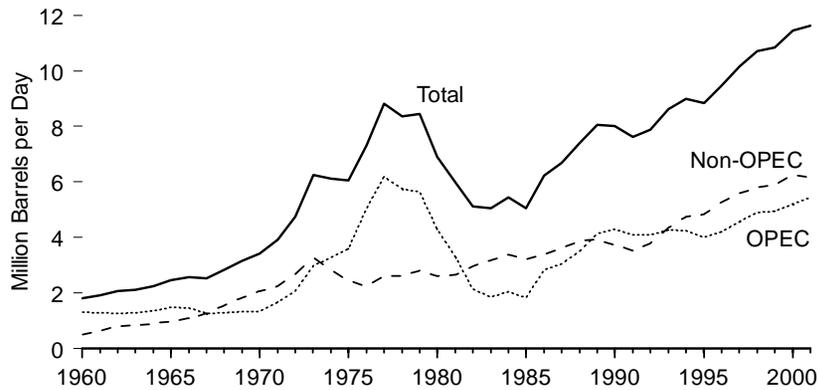

Notes: Includes imports from U.S. possessions and territories. Totals may not equal sum of components due to independent rounding.

¹ Organization of Petroleum Exporting Countries. See Glossary for current membership.

² Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and United Arab Emirates.

³ Ecuador withdrew from OPEC on December 31, 1992. Beginning in 1993, imports from Ecuador appear under "Non-OPEC." Gabon withdrew from OPEC on December 31, 1994. Beginning in 1995, imports from Gabon appear under "Non-OPEC."

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 500 barrels per day.

Notes: The country of origin for refined petroleum products may not be the country of origin for the crude oil from which the refined products were produced. For example, refined products imported from

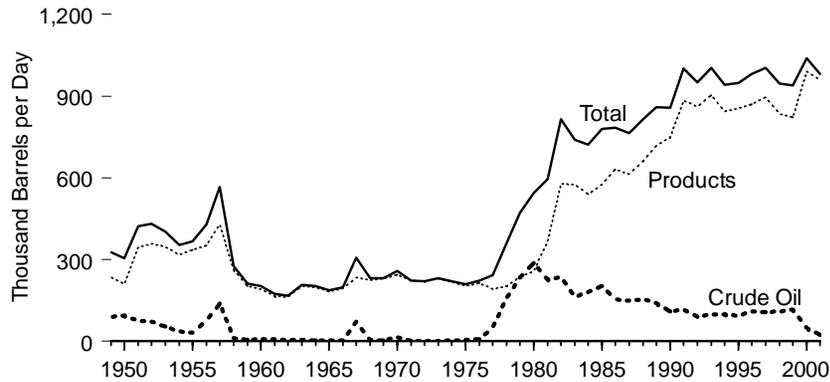

refineries in the Caribbean may have been produced from Middle East crude oil. Data include any imports for the Strategic Petroleum Reserve, which began in 1977. Totals may not equal sum of components due to independent rounding.

¹ Includes propylene.

² Includes aviation gasoline for the years 1949-1963.

³ Asphalt and road oil, aviation gasoline, kerosene, motor gasoline blending components, other hydrocarbons/oxygenates (ethers and alcohols), pentanes plus, wax, and miscellaneous products.

⁴ Included in the products from which jet fuel was blended.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 500 barrels per day.

Notes: Includes exports to U.S. possessions and territories. Totals may not equal sum of

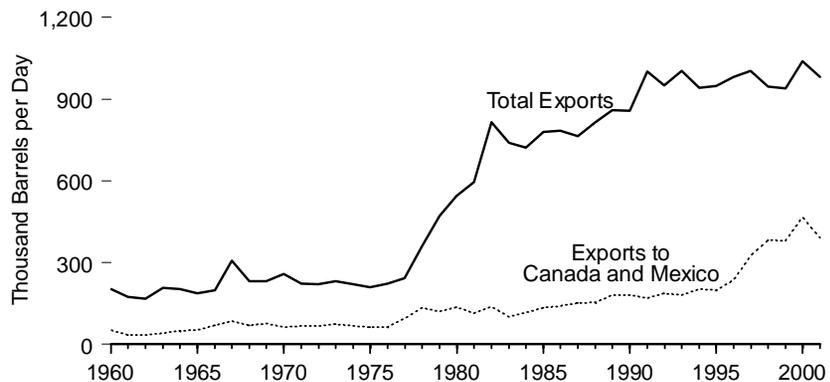

components due to independent rounding.

¹ Organization of Petroleum Exporting Countries. See Glossary for membership.

² Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and United Arab Emirates.

³ Calculated by dividing total net petroleum imports by total U.S. petroleum products supplied (consumption).

⁴ Calculated by dividing net petroleum imports from OPEC countries by total net petroleum imports.

⁵ Calculated by dividing net petroleum imports from OPEC countries by total U.S. petroleum product supplied (consumption).

R=Revised. P=Preliminary. NA=Not available.

Notes: The country of origin for refined petroleum products may not be the country of origin for the crude oil from which the refined products were produced. For example, refined products imported from

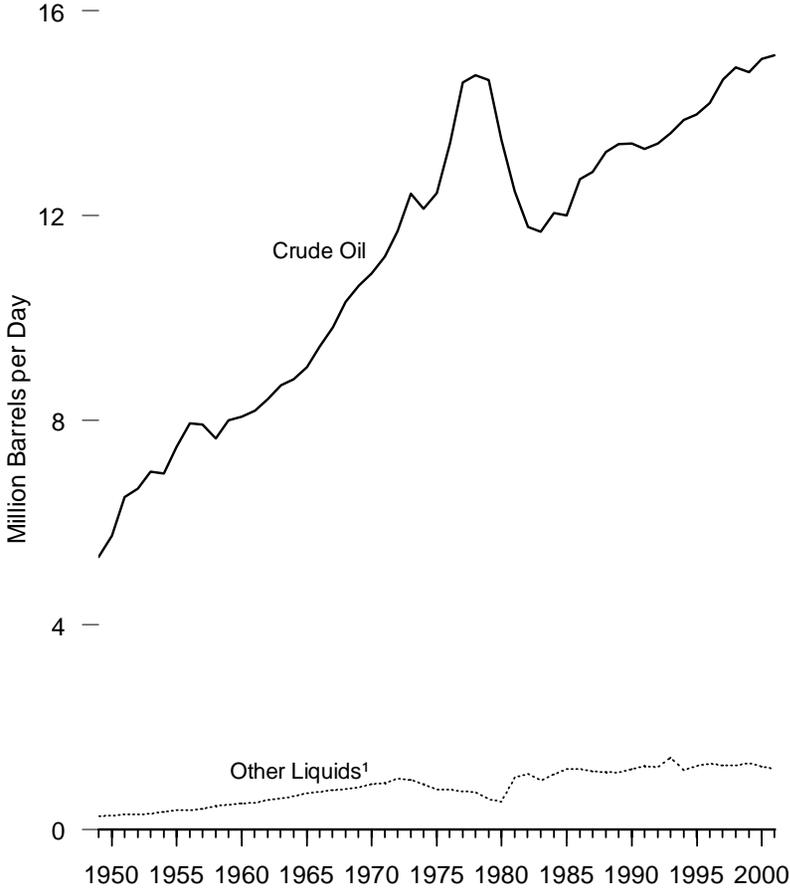

refineries in the Caribbean may have been produced from Middle East crude oil. Net imports are imports minus exports; negative numbers indicate that exports exceed imports. Data include any imports for the Strategic Petroleum Reserve, which began in 1977. Totals may not equal sum of components due to independent rounding.

¹ Prior to 1981, included unfinished oils (net), hydrogen, and hydrocarbons not included elsewhere; 1981 forward, included unfinished oils (net), motor gasoline blending components (net), aviation gasoline blending components (net), hydrogen, other hydrocarbons, and alcohol. See Note 1 at end of section.

² Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphthas.

³ Kerosene, petrochemical feedstocks (excluding still gas), lubricants, wax, and miscellaneous products. Since 1964, aviation gasoline and special naphthas have been included.

⁴ Included in the products from which jet fuel was blended: in 1952, 71 percent gasoline, 17 percent kerosene, and 12 percent distillate fuel.

⁵ Prior to 1965, kerosene-type jet fuel was included in kerosene.

R=Revised. P=Preliminary. (s)=Less than 0.005 million barrels per day.

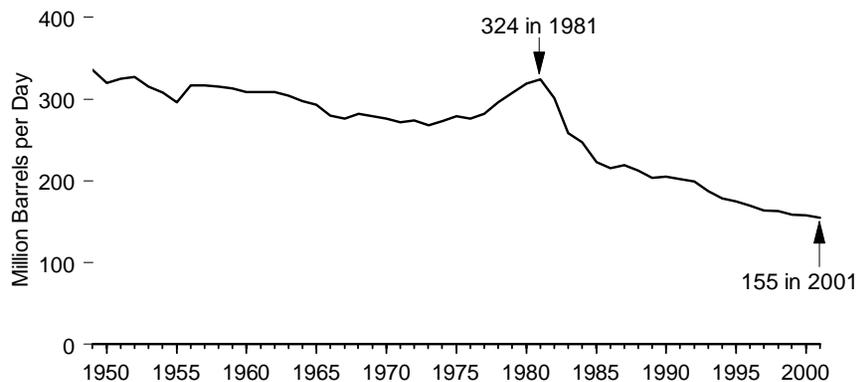

Note: Totals may not equal sum of components due to independent rounding.

¹ Prior to 1956, the number of refineries included only those in operation on January 1. For 1957 forward, the number of refineries has included all operable refineries on January 1. See Glossary.

² Capacity in million barrels per calendar day on January 1.

³ See Note 4 at end of section.

⁴ For 1949-1980, utilization is derived by dividing gross input to distillation units by one-half of the current year January 1 capacity and the following year January 1 capacity. Percentages were derived from unrounded numbers. For 1981 forward, utilization is derived by averaging reported monthly utilization.

R=Revised. P=Preliminary.

¹ Motor gasoline, aviation gasoline, special naphthas, distillate fuel oil, and miscellaneous products.

² Reported production of ethane-propane mixtures has been allocated 70 percent ethane and 30 percent propane.

³ Reported production of butane-propane mixtures has been allocated 60 percent butane and 40 percent propane.

⁴ Prior to 1984, this category was reported separately as natural gasoline, isopentane, and plant condensate.

⁵ Beginning in 1989, data on finished petroleum products production from natural gas processing plants were no longer available.

R=Revised. P=Preliminary.

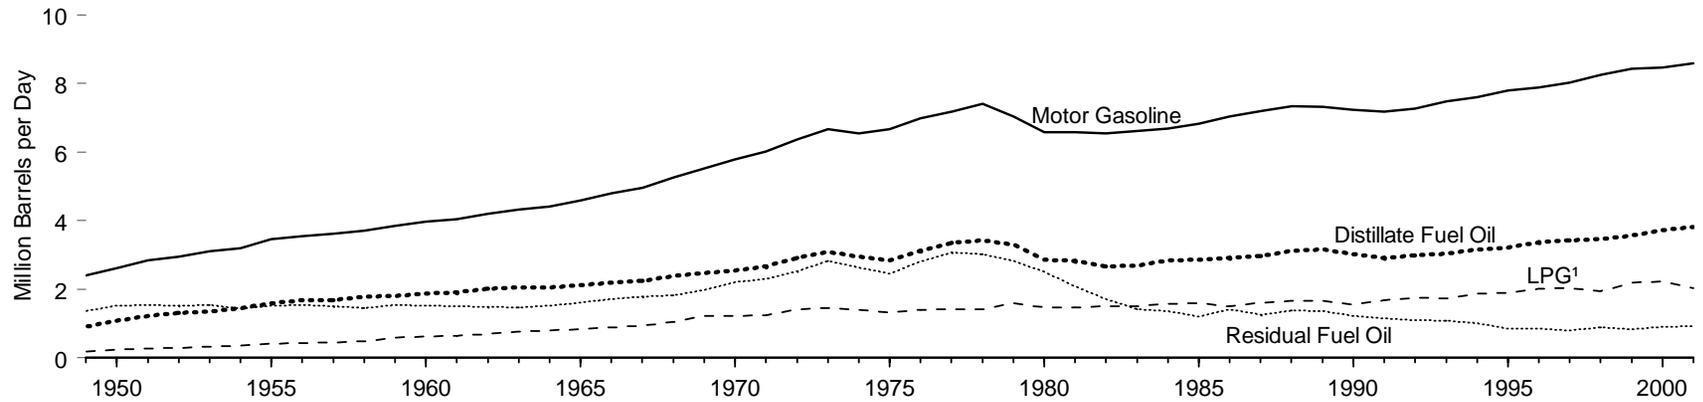

Note: Totals may not equal sum of components due to independent rounding.

¹ Includes propylene.

² Still gas (refinery gas), petrochemical feedstocks, waxes, natural gasoline, pentanes plus, and miscellaneous products. Beginning in 1964, includes special naphthas. Beginning in 1981, also includes negative barrels per day of distillate and residual fuel oil reclassified as unfinished oils, and other products (from both primary and secondary supply) reclassified as gasoline blending components. Beginning in 1983, also includes crude oil burned as fuel.

³ Percent change from previous year calculated from data in thousand barrels per year.

⁴ Included in the products from which jet fuel was blended: in 1952, 71 percent gasoline, 17 percent kerosene, and 12 percent distillate fuel.

R=Revised. P=Preliminary. NA=Not available. — = Not applicable.

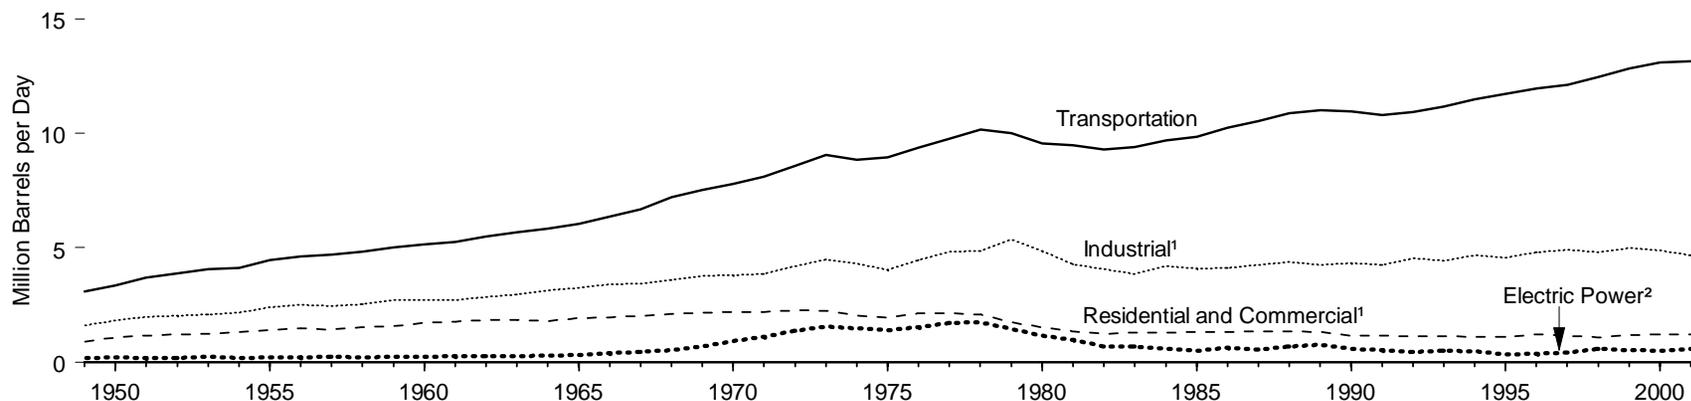

Notes: For the definition of petroleum products supplied, see Notes 1, 2, and 3 at end of section. Totals may not equal sum of components due to independent rounding.

¹ Industrial combined-heat-and-power (CHP) and a small number of industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.
² All industrial sector fuel use other than that in "CHP."
³ Still gas (refinery gas), petrochemical feedstocks, special naphthas, waxes, natural gasoline, pentanes plus, crude oil, and miscellaneous products.
⁴ Included in "Other."
R=Revised. P=Preliminary. E=Estimate.
Notes: See Notes 1, 2, and 3 at end of section for comments on the calculation of consumption. Totals may not equal sum of components due to independent rounding.

¹ Includes ethanol blended into motor gasoline.

² Included in the products from which jet fuel was blended: in 1952, 71 percent gasoline, 17 percent kerosene, and 12 percent distillate fuel.

R=Revised. E=Estimate.

Notes: See Notes 1, 2, and 3 at end of section for comments on the calculation of consumption. Totals may not equal sum of components due to independent rounding.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

² Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

³ For 1949-1979, gas turbine and internal combustion plant use of petroleum. For 1980-2001, electric utility data are for light oil (fuel oil nos. 1 and 2, and small amounts of kerosene and jet fuel).

⁴ For 1949-1979, steam plant use of petroleum. For 1980-2001, electric utility data are for heavy oil

(fuel oil nos. 5 and 6, and small amounts of fuel oil no. 4).

⁵ Electric utility CHP plants are included in "Electricity Only."

P=Preliminary. E=Estimate. NA=Not available.

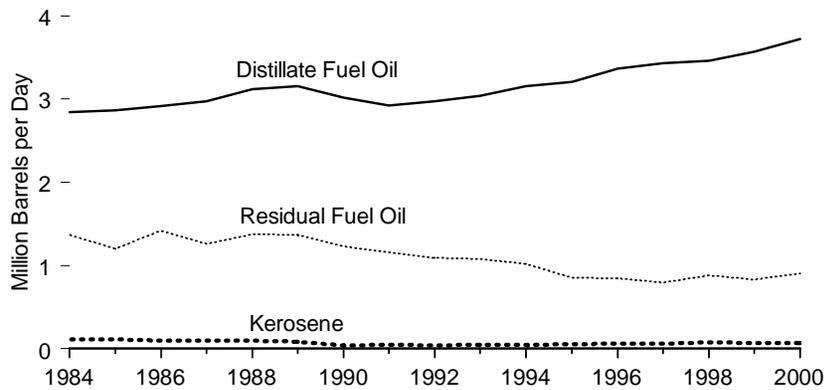

Notes: See Notes 1, 2, and 3 at end of section for comments on the calculation of consumption. Totals may not equal sum of components due to independent rounding.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Through 1988, data are for electric utilities only.

² Included in "Other."

R=Revised. P=Preliminary. E = Annual estimate based on eleven months of data. — = Not applicable. (s)=Less than 0.5 thousand barrels per day.

Notes: Sales data are adjusted to equal the Energy Information Administration (EIA) volume estimate of products supplied in the U.S. marketplace (see Table 5.11). Distillate Fuel Oil is adjusted at the

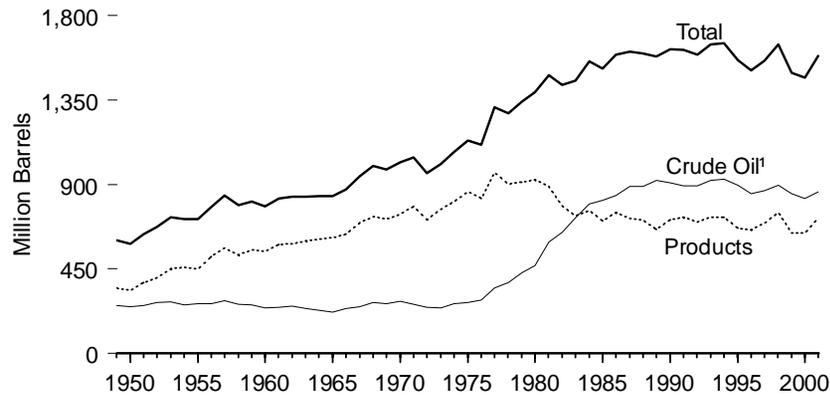

Petroleum Administration for Defense (PAD) district level. Residual Fuel Oil from 1984-1989 is adjusted at the PAD district level. From 1990 forward it is adjusted at the national level. Kerosene from 1984-1991 is adjusted at the PAD district level. From 1992 forward it is adjusted at the national level. Additional information is available in EIA's report *Fuel Oil and Kerosene Sales*. Totals may not equal sum of components due to independent rounding.

¹ Sulfur content of 0.05 percent or less by weight.

² Includes propylene.

³ Prior to 1964, motor gasoline data were for total gasoline, which included motor gasoline, aviation gasoline, and special naphthas. For 1981 forward, data include motor gasoline blending components.

⁴ Kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, pentanes plus, and miscellaneous products. Since 1964, aviation gasoline and special naphthas have been included. For 1981 forward, includes aviation gasoline blending components, hydrogen, other hydrocarbons, and alcohol.

⁵ Included in the products from which jet fuel was blended: in 1952, 71 percent gasoline, 17 percent kerosene, and 12 percent distillate fuel.

⁶ Included in liquefied petroleum gases total.

R=Revised. P=Preliminary. NA=Not available.

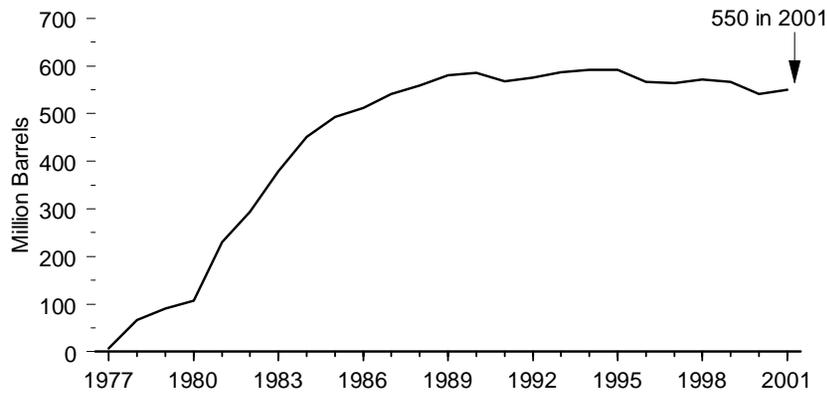

Notes: Stocks are at end of year. Distillate stocks in the "Northeast Heating Oil Reserve" are not included. Totals may not equal sum of components due to independent rounding.

¹ Represents volumes of imported crude oil received at SPR storage facilities for which the costs associated with the importation and delivery of crude oil are the responsibility of the commercial importer under contract to supply the SPR.

² The values shown for 1998-1999 represent an exchange agreement in which SPR received approximately 8.5 million barrels of high quality oil in exchange for approximately 11 million barrels of lower quality crude oil shipped from SPR during 1999-2000. Also, starting in 1999 a portion of the crude oil in-kind royalties from Federal leases in the Gulf of Mexico was transferred to the Department of Energy and exchanged with commercial entities for crude oil to fill the SPR. Crude oil exchange barrels delivered to SPR could be either domestic or imported as long as the crude oil met the specification requirements of SPR. All exchange barrels of imported crude oil are shown in the column "Foreign Crude Oil, Imported by Others," while exchange barrels of domestic crude oil are shown under the column "Domestic Crude Oil Receipts, Exchanges."

³ Stocks do not include imported quantities in transit to Strategic Petroleum Reserve terminals, pipeline fill, and above-ground storage.

⁴ Including lease condensate stocks.

⁵ Derived by dividing end-of-year Strategic Petroleum Reserve stocks by annual average daily net imports of all petroleum. Calculated prior to rounding.

⁶ The quantity of domestic fuel oil which was in storage prior to injection of foreign crude oil.

⁷ Includes 30 million barrels released to increase heating oil stocks in exchange for a like quantity plus a bonus percentage to be returned in 2001-2002, as well as additional barrels to create a Northeast Home Heating Oil Reserve.

SPR=Strategic Petroleum Reserve. R=Revised. (s)=Less than 0.005 million barrels.

¹ Nominal dollars.

² Organization of Petroleum Exporting Countries. See Glossary for current membership.

³ Ecuador, which withdrew from OPEC on December 31, 1992, is included through 1992. In June 1996, OPEC retroactively ended Gabon's membership in OPEC effective December 31, 1994. However, data for Gabon are still included here for 1995.

⁴ Data shown here represent landed value; they differ from data in Table 3.5, which are data from U.S. Customs that represent crude oil value at the port of loading.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than \$0.05 billion. W=Value withheld to avoid disclosure of individual company data.

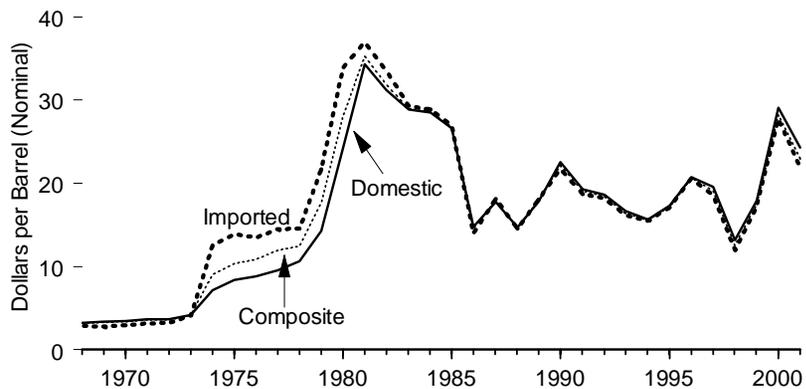

Notes: Crude oil import volumes used to calculate values in this table are for the 50 states and the District of Columbia. Totals may not equal sum of components due to independent rounding.

Web Page: http://www.eia.doe.gov/oil_gas/petroleum/info_glance/petroleum.html

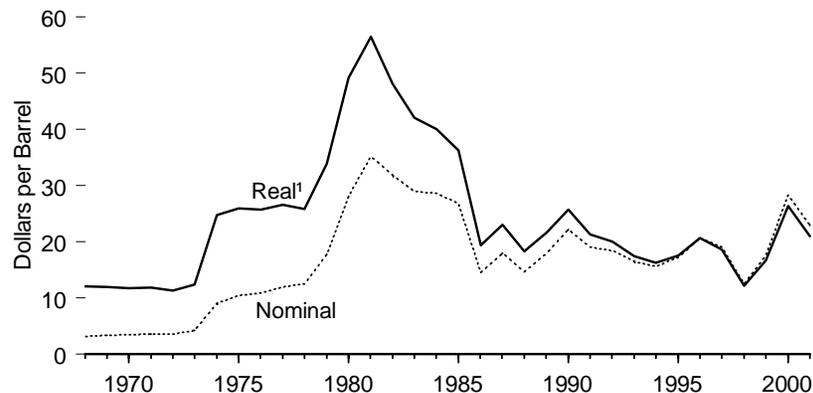

Sources: Calculated by using prices on Table 5.17 and volume data as follows: 1973-1975—U.S. Department of the Interior, Bureau of Mines, *Petroleum Statement, Annual*, annual reports. 1976-1980—Energy Information Administration (EIA), *Petroleum Statement, Annual*, annual reports. 1981-2000—EIA, *Petroleum Supply Annual*, annual reports. 2001—EIA, *Petroleum Supply Monthly* (February 2002).

¹ Nominal value.

² Sales for resale (wholesale sales) are those made to purchasers who are other than ultimate consumers. Sales to end users are those made directly to the ultimate consumer, including bulk customers, such as agriculture, industry, and utilities, as well as residential and commercial customers.

³ Includes No. 4 fuel oil and No. 4 diesel fuel.

⁴ In this table, refiner margin is the difference between the composite refiner acquisition price of crude oil and the price to resellers.

⁵ Composite of aviation gasoline, kerosene-type jet fuel, kerosene, motor gasoline, distillate fuel nos. 1, 2, and 4, and residual fuel.

Petroleum

Note 1. Accurate calculation of the quantity of petroleum products supplied to the domestic market is complicated by the recycling of products at the refinery, the renaming of products involved in a transfer, and the receipt of products from outside the primary supply system. Beginning in 1981, a single adjustment (always a negative quantity) is made to total product supplied to correct this accounting problem. The calculation of this adjustment, called “reclassified,” involves only unfinished oils and gasoline blending components. It is the sum of their net changes in primary stocks (net withdrawals is a plus quantity; net additions is a minus quantity) plus imports minus net input to refineries.

Note 2. Total petroleum products supplied is the sum of the products supplied for each petroleum product, crude oil, unfinished oils, and gasoline blending components. For each of these, except crude oil, product supplied is calculated by adding refinery production, natural gas plant liquids production, new supply of other liquids, imports, and stock withdrawals, and subtracting stock additions, refinery inputs, and exports. Crude oil product supplied is the sum of crude oil burned on leases and at pipeline pump stations as reported on Form EIA-813. Prior to 1983, crude oil burned on leases and at pipeline pump stations was reported as either distillate or residual fuel oil and was included as product supplied for these products. Petroleum product supplied is an approximation of petroleum consumption and is synonymous with the term “Petroleum Consumption” in Section 1. Sector data for petroleum products used in more than one sector are derived from surveys of sales to ultimate consumers by refiners, marketers, distributors, and dealers and from receipts at electric utilities.

Note 3. Beginning in January 1981, several Energy Information Administration survey forms and calculation methodologies were changed to reflect new developments in refinery and blending plant practices and to improve data integrity. Those changes affect production and product supplied statistics for motor gasoline, distillate fuel oil, and residual fuel oil, and stocks of motor gasoline. On the basis of those changes, motor gasoline production during the last half of 1980 would have averaged 289,000 barrels per day higher than that which was published on the old basis. Distillate and residual fuel oil production and product supplied for all of 1980 would have averaged, respectively, 105,000 and 54,000 barrels per day higher than the numbers that were published.

Note 4. The methods of deriving Gross Input to Distillation Units (GIDU) in this report are as follows: 1949-1966, GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns at refineries, and shipments of natural gasoline and plant condensate from natural gas processing plants to refineries. For 1967-1973, GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns, and refinery input of natural gasoline and plant condensate. For 1974-1980, GIDU is published annual data. For 1981 forward, GIDU is the sum of reported monthly data.

Note 5. The Crude Oil Domestic First Purchase Price were derived as follows: 1949-1973, weighted average Domestic First Purchase values as reported by State agencies and calculated by the Bureau of Mines; 1974 and 1975, weighted averages of a sample survey of major first purchasers' purchases; 1976 forward, weighted averages of all first purchasers' purchases.

Note 6. The Refiner Acquisition Cost of Crude Oil was estimated for 1968-1973. The cost of domestic crude oil was derived by adding estimated transportation costs to the reported average domestic first purchase value. The cost of imported crude oil was derived by adding an estimated ocean transport cost based on the published “Average Freight Rate Assessment” to the average “Free Alongside Ship” value published by the U.S. Bureau of the Census. The composite cost was derived by weighting domestic costs and imported costs on the basis of quantities produced and imported.

Note 7. Residential heating oil prices for 1956 through 1982 were formerly published in the *Annual Energy Review*. Those data, in cents per gallon, are: 15.2, 16.0, 15.1, 15.3, 15.0, 15.6, 15.6, 16.0, 16.1, 16.0, 16.4, 16.9, 17.4, 17.8, 18.5, 19.6, 19.7, 22.8, 36.0, 37.7, 40.6, 46.0, 49.0, 70.4, 97.4, 119.4, 116.0. The sources of these data are: 1956-1974—Bureau of Labor Statistics, *Retail Prices and Indexes of Fuels and Utilities for Residential Usage*, monthly. January 1975 through September 1977—Federal Energy Administration, Form FEA-P112-M-1, “No. 2 Heating Oil Supply/Price Monitoring Report.” October 1977 Through December 1977—Energy Information Administration (EIA), Form EIA-9, “No. 2 Heating Oil Supply/Price Monitoring Report.” 1978-forward—EIA, *Petroleum Marketing Monthly*, Table 18.

¹ Beginning with 1980, includes liquefied natural gas stored in above-ground tanks.

² Quantities lost and imbalances in data due to differences among data sources. Since 1980, excludes intransit shipments that cross the U.S.-Canada border (i.e., natural gas delivered to its destination via the other country).

³ For 1989-1992, a small amount of consumption at independent power producers may be counted in both "Other Industrial" and "Electric Power Sector" on Table 6.5. See Note 3 at end of section under "Table 6.5 Notes."

R=Revised. P=Preliminary. NA=Not available.

Notes: Beginning with 1965, all volumes are shown on a pressure base of 14.73 p.s.i.a. at 60° F. For

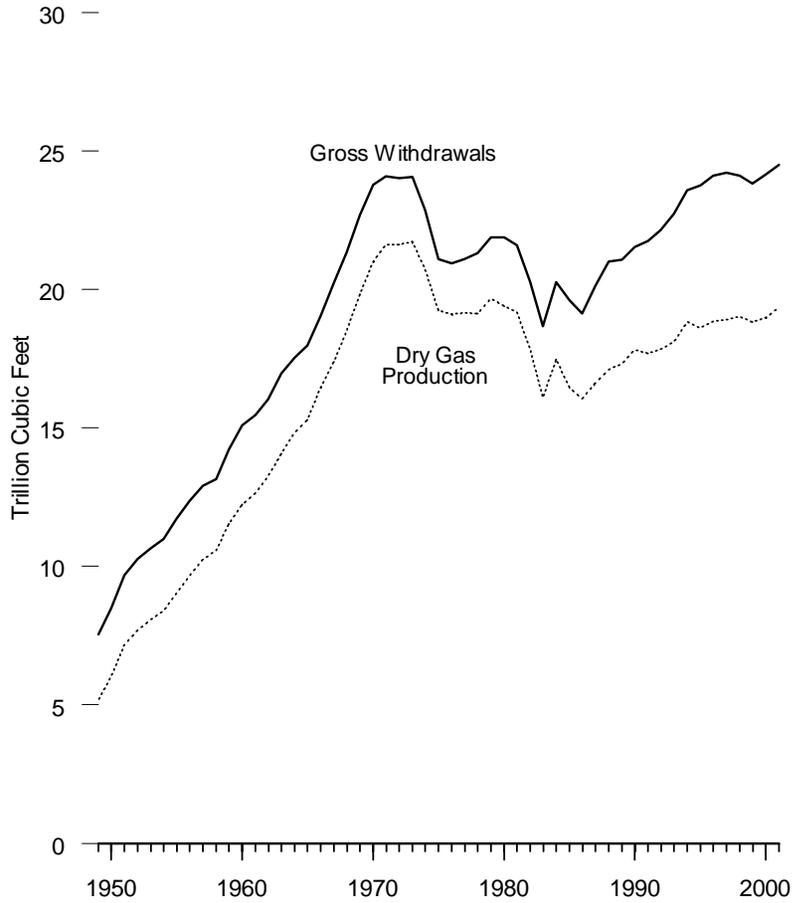

prior years, the pressure base was 14.65 p.s.i.a. at 60° F. Totals may not equal sum of components due to independent rounding.

¹ Net imports = imports minus exports.

² Imports from Algeria, Australia, Nigeria, Qatar, Trinidad, Tobago, and United Arab Emirates, and exports to Japan are liquefied natural gas. Exports to Mexico include a small amount of liquefied natural gas.

³ Included in the total but not shown separately are liquefied natural gas imports from Indonesia in 1986 and 2000, Malaysia in 1999, and Oman in 2000 and 2001.

⁴ Not meaningful because there were net exports during this year.

R=Revised. P=Preliminary. E=Estimate. (s)=Less than 0.5 billion cubic feet.

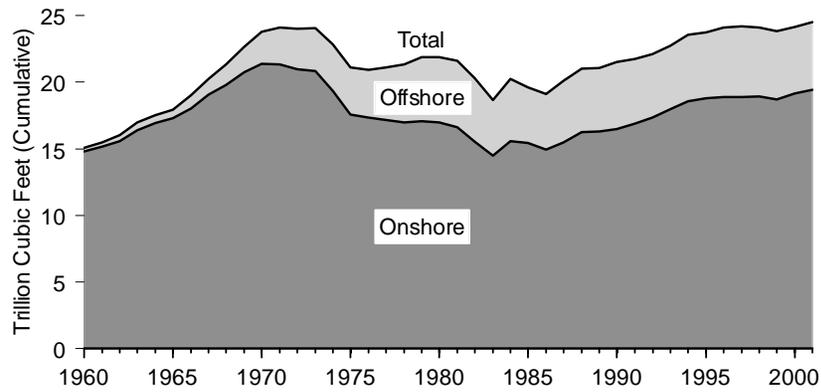

Note: Totals may not equal sum of components due to independent rounding.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

² Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

³ Commercial combined-heat-and-power and a small number of commercial electricity-only plants.

⁴ All commercial sector fuel use other than that in "Commercial CHP."

⁵ Industrial combined-heat-and-power (CHP) and a small number of industrial electricity-only plants.

⁶ All industrial sector fuel use other than that in "Lease and Plant Fuel" and "Industrial CHP."

⁷ Natural gas consumed in the operation of pipelines, primarily in compressors.

⁸ Included in "Commercial Other."

⁹ Included in "Industrial Non-CHP."

¹⁰ Electric utility CHP plants are included in "Electricity Only."

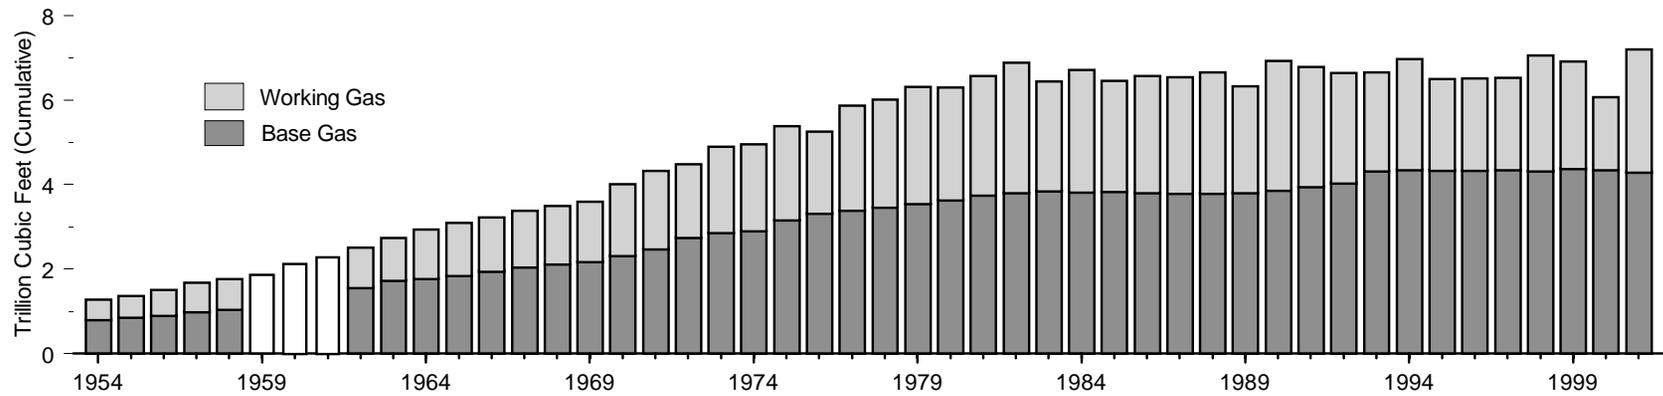

¹¹ For 1989-1992, a small amount of consumption at independent power producers may be counted in both "Other Industrial" and "Electric Power Sector." See Note 3 at end of section.

R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.005 trillion cubic feet.

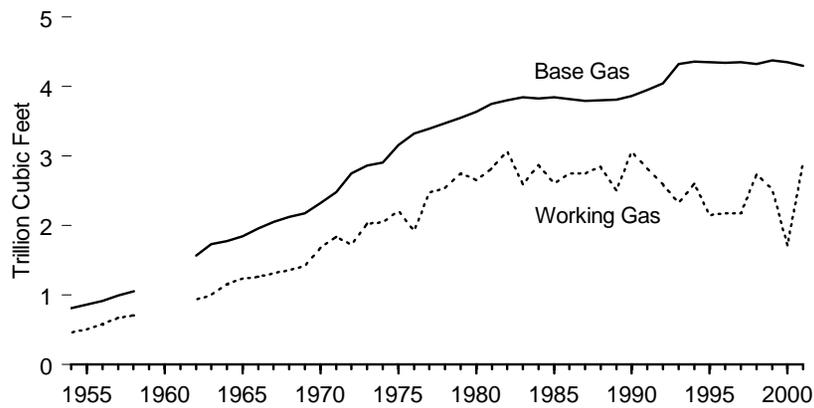

Notes, Web Page, and Sources: See end of section.

¹ Includes native gas.

R=Revised. E=Estimate. NA=Not available.

Notes: Storage is at end of year. Beginning with 1965, all volumes are shown on a pressure base of 14.73 p.s.i.a. at 60 degrees F. For prior years, the pressure base was 14.65 p.s.i.a. at 60 degrees F.

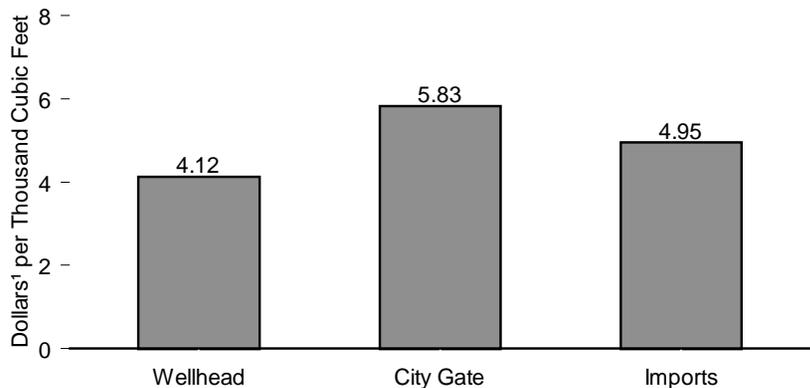

Totals may not equal sum of components due to independent rounding.

¹ Includes deliveries to municipalities and public authorities for institutional heating and other purposes.

² Most volumes and associated revenues for deliveries to nonutility power producers are included in the industrial sector. In instances where the nonutility is primarily a commercial establishment, volumes and associated revenues are included in the calculation of commercial prices.

³ Much of the natural gas delivered for vehicle fuel represents deliveries to fueling stations that are used primarily or exclusively by respondents' fleet vehicles. Thus, the prices are often those associated with the operation of fleet vehicles.

⁴ Based on all steam-electric utility plants with a combined capacity of 50 megawatts or greater.

⁵ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

R=Revised. P=Preliminary. E=Estimate. NA=Not available.

Notes: Natural gas includes supplemental gaseous fuels. Residential, commercial, and industrial price data represent prices of natural gas sold and delivered by local distribution companies to residential, commercial, and industrial consumers, respectively. The data do not reflect prices of natural gas transported for the account of others. The average for each end-use sector is calculated by dividing the total value of the gas consumed by each sector by the total quantity consumed. See Note at end of section.

Sources: **Vehicle Fuel:** 1990-2000—Energy Information Administration (EIA), *Natural Gas Annual*, annual reports. **All Other Data:** 1967-1994—EIA, *Natural Gas Annual*, annual reports. 1995 forward—EIA, *Natural Gas Monthly* (March 2002), Table 4.

Natural Gas

Table 6.5 Notes

1. See Table 8.3a for the amount of natural gas used to produce electricity and Table 8.3d for the amount of natural gas used to produce useful thermal output at combined-heat-and-power (CHP) plants. See Appendix G for the “Classification of Power Plants into Energy-Use Sectors,” and Appendix H, “Estimating and Presenting Power Sector Fuel Use in EIA Publications and Analyses,” for a description of revised electric power statistics in this report.

2. Natural gas consumption statistics are compiled from surveys of natural gas production, transmission, and distribution companies and from surveys of electric power generation. Consumption by sector from these surveys is compiled on a national and individual State basis and then balanced with national and individual State supply data. Included in the data are the following: **Residential Sector**—Consumption by private households for space heating, cooking, and other household uses; **Commercial Sector**—Consumption by nonmanufacturing establishments, by municipalities for institutional heating and lighting, and those engaged in agriculture, forestry, and fishing (through 1995). The commercial sector includes generators that produce electricity and/or useful thermal output primarily to support the activities of the above-mentioned commercial establishments; **Industrial Sector**—Consumption by establishments engaged primarily in processing unfinished materials into another form of product (includes mining, petroleum refining, manufacturing, and agriculture, forestry, and fishing (beginning in 1996), and natural gas industry use for lease and plant fuel). The industrial sector includes generators that produce electricity and/or useful thermal output primarily to support the above-mentioned industrial activities; **Transportation Sector**—Natural gas transmission (pipeline) fuel, and natural gas delivered for use as vehicle fuel; and **Electric Power Sector (electric utilities and independent power producers)**—Consumption for electricity generation and useful thermal output at electricity-only and CHP plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

3. Prior to 1993, deliveries to nonutility generators were not separately collected from natural gas companies on Form EIA-176, “Annual Report of Natural and Supplemental Gas Supply and Disposition.” As a result, for 1989 through 1992, those volumes are probably included in both the industrial and electric power sectors and double-counted in total consumption.

In 1993, 0.28 trillion cubic feet was reported as delivered to nonutility generators.

4. Beginning with 1965, all volumes are shown on a pressure base of 14.73 p.s.i.a. at 60° F. For prior years, the pressure base was 14.65 p.s.i.a. at 60° F.

5. Totals may not equal sum of components due to independent rounding.

¹ A negative value indicates a decrease in stocks; a positive value indicates an increase.

² Waste coal (including anthracite culm, bituminous gob, fine coal, and lignite waste) consumed by independent power producers. This amount is included here as a supply-side item to balance the same amount of waste coal included in "Consumption."

³ "Losses and Unaccounted for" is calculated as the sum of production, imports, and waste coal, minus exports, stock change, and consumption.

⁴ Included in "Losses and Unaccounted for."

⁵ Includes stock change.

R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.05 million short tons.

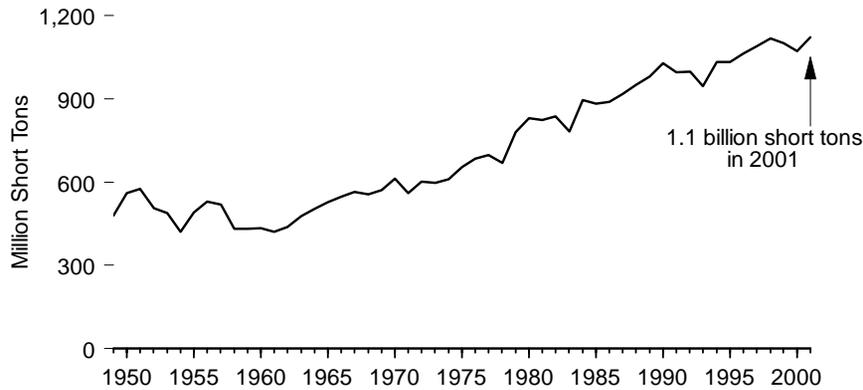

Note: Totals may not equal sum of components due to independent rounding.

Figure 7.3 Coal Consumption by Sector

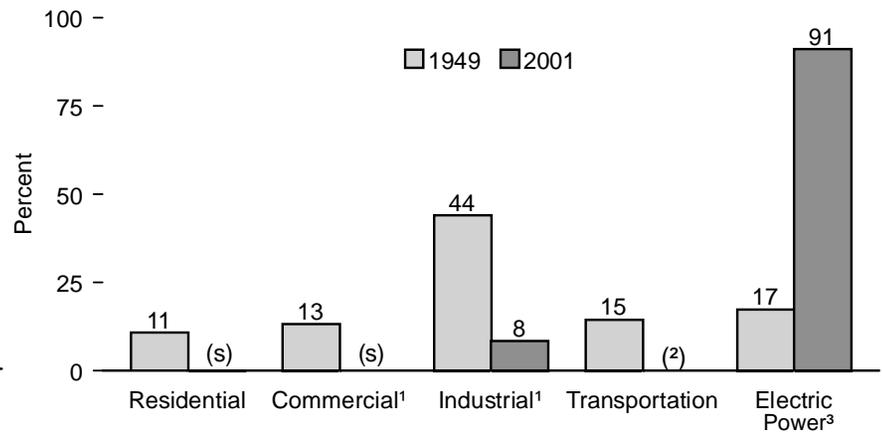

By Sector, 1949-2001

By Sector, 2001

Sector Shares, 1949 and 2001

¹ Includes combined-heat-and-power plants and a small number of electricity-only plants.
² For 1978 forward, small amounts of transportation sector use are included in "Industrial."
³ Electricity-only and combined-heat-and-power plants whose primary business is to sell electricity, or electricity and heat, to the public.

(s)=Less than 0.5 million short tons or less than 0.5 percent, as appropriate.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

² Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

³ Commercial combined-heat-and-power (CHP) and a small number of commercial electricity-only plants, such as those at hospitals and universities. See Appendix G for commercial sector NAICS codes.

⁴ All commercial sector fuel use other than that in "Commercial CHP."

⁵ Industrial combined-heat-and-power (CHP) and a small number of industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.

⁶ All industrial sector fuel use other than that in "Coke Plants" and "Industrial CHP."

⁷ Included in "Commercial Other."

⁸ Included in "Industrial Non-CHP."

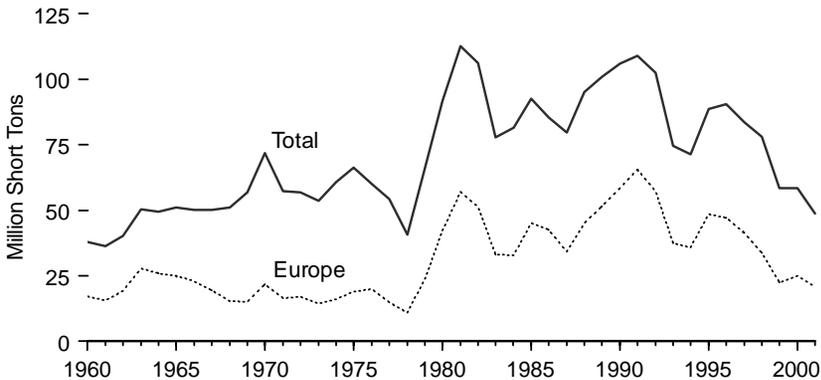

⁹ Electric utility CHP plants are included in "Electricity Only."

R=Revised. P=Preliminary. E=Estimate. (s)=Less than 0.05 million short tons.

¹ Includes transportation sector.

² The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

³ Through 1998, data are for stocks at electric utilities only. Beginning in 1999, data also include stocks at independent power producers.

R=Revised. P=Preliminary. NA=Not available.

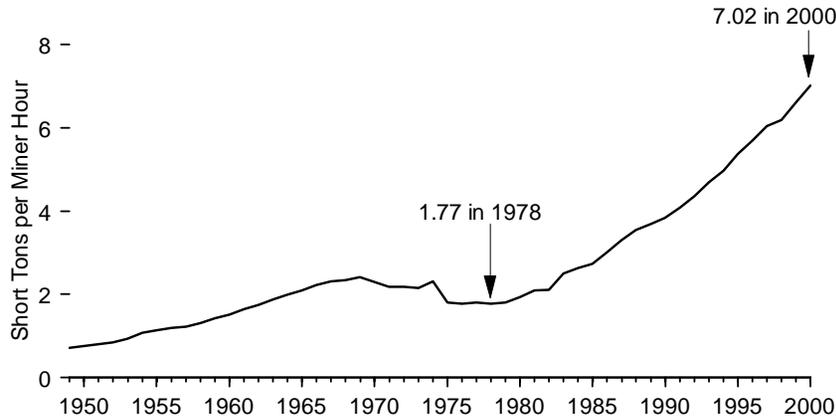

Notes: Stocks are at end of year. Totals may not equal sum of components due to independent rounding.

¹ Data for bituminous, subbituminous, and lignite mines 1949-1973 and anthracite mines 1949-1978 were originally reported in short tons per miner-day. The data were converted to short-tons per miner-hour by assuming an eight-hour day. All remaining data were calculated by dividing total production by total labor hours worked by all mine employees except office workers.

² Anthracite mining productivity is unavailable by underground and surface but is included in the Total. R=Revised. P=Preliminary. NA=Not available. Web Page: <http://www.eia.doe.gov/fuelcoal.html>.

¹ In years past, some lignite prices were withheld to protect company confidentiality. Consequently, prices for 1955 through 1977 excluded Texas lignite and prices for 1974 through 1978 excluded Montana lignite. As a result, lignite prices for the period 1974 through 1977 are based on North Dakota only.

² Subtotal of bituminous coal, subbituminous coal, and lignite.

³ In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

⁴ Includes subbituminous coal.

⁵ Included in bituminous coal.

R=Revised. P=Preliminary. W=Withheld to avoid disclosure of individual company data.

Note: Prices are free-on-board (f.o.b.) mine prices. See Glossary.

Web Page: <http://www.eia.doe.gov/fuelcoal.html>.

Coal

Note 1. Data in this report on the consumption of bituminous coal (including subbituminous coal), lignite, anthracite, and waste coal are developed primarily from consumption data reported in surveys. Included are data reported by all electric utility companies and coke plant companies. Data on coal consumption by all industrial and manufacturing establishments and by the residential and commercial sector are based on distribution data obtained quarterly from coal companies. Included in each sector's data are the following: Electric Power Sector—consumption by privately and publicly owned establishments engaged in the generation and/or distribution of electric power. Industrial and Miscellaneous Sector—consumption at manufacturing plants, large commercial establishments, coking plants, and by agriculture, mining (other than coal mining), and construction industries; Transportation Sector—sales to railroads and for vessel bunkering; Residential and Commercial Sector—retail dealer sales to households and small commercial establishments.

Coal consumption by the residential and commercial sectors is reported to the Energy Information Administration (EIA) for the two sectors combined; EIA estimates the amount consumed by the sectors individually. Previously, the breakdown was 40 percent residential and 60 percent commercial for each year. The current method results in variation over time. Beginning in 1949, a larger portion of the coal, 45 percent, is assigned to the residential sector; the share falls gradually over time and reaches 11 percent in 2001. To create the estimate, it is first assumed that

an occupied coal-heated housing unit consumes fuel at the same Btu rate as an oil-heated housing unit. Then, for the years in which data are available on the number of occupied housing units by heating source (1950, 1960, 1970, 1973–1981, and subsequent odd-numbered years (Table 2.8)), residential use of coal is estimated by the following steps: a ratio is created of the number of occupied housing units heated by coal to the number of housing units heated by oil; the ratio is multiplied by the Btu quantity of oil used by the residential sector to estimate the Btu quantity of coal used by the residential sector; and the residential sector's share of residential and commercial use is calculated. The 1950 share is applied to 1949; the 1999 share is applied to 2000; and the other missing years' shares are interpolated.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Due to the restructuring of the electric power sector, the sale of generation assets is resulting in a reclassification of plants from electric utilities to independent power producers.

² Commercial combined-heat-and-power (CHP) and commercial electricity-only plants. See Appendix G for commercial sector NAICS codes.

³ Industrial combined-heat-and-power (CHP) and industrial electricity-only plants. Through 1988, includes industrial hydroelectric power only. See Appendix G for industrial sector NAICS codes.

⁴ Electricity transmitted across U.S. borders with Canada and Mexico.

⁵ Energy losses that occur between the point of generation and delivery to the customer, and data collection frame differences and nonsampling error. See Note 1 at end of section.

⁶ Electricity retail sales to ultimate customers reported by electric utilities and other energy service providers.

⁷ Commercial and industrial facility use of onsite net electricity generation; and electricity sales among adjacent or co-located facilities for which revenue information is not available.

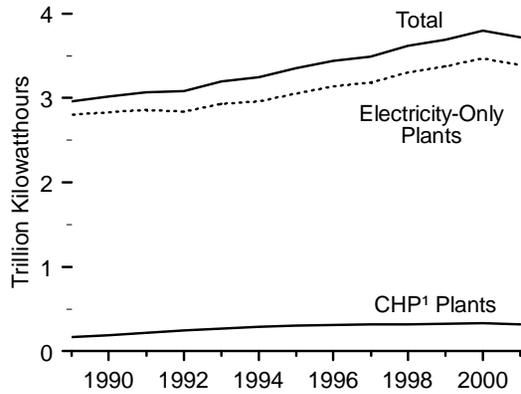

R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.5 billion kilowatthours.

Notes: See Note 2 at end of section. Totals may not equal sum of components due to independent rounding.

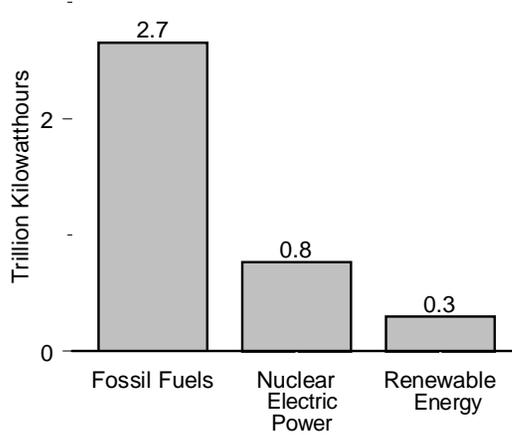

Web Page and Sources: See end of section.

Figure 8.2a Electricity Net Generation

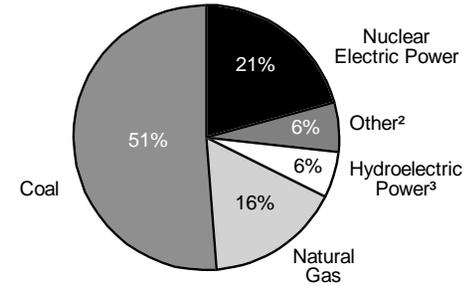

Total and by Plant Type, 1989-2001

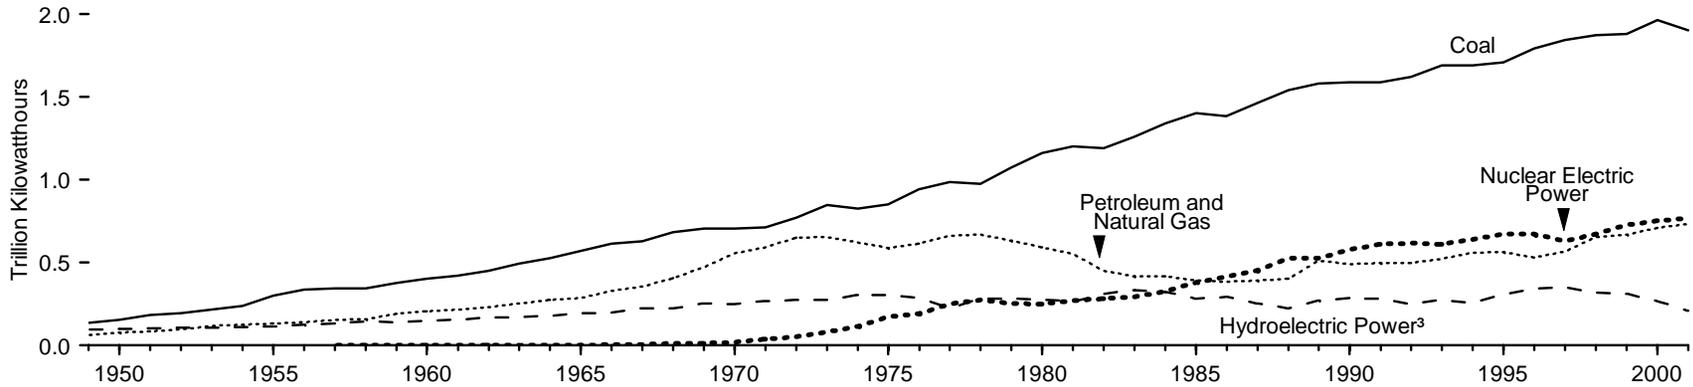

Total by Source Category, 2001

Total by Source, 2001

Total by Major Sources, 1949-2001

¹ Combined-heat-and-power.

² Petroleum, other gases, wood, waste, geothermal, solar, wind, and other.

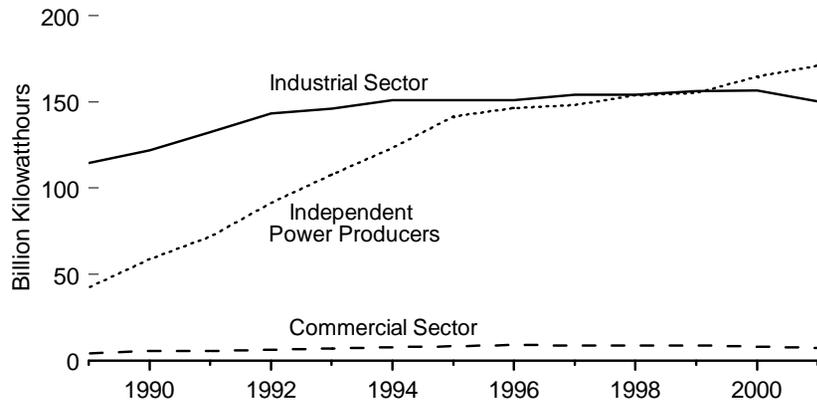

³ Conventional hydroelectric power and pumped-storage.

Note: Because vertical scales differ, graphs should not be compared.

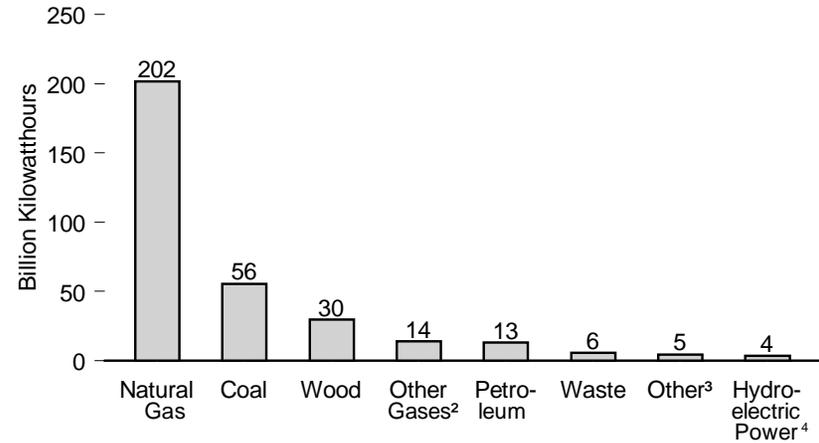

Sources: Tables 8.2a and 8.2b.

Figure 8.2b Net Generation and Useful Thermal Output at Combined-Heat-and-Power Plants

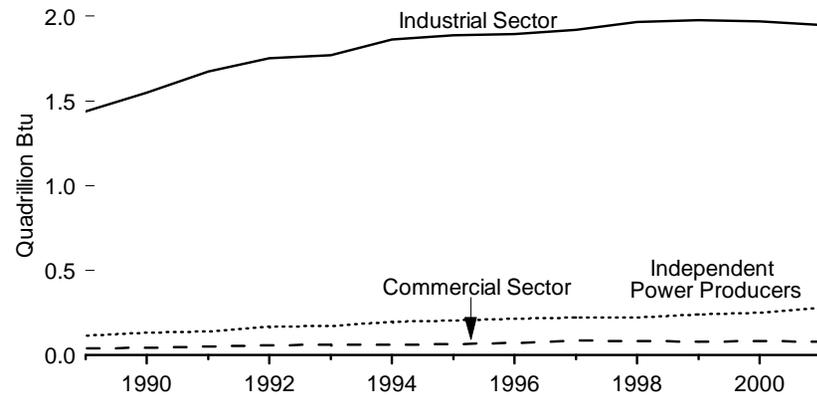

Net Generation at CHP¹ Plants by Sector, 1989-2001

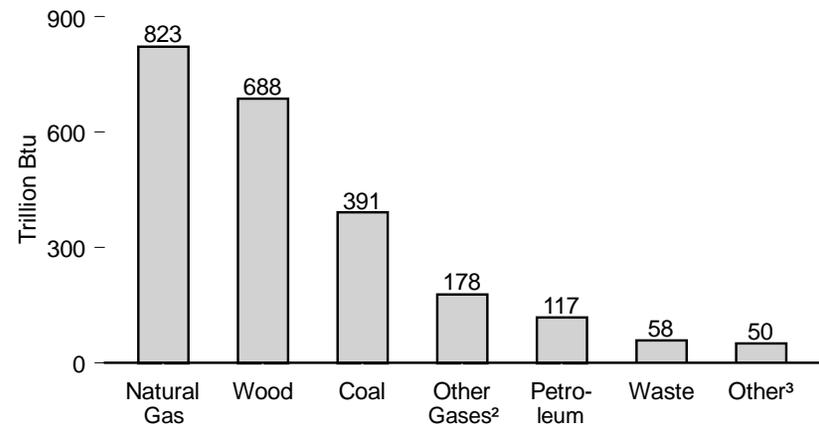

Sources of Net Generation at CHP¹ Plants, 2001

Fuel Consumption for Useful Thermal Output at CHP¹ Plants by Sector, 1989-2001

Sources of Useful Thermal Output at CHP¹ Plants, 2001

¹ Combined-heat-and-power.

² Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

³ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

⁴ Conventional hydroelectric power.

Note: Because vertical scales differ, graphs should not be compared.

Sources: Tables 8.2c and 8.2d.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.
² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.
³ Natural gas, including a small amount of supplemental gaseous fuels.
⁴ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.
⁵ Pumped storage facility production minus energy used for pumping.
⁶ Wood, black liquor, and other wood waste.
⁷ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.
⁸ Solar thermal and photovoltaic energy.
⁹ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
¹⁰ Included in "Conventional Hydroelectric Power."

¹¹ Through 1988, data are for generation at electric utilities only. Beginning in 1989, data also include generation at independent power producers.
P=Preliminary. NA=Not available. (s)=Less than 0.05 billion kilowatthours.
Notes: Data on this table for the electric power sector (electric utilities and independent power producers) are for electricity-only plants whose primary business is to sell electricity to the public—i.e., NAICS 22 electricity-only plants. For 1949-2001, also includes electric utility combined-heat-and-power (CHP) plants. Totals may not equal sum of components due to independent rounding.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.

² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.

³ Natural gas, including a small amount of supplemental gaseous fuels.

⁴ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

⁵ Includes combined-heat-and-power (CHP) plants that use multiple sources of energy including hydropower.

⁶ Wood, black liquor, and other wood waste.

⁷ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁸ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

⁹ CHP plants whose primary business is to sell electricity and heat to the public—i.e., NAICS 22 CHP plants. For 1989-2001, does not include electric utility CHP plants—these are included in "Electric Power

Sector" on Table 8.2b.

¹⁰ Commercial combined-heat-and-power (CHP) and a small number of commercial electricity-only plants. See Appendix G for commercial sector NAICS codes.

¹¹ Industrial combined-heat-and-power (CHP) and a small number of industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.

P=Preliminary. E=Estimate. (s)=Less than 0.05 billion kilowatthours.

Note: Totals may not equal sum of components due to independent rounding.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.

² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.

³ Natural gas, including a small amount of supplemental gaseous fuels.

⁴ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

⁵ Wood, black liquor, and other wood waste.

⁶ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁷ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

⁸ Combined-heat-and power (CHP) plants whose primary business is to sell electricity and heat to the public—i.e., NAICS 22 CHP plants. For 1989-2001, does not include electric utility CHP plants—these are

included in "Electric Power Sector" on Table 8.2b.

⁹ Commercial combined-heat-and-power plants. See Appendix G for commercial sector NAICS codes.

¹⁰ Industrial combined-heat-and-power plants. See Appendix G for industrial sector NAICS codes.

P=Preliminary. E=Estimate. (s)=Less than 0.5 trillion Btu.

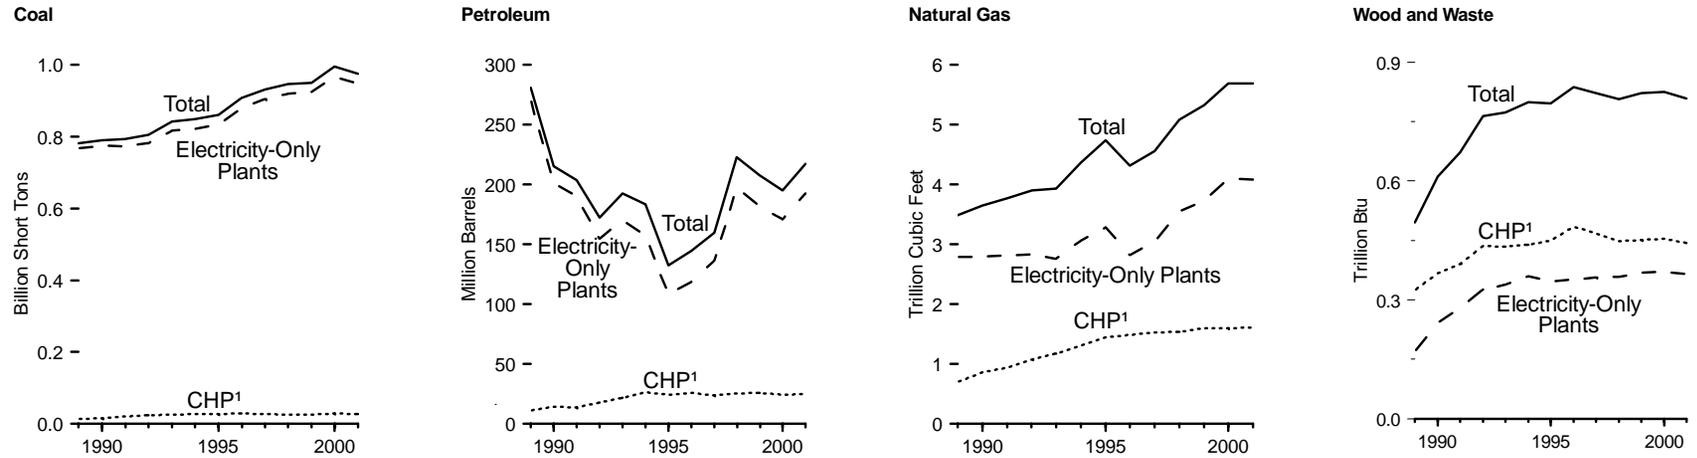

Note: Totals may not equal sum of components due to independent rounding.

Web Page: <http://www.eia.doe.gov/fuelelectric.html>.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.

² For 1949-1979, gas turbine and internal combustion plant use of petroleum. For 1980-2001, electric utility data are for light oil (fuel oil nos. 1 and 2, and small amounts of kerosene and jet fuel.)

³ For 1949-1979, steam plant use of petroleum. For 1980-2001, electric utility data are for heavy oil (fuel oil nos. 5 and 6, and small amounts of fuel oil no. 4.)

⁴ Jet fuel, kerosene, other petroleum liquids, and waste oil.

⁵ Natural gas, including a small amount of supplemental gaseous fuels.

⁶ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

⁷ Wood, black liquor, and other wood waste.

⁸ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁹ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

¹⁰ Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers, commercial plants, and industrial plants.

R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.5 trillion Btu.

Notes: Data are for fuels consumed to produce electricity; they exclude fuels consumed to produce useful thermal output. Totals may not equal sum of components due to independent rounding.

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.

² For 1949-1979, gas turbine and internal combustion plant use of petroleum. For 1980-2001, electric utility data are for light oil (fuel oil nos. 1 and 2, and small amounts of kerosene and jet fuel.)

³ For 1949-1979, steam plant use of petroleum. For 1980-2001, electric utility data are for heavy oil (fuel oil nos. 5 and 6, and small amounts of fuel oil no. 4.)

⁴ Jet fuel, kerosene, other petroleum liquids, and waste oil.

⁵ Natural gas, including a small amount of supplemental gaseous fuels.

⁶ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.

⁷ Wood, black liquor, and other wood waste.

⁸ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁹ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.

¹⁰ Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

P=Preliminary. NA=Not available. (s)=Less than 0.5.

Notes: Data are for fuels consumed to produce electricity; they exclude fuels consumed to produce useful thermal output. The electric power sector (electric utilities and independent power producers) comprises electricity-only plants whose primary business is to sell electricity to the public—i.e., NAICS 22 electricity-only plants. For 1949-2001, also includes electric utility combined-heat-and-power (CHP) plants.

Totals may not equal sum of components due to independent rounding.

Coal Stocks, 1949-2001

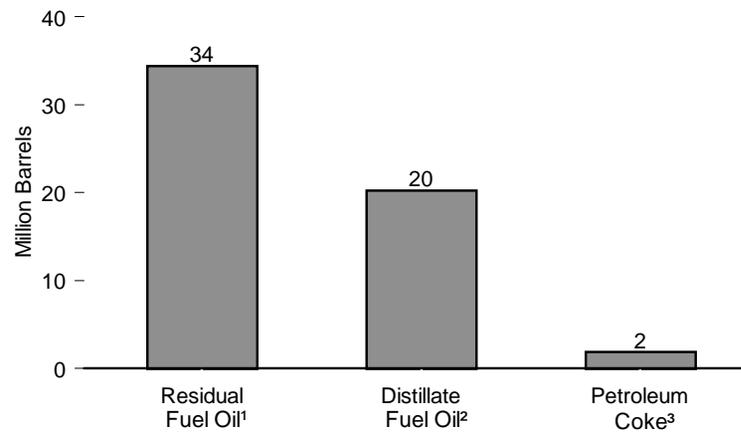

Coal and Petroleum Stocks, 1973-2001

Petroleum Stocks, 1949-2001

Petroleum Stocks by Product, 2001

¹ Fuel oil nos. 5 and 6, and small amounts of fuel oil no 4.

² Fuel oil nos. 1 and 2, and small amounts of kerosene and jet fuel.

³ Petroleum coke, which is reported in short tons, is converted at a rate of 5 barrels per short ton.

Note: Because vertical scales differ, graphs should not be compared.

¹ Anthracite, bituminous coal, subbituminous coal, and lignite.

² For 1973-1979, gas turbine and internal combustion plant stocks of petroleum. For 1980-2001, electric utility data are for light oil (fuel oil nos. 1 and 2, and small amounts of kerosene and jet fuel).

³ For 1973-1979, steam plant stocks of petroleum. For 1980-2001, electric utility data are for heavy oil (fuel oil nos. 5 and 6, and small amounts of fuel oil no. 4).

⁴ Petroleum coke is converted from short tons to barrels by multiplying by 5.

⁵ Through 1998, data are for stocks at electric utilities only. Beginning in 1999, data also include stocks at independent power producers.

R=Revised. P=Preliminary. NA=Not available.

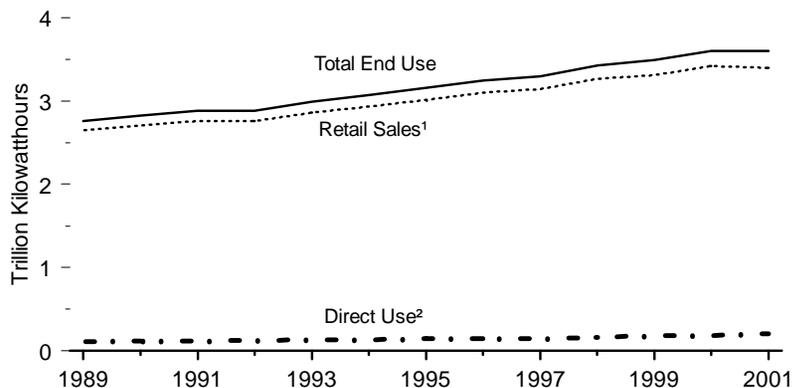

Notes: The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Stocks are at end of year. Totals may not equal sum of components due to independent rounding.

Figure 8.5 Electricity End Use

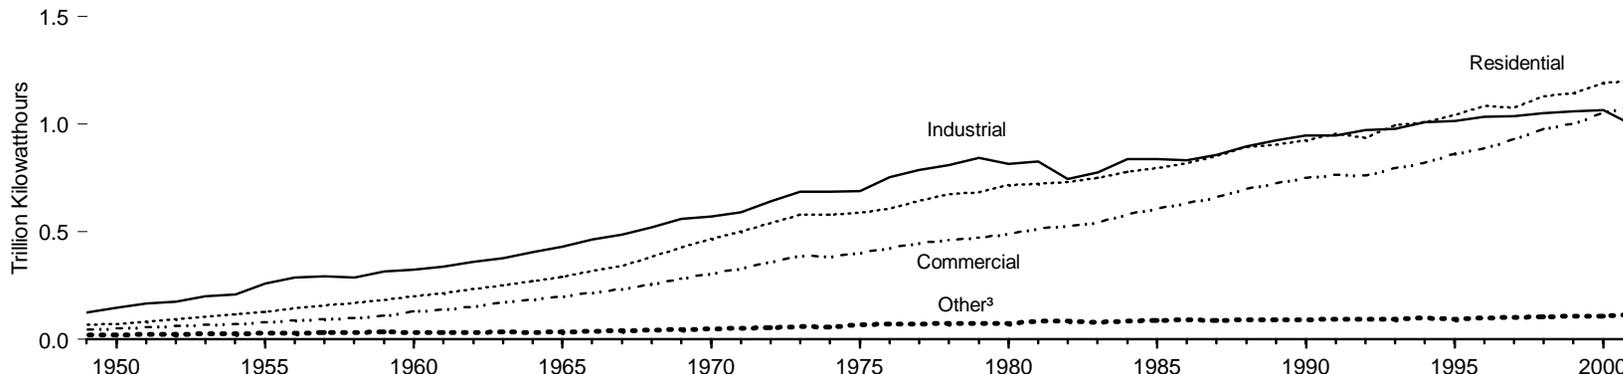

Overview, 1989-2001

Retail Sales¹ by Sector, 2001

Retail Sales¹ by Sector, 1949-2001

¹ Electricity retail sales to ultimate customers by electric utilities and other energy service providers.

² Commercial and industrial facility use of onsite net electricity generation; and electricity sales among adjacent or co-located facilities for which revenue information is not available.

³ Public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Note: Because vertical scales differ, graphs should not be compared.

¹ Public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

² In chained (1996) dollars, calculated by using gross domestic product implicit price deflators. See Table E1.

^R=Revised.

Notes: Data represent revenue from electricity retail sales divided by electricity retail sales. Through 1979, data are for Classes A and B privately owned electric utilities only. For 1980-1982, data are for selected Class A utilities whose electric operating revenues were \$100 million or more during the previous year. For 1983, data are for a selected sample of electric utilities. Beginning in 1984, data are for a census

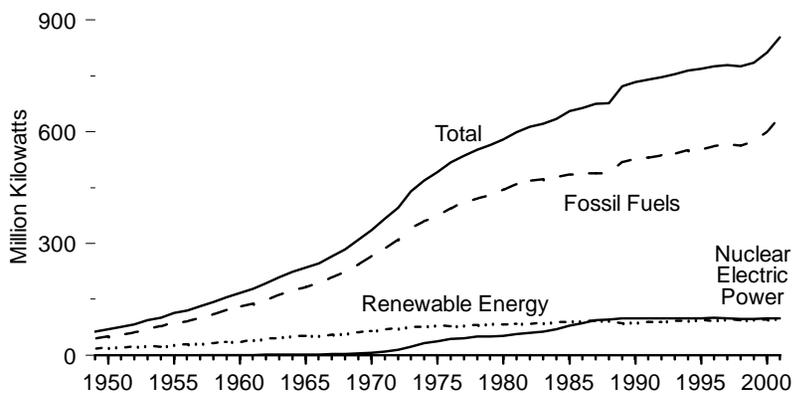

of electric utilities. Beginning in 1996, data also include energy service providers selling to retail customers.

1 Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.
2 Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.
3 Natural gas, including a small amount of supplemental gaseous fuels.
4 Petroleum and natural gas.
5 Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.
6 Wood, black liquor, and other wood waste.
7 Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.
8 Solar thermal and photovoltaic energy.
9 Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
10 Included in "Conventional Hydroelectric Power."

11 Included in "Wood."
12 Included in "Wind."
13 Through 1988, data are for net summer capacity at electric utilities only. Beginning in 1989, data also include net summer capacity at independent power producers, commercial plants, and industrial plants.
R=Revised, P=Preliminary, E=Estimate, NA=Not available, (s)=Less than 0.05 million kilowatts.
Notes: Data are at end of year. See Note 4 at end of section. Totals may not equal sum of components due to independent rounding.
Web Page: <http://www.eia.doe.gov/fuelelectric.html>

¹ Anthracite, bituminous coal, subbituminous coal, lignite, waste coal, and synthetic coal.
² Distillate fuel oil, residual fuel oil, petroleum coke, jet fuel, kerosene, other petroleum, and waste oil.
³ Natural gas, including a small amount of supplemental gaseous fuels.
⁴ Petroleum and natural gas.
⁵ Blast furnace gas, propane gas, and other manufactured and waste gases derived from fossil fuels.
⁶ Wood, black liquor, and other wood waste.
⁷ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.
⁸ Solar thermal and photovoltaic energy.
⁹ Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, and miscellaneous technologies.
¹⁰ Included in "Conventional Hydroelectric Power."
¹¹ Included in "Wood."

¹² Included in "Wind."
¹³ Through 1988, data are for net summer capacity at electric utilities only. Beginning in 1989, data also include net summer capacity at independent power producers.
P=Preliminary. NA=Not available. (s)=Less than 0.05 million kilowatts.
Notes: Data on this table for the electric power sector (electric utilities and independent power producers) are for electricity-only plants whose primary business is to sell electricity to the public—i.e., NAICS 22 electricity-only plants. For 1949-2001, also includes electric utility combined-heat-and-power (CHP) plants. Data are at end of year. See Note 4 at end of section. Totals may not equal sum of components due to independent rounding.
Web Page: <http://www.eia.doe.gov/fuelectric.html>.

¹ See Glossary for information on the North American Electric Reliability Council (NERC) Regions. Data include the U.S. portion of NERC only. See Figure 8.8 for an illustration of NERC regions.

² The percent by which planned generating capacity resources are expected to be greater (or less) than estimated net internal demand at the time of expected peak summer (or winter) demand. Net internal demand does not include estimated demand for direct control load management and customers with interruptible service agreements.

³ Data submission for ASCC (Alaska) began in 1989.

⁴ Data were not filed.

R=Revised. F=Forecast. NA=Not available. — = Not applicable.

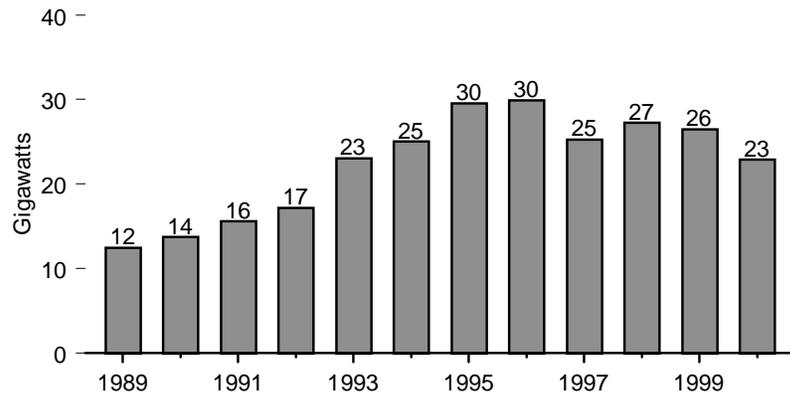

Note: Noncoincident peak load is the sum of two or more peak loads on individual systems that do not occur at the same time interval.

1999	13,003	13,452	26,455	50,563	1,423,644
2000	10,027	12,873	22,901	53,701	1,564,901

¹ The actual reduction in peak load reflects the change in demand for electricity that results from a utility demand-side management program that is in effect at the time that the utility experiences its actual peak load as opposed to the potential installed peakload reduction capability. Differences between actual and potential peak reduction result from changes in weather, economic activity, and other variable conditions.

² Load Management includes programs such as Direct Load Control and Interruptible Load Control, and beginning in 1997, "other types" of demand-side management programs. Direct load control refers to program activities that can interrupt consumer load at the time of annual peak load by direct control of the utility system operator by interrupting power supply to individual appliances or equipment on consumer premises. This type of control usually involves residential consumers. Interruptible load refers to program activities that, in accordance with contractual arrangements, can interrupt consumer load at times of seasonal peak load by direct control of the utility system operator or by action of the consumer at the direct request of the system operator. It usually involves commercial and industrial consumers. In some instances, the load reduction may be affected by direct action of the system operator (remote tripping) after notice to the consumer in accordance with contractual provisions. "Other types" are programs that limit or shift peak loads from on-peak to off-peak time periods, such as space heating and water heating storage systems.

³ Energy efficiency refers to programs that are aimed at reducing the energy used by specific end-use devices and systems, typically without affecting the services provided. These programs reduce overall electricity consumption, often without explicit consideration for the timing of program-induced savings. Such savings are generally achieved by substituting technically more advanced equipment to produce the same level of end-use services (e.g., lighting, heating, motor drive) with less electricity. Examples include high-efficiency appliances, efficient lighting programs, high-efficiency heating, ventilating, and air conditioning systems or control modifications, efficient building design, advanced electric motor drives, and heat recovery systems.

⁴ Nominal dollars.

⁵ From 1989 to 1996, Energy Efficiency includes "other types" of demand-side management programs. Beginning in 1997, these programs are included under Load Management.

Electricity

Note 1. Electrical system energy losses are estimated as the difference between total energy consumed to generate electricity and the total energy content of electricity consumed by end users. Most of these losses occur at steam-electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. This loss is a thermodynamically necessary feature of the steam-electric cycle. Part of the energy input-to-output losses are a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring these thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called “line-losses”), and unaccounted-for electricity. Total losses are allocated to the end-use sectors in proportion to each sector’s share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent is lost in transmission and distribution. Calculated electrical energy transmission system losses may be less than actual losses, because primary consumption does not include the energy equivalent of electricity imports from Canada and Mexico, although they are included in electricity end use.

Note 2. Prior to 1985, electric utility statistics included data reported by institutions (such as universities) and military facilities that generated electricity primarily for their own use. Beginning in 1985, electric utility statistics exclude data for these facilities.

Note 3. Data on electric utility retail sales of electricity represent gross output of electricity (measured at the generator terminals) minus power plant use and transmission and distribution losses. Included in each end-use sector are the following: Commercial Sector—sales of electricity to businesses that generally require less than 1,000 kilowatts of service; Industrial Sector—sales of electricity to businesses that generally require more than 1,000 kilowatts of service; Residential Sector—sales of electricity to residences for household purposes; “Other” Sector—sales of electricity for public street and highway lighting, to public authorities, railways, and railroads, and interdepartmental sales.

Note 4. Electric utility net summer capacities were first collected on Form EIA-860 for 1984. Units not assigned a net summer capacity rating by the

utility were given an estimated rating by use of a statistical relationship between installed nameplate capacity and net summer capacity for each prime mover. To estimate net summer capacity for the years 1949 through 1984, two methods were used. For each prime mover except nuclear and “other,” net summer capacity estimates were calculated in two steps. First, the unit capacity values reported on Form EIA-860 and the unit start dates contained in the 1984 Generating Unit Reference File (GURF) were used to compute preliminary aggregate estimates of annual net summer capacity and installed nameplate capacity. These preliminary estimates were obtained by aggregating unit capacity values for all units in service during a given year. Next, the ratio of the preliminary capacity to nameplate estimate was computed for each year and multiplied by the previously published installed nameplate capacity values to produce the final estimates of net summer capacity. The net summer capacity data for nuclear and “other” units were used directly from the 1984 GURF for all years. Historical aggregates were then developed by using the unit start dates on the GURF.

Historical capacity has also been modified to estimate capacity based upon the operable definition. This was accomplished by assuming that non-nuclear generating units became operable between 1 and 4 months prior to their commercial operation dates, depending upon the prime mover and time period. The actual operable dates for nuclear units were used. It should be noted that nonutility net summer capacities, which are not currently collected for nonutilities, are estimated based on installed nameplate capacity data.

¹ Placement of an order by a utility or government agency for a nuclear steam supply system.
² Cancellation by utilities of ordered units. Does not include three units (Bellefonte 1 and 2 and Watts Bar 2) where construction has been stopped indefinitely.
³ Issuance by regulatory authority of a permit, or equivalent permission, to begin construction. Numbers reflect permits issued in a given year, not extant permits.
⁴ Issuance by regulatory authority of license, or equivalent permission, to conduct testing but not to operate at full power.
⁵ Issuance by regulatory authority of full-power operating license, or equivalent permission. Units generally did not begin immediate operation. See Note 1 at end of section.
⁶ Ceased operation permanently.
⁷ Total of units holding full-power licenses, or equivalent permission to operate, at the end of the year. See Note 1 at end of section.
⁸ Includes Browns Ferry 1, which was shut down in 1985. The unit is defueled but is still fully licensed. In May 2002, the Tennessee Valley Authority announced its intention to have the unit resume operation in 2007. See Note 1 at end of section.

¹ At end of year.

² See Note 2 at end of section.

³ Through 1998, data include nuclear generating units at electric utilities only. Beginning in 1999, data also include nuclear generating units at independent power producers.

R=Revised. P=Preliminary. NA=Not available. (s)=Less than 0.05.

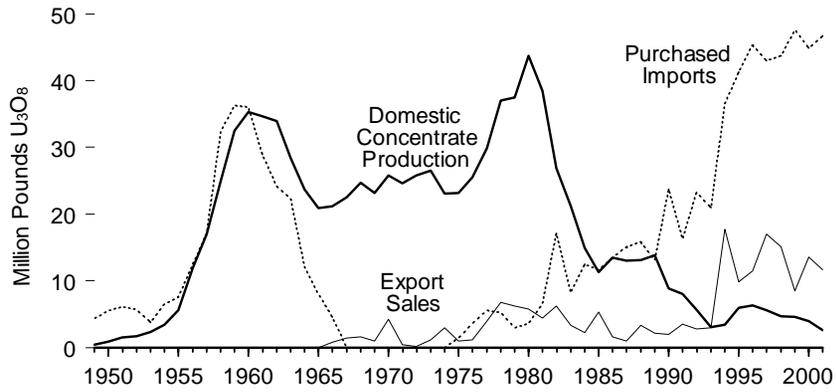

Note: The performance data shown in this table are based on a universe of reactor units that differs in some respects from the reactor universe used to profile the nuclear power industry in Table 9.1, especially

in the years prior to 1973. See Note 1 at end of section for further discussion.

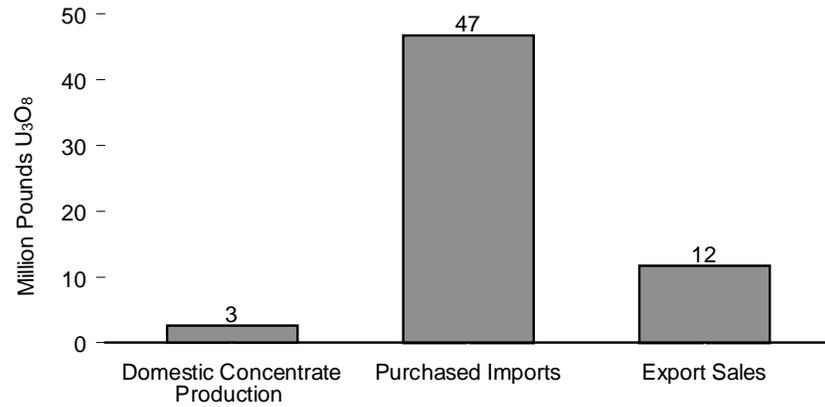

Sources: **Nuclear Electricity Net Generation** and **Nuclear Share of Electricity Net Generation:** Table 8.2a. **Net Summer Capacity of Operable Units:** Table 8.7a. **Capacity Factor:** Computed as a weighted average of monthly values for the year. Monthly factors are computed as the actual monthly generation divided by the maximum possible generation for that month. The maximum possible generation is the number of hours in the month multiplied by the net summer capacity at the end of the month. That fraction is then multiplied by 100 to obtain a percentage.

¹ Import quantities through 1970 are reported for fiscal years. Prior to 1968, the Atomic Energy Commission was the sole purchaser of all imported U₃O₈. Trade data prior to 1982 were for transactions conducted by uranium suppliers only. For 1982 forward, transactions by uranium buyers (consumers) have been included. Buyer imports and exports prior to 1982 are believed to be small.

² Does not include any fuel rods removed from reactors and later reloaded.

³ Nominal dollars.

R=Revised. P=Preliminary. NA=Not available. — = Not applicable.

Nuclear Energy

Note 1. In 1997 EIA undertook a major revision of Table 9.1 to more fully describe the history of the U.S. commercial nuclear power industry. The time frame was extended back to the birth of the industry in 1953, and the data categories were revised for greater relevance to current industry conditions and trends. To acquire the data for the revised categories it was necessary to develop a reactor unit database employing different sources than those used previously for Table 9.1 and still used for Table 9.2.

The data in Table 9.1 apply to commercial nuclear power units, which means that the units contributed power to the commercial electricity grid whether or not they were owned by an electric utility. A total of 259 units ever ordered was identified. Although most orders were placed by electric utilities, several units are or were ordered, owned, and operated wholly or in part by the Federal Government, including BONUS (Boiling Nuclear Superheater Power Station), Elk River, Experimental Breeder Reactor 2, Hallam, Hanford N, Piqua, and Shippingport.

A reactor is generally defined as operable in Table 9.1 while it possessed a full-power license from the Nuclear Regulatory Commission or its predecessor the Atomic Energy Commission, or equivalent permission to operate, at the end of the year. The definition is liberal in that it does not exclude units retaining full-power licenses during long, non-routine shut-downs. For example:

In 1985 the five then-active Tennessee Valley Authority units (Browns Ferry 1, 2, and 3 and Sequoyah 1 and 2) were shut down under a regulatory forced outage. Browns Ferry 1 remains shut down and has been defueled, while the other units were idle for several years, restarting in 1991, 1995, 1988, and 1988, respectively. All five units are counted as operable during the shut-downs. Brown's Ferry 1 is the only one of the five TVA plants that has not returned to service. Because it is still fully licensed to operate, it continues to meet the definition of operable.

Shippingport was shut down from 1974 through 1976 for conversion to a light-water breeder reactor, but is counted as operable until its retirement in 1982.

Calvert Cliffs 2 was shut down in 1989 and 1990 for replacement of pressurizer heater sleeves but is counted as operable during those years.

Exceptions to the rule are Shoreham and Three Mile Island 2. Shoreham was granted a full-power license in April 1989, but was shut down two months later and never restarted. In 1991, the license was changed to Possession Only. Although not operable at the end of the year, Shoreham is treated as operable during 1989 and shut down in 1990, because counting it as operable and shut down in the same year would introduce a statistical discrepancy in the tallies. A major accident closed Three Mile Island 2 in 1979, and although the unit retained its full-power license for several years, it is considered permanently shut down since that year.

Note 2. Net summer capacities were first collected on Form EIA-860 for 1984. Units not assigned a net summer capacity rating by the utility were given an estimated rating by use of a statistical relationship between installed nameplate capacity and net summer capacity for each prime mover. To estimate net summer capacity for 1949-1984, two methods were used. For each prime mover except nuclear and "other," net summer capacity estimates were calculated in two steps. First, the unit capacity values reported on Form EIA-860 and the unit start dates contained in the 1984 Generating Unit Reference File (GURF) were used to compute preliminary aggregate estimates of annual net summer capacity and installed nameplate capacity. These preliminary estimates were obtained by aggregating unit capacity values for all units in service during a given year. Next, the ratio of the preliminary capacity to nameplate estimate was computed for each year and multiplied by the previously published installed nameplate capacity values to produce the final estimates of net summer capacity. The net summer capacity data for nuclear and "other" units were used directly from the 1984 GURF for all years. Historical aggregates were then developed by use of the unit start dates on the GURF.

Historical capacity has also been modified to estimate capacity based upon the operable definition, by assuming that non-nuclear generating units became operable between 1 and 4 months prior to their commercial operation dates, depending upon the prime mover and time period. The actual operable dates for nuclear units were used. It should be noted that nonutility net summer capacities, which are not currently collected for nonutilities, are estimated based on installed nameplate capacity data.

¹ Commercial sector fuel use, including that at commercial combined-heat-and-power (CHP) and commercial electricity-only plants. See Appendix G for commercial sector NAICS codes.

² Industrial sector fuel use, including that at industrial combined-heat-and-power (CHP) and industrial electricity-only plants. See Appendix G for industrial sector NAICS codes.

³ Wood, black liquor, and other wood waste.

⁴ Geothermal heat pump and direct use energy.

⁵ Solar thermal direct use energy and photovoltaic electricity generation. Small amounts of commercial sector use are included in the residential sector.

⁶ Conventional hydroelectric power.

⁷ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁸ Ethanol blended into motor gasoline.

R=Revised. P=Preliminary. E=Estimate. NA=Not available.

Note: Totals may not equal sum of components due to independent rounding.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

² Through 1988, data are for consumption at electric utilities only. Beginning in 1989, data also include consumption at independent power producers.

³ Through 1988, all electricity imports and exports are included in "Hydropower." Beginning in 1989, includes only electricity imports and exports derived from hydroelectric power or geothermal energy.

⁴ Conventional hydroelectric power.

⁵ Wood, black liquor, and other wood waste.

⁶ Municipal solid waste, landfill gas, sludge waste, tires, agricultural byproducts, and other biomass.

⁷ Geothermal electricity net generation.

⁸ Solar thermal and photovoltaic electricity net generation.

⁹ Wind electricity net generation.

R=Revised. P=Preliminary. E=Estimate. NA=Not available. (s)=Less than 0.5 trillion Btu.

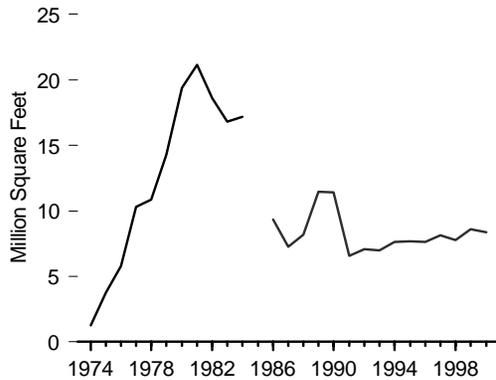

Note: Totals may not equal sum of components due to independent rounding.

¹ Low-temperature collectors are solar thermal collectors that generally operate at temperatures below 110 degrees Fahrenheit.

² Medium-temperature collectors are solar thermal collectors that generally operate in the temperature range of 140 degrees Fahrenheit to 180 degrees Fahrenheit but can also operate at temperatures as low as 110 degrees Fahrenheit. Special collectors are included in this category. Special collectors are evacuated tube collectors or concentrating (focusing) collectors. They operate in the temperature range from just above ambient temperature (low concentration for pool heating) to several hundred degrees Fahrenheit (high concentration for air conditioning and specialized industrial processes).

³ High-temperature collectors are solar thermal collectors that generally operate at temperatures above 180 degrees Fahrenheit.

⁴ Total shipments as reported by respondents include all domestic and export shipments and may

include imports that subsequently were shipped to domestic or to foreign customers.

⁵ Prices, in nominal dollars, equal shipment value divided by quantity shipped. Value includes charges for advertising and warranties. Excluded are excise taxes and the cost of freight or transportation for the shipments.

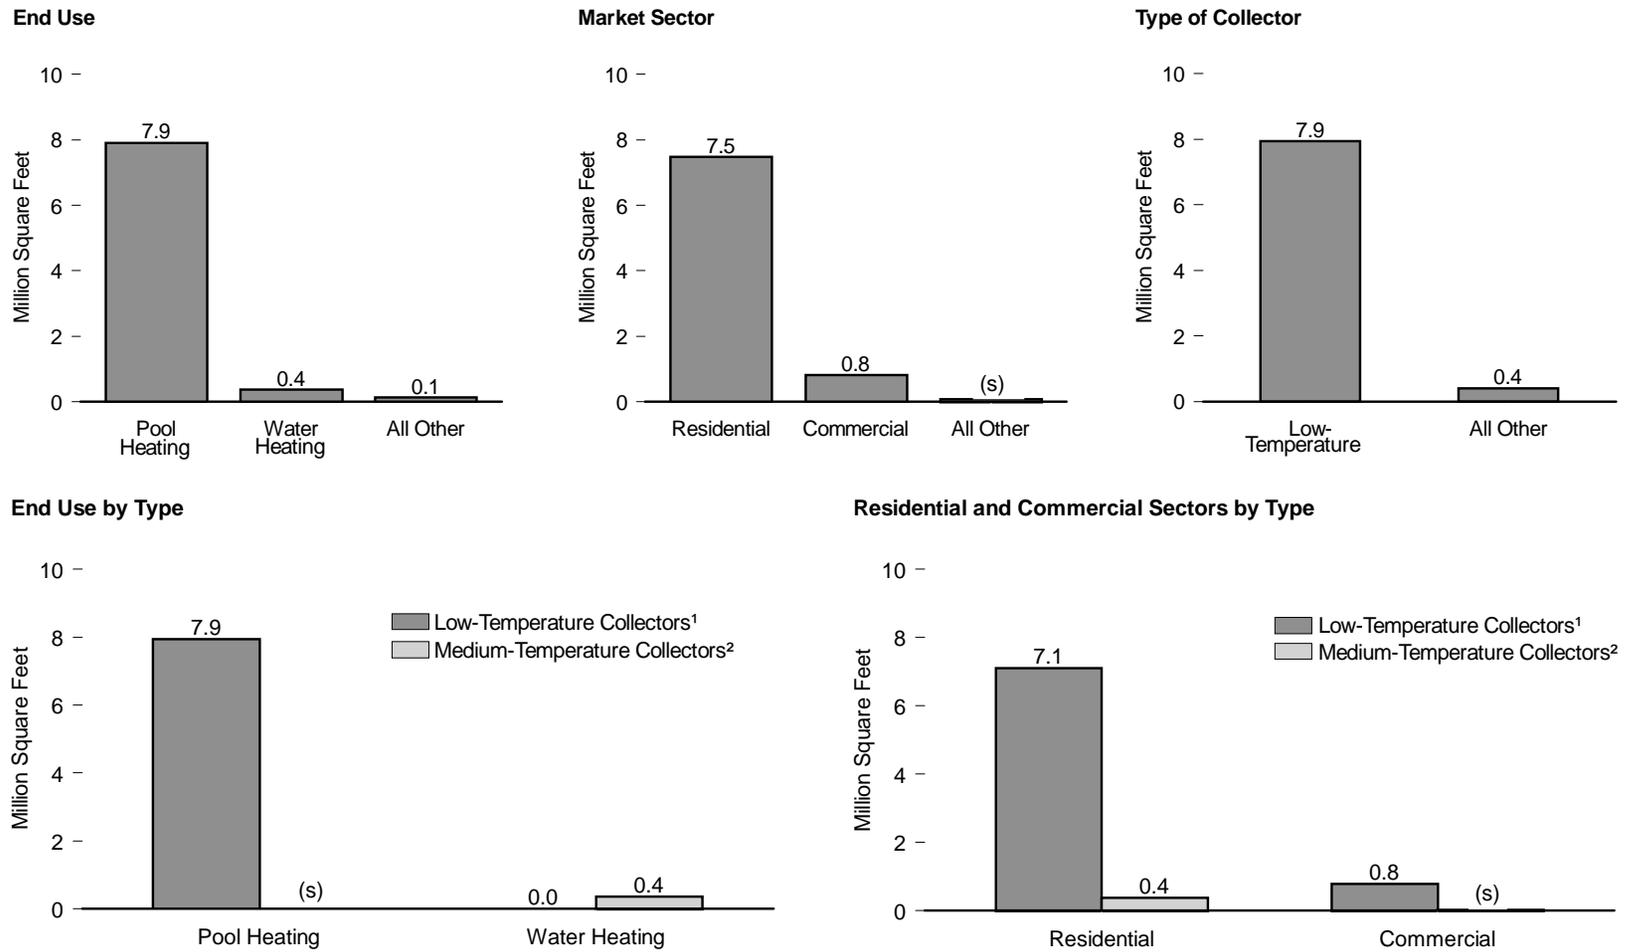

NA=Not available.

Notes: Manufacturers producing more than one type of collector are accounted for in both groups. No data are available for 1985. High-temperature collector shipments were dominated by one manufacturer.

¹ Low-temperature collectors are solar thermal collectors that generally operate at temperatures below 110 degrees Fahrenheit.

² Medium-temperature collectors are solar thermal collectors that generally operate in the temperature range of 140 degrees Fahrenheit to 180 degrees Fahrenheit but can also operate at temperatures as low as 110 degrees Fahrenheit. Special collectors are included in this category. Special collectors are evacuated tube collectors or concentrating (focusing) collectors. They operate in the temperature range from just above ambient temperature (low concentration for pool heating) to several hundred degrees Fahrenheit (high concentration for air conditioning and specialized industrial processes).

³ High-temperature collectors are solar thermal collectors that generally operate at temperatures above 180 degrees Fahrenheit. These are Parabolic dish/trough collectors used primarily by independent power producers to generate electricity for the electric grid.

⁴ Totals include other types of collectors not shown.

⁵ "Other" includes shipments of solar thermal collectors for other uses, such as cooking foods, water pumping, water purification, desalinization, distilling, etc.

⁶ Includes all independent power producers.

⁷ "Other" includes shipments of solar thermal collectors to other sectors, such as government, including the military but excluding space applications.

(s)=Less than 0.5 thousand square feet.

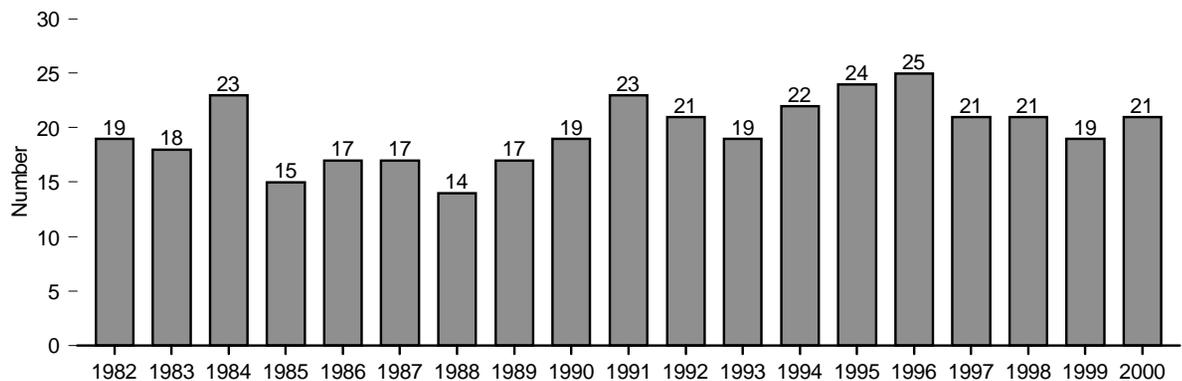

Notes: Data represent shipments from U.S. manufacturers only. Totals may not equal sum of components due to independent rounding.

¹ Prices, in nominal dollars, equal shipment value divided by quantity shipped. Value includes charges for advertising and warranties. Excluded are excise taxes and the cost of freight or transportation for the shipments.

² Total shipments include all types of photovoltaic cells and modules (single-crystal silicon, cast silicon, ribbon silicon, thin-film silicon, and concentrator silicon) and internationally traded cells and modules. Shipments of cells and modules for space and satellite applications are not included.

³ Data were imputed for one nonrespondent who exited the industry during 1990.

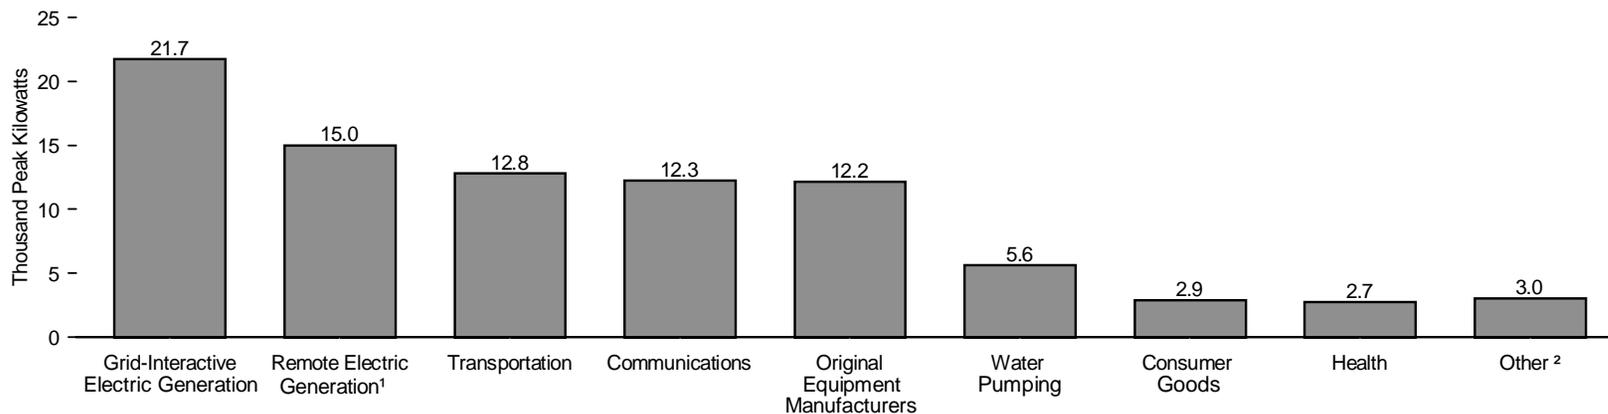

NA=Not available.

¹ Grid-interactive means connection to the electrical distribution system; remote means electricity, for general use, that does not interact with the electrical distribution system, such as at an isolated residential site or mobile home. The other end uses in this table also include electricity generation but only for the specific use cited.

² Original Equipment Manufacturers are non-photovoltaic manufacturers that combine photovoltaic technology into existing or newly developed product lines.

³ Represents such applications as cooking food, desalinization, and distilling.

⁴ Includes all independent power producers.

⁵ Shipments to foreign governments and for specialty purposes.

(s)=Less than 0.05 percent.

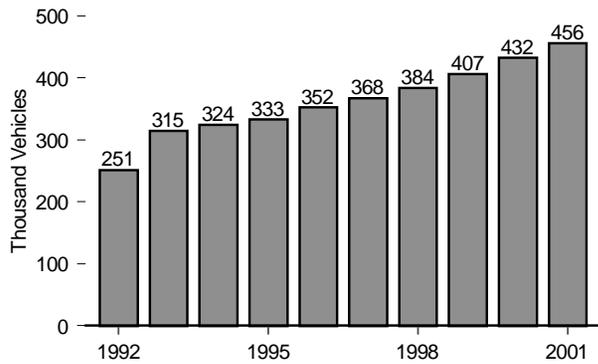

Note: Totals may not equal sum of components due to independent rounding.

¹ Dry production.

² Includes lease condensate.

³ Net generation, i.e., gross generation less plant use.

⁴ Includes net electricity generation from wood, waste, solar, and wind. Data for the United States also include other renewable energy.

R=Revised. P=Preliminary.

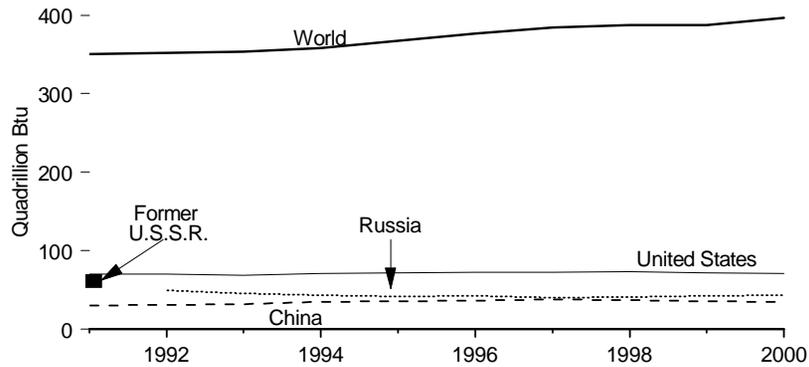

Notes: See Note 1 at end of section. Totals may not equal sum of components due to independent rounding.

P=Preliminary. — = Not applicable.

Notes: World primary energy consumption includes consumption of petroleum products (including natural gas plant liquids, and crude oil burned as fuel), dry natural gas, and coal (including net imports of coal coke); and the consumption of net electricity generated from nuclear electric power, hydroelectric power, wood, waste, geothermal, solar, and wind. It also includes, for the United States, the consumption

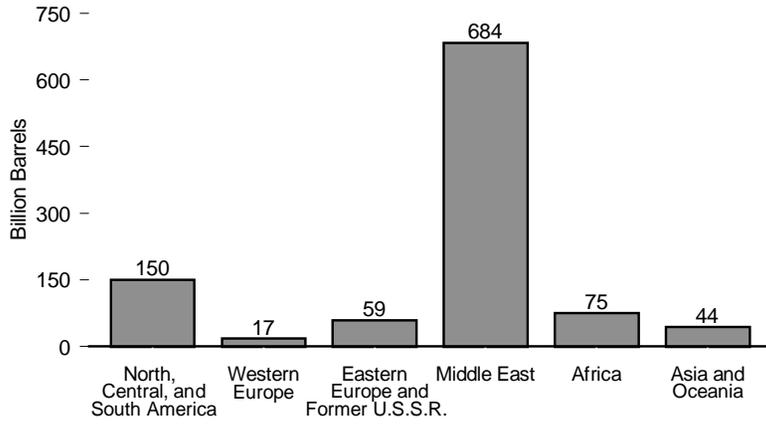

of renewable energy by the end-use sector. Totals may not equal sum of components due to independent rounding.

NA=Not available. (s)=Less than 0.05 billion barrels.

Notes: Data for Kuwait and Saudi Arabia include one-half of the reserves in the Neutral Zone between Kuwait and Saudi Arabia. All reserve figures except those for the former U.S.S.R. and natural gas reserves in Canada are proved reserves recoverable with present technology and prices at the time of

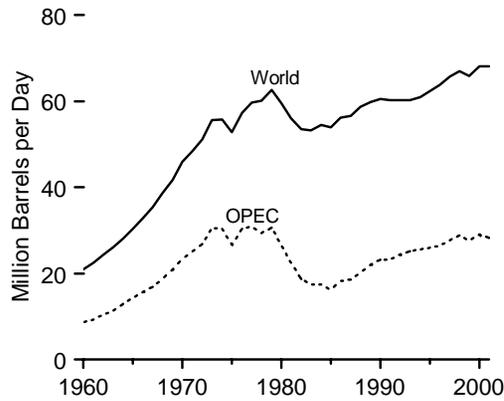

estimation. Former U.S.S.R. and Canadian natural gas figures include proved, and some probable reserves. Totals may not equal sum of components due to independent rounding.

¹ Organization of Petroleum Exporting Countries. See Glossary for membership.

² Persian Gulf Nations are Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and United Arab Emirates.

³ Includes about one-half of the production in the Neutral Zone between Kuwait and Saudi Arabia.

⁴ Ecuador, which withdrew from OPEC on December 31, 1992, and Gabon, which withdrew on December 31, 1994, are included in "Non-OPEC" for all years.

R=Revised. P=Preliminary. — = Not applicable. (s)=Less than 0.005 million barrels per day.

Notes: Includes lease condensate, excludes natural gas plant liquids. Totals may not equal sum of components due to independent rounding.

¹ Nominal dollars.

² Prices for 1974 and 1975 are for crude oil with 40 API gravity. Prices for 1980 include \$4.72 in retroactive charges and market premiums.

³ Prices from 1977 forward include 2 cents per barrel harbor dues.

⁴ 1970-1985—26 API; 1986 forward—31 API.

⁵ Price for 1980 includes \$1.87 market premiums and credit charges.

API=API gravity. R=Revised. NA=Not available.

Notes: Based on official government-selling prices, netback values, or spot market quotations.

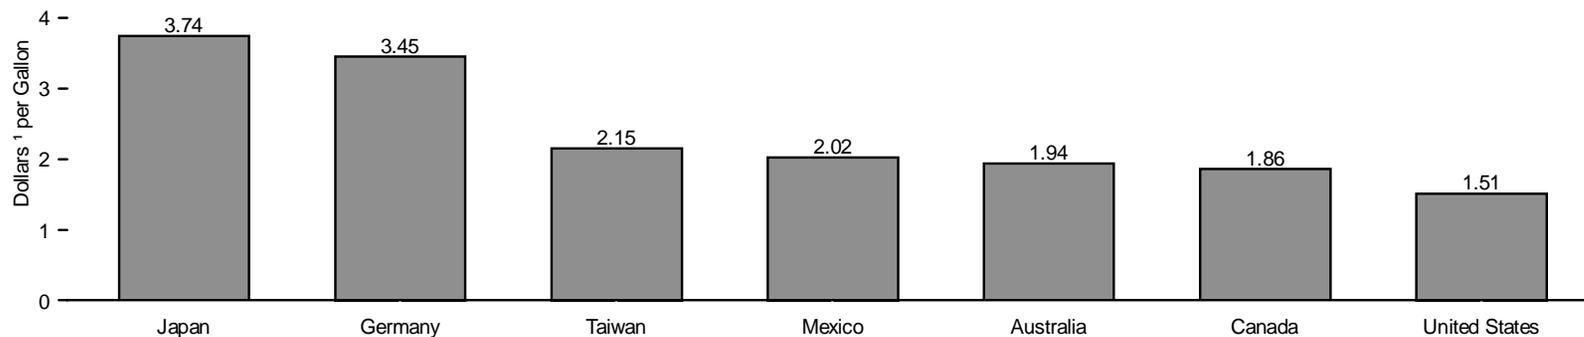

Prices are usually f.o.b. at the foreign port of lading. Prices are as of the Friday that is closest to January 1, except in 1987, when prices are as of the first Friday in February. See Tables 5.16, 5.17, and 5.19 for other types of crude oil prices for the United States, such as Domestic First Purchase Prices, Landed Costs of Crude Oil Imports, and Refiner Acquisition Costs.

¹ Nominal dollars.

² Research Octane Number (RON) of 95.

R=Revised. NA=Not available.

Notes: Prices are those actually paid, i.e., net of rebates, and include transport costs and taxes which are not refundable. Prices in national currencies are converted to U.S. dollars using exchange rates published by the International Monetary Fund. Prices for all countries, except the United States, have been converted from dollars per liter to dollars per gallon at 3.786 liters per gallon. Comparisons between prices and price trends in different countries require care. They are of limited validity because of

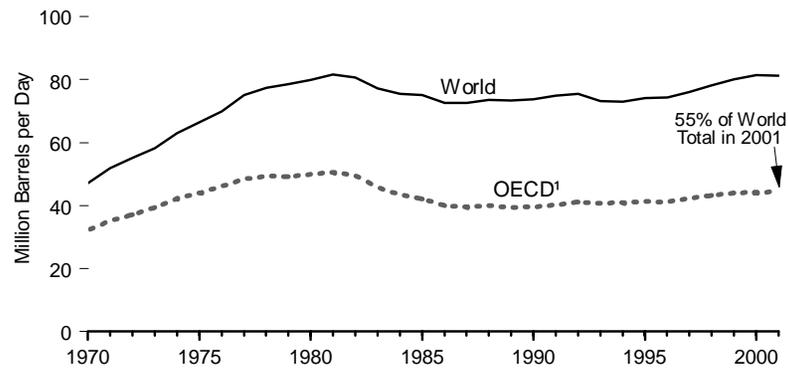

fluctuations in exchange rates, differences in product quality, marketing practices, market structures, and the extent to which the standard categories of sales are representative of total national sales for a given period.

¹ Organization for Economic Cooperation and Development. See Glossary for membership.

² Through 1969, the data for Germany are for the former West Germany only. For 1970 through 1990, this is East and West Germany. Beginning in 1991, this is unified Germany.

³ Mexico, which joined the OECD on May 18, 1994, and South Korea, which joined the OECD on December 12, 1996, are included in the OECD for all years shown in this table.

⁴ Hungary and Poland, which joined the OECD on May 7, 1996, and November 22, 1996, respectively, are included in Total OECD beginning in 1970, the first year that data for these countries were available.

The Czech Republic, which joined the OECD on December 21, 1995, is included in Total OECD beginning in 1993, the year that it came into existence.

¹ U.S. data are more current than other data on this table. They represent recoverable reserves as of December 31, 2000; data for the other countries are as of December 31, 1999, the most recent period for which they are available.

R=Revised.

Notes: World Energy Council data represent "Proved Recoverable Reserves," which are the tonnage within the "Proved Amount in Place" that can be recovered (extracted from the earth in raw form) under present and expected local economic conditions with existing, available technology. The EIA does not certify the international reserves data but reproduces the information as a matter of convenience for the reader. U. S. reserves represent estimated recoverable reserves from the Demonstrated Reserve Base

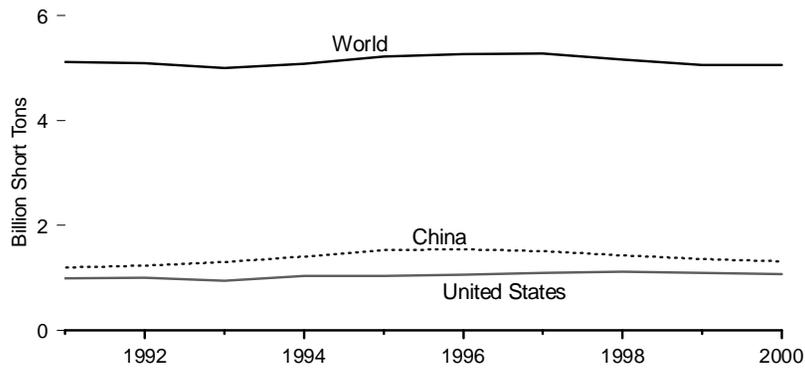

which includes both measured and indicated tonnage. The U.S. term "measured" approximates the term "proved," used by the World Energy Council. The U.S. "measured and indicated" data have been combined and cannot be recaptured as "measured alone." Totals may not equal sum of components due to independent rounding.

¹ Tons of carbon equivalent can be converted to tons of carbon dioxide gas by multiplying by 3.667. One ton of carbon equivalent = 3.667 tons of carbon dioxide gas.

² Data, when converted to million metric tons of carbon dioxide gas, may differ from the values shown for the United States in Table 12.1 because they exclude carbon dioxide emissions from geothermal, cement production, other industrial sources, waste combustion, and U.S. Territories, and include emissions from bunker fuels consumption.

R=Revised. P=Preliminary. — = Not applicable. (s)=Less than 0.5 million metric tons.
Notes: See Note 3 at end of section. Totals may not equal sum of components due to independent rounding.

International Energy

Note 1. World primary energy production includes production of crude oil (including lease condensate), natural gas plant liquids, dry natural gas, and coal; and net electricity generation from nuclear electric power, hydroelectric power, wood, waste, geothermal, solar, and wind. Data for the United States also include other renewable energy. Crude oil production is measured at the wellhead and includes lease condensate. Natural gas plant liquids are products obtained from processing natural gas at natural gas processing plants, including natural gas plants, cycling plants, and fractionators. Dry natural gas production is that amount of natural gas produced that is available to be marketed and consumed as a gas. Coal (anthracite, bituminous, subbituminous, and lignite) production is the sum of sales, mine consumption, issues to miners, and issues to coking, briquetting, and other ancillary plants at mines. Coal production data include quantities extracted from surface and underground mines and normally exclude wastes removed at mines or associated preparation plants. The data on generation of electricity from nuclear electric power, hydroelectric power, wood, waste, geothermal, solar, and wind include data reported on a net basis, thus excluding electricity that is generally used by the electric power plant for its own operating purposes or electricity losses in the transformers that are considered integral parts of the station.

Note 2. Nuclear electricity generation data in Table 11.18 are for gross output of electricity (measured at the generator terminals). Data on the gross generation of electricity in the United States are derived from data for net generation, which is gross output of electricity minus power plant use.

Note 3. Data for carbon dioxide emissions include anthropogenic (human-caused) emissions from the consumption of petroleum, natural gas, and coal, and the flaring of natural gas. They do not include carbon dioxide emissions from cement production and other industrial sources. Hydrocarbon consumption and flaring statistics for each country have been reduced to account for the fraction of fuels not combusted and, in the case of petroleum, for the fraction of sequestration of non-fuel uses. Carbon dioxide emissions have been determined by applying carbon emission coefficients to the adjusted consumption and flaring data. Carbon emission coefficients for petroleum, natural gas, and flared gas are from Energy Information Administration, *Emissions of Greenhouse Gases in the United States 2000*, DOE/EIA-0573(2000), October 2001, Table B1 at: <http://www.eia.doe.gov/oiaf/1605/ggrpt/appendixb.html>. Carbon emission coefficients for coal are from Energy Information Administration, *Emissions of Greenhouse Gases in the United States 1985-1990*, DOE/EIA-0573, October 1993, Table 11.

¹ Emissions of greenhouse gases were weighted based upon their relative global warming potential (gwp), with carbon dioxide gas equal to a weight of one, and were converted to carbon equivalent by dividing by 3.667. The use of updated estimates of gwp resulted in a number of revisions to previously published data. It is also important to note that revisions in estimated emissions result from revisions in energy consumption as well.

² Carbon dioxide emissions do not reflect the revised electric power statistics that are presented in other sections of the *Annual Energy Review 2001*.

R=Revised. P=Preliminary. (s)=Less than 0.05 million metric tons.

Notes: HFCs = hydrofluorocarbons; PFCs = perfluorocarbons; and SF₆ = sulfur hexafluoride. Emissions are from anthropogenic sources. Anthropogenic means produced as the result of human

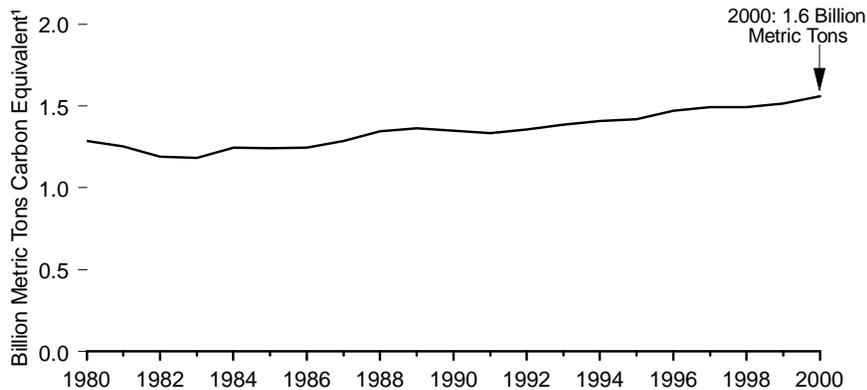

activities, including emissions from agricultural activity and domestic livestock. Emissions from natural sources, such as wetlands and wild animals, are not included. Because estimation methods for greenhouse gases are currently being developed, data are frequently revised on an annual basis in keeping with the latest findings of the international scientific community. For some of the gases, such as carbon dioxide, revisions are a small percentage of the total (on the order of 1 percent), but for other gases, such as nitrous oxide, they may be on the order of 100 percent.

¹ Tons of carbon equivalent can be converted to tons of carbon dioxide gas by multiplying by 3.667. One ton of carbon equivalent = 3.667 tons of carbon dioxide gas.

² The Standard Industrial Classification (SIC) system has been replaced by the North American Industry Classification System (NAICS).

³ "Net Electricity" is obtained by summing purchases, transfers in, and generation from noncombustible renewable resources, minus quantities sold and transferred out. It excludes electricity generated from combustible fuels.

⁴ Includes all other types of energy that respondents indicated were consumed.

⁵ Carbon Intensity is million metric tons of carbon per quadrillion Btu. In the carbon intensity calculations electricity was evaluated as site electricity, the electricity delivered to the end user. Site electricity is equal to 3,412 Btu per kilowatt-hour.

(s)=Less than 0.05 million metric tons. Q=Data withheld because the relative standard error was greater

than 50 percent.

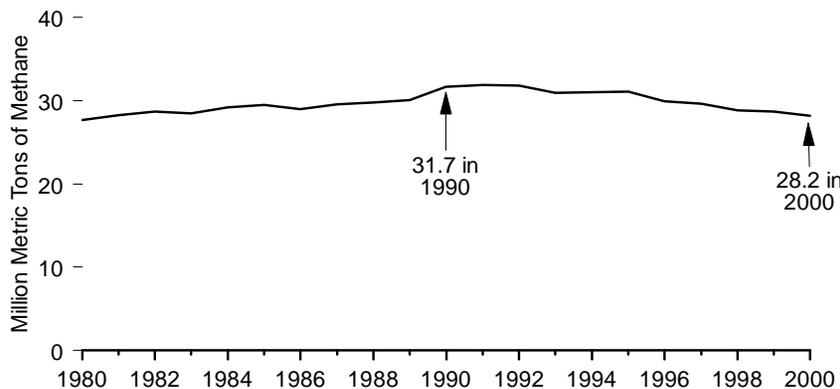

Notes: For prior surveys and the current Manufacturing Energy Consumption Survey, emissions are available classified under the old Standard Industrial Classification System. See the Web Page. The estimates are for the first use of energy for heat and power and as feedstocks or raw material inputs. First use is defined as the consumption of the energy that was originally produced offsite or was produced onsite from input materials not classified as energy. See Table 2.3 for manufacturing energy use. Totals may not equal sum of components due to independent rounding.

Web Page: <http://www.eia.doe.gov/emeu/mecs>.

¹ Animals such as cattle, buffalo, sheep, goats, and camels emit methane as a product of digestion.

² There is a discontinuity in this time series between 1989 and 1990 due to the expanded coverage of the emissions from oil production beginning in 1990.

R=Revised. P=Preliminary.

Notes: Emissions are from anthropogenic sources. Anthropogenic means produced as the result of human activities, including emissions from agricultural activity and domestic livestock. Emissions from natural sources, such as wetlands and wild animals, are not included. Estimates of methane emissions are, in general, highly uncertain. The level of precision is probably on the order of 30 to 50 percent. For additional information, see "Appendix C, Tier 1 Uncertainty Analysis of Emissions Estimates" in the source

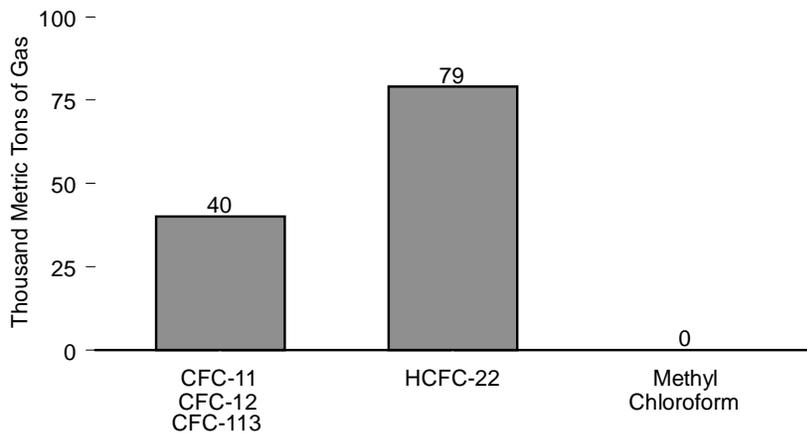

report. Under certain conditions, methane may be produced via anaerobic decomposition of organic materials in landfills, animal wastes, and rice paddies. Because inventory methods for greenhouse gases are currently being developed, data are frequently revised on an annual basis in keeping with the latest findings of the international scientific community. Totals may not equal sum of components due to independent rounding.

R=Revised. P=Preliminary. NA=Not available.

Notes: CFC = chlorofluorocarbons; HCFC = chlorodifluoromethane; and VOCs = volatile organic compounds. Ozone depleting substances are gases containing chlorine that are being controlled under the Montreal Protocol because they deplete the earth's stratospheric ozone layer. They are also powerful greenhouse gases that have direct and indirect impacts on the earth's climate. CFC-113, carbon tetrachloride, and methyl chloroform were primarily used as solvents until the production of these ozone depleting compounds ended in 1995. Emissions of these compounds will eventually end completely when all stockpiles are used. Criteria pollutants are regulated as urban air pollutants. They are also powerful

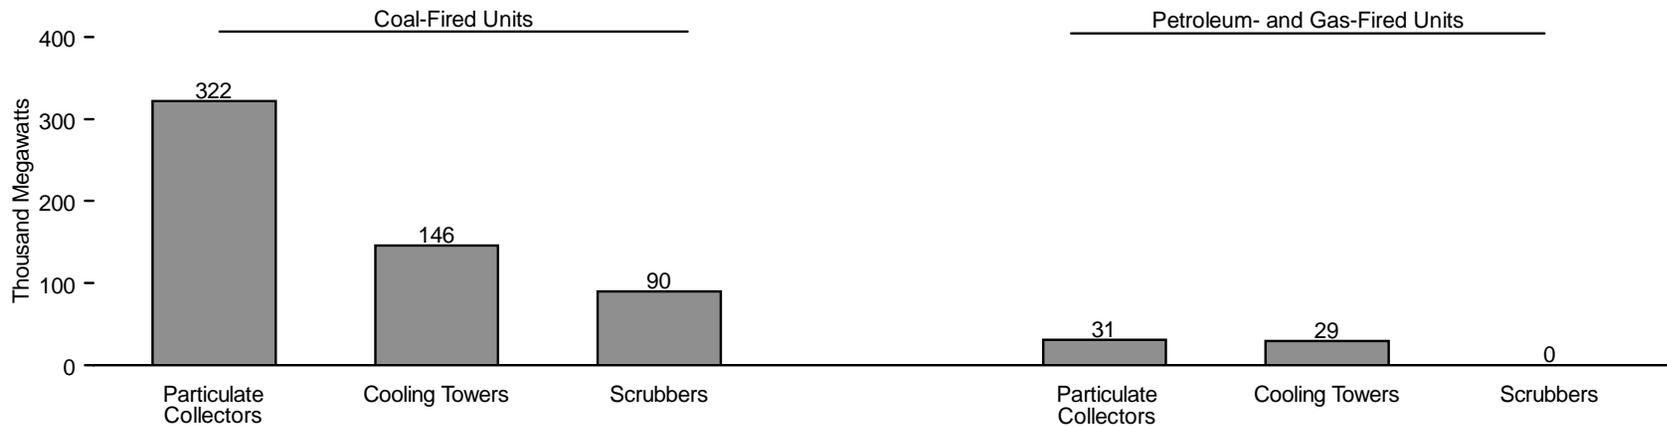

greenhouse gases that have direct and indirect impacts on Earth's climate. Because estimation methods for greenhouse gases are currently being developed, data are frequently revised on an annual basis in keeping with the latest findings of the international scientific community.

Appendix A

Thermal Conversion Factors

Using Thermal Conversion Factors

The thermal conversion factors presented in the following tables can be used to estimate the heat content in British thermal units (Btu) of a given amount of energy measured in physical units, such as barrels or cubic feet. For example, 10 barrels of asphalt has a heat content of approximately 66.36 million Btu (10 barrels x 6.636 million Btu per barrel = 66.36 million Btu).

The heat content rates (i.e., thermal conversion factors) provided in this section represent the gross (or upper) energy content of the fuels. Gross heat content rates are applied in all Btu calculations for the *Annual Energy Review* and are commonly used in energy calculations in the United States; net (or lower) heat content rates are typically used in European energy calculations. The difference between the two rates is the amount of energy that is consumed to vaporize water that is created during the combustion process. Generally, the difference ranges from 2 percent to 10 percent, depending on the specific fuel and its hydrogen content. Some fuels, such as unseasoned wood, can be more than 40 percent different in their gross and net heat content rates.

In general, the annual thermal conversion factors presented in Tables A2 through A6 are computed from final annual data or from the best available data and are labeled “preliminary.” Often, the previous year’s factor is used as the preliminary value until data become available to calculate the factor appropriate to the year. The source of each factor is described in the section entitled “Thermal Conversion Factor Source Documentation,” which follows Table A6 in this appendix.

Thermal conversion factors for hydrocarbon mixes are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60-40 butane-propane mixture, the thermal conversion factor for butane is weighted 1.5 times the thermal conversion factor for propane.

More information about British thermal units (the standardized unit of measure for energy) can be found in the Glossary.

Table A1. Approximate Heat Content of Petroleum Products
(Million Btu per Barrel)

Energy Source	Heat Content
Asphalt	6.636
Aviation Gasoline	5.048
Butane	4.326
Butane-Propane Mixture (60 percent-40 percent)	4.130
Distillate Fuel Oil	5.825
Ethane	3.082
Ethane-Propane Mixture (70 percent-30 percent)	3.308
Isobutane	3.974
Jet Fuel, Kerosene-Type	5.670
Jet Fuel, Naphtha-Type	5.355
Kerosene	5.670
Lubricants	6.065
Motor Gasoline	
Conventional ¹	5.253
Oxygenated ¹	5.150
Reformulated ¹	5.150
Fuel Ethanol ²	3.539
Natural Gasoline	4.620
Pentanes Plus	4.620
Petrochemical Feedstocks	
Naphtha less than 401° F	5.248
Other Oils equal to or greater than 401° F	5.825
Still Gas	6.000
Petroleum Coke	6.024
Plant Condensate	5.418
Propane	3.836
Residual Fuel Oil	6.287
Road Oil	6.636
Special Naphthas	5.248
Still Gas	6.000
Unfinished Oils	5.825
Unfractionated Stream	5.418
Waxes	5.537
Miscellaneous	5.796

¹See Table A3 for motor gasoline annual weighted averages beginning in 1994.

²Fuel ethanol, which is derived from agricultural feedstocks (primarily corn), is not a petroleum product but is blended into motor gasoline. Its gross heat content (3.539 million Btu per barrel) is used in *Annual Energy Review* calculations; its net heat content (3.192 million Btu per barrel) is used in the Energy Information Administration’s *Renewable Energy Annual* calculations.

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants.

² There is a discontinuity in this time series between 1966 and 1967; beginning in 1967, the single constant factor is replaced by a quantity-weighted average of liquefied petroleum gases' major components.

³ There is a discontinuity in this time series between 1993 and 1994; beginning in 1994, the single

constant factor is replaced by a factor that is a quantity-weighted average of motor gasoline's major components. See Table A1.

R=Revised. P=Preliminary.

Note: Weighted averages of the products included in each category are calculated by using heat content values shown in Table A1.

Source: See "Thermal Conversion Factor Source Documentation," which follows Table A6.

¹ Used as the thermal conversion factor for hydroelectric, solar, and wind electricity net generation.

² Used as the thermal conversion factor for geothermal electricity net generation.

R=Revised data. P=Preliminary data. — = Not applicable.

Source: See "Thermal Conversion Factor Source Documentation," which follows this table.

Thermal Conversion Factor Source Documentation

Approximate Heat Content of Petroleum and Natural Gas Plant Liquids

Asphalt. The Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Aviation Gasoline. EIA adopted the thermal conversion factor of 5.048 million Btu per barrel as adopted by the Bureau of Mines from the Texas Eastern Transmission Corporation publication *Competition and Growth in American Energy Markets 1947-1985*, a 1968 release of historical and projected statistics.

Butane. EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Butane-Propane Mixture. EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See **Butane** and **Propane**.

Crude Oil, Exports. Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See **Crude Oil** and **Lease Condensate, Production**.

Crude Oil, Imports. Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content by using National Bureau of Standards, Miscellaneous Publication No. 97, *Thermal Properties of Petroleum Products*, 1933.

Crude Oil and Lease Condensate, Production. EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of

Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Crude Oil and Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See **Crude Oil, Exports** and **Exports Petroleum Products**.

Crude Oil and Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product and each crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See **Crude Oil, Imports** and **Petroleum Products, Imports**.

Distillate Fuel Oil. EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Ethane. EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Ethane-Propane Mixture. EIA calculation of 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See **Ethane** and **Propane**.

Isobutane. EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Jet Fuel, Kerosene Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel for "Jet Fuel, Commercial" as published by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, a 1968 release of historical and projected statistics.

Jet Fuel, Naphtha Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel for “Jet Fuel, Military” as published by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, a 1968 release of historical and projected statistics.

Kerosene. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, “Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950.”

Liquefied Petroleum Gases (LPG) Consumption. Ethane, ethylene, propane, propylene, normal butane, butylene, and isobutane produced at refineries or natural gas processing plants, including plants that fractionate new natural gas plants liquids.

Lubricants. EIA adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Miscellaneous Products. EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Motor Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.253 million Btu per barrel for “Gasoline, Motor Fuel” as published by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, a 1968 release of historical and projected statistics. Conversion factors for reformulated and oxygenated motor gasolines are calculated by EIA based on data published in the Environmental Protection Agency, Office of Mobile Sources, National Vehicle and Fuel Emissions Laboratory report EPA 420-F-95-003 *Fuel Economy Impact Analysis of Reformulated Gasoline*. Both of the factors are currently 5.150 million Btu per barrel.

Natural Gas Plant Liquids, Production. Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced, weighted by the quantity of each natural gas plant liquid produced.

Natural Gasoline. EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Pentanes Plus. EIA assumed the thermal conversion factor to be 4.620 million Btu or equal to that for natural gasoline. See **Natural Gasoline**.

Petrochemical Feedstocks, Naphtha less than 401° F. Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion factor for special naphthas. See **Special Naphthas**.

Petrochemical Feedstocks, Other Oils equal to or greater than 401° F. Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See **Distillate Fuel Oil**.

Petrochemical Feedstocks, Still Gas. Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See **Still Gas**.

Petroleum Coke. EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal memorandum, “Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950.” The Bureau of Mines calculated this factor by dividing 30.120 million Btu per short ton, as given in the referenced Bureau of Mines internal memorandum, by 5.0 barrels per short ton, as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

Petroleum Products, Total Consumption. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed, weighted by the quantity of each petroleum product consumed.

Petroleum Products, Consumption by Electric Utilities. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in EIA’s *State Energy Data Report*.

Petroleum Products, Consumption by Industrial Users. Calculated annually by EIA as the average of the thermal conversion factors for all

petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in EIA's *State Energy Data Report*.

Petroleum Products, Consumption by Residential and Commercial Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in EIA's *State Energy Data Report*.

Petroleum Products, Consumption by Transportation Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the transportation sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in EIA's *State Energy Data Report*.

Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product, weighted by the quantity of each petroleum product exported.

Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported, weighted by the quantity of each petroleum product imported.

Plant Condensate. Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas.

Propane. EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Residual Fuel Oil. EIA adopted the thermal conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Road Oil. EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel, which was assumed to be equal to that of asphalt (see **Asphalt**) and was first published by the Bureau of Mines in the *Petroleum Statement, Annual, 1970*.

Special Naphthas. EIA adopted the Bureau of Mines thermal conversion factor of 5.248 million Btu per barrel, which was assumed to be equal to that of the total gasoline (aviation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970*.

Still Gas. EIA adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel, first published in the *Petroleum Statement, Annual, 1970*.

Unfinished Oils. EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel (see **Distillate Fuel Oil**) and first published it in EIA's *Annual Report to Congress, Volume 3, 1977*.

Unfractionated Stream. EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see **Plant Condensate**) and first published it in EIA's *Annual Report to Congress, Volume 2, 1981*.

Waxes. EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Approximate Heat Content of Natural Gas

Natural Gas, Total Consumption. • 1949-1962: EIA adopted the thermal conversion factor of 1,035 Btu per cubic foot as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*. • 1963-1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in *Gas Facts*, an AGA annual publication. • 1980 forward: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity of natural gas consumed.

Natural Gas, Consumption by Electric Utilities. Calculated annually by EIA by dividing the total heat content of natural gas received at electric

utilities by the total quantity received at electric utilities. The heat contents and receipts are from Form FERC-423 and predecessor forms.

Natural Gas, Consumption by Sectors Other Than Electric Utilities.

Calculated annually by EIA by dividing the heat content of all natural gas consumed less the heat content of natural gas consumed at electric utilities by the quantity of all natural gas consumed less the quantity of natural gas consumed at electric utilities. Data are from Forms EIA-176, FERC-423, EIA-759, and predecessor forms.

Natural Gas, Exports. • 1949-1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. (See **Natural Gas, Total Consumption**). • 1973 forward: Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on Form FPC-14.

Natural Gas Imports. • 1949-1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See **Natural Gas, Total Consumption**. • 1973 forward: Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity of natural gas imported, both reported on Form FPC-14.

Natural Gas, Production (Dry). Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See **Natural Gas, Total Consumption**.

Natural Gas, Production, Marketed (Wet). Calculated annually by EIA by adding the heat content of natural gas, dry production, and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production.

Approximate Heat Content of Coal and Coal Coke

Coal, Total Consumption. Calculated annually by EIA by dividing the sum of the heat content of coal consumption by the total tonnage.

Coal, Consumption by Electric Utilities. Calculated annually by EIA by dividing the sum of the heat content of coal received at electric utilities by the sum of the total tonnage received.

Coal, Consumption by Other Power Producers. Calculated annually by dividing the total heat content of coal consumed by other power producers by their total consumption tonnage.

Coal, Consumption by the Electric Power Sector. Calculated annually by dividing the total heat content of coal by total consumption tonnage of the electric power sector.

Coal, Consumption by End-Use Sectors. Calculated annually by EIA by dividing the sum of the heat content of coal consumed by the end-use sectors by the sum of the total tonnage.

Coal, Exports. Calculated annually by EIA by dividing the sum of the heat content of coal exported by the sum of the total tonnage.

Coal, Imports. Calculated annually by EIA by dividing the sum of the heat content of coal imported by the sum of the total tonnage.

Coal, Production. Calculated annually by EIA by dividing the sum of the total heat content of coal produced by the sum of the total tonnage.

Coal Coke, Imports and Exports. EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

Approximate Heat Rates for Electricity

Fossil-Fueled Steam-Electric Plant Generation. There is no generally accepted practice for measuring the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. Therefore, EIA used data from Form EIA-767, "Steam-Electric Plant Operation and Design Report," to calculate a rate factor that is equal to the prevailing annual average heat rate factor for fossil-fueled steam-electric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption, such as droughts. The heat content of a kilowatt-hour of electricity produced, regardless of the generation process, is 3,412 Btu. • 1949-1955: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in *Thermal-Electric Plant Construction Cost and Annual Production Expenses-1981* and *Steam-Electric Plant Construction Cost and Annual Production Expenses-1978*. • 1956-1988: The weighted annual average heat

rate for fossil-fueled steam-electric power plants in the United States, as published in EIA, *Electric Plant Cost and Power Production Expenses 1991*, Table 9. • 1989 forward: Calculated annually by EIA by using the heat rate reported on Form EIA-860, “Annual Electric Generator Report” (and predecessor forms EIA-860A, EIA-860B, and EIA-867), and the generation on Form EIA-906, “Power Plant Report” (and predecessor forms).”

Geothermal Energy Plant Generation. • 1960-1981: Calculated annually by EIA by weighting the annual average heat rates of operating geothermal units by the installed nameplate capacities as reported on Form FPC-12, “Power System Statement.” • 1982 forward: Estimated annually by EIA on the basis of an informal survey of relevant plants.

Nuclear Steam-Electric Plant Generation. • 1957-1984: Calculated annually by dividing the total heat content consumed in nuclear generating units by the total (net) electricity generated by nuclear generating units. The heat content and electricity generation were reported on Form FERC-1, “Annual Report of Major Electric Utilities, Licensees, and Others”; Form EIA-412, “Annual Report of Public Electric Utilities”; and predecessor forms. The factors for 1982 through 1984 were published in the following EIA reports-1982: *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants 1982*, page 215. 1983 and 1984: *Electric Plant Cost and Power Production Expenses 1991*, Table 13. 1985 forward: Calculated annually by EIA by using the heat rate reported on Form EIA-860, “Annual Electric Generator Report,” and the generation reported on Form EIA-906, “Power Plant Report” (and predecessor forms).

Appendix B

Metric and Other Physical Conversion Factors

Data presented in the *Annual Energy Review* and in other Energy Information Administration publications are expressed predominately in units that historically have been used in the United States, such as British thermal units, barrels, cubic feet, and short tons. However, because U.S. commerce involves other nations, most of which use metric units of measure, the U.S. Government is committed to the transition to the metric system, as stated in the Metric Conversion Act of 1975 (Public Law 94-168), amended by the Omnibus Trade and Competitiveness Act of 1988 (Public Law 100-418), and Executive Order 12770 of July 25, 1991.

The metric conversion factors presented in Table B1 can be used to calculate the metric-unit equivalents of values expressed in U.S. customary units. For

example, 500 short tons is the equivalent of 453.6 metric tons (500 short tons x 0.9071847 metric tons/short ton = 453.6 metric tons).

In the metric system of weights and measures, the names of multiples and subdivisions of any unit may be derived by combining the name of the unit with prefixes, such as deka, hecto, and kilo, meaning, respectively, 10, 100, 1,000, and deci, centi, and milli, meaning, respectively, one-tenth, one-hundredth, and one-thousandth. Common metric prefixes can be found in Table B2.

The conversion factors presented in Table B3 can be used to calculate equivalents in various physical units commonly used in energy analyses. For example, 10 barrels is the equivalent of 420 U.S. gallons (10 barrels x 42 gallons/barrel = 420 gallons).

Table B1. Metric Conversion Factors

U.S. Unit	multiplied by	Conversion Factor	equals	Metric Unit	U.S. Unit	multiplied by	Conversion Factor	equals	Metric Unit
Mass					Volume				
short tons (2,000 lb)	x	0.907 184 7	=	metric tons (t)	barrels of oil (bbl)	x	0.158 987 3	=	cubic meters (m ³)
long tons	x	1.016 047	=	metric tons (t)	cubic yards (yd ³)	x	0.764 555	=	cubic meters (m ³)
pounds (lb)	x	0.453 592 37 ^a	=	kilograms (kg)	cubic feet (ft ³)	x	0.028 316 85	=	cubic meters (m ³)
pounds uranium oxide (lb U ₃ O ₈)	x	0.384 647 ^b	=	kilograms uranium (kgU)	U.S. gallons (gal)	x	3.785 412	=	liters (L)
ounces, avoirdupois (avdp oz)	x	28.349 52	=	grams (g)	ounces, fluid (fl oz)	x	29.573 53	=	milliliters (mL)
					cubic inches (in ³)	x	16.387 06	=	milliliters (mL)
Length					Area				
miles (mi)	x	1.609 344 ^a	=	kilometers (km)	acres	x	0.404 69	=	hectares (ha)
yards (yd)	x	0.914 4 ^a	=	meters (m)	square miles (mi ²)	x	2.589 988	=	square kilometers (km ²)
feet (ft)	x	0.304 8 ^a	=	meters (m)	square yards (yd ²)	x	0.836 127 4	=	square meters (m ²)
inches (in)	x	2.54 ^a	=	centimeters (cm)	square feet (ft ²)	x	0.092 903 04 ^a	=	square meters (m ²)
					square inches (in ²)	x	6.451 6 ^a	=	square centimeters (cm ²)
Energy					Temperature				
British Thermal Units (Btu)	x	1,055.055 852 62 ^{a,c}	=	joules (J)	degrees Fahrenheit (°F)	x	5/9 (after subtracting 32) ^{a,d}	=	degrees Celsius (°C)
calories (cal)	x	4.186 8 ^a	=	joules (J)					
kilowatthours (kWh)	x	3.6 ^a	=	megajoules (MJ)					

^aExact conversion.

^bCalculated by the Energy Information Administration.

^cThe Btu used in this table is the International Table Btu adopted by the Fifth International Conference on Properties of Steam, London, 1956.

^dTo convert degrees Celsius (°C) to degrees Fahrenheit (°F) exactly, multiply by 9/5, then add 32.

Notes: • Spaces have been inserted after every third digit to the right of the decimal for ease of reading. • Most metric units shown belong to the International System of Units (SI), and the liter, hectare, and

metric ton are accepted for use with the SI units. For more information about the SI units, contact Dr. Barry Taylor at Building 221, Room B610, National Institute of Standards and Technology, Gaithersburg, MD 20899, or on telephone number 301-975-4220.

Appendix C

Carbon Dioxide Emission Factors for Coal

Table C1 presents U.S. average carbon dioxide emission factors for coal by sector. The factors measure the emissions produced during the combustion of coal and were derived from coal sample analyses. The factors are ratios of the carbon dioxide emitted to the heat content of the coal burned,

assuming complete combustion. Factors vary according to the rank and geographic origin of the coal. Sectoral factors reflect the rank and origin of the coal consumed annually in the sector.

Table C1. Average Carbon Dioxide Emission Factors for Coal by Sector, 1980-2000
(Pounds of Carbon Dioxide per Million Btu)

Year	Residential and Commercial	Industrial			U.S. Average ^b
		Coke Plants ^a	Other Coal	Electricity Generation	
1980	210.6	205.8	205.9	206.7	206.5
1981	212.0	205.8	205.9	206.9	206.7
1982	210.4	205.7	206.0	207.0	206.9
1983	209.2	205.5	205.9	207.1	207.0
1984	209.5	205.6	206.2	207.1	207.0
1985	209.3	205.6	206.4	207.3	207.1
1986	209.2	205.4	206.5	207.3	207.1
1987	209.4	205.2	206.4	207.3	207.2
1988	209.1	205.3	206.4	207.6	207.3
1989	209.7	205.3	206.6	207.5	207.3
1990	212.0	206.6	208.7	209.7	209.6
1991	212.6	206.6	209.3	209.9	209.9
1992	213.5	206.5	209.1	210.1	209.9
1993	211.7	206.4	208.3	209.1	209.0
1994	211.1	206.7	208.4	209.2	209.1
1995	211.4	206.7	208.6	209.5	209.4
1996	210.7	206.6	208.2	209.5	209.3
1997	209.6	206.9	208.2	209.4	209.3
1998	210.9	207.1	208.5	209.6	209.5
1999	210.3	206.9	208.6	209.9	209.7
2000	210.5	207.2	208.1	210.0	209.8

^aNo allowances have been made for carbon retained in non-energy coal chemical byproducts from the carbonization process.

^bWeighted average. The weights used are consumption values by sector.

NA=Not available. — = Not applicable. (s)=Less than 0.0005 quadrillion Btu.

Notes: No data are available for years not shown. See end of section for discussion of geographic coverage of data.

Sources: **Coal, Natural Gas, Petroleum, and Hydroelectric Power:** 1850-1945: *Energy in the American Economy, 1850-1975*, Table VII. **Wood:** 1635-1845: U.S. Department of Agriculture Circular No. 641, *Fuel Wood Used in the United States 1630-1930*, February 1942. This source estimates fuelwood consumption in cords per decade, which were converted to Btu using the conversion factor of 20 million Btu

per cord. The annual average value for each decade was assigned to the fifth year of the decade on the assumption that annual use was likely to increase during any given decade and the average annual value was more likely to reflect mid-decade yearly consumption than use at either the beginning or end of the decade. Values thus begin at 1635 and are plotted at 10-year intervals. 1850-1945: *Energy in the American Economy, 1850-1975*, Table VII. Values are plotted at 5-year intervals. There is a discontinuity in the wood plot between 1945 and 1949 due to changes in definitions. Data through 1945 are for fuelwood only, while thereafter include wood-derived fuel and wood byproducts burned as fuel.

Table F1b. Energy Consumption in the United States, 1949-2001
(Quadrillion Btu)

Year	Coal	Natural Gas ¹	Petroleum ²	Nuclear Electric Power	Hydroelectric Power ³	Wood

¹ Includes supplemental gaseous fuels.

² Petroleum products supplied, including natural gas plant liquids and crude oil burned as fuel.

³ Conventional hydroelectric power and hydroelectric pumped storage (pumped storage facility production minus energy used for pumping). Through 1988, includes all electricity net imports. From 1989,

includes only electricity net imports derived from hydroelectric power.

P=Preliminary. R=Revised data. (s)=Less than 0.0005 quadrillion Btu.

Sources: **Wood:** Table 10.1. **All Other Data:** Table 1.3.

Geographic Coverage Note

Tables F1a and F1b present estimates of U.S. energy consumption by energy source for a period that begins a century and a half before the original 13 colonies formed a political union and continues through the decades during which the United States was still expanding territorially. The question thus arises, what exactly is meant by “U.S. consumption” of an energy source for those years when the United States did not formally exist or consisted of less territory than is now encompassed by the 50 States and the District of Columbia?

The documents used to assemble the estimates, and (as far as possible) the sources of those documents, were reviewed carefully for clues to geographic coverage. For most energy sources, the extent of coverage expanded more rapidly than the Nation, defined as all the official States and the District of Columbia. Estimates or measurements of consumption of each energy source generally appear to follow settlement patterns. That is, they were made for areas of the continent that were settled enough to have economically significant consumption even though those areas were not to become States for years. The wood data series, for example, begins in 1635 and includes 12 of the original colonies (excepting Georgia), as well as Maine, Vermont, and the area that would become the District of Columbia.

By the time the series reaches 1810, the rest of the continental States are all included, though the last of the 48 States to achieve statehood did not do so until 1912. Likewise, the coal data series begins in 1850 but includes consumption in areas, such as Utah and Washington (State), which were significant coal-producing regions but had not yet attained statehood. (Note: No data were available on State-level historical coal consumption. The coal data shown in Table F1a through 1945 describe *apparent* consumption, i.e., production plus imports minus exports. The geographic coverage for coal was therefore based on a tally of coal-producing States listed in various historical issues of *Minerals Yearbook*. It is likely that coal was consumed in States where it was not mined in significant quantities.)

By energy source, the extent of coverage can be summarized as follows:

- **Wood**—All 48 contiguous States and the District of Columbia by 1810; Alaska and Hawaii beginning in 1949.
- **Coal**—35 coal-producing States by 1885.
- **Petroleum and natural gas**—All 48 contiguous States, the District of Columbia, and Alaska by 1885; Hawaii beginning in 1949.
- **Hydroelectric power**—Coverage for 1890 and 1895 is uncertain, but probably the 48 contiguous States and the District of Columbia. Coverage for 1900 through 1945 is the 48 contiguous States, and the District of Columbia; Alaska and Hawaii beginning in 1949.
- **Nuclear electric power**—Coverage is all 50 States and the District of Columbia throughout.

Appendix G

Classification of Power Plants into Energy-Use Sectors

The Energy Information Administration (EIA) classifies power plants (both electricity-only and combined-heat-and-power plants) into energy-use sectors based on the North American Industry Classification System (NAICS), which replaced the Standard Industrial Classification (SIC) system in 1997. Plants with a NAICS code of 22 are assigned to the Electric Power Sector; those with NAICS codes beginning with 11, 21, 23, 31, 32, and 33, as well as the codes 2212 and 22131, are assigned to the Industrial Sector; and those with all other codes are assigned to the Commercial Sector. The Form EIA-860B, "Annual Electric Generator Report–Nonutility," asked respondents to indicate the primary purpose of the facility by selecting a NAICS code from the table below. The new Form EIA-860, "Annual Electric Generator Report," asks respondents to indicate the primary purpose of the facility by selecting from the universal list of NAICS codes at: www.census.gov/epcd/naics02/naicod02.htm.

Agriculture, Forestry, and Fishing

- 111 Agriculture production-crops
- 112 Agriculture production, livestock and animal specialties.
- 115 Agricultural services
- 113 Forestry
- 114 Fishing, hunting, and trapping

Mining

- 2122 Metal mining
- 2121 Coal mining
- 211 Oil and gas extraction
- 2123 Mining and quarrying of nonmetallic minerals except fuels

Construction

23

Manufacturing

- 311 Food and kindred products
- 3122 Tobacco products
- 314 Textile and mill products
- 315 Apparel and other finished products made from fabrics and similar materials
- 321 Lumber and wood products, except furniture
- 337 Furniture and fixtures
- 322 Paper and allied products (other than 322122 or 32213)
- 322122 Paper mills, except building paper
- 32213 Paperboard mills
- 323 Printing and publishing
- 325 Chemicals and allied products (other than 325188, 325211, 32512, or 325311)
- 325188 Industrial inorganic chemicals
- 325211 Plastics materials and resins
- 32512 Industrial organic chemicals
- 325311 Nitrogenous fertilizers

- 324 Petroleum refining and related industries (other than 32411)
- 32411 Petroleum refining
- 326 Rubber and miscellaneous plastic products
- 316 Leather and leather products
- 327 Stone, clay, glass, and concrete products (other than 32731)
- 32731 Cement, hydraulic
- 331 Primary metal industries (other than 331111 or 331312)
- 331111 Blast furnaces and steel mills
- 331312 Primary aluminum
- 332 Fabricated metal products, except machinery and transportation equipment
- 333 Industrial and commercial equipment and components except computer equipment

Appendix H

Estimating and Presenting Power Sector Fuel Use in EIA Publications and Analyses

This appendix was prepared by an inter-office team under the direction of Mary J. Hutzler. General questions and comments about this document may be referred to Renee Miller (202) 287-1718. Specific technical questions may be referred to:

Section I (Overview) and Section II (Background) – Alan Beamon (202) 586-2025

Section III (Multi-Fuel Publications) – Katherine E. Seiferlein (202) 586-5695

Section IV (Electric Power) – Robert M. Schnapp (202) 287-1787

Section V (Natural Gas) – Roy Kass (202) 586-4790

Section VI (Coal) – Betsy K. O'Brien (202) 287-1760

Section VII (Petroleum) – Alice A. Lippert (202) 586-9600

Section VIII (Renewable Energy) – Louise A. Guey-Lee (202) 287-1731

Section IX (Greenhouse Gas Emissions) – Perry M. Lindstrom (202) 586-0934

I. Background

The Energy Information Administration (EIA) has comprehensively reviewed and revised how it collects, estimates, and reports fuel use for facilities producing electricity. The review addressed inconsistent reporting of the fuels used for electric power and changes in the electric power marketplace that have been inconsistently represented in various EIA survey forms and publications. For example:

In some cases fuel use by combined-heat-and-power (CHP) plants¹ has been reported as industrial sector fuel use, while in other cases it has been reported as electric power sector fuel use.

Electricity generation and fuel consumption have been categorized and reported in several different ways, such as (1) utility only; (2) utility and independent power producers; or (3) utility, independent power producers, and CHP plants. The restructuring of the power industry is making some of these categories less meaningful.

The goal of EIA's comprehensive review was to improve the quality and consistency of its electric power data throughout all data and analysis products. Because power facilities operate in all sectors of the economy (e.g., in commercial buildings, such as hospitals and college campuses, and industrial facilities, such as paper mills and refineries) and use many fuels, any change to electric power data affects data series in nearly all fuel areas and causes changes in a wide variety of EIA publications.

As a result of the comprehensive review, EIA has made the following changes:

EIA has adjusted all presentations of data on electric power to a consistent format and defined the electric power sector to include electricity-only and CHP plants whose primary business is to sell electricity, or electricity and heat, to the public.

¹ Combined-heat-and-power plants (CHP) produce both electricity and useful thermal output. EIA formerly referred to these plants as cogenerators, but has determined that CHP better describes the facilities because some of the plants included in EIA's data do not produce heat and power in a sequential fashion, and as a result do not meet the legal definition of cogeneration specified in the Public Utilities Regulatory Policies Act (PURPA).

EIA is providing detail within the electric power sector, commercial sector, and industrial sector on fuel used by CHP plants in those sectors.

EIA has changed the sources of data on fuel used by components of the electric power sector. All tabulations and publications will use data obtained from EIA's surveys of electric power generators. This change in data source contributes to changes in total fuel consumption of natural gas.

EIA has revised its historical data on electric power to resolve data anomalies. The revisions contribute to changes in EIA's electricity series as well as the fuel-use series.

This document provides detail on these changes and describes the reasoning behind the changes and their effects on EIA forms and publications. The *Annual Energy Review (AER) 2001* is the first of the annual publications to be released with the new formats. In the upcoming months, EIA will be releasing other annual publications, followed by the monthly publications. The remainder of this document is organized as follows:

Section II provides an overview of the key changes.

Section III discusses the impacts on multi-fuel publications.²

Sections IV through VIII provide specific information for electric power, natural gas, coal, petroleum, and renewable energy surveys and publications, respectively. Although the changes have not yet been implemented in these publications, they are reflected in *AER 2001* for these topics.

Section IX provides information on the estimation of greenhouse gas emissions. These data do not appear in the *AER 2001*, but are based on data in it. Data on greenhouse gas emissions will appear in the upcoming EIA publication, *Emissions of Greenhouse Gases in the United States*.

² Multi-fuel publications are those that provide information on multiple fuels and sectors, such as the *Monthly Energy Review* and the *Annual Energy Review*.

II. Overview of Key Changes

The many changes that will occur because of the fuel review generally fall into three broad categories: (1) the categorization of electric power facilities, (2) the reporting of combined-heat-and-power plant fuel use, and (3) data series revisions resulting from revised electric power fuel use estimates. Each of these areas is discussed below.

Categorization of Electric Power Facilities

Until the 1990s, most electric power generation and fuel use data could be meaningfully categorized into electric utilities and nonutility power producers.³ Electric utilities were generally structured as vertically integrated⁴ power companies that were responsible for generating, transmitting, and distributing power to consumers within their franchised service territory. Nonutility power producers were generally independent generators—mostly combined-heat-and-power plants—that produced some power for their own use and sold the remainder to utilities for distribution to consumers. However, in recent years, many formerly integrated utilities have split apart, spinning off the generating part of their business into separate companies. Independent developers have built most of the new generating capacity that has been installed in recent years. As a result, the distinction between utility and nonutility power plants has become much less meaningful. In fact, a large portion of the growth in nonutility generation in recent years is due to the reclassification of utility power plants as nonutility power plants.

To reflect the changing industry structure, EIA is now organizing electric power generation and fuel use data into two new categories: electricity-only and combined-heat-and-power (CHP) plants. These categories separate power plants by function; i.e., power only or power plus thermal, rather than by ownership class.

Electricity-only plants represent all plants, whether owned by utilities or nonutilities that produce only electricity. CHP plants represent entities that

³ For an example of this, see *Electric Power Annual 1998*, Volume II, DOE/EIA-0348(98)/2, December 1999.

⁴ In this context "integrated" means that the company is involved in the three main sectors of the electric power business—generation, transmission, and distribution.

produce both electricity and some form of thermal energy. Both categories will have some facilities that are owned by traditional utilities and independent companies.

In addition, EIA is now presenting data for an electric power sector that includes electricity-only plants and CHP plants whose primary business is to sell electricity, or electricity and heat, to the public (North American Industry Classification System code 22). This contrasts with some previous data presentations in which the electric power sector included industrial and commercial CHP plants as well (Figure H1).

Figure H1. Electric Power Sector in AER 2001 and AER 2000

AER 2001			AER 2000		
Electric Power Sector ^{1,2}			Electric Power Sector ¹		
Electricity Only	CHP	Total	Electric Utilities	Nonutility Power Producers	Total

In some tables and publications, the electric power sector will continue to be broken down into electric utilities and independent power producers for customers who have expressed an interest in this breakout. For example, Table 8.1 of *AER 2001* presents an electricity overview and shows data on net generation for electric utilities and independent power producers separately. It is the only table in *AER 2001* that has this break-out (Figure H2).

Figure H2. Electric Utilities and Independent Power Producers are shown separately in Electricity Overview

Year	Net Generation					
	Electric Power Sector ¹			Commercial Sector ²	Industrial Sector ³	Total
	Electric Utilities	Independent Power Producers	Total			

¹ The electric power sector (electric utilities and independent power producers) comprises electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public—i.e., NAICS 22 plants. Due to the restructuring of the electric power sector, the sale of generation assets is resulting in a reclassification of plants from electric utilities to independent power producers.

Reporting of CHP Facility Fuel Use

Historically, fuel consumption in CHP plants has been combined with other uses in many EIA publications. For example, in some tables the use of natural gas in commercial and industrial CHP plants was included with other commercial and industrial uses. Further, some of the fuel consumption (the portion associated with electricity production) at these same facilities was also reported under the column labeled “Nonutility Power Producers.” Based on questions received, it became clear that this categorization led to confusion for many EIA customers.

In the future, EIA will distinguish within the industrial, commercial, and electric power sectors what portion of fuel consumption is used in CHP facilities and non-CHP facilities. For example:

In tabulations of energy use by economic sector, if a commercial or industrial facility has a CHP unit, the total fuel consumption for that unit will be reported under commercial or industrial, but it will be identified separately from other commercial or industrial consumption. Figure H3 provides an example for natural gas consumption in the industrial sector. It shows the headings in Table 6.5 of *AER 2001* compared with the headings for the same table in *AER 2000*.

Figure H3. Electric Power Sector in AER 2001 and AER 2000

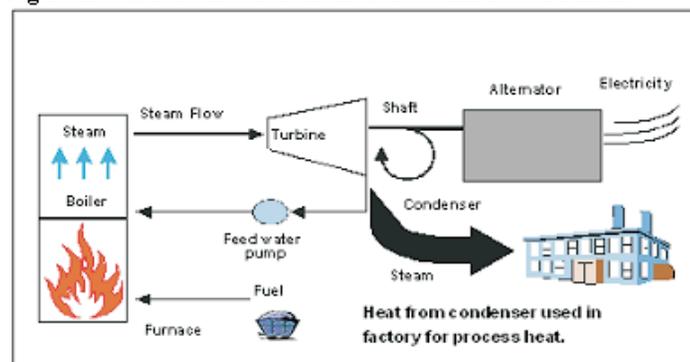

AER 2001				AER 2000		
End-Use Sectors				End-Use Sectors		
Industrial				Industrial ²		
Lease and Plant Fuel	Other Industrial			Delivered to Industrial Facilities	Lease and Plant Fuel	Total
	CHP ¹	Non-CHP ¹	Total			

CHP plants that report their primary business is generating and selling power to others will be reported in a separate column in the electric power sector, as shown in Figure H1.

In tabulations of energy use to produce electric power, the total fuel consumption reported by CHP plants will be further separated into that which is used to produce electricity and that

which is used to produce thermal energy.⁵ See Tables 8.3b,c, and d of *AER 2001*. Figure H4 shows a schematic for combined heat and power producers.

Figure H4. Schematic for Combined Heat and Power Plants

The separation between electricity and thermal uses is being done because many EIA data users have expressed interest in knowing how much fuel is used to produce electricity in the United States.

Data Series Revisions Resulting From Changes in Electric Power Fuel Use Estimates

The revisions to electric power data affect many areas. For example, historically, to estimate natural gas use, EIA surveyed natural gas pipeline-companies and local gas utilities to obtain data on natural gas used by residential, commercial, industrial, and electric utility sectors, and nonutility generators.⁶ However, EIA also surveyed electric utilities on their natural gas use. These data obtained directly from the end user were generally thought to be more accurate than the data obtained from natural gas suppliers. As a result, total natural gas use was estimated by adding together the data from natural gas companies on residential, commercial, industrial, and nonutility power producer use to the amount reported directly

⁵ For the method used to separate the fuel used at CHP plants between electricity and useful thermal energy production, see Section IV.

⁶ Energy Information Administration, Form EIA-176, "Annual Report of Natural and Supplemental Gas Supply and Disposition."

by electric utilities. The data collected for nonutility power producers were included with industrial use in previous EIA natural gas publications.

With the changing structure of the electricity sector, this reporting approach no longer appears reasonable. EIA has decided to follow the procedure described for electric utilities and use data obtained from its direct surveys of nonutility electric generators rather than the natural gas supplier surveys.⁷ More detail on how the various fuel sectors are affected is given in the following sections.

Data changes are also occurring because of the extensive review of reported data that was undertaken in this process. Since it was decided that data reported directly by utilities and nonutility power generators would be the primary source of fuel consumption data for the power sector, an examination of heat rates,⁸ capacity factors,⁹ and power-to-steam ratios across 12 years of reported data was conducted. As a result, data for nonutility power producers for 1989 through 2000 have been revised. The data review procedure is described in Section IV under the heading "Efforts to Improve Data." As a result of the review by expert EIA analysts, anomalous values have been investigated and resolved and the result is higher quality data at aggregated levels.

Revisions resulting from changing the source of fuel consumption data for nonutilities and from EIA's data review affect data beyond the category of nonutilities. For example, the revised estimate of natural gas consumption for 2000 is 3 percent higher (.75 trillion cubic feet) in the *Annual Energy Review (AER) 2001* than in *AER 2000* (Table H1 and Figure H5).

On the other hand, the revised estimate of renewable energy consumption for 2000 is 5 percent lower in *AER 2001* than in *AER 2000* (Figure H6), due largely to a downward revision in the estimate of biomass energy consumption particularly wood/wood waste at electric power plants. A

⁷ Energy Information Administration, Form EIA-759, "Monthly Power Plant Report" for electric utilities and Forms EIA-867 and EIA-860B, "Annual Electric Generator Report-Nonutility" for nonutilities. Starting with 2001, data for both utilities and nonutilities are collected on a new survey, Form EIA-906, "Power Plant Report."

⁸ Heat rates are computed by dividing the heat content of the fuel burned to generate electricity by the resulting net kilowatt-hour generation.

⁹ Capacity factors are the ratio of the electrical energy produced by a generating unit for the period of time considered to the electrical energy that could have been produced at continuous full power operation during the same period.

Table H1. Revisions to Selected Estimates: AER 2001 and AER 2000

Electricity Net Generation: Total (All Sectors)			
(Billion Kilowatthours)			
Year	AER 2000	AER 2001	Percent Difference
1998	3,618	3,620	0.1
1999	3,706	3,695	-0.3
2000	3,792	3,802	0.3
Total Natural Gas Consumption			
(Trillion Cubic feet)			
Year	AER 2000	AER 2001	Percent Difference
1998	21.26	22.24	4.6
1999	21.70	22.40	3.2
2000	22.71	23.46	3.3
Total Coal Consumption			
(Million Short Tons)			
Year	AER 2000	AER 2001	Percent Difference
1998	1,038.30	1,037.10	-0.1
1999	1,045.30	1,038.60	-0.6
2000	1,079.70	1,084.10	0.4
Total Petroleum Consumption			
(Million Barrels Per Day)			
Year	AER 2000	AER 2001	Percent Difference
1998	18.92	18.92	0.0
1999	19.52	19.52	0.0
2000	19.48	19.70	1.1
Total Renewable Energy Consumption			
(Trillion Btu)			
Year	AER 2000	AER 2001	Percent Difference
1998	6,977	6,782	-2.8
1999	7,226	6,790	-6.0
2000	6,823	6,465	-5.2

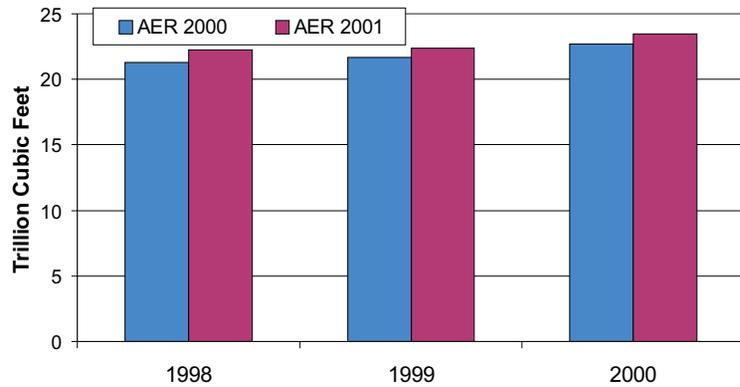

Sources: Electricity Net Generation, Table 8.1 of *AER 2000* and *AER 2001*. Natural Gas, Consumption, Table 6.5 of *AER 2000* and *AER 2001*. Coal Consumption, Table 6.5 of *AER 2000* and *AER 2001*. Petroleum Consumption, Table 5.12 of *AER 2000* and *AER 2001*. Renewable Energy Consumption, Table 10.2b of *AER 2000* and *AER 2001*.

smaller revision resulted from the procedure to assign fuel consumption by energy type at some solar and hydroelectric plants. In *AER 2001*, the assignment was made at the boiler level while in *AER 2000* it was based on aggregate plant-level information.

Estimates for petroleum and coal consumption show little change between the 2000 and 2001 *AERs* for the same year. This is also true for electricity net generation.

In addition, as a result of the recategorization of nonutility data, estimates of industrial natural gas consumption have been revised and are lower. For example, in *AER 2000* EIA showed 9.39 trillion cubic feet delivered to industrial facilities in 2000. In *AER 2001* the comparable figure (under the

Figure H5. Impact of Revisions to Total Natural Gas Consumption

“other industrial” heading) for 2000 is 8.25 trillion cubic feet (Figure H7). This change is a result of the change in the operational definition of deliveries to the industrial sector, which is explained in Section V.

Because the natural gas consumption table in the AER best illustrates the changes that have been made, Table 6.5 of *AER 2001* and *AER 2000* are presented here for comparison.

<http://www.eia.doe.gov/emeu/aer/txt/ptb0605.html>
<http://www.eia.doe.gov/emeu/aer/txt/tab0605.htm>

To summarize the changes, data for combined-heat-and-power plants are shown separately by end-use sector in *AER 2001* while they are included with the sector totals for *AER 2000*. Independent power producers are excluded from the industrial sector in *AER 2001* and included in the electric power sector. Data are based on a survey of electric generators. By contrast, independent power producers were included in the industrial sector in *AER 2000* and data were based on a survey of natural gas suppliers.

Figure H6. Impact of Revisions to Total Renewable Energy Consumption

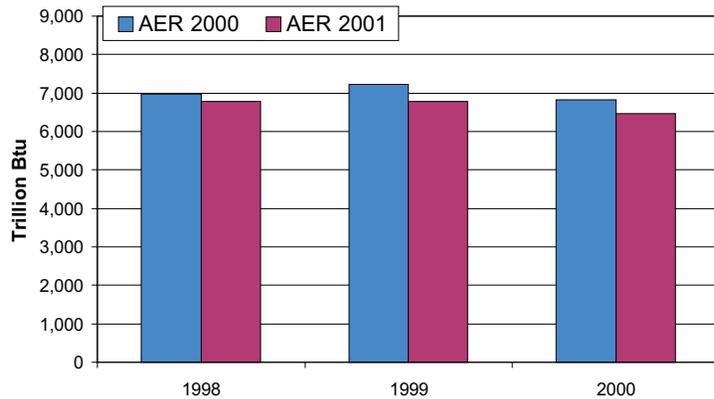

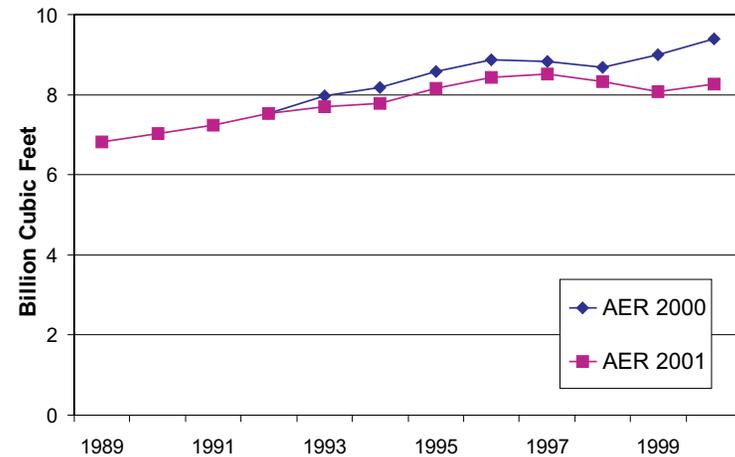

Figure H7. Industrial Natural Gas Consumption: AER 2001 and AER 2000

Note: AER 2000 Industrial equals “Deliveries to Industrial Facilities.”
 AER 2001 Industrial equals “Other Industrial Total.”

III. Multi-Fuel Publications

EIA's multi-fuel publications—i.e., those that report data on numerous energy sources and provide overall energy totals—will be reformatted to incorporate the new approach described in detail in the preceding sections. The *Annual Energy Review 2001* is the first of the historical multi-fuel publications to be released with the new formats. In the months ahead, EIA will undertake the redesign of the *Monthly Energy Review* (MER) to make its data and presentations conform to the new AER. In addition to the MER, the State-level consumption, price, and expenditure estimates that have previously been released under the titles *State Energy Data Report* and *State Energy Price and Expenditure Report* will be reformatted beginning with the 2001 update; the 2000 updates are now in final processing and will not conform to the new AER formats. Coordinated data and presentation changes will also be incorporated into EIA's forecast products—the *Short-Term Energy Outlook* (STEO) and the *Annual Energy Outlook* (AEO).

The *Annual Energy Review 2001* (AER 2001) includes many redesigned tables (and related graphs) that were adapted to present the new electricity data. Revised tables fall into three groupings: electricity, fuels, and total energy. These tables are interrelated.

Table 8.3e provides data on fuel consumption for both electricity generation and useful thermal output. Data on consumption by the electric power sector on Table 8.3e correspond with data for this sector on fuel consumption tables (e.g., Table 6.5 on natural gas, Table 7.3 on coal, and Table 10.2b on renewable energy consumption). See Figure H8 for natural gas.

Similarly, data on commercial sector CHP plants on Table 8.3e correspond with the commercial sector CHP columns of the fuel consumption tables and data on industrial sector CHP plants on Table 8.3e correspond with the industrial sector CHP columns of the fuel consumption tables.

Table 8.3a provides data on consumption of combustible fuels for electricity generation. Data on the amount of fossil fuel (such as coal, residual fuel oil, and natural gas) and on the amount of renewable energy used to generate electricity at both electricity-only and combined-heat-and-power (CHP) plants can be found on this table.

Table 8.3a data on fuel consumed for electricity generation differ from those for the electric power sector on the fuel consumption tables (e.g., Table 6.5 for natural gas) because the electric power sector includes entities that produce thermal energy as well as electricity (CHP plants whose primary business is to sell electricity). In addition, there are entities that generate electricity that are not in the electric power sector (commercial sector CHP plants and industrial sector CHP plants). Table 8.3d provides data on consumption for useful thermal output at CHP plants.

Electricity Tables. Most AER 2000 electricity tables were altered in format for presentation in the AER 2001. This crosswalk provides the relationship from each AER 2000 table to its closest match in the AER 2001:

AER 2000	AER 2001	Title in the AER 2001
8.1	8.1	Electricity Overview
8.2	8.2a	Electricity Net Generation: Total (All Sectors)
8.3	8.2b	Electricity Net Generation at Electricity-Only Plants: Electric Power Sector
8.4	8.2c	Electricity Net Generation at Combined-Heat-and-Power Plants by Sector
--	8.2d	Useful Thermal Output at Combined-Heat-and-Power-Plants by Sector
8.8	8.3a	Consumption of Combustible Fuels for Electricity Generation: Total (All Sectors)
8.9	8.3b	Consumption of Combustible Fuels for Electricity Generation at Electricity-Only Plants: Electric Power Sector
8.10	8.3c	Estimated Consumption of Combustible Fuels for Electricity Generation at Combined-Heat-and-Power-Plants by Sector
--	8.3d	Estimated Consumption of Combustible Fuels for Useful Thermal Output at Combined-Heat-and-Power Plants by Sector
--	8.3e	Consumption of Combustible Fuels for Electricity Generation and Useful Thermal Output at Electricity-Only and Combined-Heat-and-Power Plants by Sector
8.11	8.4	Stocks of Coal and Petroleum: Electric Power Sector
8.12	8.5	Electricity End Use
8.15	8.6	Average Retail Prices of Electricity
8.5	8.7a	Electric Net Summer Capacity: Total (All Sectors)
8.6	8.7b	Electric Net Summer Capacity at Electricity-Only Power Plants: Electric Power Sector
8.7	8.7c	Electric Net Summer Capacity at Combined-Heat-and-Power Plants by Sector
8.14	8.8	Electric Noncoincident Peak Load and Capacity Margin
8.13	8.9	Electric Utility Demand-Side Management Programs

Fuel Tables. The following AER 2001 fuel tables were reformatted from the previous year's report to incorporate the new electricity information:

- 5.12a Petroleum Consumption: Residential and Commercial Sectors
- 5.2b Petroleum Consumption: Industrial Sector
- 5.12d Petroleum Consumption: Electric Power Sector
- 5.13 Oil and Kerosene Adjusted Sales
- 6.5 Natural Gas Consumption by Sector
- 7.3 Coal Consumption by Sector
- 7.5 Coal Stocks by Sector
- 10.2a Renewable Energy Consumption: End-Use Sectors
- 10.2b Renewable Energy Consumption: Electric Power Sector, Electricity Trade, and Total
- 12.2 Carbon Dioxide Emissions From Energy Consumption by Sector
- 12.3 Carbon Dioxide Emissions From Energy Consumption by Sector by Energy Source
- 12.7 Emissions From Electricity Generation
- A3 Approximate Heat Content of Petroleum Product Weighted Averages
- A4 Approximate Heat Content of Natural Gas
- A5 Approximate Heat Content of Coal and Coal Coke

Total Energy Tables. The following AER 2001 tables summarize all energy consumption and include format changes that are related to the new electricity information:

- 2.1a Energy Consumption by Sector
- 2.1c Commercial Energy Consumption Sector
- 2.1d Industrial Energy Consumption Sector
- 2.1f Electric Power Sector Energy Consumption

AER 2000 Table 2.1f is replaced in the AER 2001 with:

- 2.2a Energy Consumption for Electricity Generation: Total (All Sectors)
- 2.2b Energy Consumption for Electricity Generation: Electric Power Sector
- 2.2c Consumption for Electricity Generation: Commercial and Industrial Sectors

IV. Electric Power Surveys and Publications

Summary of Key Changes

EIA previously presented data on electric power, such as generation and fuel consumption, in the following categories:

- Electric utilities,
- Nonutility power producers (independent power producers and combined-heat-and power plants),
- Electric power industry (sum of electric utilities and nonutility power producers).

Now EIA is presenting data for the following new categories:

- Electricity-only-plants
- Combined-heat-and-power (CHP) plants,
- U.S. power producers (sum of electricity-only plants and CHP plants and equal to the prior "electric power industry" category).

Data on electricity-only plants are disaggregated for utilities and independent power producers, as there are customers who are interested in maintaining this distinction. Data on CHP plants are disaggregated by the end-use category (commercial, industrial, electric power) they report as their major line of business. The categorization is based on their North American Industrial Classification System code. For example, a CHP plant that is part of a hospital will be classified as "commercial." Similarly, a CHP plant that reports that it is part of a paper mill will be classified as "industrial," and a plant that reports that its primary business is selling power to others will be classified as "electric power."

In addition, EIA has estimated and is presenting data on the amount of fuel used to generate electricity and the amount of fuel used for useful thermal output. Furthermore, during the course of recategorizing the data, EIA performed a thorough data quality review and revised data to resolve anomalies.

Efforts to Improve Data

EIA reviewed electric power-data from 1989 through 2001 to determine whether there were anomalies. The 1989–2000 data for nonutilities were from Form EIA-860B, "Annual Electric Generator Report-Nonutility," and its predecessor, Form EIA-867, "Annual Nonutility Power Producer

Report.” The 2001 data are from Form EIA-906, “Power Plant Report.” These forms collect data on fuel consumption, generation, and, with the exception of 1995 through 1997, useful thermal output. When anomalies were identified in the data for the more recent years (1998–2001), EIA contacted selected respondents to resolve the inconsistencies. For the historical data it was not possible to contact respondents. In this situation EIA made data adjustments to resolve the anomalies.

EIA reviewed data for facilities with heat rates greater than 40,000 Btu per kilowatt-hour and less than 5,500 Btu per kilowatt-hour. The upper limit was chosen to allow for the heat rates of older non-electricity boilers. In addition, EIA reviewed data for facilities with overall efficiency of greater than 100 percent and identified facilities with thermal output that were not designated as CHP plants. To ensure consistency, EIA compared North American Industry Classification System (NAICS) codes, cogenerator status, fuel consumption, electric generation, and thermal output levels over time. Moreover, EIA analysts also reviewed and evaluated aggregate-level data by State, NAICS code, fuel type, and generator type. For the historical data (1989–1997), EIA also:

- Estimated a value for useful thermal output for 1995 through 1997 (when useful thermal output was not included on the survey form) that produced a heat rate between 5,500 and 40,000 Btu per kilowatt-hour and an efficiency rate consistent with that observed in other years (see discussion below on CHP fuel use methodology).
- Corrected errors in units reported for fuel consumption.
- Compared data on fuel consumption with data on electric generation and adjusted data on fuel consumption or generation to maintain a consistent ratio.
- Adjusted data on useful thermal output for those respondents with heat rates outside the 5,500-to-40,000 Btu per kilowatt-hour range and an efficiency rate consistent with other years.

The review included an examination of both respondent-level data and aggregate-level data. For the 1998-2000 data, the review also included a comparison for consistency with data reported by manufacturing plants on Form EIA-3, “Quarterly Coal Consumption—Manufacturing Plants,” since a subset of the EIA-3 manufacturing plants generate electricity and also reported on the electric generator survey Form EIA-860B. In general, there was good correspondence between the data submissions. In situations where there were inconsistencies, selected respondents were contacted to explain the differences. The analysis revealed that in some instances there were legitimate explanations for high percentage differences, such as a

respondent reporting data for a facility on one survey that should not be included in the other survey.

For 2001, EIA determined that the monthly submissions for a substantial number of facilities were not of high enough quality. For those facilities in question and for all of the facilities that submit data only on an annual basis, EIA substituted that facility’s 2000 data submission for total fuel consumption, electricity generation, and useful thermal output to obtain estimates for *AER 2001*. EIA is in the process of reviewing and revising these submissions for release at a later date.

Allocating CHP Fuel Use

Because respondents do not keep records on how much fuel a CHP plant uses exclusively to produce electricity, EIA developed the following method for estimating how the total fuel consumed in the boiler is split between electricity generation and useful thermal output:

First, a steam boiler efficiency rate of 80 percent was assumed.¹⁰ Then the reported or estimated value for useful thermal output (in Btu) was divided by 0.8 to estimate the fuel used to generate this amount of thermal output.

Next, this value was subtracted from total fuel consumption and the remainder was assumed to be the amount used for electric generation.

Electric Power Publication Tables Affected

In both the *Electric Power Monthly* and the *Electric Power Annual*:

- Data will be shown for the following categories throughout most of the report: (1) U.S. power producers, (2) electricity-only plants, and (3) CHP plants (commercial, industrial, and electric power). Data on fuel consumption are shown for both electric generation and thermal output.
- The lowest level of aggregation is at the State level.
- Data on petroleum coke are converted to barrels and included in petroleum consumption and stocks tables.
- Fuel types are revised to be consistent with the *Annual Energy Review*.

¹⁰ Arthur D. Little, Report to the Energy Information Administration, Industrial Model: *Update on Energy Use and Industrial Characteristics*, (September 2001), Appendix C, “Average Boiler Efficiencies.”

V. Natural Gas Surveys and Publications

Summary of Key Changes

A number of changes have been made to natural gas consumption data presentations, definitions, and data sources. As a result of these changes the presentation of natural gas consumption by end-use sector will be consistent with end-use sector presentations and definitions in other EIA publications and the measures of natural gas used by electricity generators will be explicitly presented and identical to the quantities presented in electric power publications.

In prior EIA data publications natural gas consumption was presented for residential, commercial, industrial, transportation, and electric utility sectors. Deliveries of natural gas to independent power producers (called “other nonutility power producers” on the survey form) were included in the data reported for the industrial sector and the measures were collected through natural gas survey forms submitted by gas delivery agents (local distribution companies and pipelines).

Beginning with *Annual Energy Review (AER) 2001*, the definition of industrial sector gas consumption for 1993-2001 no longer includes independent power producers. In addition, a new electric power sector is being used which includes independent power producers, utilities, and other electricity generators as described in the previous electricity discussion. The data reported for the electric power sector are derived entirely from data submitted on electricity data collection forms used over the period 1993-2001. These include Forms EIA-759, “Monthly Power Plant Report” and EIA-860B, “Annual Electric Generator Report-Nonutility” through 2000 and Form EIA-906, “Power Plant Report” for 2001.

Compared with past publications, the impact of the definitional change for the industrial sector is to reduce measured natural gas consumption by the industrial sector. For example, in *AER 2000* EIA showed 9.39 trillion cubic feet delivered to industrial facilities in 2000. In *AER 2001*, the comparable figure (under the “other industrial” heading) for 2000 is 8.25 trillion cubic feet. This change is a result of the change in the operational definition of deliveries to the industrial sector.

Compared with past publications, the impact of the definitional change and the new data sources for the electric power sector is to increase measured natural gas consumption compared to the previous electric utility data series. As a result of the changes in data sources (predominantly new electric power data sources), total natural gas consumption is higher than previously published; i.e., total natural gas consumption has increased by 5, 3, and 3 percent in 1998, 1999, and 2000, respectively.

Also beginning with the publication of *AER 2001* and following with the *Natural Gas Annual*, new detail is available about gas consumption in the commercial, industrial and electric power sectors that distinguishes deliveries of natural gas to combined-heat-and-power (CHP) plants in these sectors from deliveries to other facilities within these sectors. “Deliveries to industrial consumers” includes deliveries to industrial consumers that are CHP plants, such as paper mills, as well as other industrial users. Included with the CHP plant data are a small number of industrial firms that report using natural gas only to generate electricity (most likely for their own use). “Deliveries to commercial consumers” also include deliveries to CHP plants, such as hospitals. Similarly, a small number of plants that report natural gas use for only electricity generation are included with the data on commercial CHP plants.

The sources for total commercial and industrial sector data are natural gas survey forms while the sources of the subcomponent CHP data series are electric power survey forms. The sources of all electric power data series, including the CHP subcomponent, are electric power survey forms.

Publication Elements Affected

- Deliveries to industrial consumers
- Deliveries to industrial consumers for the account of others
- Deliveries to electric utilities (deleted)
- Total deliveries to consumers
- Total consumption
- Balancing item
- Deliveries to electric generators (new element)
- Average price for natural gas delivered to industrial consumer
- Number of industrial consumers
- Average annual consumption per industrial consumer

Publication Tables Affected

Changes affect 64 of the 83 tables in the *Natural Gas Annual*.

- National-level tables (Tables 1, 26, B1, B2)
- State-level or State-detail tables (Tables 2, 15, 16, 18, 21, 23, 27, A2)
- Summary Statistics by State (Tables 29-79)

VI. Coal Survey and Publications

Summary of Key Changes

Data on coal consumed by the commercial and industrial sectors will now be separated into coal consumed by combined-heat-and-power (CHP) plants and coal consumed by the other plants in the commercial and industrial sector (referred to as other or “non-CHP”).¹¹ Consumption by electric utilities and independent power producers, shown separately in the past, will be combined and called “electric power sector.” Coal consumed by the electric power sector will be subdivided into coal consumed solely for power generation (“electricity-only plants”) and coal used at CHP plants. Note that “independent power producers” were previously called “other power producers” in the coal publications and tabulations. Both terms refer to the same entities, i.e., generating facilities with a North American Industrial Classification System (NAICS) code of 22.

Coal Consumption Data Sources

The sources for total coal consumption remain unchanged for the residential and commercial sectors and for coke plants. They are:

- Residential and Commercial—Form EIA-6A, “Coal Distribution Report.”
- Coke—Form EIA-5, “Coke Plant Report.”

For the industrial sector excluding coke plants (referred to as “other industrial,”) the data sources remain the same for the following categories:

- Manufacturing—Form EIA-3, “Quarterly Coal Consumption—Manufacturing Plants.”
- Mines—Form EIA-7A, “Coal Production Report.”

¹¹ A small number of commercial and industrial plants that use coal only to generate electricity are included with the data on commercial and industrial CHP plants.

- Agriculture, Mining, Construction, and Transportation—Form EIA-6A, “Coal Distribution Report.”

For the portion of coal consumed by CHP plants in the commercial and industrial sectors through 2000, data were obtained from Form EIA-860B, “Annual Electric Generator Report-Nonutility” and beginning in 2001, Form EIA-906, “Power Plant Report.”

Data for the electric power sector for the years 1989 through 2000 were from Form EIA-759 and Form EIA-860B. Beginning in 2001, data from Form EIA-906 will be used.

VII. Petroleum Surveys and Publications

Summary of Key Changes

Data on sales to independent power producers (that may have been previously reported in the industrial sector) are now included in the sales for electric power generation category in the “adjusted sales” tables of the *Fuel Oil and Kerosene Sales Report*, Tables 13-24. This category includes data on electric utilities and data on independent power producers. The data on electric utilities are obtained from Form EIA-759, “Monthly Power Plant Report,” and FERC Form 423, “Monthly Report of Cost and Quality of Fuels for Electric Plants.” The data on independent power producers are from Form EIA-860B, “Annual Electric Generator Report-Nonutility” through 2000, and Form EIA-906, “Power Plant Report” for 2001. Previously, some data on sales of kerosene, distillate, and residual fuel oils to independent power producers were obtained from Form EIA-821 survey, “Fuel Oil and Kerosene Sales Report” but coverage may not have been complete or data for independent power producers may have been included in the end-use sectors.

Publication Tables Affected

Data on sales by end-use sector are published in the *Fuel Oil and Kerosene Sales Report*. Data appear in two sets of tables. Tables 1-12 publish the results of the EIA-821 survey, except for on-highway diesel and kerosene. For on-highway diesel, State-level estimates are obtained from the Federal Highway Administration.

In Tables 13-24 (Adjusted Sales), estimates of distillate fuel oil are adjusted at the Petroleum Administration for Defense (PAD) district level to equal published *Petroleum Supply Annual (PSA)* volume estimates of products supplied. On-highway diesel State-level sales are calculated from Federal Highway Administration data.

Residual fuel oil volumes in Tables 13-24 are adjusted at the national level to equal published *PSA* products supplied estimates.

VIII. Renewable Energy Publications

Summary of Key Changes

For the first time EIA is presenting data on biomass energy consumption that were obtained by aggregating individual power plant data for nonutilities rather than by applying a generalized heat rate to the aggregate net generation figure. All new renewable energy publications also reflect changes in EIA definitions of the energy use sectors described earlier.

Publication Tables Affected

The main changes occur in estimates of renewable energy consumption and outputs found in the *Renewable Energy Annual's* Executive Summary, Chapter 1, and Appendix C.

Detailed Table Changes for the *Renewable Energy Annual*

Throughout the tables, estimates of biomass consumption are based on the new methodology described earlier and result in significant revisions. Where energy use sectors are presented, information reflects the new definitions.

Table presentations remain the same for Table H1 in the Executive Summary and Tables 1 and 5 in Chapter 1. Changes to the other tables are as follows:

Table 2. Renewable Energy Consumption by Energy Use Sector and Energy Source, 1997-2001

- Commercial sector now includes energy consumption for electric-only power plants and combined-heat-and-power (CHP) plants.

Previously, this was included as a small fraction of the industrial sector's consumption.

- Industrial sector energy consumption no longer includes commercial sector or independent power producers' consumption.
- Electric utility sector is changed to electric power sector and now includes consumption for electric utilities and independent power producers combined.

Table 3. Renewable Energy Consumption for Electricity Generation by Energy Use Sector and Energy Source, 1997-2001

- Commercial sector is added for the first time. Previously, commercial sector energy consumption was included as a small fraction of industrial.
- Industrial sector energy consumption no longer includes consumption by the commercial sector or independent power producers..
- Electric utility sector is changed to electric power sector and now includes information for electric utility and independent power producers combined. Previously, independent power producers' consumption was included in industrial.
- Electric power industry is changed to total, which is the sum of the commercial, industrial, and electric power sectors.

Table 4. Electricity Net Generation from Renewable Energy by Energy Use Sector and Energy Source, 1997-2001

- Generation is reorganized into three new sectors: commercial, industrial, and electric power.
- Commercial sector includes generation by nonutilities whose primary purpose of business is commercial.
- Industrial sector includes generation by nonutilities whose primary purpose of business is industrial.
- Electric power sector includes generation by electric utilities and nonutilities that are independent power producers.
- Total by energy source is the sum of the commercial, industrial and electric power sectors.

Table 6. Renewable Energy Consumption of Nonelectric use by Energy Use Sector and Energy Source, 1997-2001

- Commercial sector now includes energy consumption for useful thermal output at combined-heat-and-power plants. Previously this was included as a small fraction of the industrial sector's consumption.
- Industrial sector energy consumption no longer includes commercial sector or independent power producers' consumption.

- Electric power sector now includes consumption for electric utilities and independent power producer combined.

Table 7. Biomass Energy Consumption by Energy Source and Energy Use Sector, 1997-2001

- Electric power sector includes wood energy consumption by electric utilities and independent power producers that were previously included in the industrial sector.
- Distributions of biomass energy consumption by Census Region are no longer included.

Table 8. Industrial Biomass Energy Consumption and Electricity Net Generation by Primary Purpose of Business, 2000

- New table that presents detailed characteristics of industrial biomass consumption.

Table 9. Waste Energy Consumption by Type and Energy Use Sector, 2000

- New table that presents detailed information on waste consumption excluding wood waste.

Appendix B

Table B1 is a new table presenting historical renewable energy consumption for 1989 to 2001. It reflects the changes described for Table 2 above.

Appendix C

Throughout Appendix C, information on electricity generation and net summer capacity by State, which was previously provided in separate tables for electric utilities and nonutilities, is now provided in separate tables for the electric power sector, which includes electric utilities and independent power producers, and for the commercial and industrial sectors combined.

IX. Greenhouse Gas Emissions Publication

Summary of Key Changes

The EIA report *Emissions of Greenhouse Gases in the United States* assigns all energy-consumption-related carbon dioxide emissions to one of four end-use sectors: residential, commercial, industrial and

transportation. A sector's emissions consist of the fuels directly burned in that sector (e.g., natural gas consumed to heat homes) as well as a share of the emissions resulting from electricity generation. Previously, emissions from nonutility generators were all assigned to the industrial sector, even though some of those emissions were based on electricity that was sold into the electricity grid and consumed in the residential and commercial sectors. Only emissions attributable to conventional electric utilities were shared out to the end-use sectors. Beginning with the 2002 publication on greenhouse gas emissions, emissions attributable to the electric power sector (which includes entities other than utilities) will be shared out to the end-use sectors. The electric power sector includes electricity-only plants (utilities and independent power producers) and combined-heat-and-power plants who are primarily in the business of selling electricity.

Evolution of Presentation of Emissions Data

In the 2000 report a table was created that measured emissions based on electricity generation in the industrial sector and traditional electric utility emissions. Emissions from the two sources were summed to provide EIA's customers with a more complete total. However, in the end-use sector tables only the electric utility emissions were shared out. This created some confusion for EIA customers who could not add the electricity totals across sectors and arrive at the value in the stand-alone table.

In the 2001 report a table was created that presented an emissions total for both utility and nonutility generators. Unlike the previous year, this was not a stand-alone table, and the value from this table was shared out to the four end-use sectors. Because none of EIA's other multi-fuel publications allocated energy consumption in quite this same way there was somewhat of a disconnect created by this method as EIA customers could not re-create these emission values based on energy consumption in the multi-fuel, integrated publications.

For the 2002 report and beyond, the electric power sector will consist of emissions based on the multi-fuel, integrated publications that, beginning with the *Annual Energy Review* (AER), include plants whose primary business is to sell electricity (North American Industrial Classification System, NAICS, code 22). The consumption tables (e.g., *AER* Table 6.5 for natural gas) include a small amount of thermal energy produced by NAICS 22 CHP plants. In assigning emissions to end-use sectors, all of the emissions related to fuel consumed for electricity only or CHP plants remain in the

commercial and industrial sector unless they are categorized as being primarily in the business of selling electricity (NAICS 22) in which case they are included in the electric power sector as indicated above.

The electric power sector's emissions are shared out to the end-use sectors as determined by *AER* Table 8.5. Because the end-use categories in Table 8.5 differ slightly from the four detailed above in that there is an "Other"

category rather than "Transportation," an alteration is made to the data. A small amount of the "Other" category is estimated to be Transportation (4 to 6 billion kilowatthours). The rest of the "Other" category's electricity sales are allocated to the "Commercial Sector." Likewise, because there are no data to separate the "Direct Use" category, it is all allocated to the "Industrial Sector."

Glossary

Account of Others (Natural Gas): Natural gas deliveries for the account of others are deliveries to customers by transporters that do not own the natural gas but deliver it for others for a fee. Included are quantities covered by long-term contracts and quantities involved in short-term or spot market sales.

Alcohol: The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The series of molecules vary in chain length and are composed of a hydrocarbon plus a hydroxyl group: $\text{CH}_3\text{-(CH}_2\text{)}_n\text{-OH}$ (e.g., methanol, ethanol, and tertiary butyl alcohol).

Alternative-fuel Vehicle (AFV): A vehicle designed to operate on an alternative fuel (e.g., compressed natural gas, methane blend, electricity). The vehicle could be either a dedicated vehicle designed to operate exclusively on alternative fuel or a nondedicated vehicle designed to operate on alternative fuel and/or a traditional fuel.

Anthracite: The highest rank of coal; used primarily for residential and commercial space heating. It is a hard, brittle, and black lustrous coal, often referred to as hard coal, containing a high percentage of fixed carbon and a low percentage of volatile matter. The moisture content of fresh-mined anthracite generally is less than 15 percent. The heat content of anthracite ranges from 22 to 28 million Btu per short ton on a moist, mineral-matter-free basis. The heat content of anthracite coal consumed in the United States averages 25 million Btu per short ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter). *Note:* Since the 1980's, anthracite refuse or mine waste has been used for steam-electric power generation. This fuel typically has a heat content of 15 million Btu per short ton or less.

Anthracite Culm: Waste from Pennsylvania anthracite preparation plants, consisting of coarse rock fragments containing as much as 30 percent small-sized coal; sometimes defined as including very fine coal particles called silt. Its heat value ranges from 8 to 17 million Btu per short ton.

Anthropogenic: Made or generated by a human or caused by human activity. The term is used in the context of global climate change to refer to

gaseous emissions that are the result of human activities, as well as other potentially climate-altering activities, such as deforestation.

API: The American Petroleum Institute, a trade association.

API Gravity: American Petroleum Institute measure of specific gravity of crude oil or condensate in degrees. An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API; it is calculated as follows:
$$\text{Degrees API} = (141.5 / \text{sp.gr.60 deg.F/60 deg.F}) - 131.5.$$

Asphalt: A dark-brown to black cement-like material obtained by petroleum processing and containing bitumens as the predominant component; used primarily for road construction. It includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts. *Note:* The conversion factor for asphalt is 5.5 barrels per short ton.

ASTM: The acronym for the American Society for Testing and Materials.

Aviation Gasoline Blending Components: Naphthas that will be used for blending or compounding into finished aviation gasoline (e.g., straight run gasoline, alkylate, reformate, benzene, toluene, and xylene). Excludes oxygenates (alcohols, ethers), butane, and pentanes plus. Oxygenates are reported as other hydrocarbons, hydrogen, and oxygenates.

Aviation Gasoline, Finished: A complex mixture of relatively volatile hydrocarbons with or without small quantities of additives, blended to form a fuel suitable for use in aviation reciprocating engines. Fuel specifications are provided in ASTM Specification D910 and Military Specification MIL-G-5572. *Note:* Data on blending components are not counted in data on finished aviation gasoline. See **Jet Fuel, Finished**; **Jet Fuel, Kerosene-Type**; and **Jet Fuel, Naphtha-Type**.

Barrel (Petroleum): A unit of volume equal to 42 U.S. gallons.

Barrels per Calendar Day: The amount of input that a distillation facility can process under usual operating conditions. The amount is expressed in terms of capacity during a 24-hour period and reduces the maximum processing capability of all units at the facility under continuous operation to account for the following limitations that may delay, interrupt, or slow down production: 1) the capability of downstream processing units to absorb the output of crude oil processing facilities of a given refinery (no reduction is necessary for intermediate streams that are distributed to other than downstream facilities as part of a refinery's normal operation); 2) the types and grades of inputs to be processed; 3) the types and grades of products expected to be manufactured; 4) the environmental constraints associated with refinery operations; 5) the reduction of capacity for scheduled downtime due to such conditions as routine inspection, maintenance, repairs, and turnaround; and 6) the reduction of capacity for unscheduled downtime due to such conditions as mechanical problems, repairs, and slowdowns.

Base Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

Bituminous Coal: A dense coal, usually black, sometimes dark brown, often with well-defined bands of bright and dull material, used primarily as fuel in steam-electric power generation, with substantial quantities also used for heat and power applications in manufacturing and making coke. Bituminous coal is the most abundant coal in active U.S. mining regions. Its moisture content usually is less than 20 percent. The heat content of bituminous coal ranges from 21 to 30 million Btu per short ton on a moist, mineral-matter-free basis. The heat content of bituminous coal consumed in the United States averages 24 million Btu per short ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter).

Black Liquor (Pulping Liquor): The alkaline spent liquor removed from the digesters in the process of chemically pulping wood. After evaporation, the liquor is burned as a fuel in a recovery furnace that permits the recovery of certain basic chemicals.

British Thermal Unit (Btu): The quantity of heat required to raise the temperature of 1 pound of liquid water by 1 degree Fahrenheit at the temperature at which water has its greatest density (approximately 39 degrees

Fahrenheit). See **Heat Content of a Quantity of Fuel, Gross, and Heat Content of a Quantity of Fuel, Net.**

Bunker fuels: Fuel supplied to ships and aircraft, both domestic and foreign, consisting primarily of residual and distillate fuel oil for ships and kerosene-based jet fuel for aircraft. The term "international bunker fuels" is used to denote the consumption of fuel for international transport activities. *Note:* For the purposes of greenhouse gas emissions inventories, data on emissions from combustion of international bunker fuels are subtracted from national emissions totals. Historically, bunker fuels have meant only ship fuel.

Butane: A normally gaseous straight-chain or branched-chain hydrocarbon (C₄H₁₀) extracted from natural gas or refinery gas streams. It includes isobutane and normal butane and is designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial butane. *Isobutane:* A normally gaseous branched-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 10.9 degrees Fahrenheit. It is extracted from natural gas or refinery gas streams. *Normal Butane:* A normally gaseous straight-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 31.1 degrees Fahrenheit. It is extracted from natural gas or refinery gas streams.

Butylene: An olefinic hydrocarbon (C₄H₈) recovered from refinery processes.

Capacity: See **Generator Capacity** and **Generator Nameplate Capacity (Installed).**

Capacity Factor: The ratio of the electrical energy produced by a generating unit for a given period of time to the electrical energy that could have been produced at continuous full-power operation during the same period.

Carbon Dioxide: A colorless, odorless, non-poisonous gas (CO₂) that is a normal part of Earth's atmosphere. Carbon dioxide is a product of fossil-fuel combustion as well as other processes. It is considered a greenhouse gas as it traps heat (infrared energy) radiated by the Earth into the atmosphere and thereby contributes to the potential for global warming. The global warming potential (GWP) of other greenhouse gases is measured in relation to that of carbon dioxide, which by international scientific

convention is assigned a value of one (1). See **Global warming potential (GWP)** and **Greenhouse gases**.

Carbon Dioxide Equivalent: The amount of carbon dioxide by weight emitted into the atmosphere that would produce the same estimated radiative forcing as a given weight of another radiatively active gas. Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured (for example, methane) by its estimated global warming potential (which is 21 for methane). "Carbon equivalent units" are defined as carbon dioxide equivalents multiplied by the carbon content of carbon dioxide (i.e., 12/44).

Chained Dollars: A measure used to express real prices. Real prices are those that have been adjusted to remove the effect of changes in the purchasing power of the dollar; they usually reflect buying power relative to a reference year. Prior to 1996, real prices were expressed in constant dollars, a measure based on the weights of goods and services in a single year, usually a recent year. In 1996, the U.S. Department of Commerce introduced the chained-dollar measure. The new measure is based on the average weights of goods and services in successive pairs of years. It is "chained" because the second year in each pair, with its weights, becomes the first year of the next pair. The advantage of using the chained-dollar measure is that it is more closely related to any given period covered and is therefore subject to less distortion over time.

Chlorofluorocarbon (CFC): Any of various compounds consisting of carbon, hydrogen, chlorine, and fluorine used as refrigerants. CFCs are now thought to be harmful to the Earth's atmosphere.

City Gate: A point or measuring station at which a distribution gas utility receives gas from a natural gas pipeline company or transmission system.

Climate Change: A term used to refer to all forms of climatic inconsistency, but especially to significant change from one prevailing climatic condition to another. In some cases, "climate change" has been used synonymously with the term "global warming"; scientists, however, tend to use the term in a wider sense to include natural changes in climate as well as climatic cooling.

Coal: A readily combustible black or brownish-black rock whose composition, including inherent moisture, consists of more than 50 percent by

weight and more than 70 percent by volume of carbonaceous material. It is formed from plant remains that have been compacted, hardened, chemically altered, and metamorphosed by heat and pressure over geologic time. See **Coal Rank**.

Coal Coke: See **Coke, Coal**.

Coal Rank: The classification of coals according to their degree of progressive alteration from lignite to anthracite. In the United States, the standard ranks of coal include lignite, subbituminous coal, bituminous coal, and anthracite and are based on fixed carbon, volatile matter, heating value, and agglomerating (or caking) properties. See **Anthracite, Bituminous Coal, Lignite, and Subbituminous Coal**.

Coal Stocks: Coal quantities that are held in storage for future use and disposition. *Note:* When coal data are collected for a particular reporting period (month, quarter, or year), coal stocks are commonly measured as of the last day of this period.

Coke, Coal: A solid carbonaceous residue derived from low-ash, low-sulfur bituminous coal from which the volatile constituents are driven off by baking in an oven at temperatures as high as 2,000 degrees Fahrenheit so that the fixed carbon and residual ash are fused together. Coke is used as a fuel and as a reducing agent in smelting iron ore in a blast furnace. Coke from coal is gray, hard, and porous and has a heating value of 24.8 million Btu per short ton.

Coke, Petroleum: A residue high in carbon content and low in hydrogen that is the final product of thermal decomposition in the condensation process in cracking. This product is reported as marketable coke or catalyst coke. The conversion is 5 barrels (of 42 U.S. gallons each) per short ton. Coke from petroleum has a heating value of 6.024 million Btu per barrel.

Combined Heat and Power Plant (CHP): A plant designed to produce both heat and electricity. If one or more units of the plant is a CHP unit, then the whole plant is designated as a CHP plant. *Note:* This term is being used in place of the term "Cogenerator" that was used by EIA in the past. CHP better describes the facilities because some of the plants included do not produce heat and power in a sequential fashion and, as a result, do not meet the legal definition of cogeneration specified in the Public Utility Regulatory Policies Act (PURPA). See **Cogenerator**.

Commercial Building: A building with more than 50 percent of its floorspace used for commercial activities. Commercial buildings include, but are not limited to, stores, offices, schools, churches, gymnasiums, libraries, museums, hospitals, clinics, warehouses, and jails. Government buildings are included, except buildings on military bases or reservations.

Commercial Sector: An energy-consuming sector that consists of service-providing facilities and equipment of: businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social, or fraternal groups. The commercial sector includes institutional living quarters. It also includes sewage treatment facilities. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a wide variety of other equipment. *Note:* This sector includes generators that produce electricity and/or useful thermal output primarily to support the activities of the above-mentioned commercial establishments.

Completion (oil/gas production): The term refers to the installation of permanent equipment for the production of oil or gas. If a well is equipped to produce only oil or gas from one zone or reservoir, the definition of a "well" (classified as an oil well or gas well) and the definition of a "completion" are identical. However, if a well is equipped to produce oil and/or gas separately from more than one reservoir, a "well" is not synonymous with a "completion." See **Well**.

Conversion Factor: A number that translates units of one system into corresponding values of another system. Conversion factors can be used to translate physical units of measure for various fuels into Btu equivalents. See **British Thermal Unit**.

Cooling Tower: A common type of environmental equipment installed at power plants used to transfer heat, produced by burning fuel, to the atmosphere. Cooling towers are installed where there is insufficient cooling water available or where waste heat discharged into cooling water would affect marine life.

Criteria Pollutant: A pollutant determined to be hazardous to human health and regulated under the Environmental Protection Agency's (EPA) National Ambient Air Quality Standards. The 1970 amendments to the Clean Air Act require EPA to describe the health and welfare impacts of a pollutant as the "criteria" for inclusion in the regulatory regime.

Crude Oil: A mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Depending upon the characteristics of the crude stream, it may also include: 1) small amounts of hydrocarbons that exist in gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casinghead) gas in lease separators and are subsequently commingled with the crude stream without being separately measured. Lease condensate recovered as a liquid from natural gas wells in lease or field separation facilities and later mixed into the crude stream is also included; 2) small amounts of nonhydrocarbons produced with the oil, such as sulfur and various metals; and 3) drip gases, and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Liquids produced at natural gas processing plants are excluded. Crude oil is refined to produce a wide array of petroleum products, including heating oils; gasoline, diesel and jet fuels; lubricants; asphalt; ethane, propane, and butane; and many other products used for their energy or chemical content.

Crude Oil Landed Cost: The price of crude oil at the port of discharge, including charges associated with purchasing, transporting, and insuring a cargo from the purchase point to the port of discharge. The cost does not include charges incurred at the discharge port (e.g., import tariffs or fees, wharfage charges, and demurrage).

Crude Oil Refinery Input: The total crude oil put into processing units at refineries.

Crude Oil Stocks: Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

Crude Oil Used Directly: Crude oil consumed as fuel by crude oil pipelines and on crude oil leases.

Cubic foot (cf), natural gas: The amount of natural gas contained at standard temperature and pressure (60 degrees Fahrenheit and 14.73 pounds standard per square inch) in a cube whose edges are one foot long.

Culm: See **Anthracite Culm**.

Degree-Days, Cooling (CDD): A measure of how warm a location is over a period of time relative to a base temperature, most commonly specified

as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the base temperature (65 degrees) from the average of the day's high and low temperatures, with negative values set equal to zero. Each day's cooling degree-days are summed to create a cooling degree-day measure for a specified reference period. Cooling degree-days are used in energy analysis as an indicator of air conditioning energy requirements or use.

Degree-Days, Heating (HDD): A measure of how cold a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the average of the day's high and low temperatures from the base temperature (65 degrees), with negative values set equal to zero. Each day's heating degree-days are summed to create a heating degree-day measure for a specified reference period. Heating degree-days are used in energy analysis as an indicator of space heating energy requirements or use.

Degree-Days, Population-Weighted: Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree-days, each State is divided into from one to nine climatically homogeneous divisions, which are assigned weights based on the ratio of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and those products are then summed to arrive at the State population-weighted degree-day figure. To compute national population-weighted degree-days, the Nation is divided into nine Census regions, each comprising from three to eight States, which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and those products are then summed to arrive at the national population-weighted degree-day figure.

Demand-Side Management: The planning, implementation, and monitoring of utility activities designed to encourage consumers to modify patterns of electricity usage, including the timing and level of electricity demand.

Demonstrated Reserve Base (Coal): A collective term for the sum of coal in both measured and indicated resource categories of reliability, representing 100 percent of the in-place coal in those categories as of a certain

date. Includes beds of bituminous coal and anthracite 28 or more inches thick and beds of subbituminous coal 60 or more inches thick that can occur at depths of as much as 1,000 feet. Includes beds of lignite 60 or more inches thick that can be surface mined. Includes also thinner and/or deeper beds that currently are being mined or for which there is evidence that they could be mined commercially at a given time. Represents that portion of the identified coal resource from which reserves are calculated.

Design Electrical Rating (Capacity), Net: The nominal net electrical output of a nuclear unit as specified by the electric utility for the purpose of plant design.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive. See **Well**.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. It includes diesel fuels and fuel oils. Products known as No. 1, No. 2, and No. 4 diesel fuel are used in on-highway diesel engines, such as those found in cars and trucks, as well as off-highway engines, such as those in railroad locomotives and agricultural machinery. Products known as No. 1, No. 2, and No. 4 fuel oils are used primarily for space heating and electric power generation.

Distillation Unit (Atmospheric): The primary distillation unit that processes crude oil (including mixtures of other hydrocarbons) at approximately atmospheric conditions. It includes a pipe still for vaporizing the crude oil and a fractionation tower for separating the vaporized hydrocarbon components in the crude oil into fractions with different boiling ranges. This is done by continuously vaporizing and condensing the components to separate higher boiling point material. The selected boiling ranges are set by the processing scheme, the properties of the crude oil, and the product specifications.

District Heat: Steam or hot water from an outside source used as an energy source in a building. The steam or hot water is produced in a central plant and is piped into the building. District heat may be purchased from a utility or provided by a physical plant in a separate building that is part of the same facility (for example, a hospital complex or university).

Dry Hole: An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well. See **Well**.

Dry Gas Production: See **Natural Gas (Dry) Production**.

Dual-Fired Unit: A generating unit that can produce electricity using two or more input fuels. In some of these units, only the primary fuel can be used continuously; the alternate fuel(s) can be used only as a start-up fuel or in emergencies.

Eastern Europe and Former U.S.S.R.: Includes Albania, Azerbaijan, Belarus, Bulgaria, Czech Republic, Estonia, Georgia, Hungary, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Poland, Romania, Russia, Slovakia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. See **U.S.S.R.**

Electric Power Sector: An energy-consuming sector that consists of electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public--i.e., North American Industry Classification System 22 plants. See also **Combined-Heat-and-Power (CHP) Plant** and **Electricity-Only Plant**.

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted-for uses.

Electricity: A form of energy characterized by the presence and motion of elementary charged particles generated by friction, induction, or chemical change.

Electricity-only plant: A plant designed to produce electricity only. See **Combined-heat-and-power (CHP) plant**.

Electricity Generation: The process of producing electric energy by transforming other forms of energy; also, the amount of electric energy produced, expressed in kilowatthours.

Electricity Generation, Gross: The total amount of electric energy produced by generating units and measured at the generating terminal in kilowatthours (kWh) or megawatthours (MWh).

Electricity Generation, Net: The amount of gross generation less the electrical energy consumed at the generating station(s) for station service or auxiliaries. *Note:* Electricity required for pumping at pumped-storage plants is regarded as station use and is deducted from gross generation.

Electricity Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. "Other" sales include sales for public street and highway lighting and other sales to public authorities and railways, and interdepartmental sales.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality aligned with distribution facilities for delivery of electric energy for use primarily by the public. Included are investor-owned electric utilities, municipal and State utilities, Federal electric utilities, and rural electric cooperatives. A few entities that are tariff based and corporately aligned with companies that own distribution facilities are also included. *Note:* Due to the issuance of FERC Order 888 that required traditional electric utilities to functionally unbundle their generation, transmission, and distribution operations, "electric utility" currently has inconsistent interpretations from State to State.

Eliminations: Revenues and expenses resulting from transactions between segments of the energy industry. Consolidated company accounts do not include intersegment revenues and expenses. Therefore, such intersegment transactions must be eliminated.

Emissions: Anthropogenic releases of gases to the atmosphere. In the context of global climate change, they consist of radiatively important greenhouse gases (e.g., the release of carbon dioxide during fuel combustion).

End-Use Sectors: The residential, commercial, industrial, and transportation sectors of the economy.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured

in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Consumption: The use of energy as a source of heat or power or as an input in the manufacturing process.

Energy Expenditures: The money spent directly by consumers to purchase energy. Expenditures equal the amount of energy used by the consumer times the price per unit paid by the consumer.

Energy service provider: An energy entity that provides service to a retail or end-use customer.

Energy Source: Any substance or natural phenomenon that can be consumed or transformed to supply heat or power. Examples include petroleum, coal, natural gas, nuclear, biomass, electricity, wind, sunlight, geothermal, water movement, and hydrogen in fuel cells.

Ethane: A normally gaseous straight-chain hydrocarbon (C₂H₆). It is a colorless, paraffinic gas that boils at a temperature of -127.48 degrees Fahrenheit. It is extracted from natural gas and refinery gas streams.

Ethylene: An olefinic hydrocarbon recovered from refinery processes or petrochemical processes. Ethylene is used as a petrochemical feedstock for numerous chemical applications and the production of consumer goods.

Exploratory Well: A well drilled to find and produce oil or gas in an area previously considered unproductive, to find a new reservoir in a known field (i.e., one previously producing oil or gas in another reservoir), or to extend the limit of a known oil or gas reservoir. See **Well**.

Exports: Shipments of goods from within the 50 States and the District of Columbia to U.S. possessions and territories or to foreign countries.

Extraction Loss: The reduction in volume of natural gas due to the removal of natural gas liquid constituents such as ethane, propane, and butane at natural gas processing plants.

Federal Energy Administration: A predecessor of the Energy Information Administration.

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy and is the successor to the Federal Power Commission.

Federal Power Commission (FPC): The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. It was abolished on September 30, 1977, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency.

Financial Reporting System (FRS): The Energy Information Administration's statutory requirement to identify major energy-producing companies and develop and implement a data-reporting program for energy financial and operating information from these companies. Companies are selected if they are within the top 50 publicly-owned U.S. crude oil producers that have at least 1 percent of either production or reserves of oil, gas, coal, or uranium in the United States, or 1 percent of either refining capacity or petroleum product sales in the United States.

First Use: Manufacturing establishments' consumption of the energy that was originally produced offsite or was produced onsite from input materials not classified as energy.

First Purchase Price: The marketed first sales price of domestic crude oil, consistent with the removal price defined by the provisions of the Windfall Profits Tax on Domestic Crude Oil (Public Law 96-223, Sec. 4998 [c]).

Fiscal Year: The U.S. Government's fiscal year runs from October 1 through September 30. The fiscal year is designated by the calendar year in which it ends; e.g., fiscal year 2000 began on October 1, 1999, and ended on September 30, 2000.

Flared Natural Gas: Natural gas burned in flares on the base site or at gas processing plants.

f.o.b.: See **Free on Board**.

Footage Drilled: Total footage for wells in various categories, as reported for any specified period, includes (1) the deepest total depth (length of well bores) of all wells drilled from the surface, (2) the total of all bypassed footage drilled in connection with reported wells, and (3) all new footage drilled for directional sidetrack wells. Footage reported for directional sidetrack wells does not include footage in the common bore, which is reported as footage for the original well. In the case of old wells drilled deeper, the reported footage is that which was drilled below the total depth of the old well.

Former U.S.S.R.: See **U.S.S.R.**

Forward Costs (Uranium): The operating and capital costs that will be incurred in any future production of uranium from in-place reserves. Included are costs for labor, materials, power and fuel, royalties, payroll taxes, insurance, and general and administrative costs that are dependent upon the quantity of production and, thus, applicable as variable costs of production. Excluded from forward costs are prior expenditures, if any, incurred for property acquisition, exploration, mine development, and mill construction, as well as income taxes, profit, and the cost of money. *Note:* By use of forward costing, estimates of reserves for ore deposits in differing geological settings can be aggregated and reported as the maximum amount that can theoretically be extracted to recover the specified costs of uranium oxide production under the listed forward cost categories.

Fossil Fuel: An energy source formed in the Earth's crust from decayed organic material, such as petroleum, coal, and natural gas.

Fossil-Fueled Steam-Electric Power Plant: An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Fractionation: The process by which saturated hydrocarbons are removed from natural gas and separated into distinct parts, or "fractions" such as propane, butane, and ethane.

Free Alongside Ship (f.a.s.): The value of a commodity at the port of exportation, generally including the purchase price plus all charges incurred in placing the commodity alongside the carrier at the port of exportation.

Free on Board (f.o.b.): A sales transaction in which the seller makes the product available for pick up at a specified port or terminal at a specified price and the buyer pays for the subsequent transportation and insurance.

Fuel Ethanol: An anhydrous, denatured aliphatic alcohol (C₂H₅OH) intended for motor gasoline blending. See **Oxygenates**.

Full-Power Operation: Operation of a nuclear generating unit at 100 percent of its design capacity. Full-power operation precedes commercial operation.

Gas Well: A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

Gas Well Productivity: Derived annually by dividing gross natural gas withdrawals from gas wells by the number of producing gas wells on December 31 and then dividing the quotient by the number of days in the year.

Generator capacity: The maximum output, commonly expressed in megawatts (MW), that generating equipment can supply to system load, adjusted for ambient conditions.

Generator nameplate capacity (installed): The maximum rated output of a generator, prime mover, or other electric power production equipment under specific conditions designated by the manufacturer. Installed generator nameplate capacity is commonly expressed in megawatts (MW) and is usually indicated on a nameplate physically attached to the generator.

Geothermal Energy: Hot water or steam extracted from geothermal reservoirs in the Earth's crust and used for geothermal heat pumps, water heating, or electricity generation.

Global Warming: An increase in the near-surface temperature of the Earth. Global warming has occurred in the distant past as the result of natural influences, but the term is today most often used to refer to the warming some scientists predict will occur as a result of increased anthropogenic emissions of greenhouse gases. See **Greenhouse Gases** and **Climate Change**.

Global Warming Potential (GWP): An index used to compare the relative radiative forcing of different gases without directly calculating the changes in atmospheric concentrations. GWPs are calculated as the ratio of the radiative forcing that would result from the emission of one kilogram of a greenhouse gas to that from the emission of one kilogram of carbon dioxide over a period of time, such as 100 years.

Greenhouse Gases: Those gases, such as water vapor, carbon dioxide, nitrous oxide, methane, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride, that are transparent to solar (short-wave) radiation but opaque to long-wave radiation, thus preventing long-wave radiant energy from leaving the Earth's atmosphere. The net effect is a trapping of absorbed radiation and a tendency to warm the planet's surface.

Gross Domestic Product (GDP): The total value of goods and services produced by labor and property located in the United States. As long as the labor and property are located in the United States, the supplier (that is, the workers and, for property, the owners) may be either U.S. residents or residents of foreign countries.

Gross Domestic Product (GDP) Implicit Price Deflator: A measure used to convert nominal prices to real prices. See **Chained Dollars**.

Gross Electricity Generation: See **Electricity Generation, Gross**.

Gross Withdrawals: See **Natural Gas Gross Withdrawals**.

Gross Input to Atmospheric Crude Oil Distillation Units: Total input to atmospheric crude oil distillation units. Includes all crude oil, lease condensate, natural gas plant liquids, unfinished oils, liquefied refinery gases, slop oils, and other liquid hydrocarbons produced from tar sands, gilsonite, and oil shale.

Heat Content of a Quantity of Fuel, Gross: The total amount of heat released when a fuel is burned. Coal, crude oil, and natural gas all include chemical compounds of carbon and hydrogen. When those fuels are burned, the carbon and hydrogen combine with oxygen in the air to produce carbon dioxide and water. Some of the energy released in burning goes into transforming the water into steam and is usually lost. The amount of heat spent in transforming the water into steam is counted as part of gross heat content but is not counted as part of net content. Gross heat

content is also referred to as the higher heating value. Btu conversion factors typically used by Energy Information Administration represent gross heat content.

Heat Content of a Quantity of Fuel, Net: The amount of usable heat energy released when a fuel is burned under conditions similar to those in which it is normally used. Net heat content is also referred to as the lower heating value. Btu conversion factors typically used by the Energy Information Administration represent gross heat content.

Heavy Oil: The fuel oils remaining after the lighter oils have been distilled off during the refining process. Except for start-up and flame stabilization, virtually all petroleum used in steam plants is heavy oil. Includes fuel oil numbers 4, 5, and 6; crude; and topped crude.

Household: A family, an individual, or a group of up to nine unrelated persons occupying the same housing unit. "Occupy" means the housing unit was the person's usual or permanent place of residence.

Housing Unit: A house, an apartment, a group of rooms, or a single room if it is either occupied or intended for occupancy as separate living quarters by a family, an individual, or a group of one to nine unrelated persons. Separate living quarters means the occupants (1) live and eat separately from other persons in the house or apartment and (2) have direct access from the outside of the buildings or through a common hall--that is, they can get to it without going through someone else's living quarters. Housing units do not include group quarters such as prisons or nursing homes where ten or more unrelated persons live. A common dining area used by residents is an indication of group quarters. Hotel and motel rooms are considered housing units if occupied as the usual or permanent place of residence.

Hydrocarbon: An organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, a constituent of natural gas) to the very heavy and very complex.

Hydroelectric Power: The use of flowing water to produce electrical energy.

Hydroelectric Pumped Storage Plant: A plant that usually generates electric energy during peak load periods by using water previously pumped

into an elevated storage reservoir during off-peak periods when excess generating capacity is available to do so. When additional generating capacity is needed, the water can be released from the reservoir through a conduit to turbine generators located in a power plant at a lower level.

Hydrofluorocarbons (HFCs): A group of man-made chemicals composed of one or two carbon atoms and varying numbers of hydrogen and fluorine atoms. Most HFCs have 100-year Global Warming Potentials in the thousands.

Implicit Price Deflator: See **Chained Dollars**.

Imports: Receipts of goods into the 50 States and the District of Columbia from U.S. possessions and territories or from foreign countries.

Independent Power Producer: A corporation, person, agency, authority, or other legal entity or instrumentality that owns or operates facilities for the generation of electricity for use primarily by the public, and that is not an electric utility.

Indicated Resources, Coal: Coal for which estimates of the rank, quality, and quantity are based partly on sample analyses and measurements and partly on reasonable geologic projections. Indicated resources are computed partly from specified measurements and partly from projection of visible data for a reasonable distance on the basis of geologic evidence. The points of observation are ½ to 1½ miles apart. Indicated coal is projected to extend as a ½-mile-wide belt that lies more than ¼ mile from the outcrop or points of observation or measurement.

Industrial Sector: An energy-consuming sector that consists of all facilities and equipment used for producing, processing, or assembling goods. The industrial sector encompasses the following types of activity: manufacturing (NAICS codes 31-33); agriculture, forestry, and fisheries (NAICS code 11); mining, including oil and gas extraction (NAICS code 21); natural gas transmission (NAICS code 2212); and construction (NAICS code 23). Overall energy use in this sector is largely for process heat and cooling and powering machinery, with lesser amounts used for facility heating, air conditioning, and lighting. Fossil fuels are also used as raw material inputs to manufactured products. *Note:* This sector includes generators that produce electricity and/or useful thermal output primarily to support the above-mentioned industrial activities.

Jet Fuel: A refined petroleum product used in jet aircraft engines. It includes kerosene-type jet fuel and naphtha-type jet fuel.

Jet Fuel, Kerosene-Type: A kerosene-based product with a maximum distillation temperature of 400 degrees Fahrenheit at the 10-percent recovery point and a final maximum boiling point of 572 degrees Fahrenheit and meeting ASTM Specification 1655 and Military Specifications MIL-T-5624P and MIL-T-83133D (Grades JP-5 and JP-8). It is used for commercial and military turbojet and turboprop aircraft engines.

Jet Fuel, Naphtha-Type: A fuel in the heavy naphtha boiling range, with an average gravity of 52.8° API, 20 to 90 percent distillation temperature of 290 to 470 degrees Fahrenheit, and meeting Military Specification MIL-T-5624L (Grade JP-4). It is used primarily for military turbojet and turboprop aircraft engines because it has a lower freeze point than other aviation fuels and meets engine requirements at high altitudes and speeds.

Kerosene: A light petroleum distillate that is used in space heaters, cook stoves, and water heaters and is suitable for use as a light source when burned in wick-fed lamps. Kerosene has a maximum distillation temperature of 400 degrees Fahrenheit at the 10-percent recovery point, a final boiling point of 572 degrees Fahrenheit, and a minimum flash point of 100 degrees Fahrenheit. Included are No. 1-K and No. 2-K, the two grades recognized by ASTM Specification D3699 as well as all other grades of kerosene called range or stove oil, which have properties similar to those of No. 1 fuel oil. See **Jet Fuel, Kerosene-Type**.

Kilowatthour (kWh): A measure of electricity defined as a unit of work or energy, measured as 1 kilowatt (1,000 watts) of power expended for 1 hour. One kilowatthour is equivalent to 3,412 Btu.

Landed Cost: See **Crude Oil Landed Cost**.

Lease and Plant Fuel: Natural gas used in well, field, and lease operations (such as gas used in drilling operations, heaters, dehydrators, and field compressors) and used as fuel in natural gas processing plants.

Lease Condensate: A mixture consisting primarily of pentanes and heavier hydrocarbons which is recovered as a liquid from natural gas in lease separation facilities. This category excludes natural gas plant

liquids, such as butane and propane, which are recovered at downstream natural gas processing plants or facilities.

Light Oil: Lighter fuel oils distilled off during the refining process. Virtually all petroleum used in internal combustion and gas-turbine engines is light oil. Includes fuel oil numbers 1 and 2, kerosene, and jet fuel.

Lignite: The lowest rank of coal, often referred to as brown coal, used almost exclusively as fuel for steam-electric power generation. It is brownish-black and has a high inherent moisture content, sometimes as high as 45 percent. The heat content of lignite ranges from 9 to 17 million Btu per short ton on a moist, mineral-matter-free basis. The heat content of lignite consumed in the United States averages 13 million Btu per short ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter).

Liquefied Natural Gas (LNG): Natural gas (primarily methane) that has been liquefied by reducing its temperature to -260 degrees Fahrenheit at atmospheric pressure.

Liquefied Petroleum Gases (LPG): A group of hydrocarbon-based gases derived from crude oil refining or natural gas fractionation. They include ethane, ethylene, propane, propylene, normal butane, butylene, isobutane, and isobutylene. For convenience of transportation, these gases are liquefied through pressurization.

Liquefied Refinery Gases (LRG): Liquefied petroleum gases fractionated from refinery or still gases. Through compression and/or refrigeration, they are retained in the liquid state. The reported categories are ethane/ethylene, propane/propylene, normal butane/butylene, and isobutane. Excludes still gas.

Losses: See **Electrical System Energy Losses**.

Low-Power Testing: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its operating (full-power) license. The maximum level of operation during that period is 5 percent of the unit's design thermal rating.

Lubricants: Substances used to reduce friction between bearing surfaces or incorporated into other materials used as processing aids in the

manufacture of other products, or used as carriers of other materials. Petroleum lubricants may be produced either from distillates or residues. Lubricants include all grades of lubricating oils, from spindle oil to cylinder oil, and those used in greases.

Major Energy Producers: The top publicly-owned crude oil and natural gas producers and petroleum refiners that form the Financial Reporting System. See **Financial Reporting System**.

Manufacturing: An energy-consuming subsector of the industrial sector that consists of all facilities and equipment engaged in the mechanical, physical, chemical, or electronic transformation of materials, substances, or components into new products. Assembly of component parts of products is included, except for that which is included in construction.

Marketed Production, Natural Gas: Gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations. Includes all quantities of gas used in field and processing operations.

Measured Resources, Coal: Coal resources for which estimates of the rank, quality, and quantity have been computed, within a margin of error of less than 20 percent, from sample analyses and measurements from closely spaced and geologically well known sample sites. Measured resources are computed from dimensions revealed in outcrops, trenches, mine workings, and drill holes. The points of observation and measurement are so closely spaced and the thickness and extent of coals are so well defined that the tonnage is judged to be accurate within 20 percent. Although the spacing of the point of observation necessary to demonstrate continuity of the coal differs from region to region, according to the character of the coalbeds, the points of observation are no greater than ½ mile apart. Measured coal is projected to extend as a belt ¼ mile wide from the outcrop or points of observation or measurement.

Methane: A colorless, flammable, odorless hydrocarbon gas (CH₄), which is the major component of natural gas. It is also an important source of hydrogen in various industrial processes.

Methanol: A light, volatile alcohol (CH₃OH) eligible for motor gasoline blending. See **Oxygenates**.

Miscellaneous Petroleum Products: All finished petroleum products not classified elsewhere—for example, petrolatum, lube refining byproducts (aromatic extracts and tars), absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and specialty oils.

Motor Gasoline Blending Components: Naphthas (e.g., straight-run gasoline, alkylate, reformate, benzene, toluene, xylene) used for blending or compounding into finished motor gasoline. These components include reformulated gasoline blendstock for oxygenate blending (RBOB) but exclude oxygenates (alcohols, ethers), butane, and pentanes plus. *Note:* Oxygenates are reported as individual components and are included in the total for other hydrocarbons, hydrogens, and oxygenates.

Motor Gasoline, Conventional: Finished motor gasoline not included in the oxygenated or reformulated gasoline categories. *Note:* This category excludes reformulated gasoline blendstock for oxygenate blending (RBOB) as well as other blendstock. Conventional motor gasoline can be leaded or unleaded; regular, midgrade, or premium. See **Motor Gasoline Grades**.

Motor Gasoline Grades: The classification of gasoline by octane ratings. Each type of gasoline (conventional, oxygenated, and reformulated; leaded or unleaded) is classified by three grades: regular, midgrade, and premium. *Note:* Gasoline sales are reported by grade in accordance with their classification at the time of sale. In general, automotive octane requirements are lower at high altitudes. Therefore, in some areas of the United States, such as the Rocky Mountain States, the octane ratings for the gasoline grades may be 2 or more octane points lower.

Regular Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 85 and less than 88.

Midgrade Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 88 and less than or equal to 90.

Premium Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than 90.

Motor Gasoline, Oxygenated: Finished motor gasoline other than reformulated gasoline, having an oxygen content of 2.7 percent or higher by weight and required by the U.S. Environmental Protection Agency (EPA) to be sold in areas designated by EPA as carbon monoxide (CO)

nonattainment areas. *Note:* Oxygenated gasoline excludes reformulated gasoline, oxygenated fuels program reformulated gasoline (OPRG), and reformulated gasoline blendstock for oxygenated blending (RBOB). It can be formulated for regular, midgrade, or premium grade. See **Motor Gasoline Grades**.

Motor Gasoline, Reformulated: Finished motor gasoline formulated for use in motor vehicles, the composition and properties of which meet the requirements of the reformulated gasoline regulations promulgated by the U.S. Environmental Protection Agency under Section 211(k) of the Clean Air Act. *Note:* This category includes oxygenated fuels program reformulated gasoline (OPRG) but excludes reformulated gasoline blendstock for oxygenate blending (RBOB). It can be formulated for regular, midgrade, and premium grades. See **Motor Gasoline Grades**.

NAICS: See **North American Industry Classification System**.

Natural Gas: A gaseous mixture of hydrocarbon compounds, the primary one being methane. *Note:* The Energy Information Administration measures wet natural gas and its two sources of production, associated/dissolved natural gas and nonassociated natural gas, and dry natural gas, which is produced from wet natural gas.

Wet natural gas: A mixture of hydrocarbon compounds and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in porous rock formations at reservoir conditions. The principal hydrocarbons normally contained in the mixture are methane, ethane, propane, butane, and pentane. Typical nonhydrocarbon gases that may be present in reservoir natural gas are water vapor, carbon dioxide, hydrogen sulfide, nitrogen and trace amounts of helium. Under reservoir conditions, natural gas and its associated liquefiable portions occur either in a single gaseous phase in the reservoir or in solution with crude oil and are not distinguishable at the time as separate substances. *Note:* The Securities and Exchange Commission and the Financial Accounting Standards Board refer to this product as natural gas.

- **Associated-dissolved natural gas:** Natural gas that occurs in crude oil reservoirs either as free gas (associated) or as gas in solution with crude oil (dissolved gas).
- **Nonassociated natural gas:** Natural gas that is not in contact with significant quantities of crude oil in the reservoir.

Dry natural gas: Natural gas which remains after: 1) the liquefiable hydrocarbon portion has been removed from the gas stream (i.e., gas after lease, field, and/or plant separation); and 2) any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable. *Note:* Dry natural gas is also known as consumer-grade natural gas. The parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute.

Natural Gas Gross Withdrawals: Full well stream volume of produced natural gas, excluding condensate separated at the lease.

Natural Gas Liquids (NGL): A general term for all liquid products separated from natural gas in gas processing or cycling plants. They include natural gas plant liquids and lease condensate.

Natural Gas Marketed Production: See **Marketed Production, Natural Gas**.

Natural Gas Plant Liquids (NGPL): Those hydrocarbons in natural gas that are separated as liquids at downstream gas processing plants, fractionating and cycling plants, and in some instances at field facilities. Lease condensate is excluded. Products obtained include liquefied petroleum gases and pentanes plus.

Natural Gas Wellhead Price: Price of natural gas calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States and the U.S. Mineral Management Service. The price includes all costs prior to shipment from the lease, including gathering and compression costs, in addition to State production, severance, and similar charges.

NERC: See **North American Electric Reliability Council**.

Net Electricity Generation: See **Electricity Generation, Net**.

Net Income: Operating income plus other income and extraordinary income less operating expenses, taxes, interest charges, other deductions, and extraordinary deductions.

Net Investment in Place: Net property, plant, and equipment plus investments and advances to unconsolidated affiliates.

Net Summer Capacity: The maximum output, commonly expressed in megawatts (MW), that generating equipment can supply to system load, as demonstrated by a multi-hour test, at the time of summer peak demand (period of May 1 through October 31). This output reflects a reduction in capacity due to electricity use for station service or auxiliaries.

Neutral Zone: A 6,200 square-mile area shared equally between Kuwait and Saudi Arabia under a 1992 agreement.

Nitrogen Oxides (No_x): Compounds of nitrogen and oxygen produced by the burning of fossil fuels.

Nominal Dollars: A measure used to express nominal price.

Nominal Price: The price paid for a product or service at the time of the transaction. Nominal prices are those that have not been adjusted to remove the effect of changes in the purchasing power of the dollar; they reflect buying power in the year in which the transaction occurred.

Noncoincidental Peak Load: The sum of two or more peak loads on individual systems that do not occur in the same time interval. Meaningful only in the context of loads within a limited period of time, such as day, week, month, a heating or cooling season, and usually for not more than 1 year.

Nonhydrocarbon Gases: Typical nonhydrocarbon gases that may be present in reservoir natural gas, such as carbon dioxide, helium, hydrogen sulfide, and nitrogen.

Nontraceables: Energy companies' revenues, costs, assays, and liabilities that cannot be directly attributed to a type of business by use of a reasonable allocation method developed on the basis of operating-level utilities.

Nonutility Power Producer: A corporation, person, agency, authority, or other legal entity or instrumentality that owns or operates facilities for electric generation and is not an electric utility. Nonutility power producers include qualifying cogenerators, qualifying small power producers, and other nonutility generators (including independent power producers). Nonutility

power producers are without a designated franchised service area and do not file forms listed in the Code of Federal Regulations, Title 18, Part 141.

North American Electric Reliability Council (NERC): A council formed in 1968 by the electric utility industry to promote the reliability and adequacy of bulk power supply in the electric utility systems of North America. NERC consists of regional reliability councils and encompasses essentially all the power regions of the contiguous United States, Canada, and Mexico. See the various NERC Regional Reliability Councils at <http://www.eia.doe.gov/neic/pubstyle/nerc.htm>.

North American Industry Classification System (NAICS): A coding system developed jointly by the United States, Canada, and Mexico to classify businesses and industries according to the type of economic activity in which they are engaged. NAICS replaces the Standard Industrial Classification (SIC) codes.

Nuclear Electric Power (nuclear power): Electricity generated by the use of the thermal energy released from the fission of nuclear fuel in a reactor.

OECD: See **Organization for Economic Cooperation and Development**.

Offshore: That geographic area that lies seaward of the coastline. In general, the coastline is the line of ordinary low water along with that portion of the coast that is in direct contact with the open sea or the line marking the seaward limit of inland water. If a state agency uses a different basis for classifying onshore and offshore areas, the state classification is used (e.g., Cook Inlet in Alaska is classified as offshore; for Louisiana, the coastline is defined as the Chapman Line, as modified by subsequent adjudication).

Oil: See **Crude Oil**.

Oil Well: A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

Operable Nuclear Unit: In the United States, a nuclear generating unit that has completed low-power testing and is in possession of a full-power operating license issued by the Nuclear Regulatory Commission.

Operable Refineries: Refineries that were in one of the following three categories at the beginning of a given year: in operation; not in operation and not under active repair, but capable of being placed into operation within 30 days; or not in operation, but under active repair that could be completed within 90 days.

Operating Income: Operating revenues less operating expenses. Excludes items of other revenue and expense, such as equity in earnings of unconsolidated affiliates, dividends, interest income and expense, income taxes, extraordinary items, and cumulative effect of accounting changes.

Organization for Economic Cooperation and Development (OECD): An international organization helping governments tackle the economic, social and governance challenges of a globalized economy. Its membership comprises about 30 member countries. With active relationships with some 70 other countries, NGOs and civil society, it has a global reach. For details about the organization, see <http://www.oecd.org>.

Organization of Petroleum Exporting Countries (OPEC): Countries that have organized for the purpose of negotiating with oil companies on matters of oil production, prices, and future concession rights. Current members (as of the date of writing this definition) are Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. See OPEC's site at <http://www.opec.org> for more information.

Other Hydrocarbons: Materials received by a refinery and consumed as a raw material. Includes hydrogen, coal tar derivatives, gilsonite, and natural gas received by the refinery for reforming into hydrogen. Natural gas to be used as fuel is excluded.

Oxygenated Motor Gasoline: See **Motor Gasoline, Oxygenated**.

Oxygenates: Substances which, when added to motor gasoline, increase the amount of oxygen in that gasoline blend. Ethanol, methyl tertiary butyl ether (MTBE), ethyl tertiary butyl ether (ETBE), and methanol are common oxygenates. See **Motor Gasoline, Oxygenated**.

Ozone: A molecule made up of three atoms of oxygen. Occurs naturally in the stratosphere and provides a protective layer shielding the Earth from harmful ultraviolet radiation. In the troposphere, it is a chemical oxidant, a greenhouse gas, and a major component of photochemical smog.

Particulate Collectors: Equipment used to remove fly ash from the combustion gases of a boiler plant before discharge to the atmosphere. Particulate collectors include electrostatic precipitators, mechanical collectors (cyclones, fabric filters [baghouses]), and wet scrubbers.

Pentanes Plus: A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. Includes isopentane, natural gasoline, and plant condensate.

Perfluorocarbons (PFCs): A group of man-made chemicals composed of one or two carbon atoms and four to six fluorine atoms, containing no chlorine. PFCs have no commercial uses and are emitted as a byproduct of aluminum smelting and semiconductor manufacturing. PFCs have very high 100-year Global Warming Potentials and are very long-lived in the atmosphere.

Petrochemical Feedstocks: Chemical feedstocks derived from petroleum principally for the manufacture of chemicals, synthetic rubber, and a variety of plastics.

Petroleum: A broadly defined class of liquid hydrocarbon mixtures. Included are crude oil, lease condensate, unfinished oils, refined products obtained from the processing of crude oil, and natural gas plant liquids. *Note:* Volumes of finished petroleum products include nonhydrocarbon compounds, such as additives and detergents, after they have been blended into the products.

Petroleum Coke: See **Coke**, **Petroleum**.

Petroleum Consumption: The sum of all refined petroleum products supplied. For each refined petroleum product, the amount supplied is calculated by adding production and imports, then subtracting changes in primary stocks (net withdrawals are a plus quantity and net additions are a minus quantity) and exports.

Petroleum Imports: Imports of petroleum into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

Petroleum Products: Petroleum products are obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Petroleum Products Supplied: An approximate measure of consumption. It measures the disappearance of the products from primary sources, i.e., refineries, blending plants, and bulk terminals. In general, products supplied in any given period are computed as follows: field production, plus imports, plus unaccounted-for crude oil (plus net receipts when calculated on a PAD District basis) minus stock change, minus crude oil losses, minus refinery inputs, and minus exports. See also **Petroleum Consumption**.

Petroleum Stocks, Primary: For individual products, quantities that are held at refineries, in pipelines, and at bulk terminals that have a capacity of 50,000 barrels or more, or that are in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but are included in other oil estimates and total.

Photovoltaic Energy: Direct-current electricity generated from sunlight through solid-state semiconductor devices that have no moving parts.

Photovoltaic Module: An integrated assembly of interconnected photovoltaic cells designed to deliver a selected level of working voltage and current at its output terminals, packaged for protection against environmental degradation, and suited for incorporation in photovoltaic power systems.

Pipeline Fuel: Gas consumed in the operation of pipelines, primarily in compressors.

Pipeline, Natural Gas: A continuous pipe conduit, complete with such equipment as valves, compressor stations, communications systems, and meters, for transporting natural gas and/or supplemental gaseous fuels from one point to another, usually from a point in or beyond the producing field or processing plant to another pipeline or to points of utilization. Also refers to a company operating such facilities.

Pipeline, Petroleum: Crude oil and product pipelines used to transport crude oil and petroleum products, respectively (including interstate, intrastate, and intracompany pipelines), within the 50 states and the District of Columbia.

Plant Condensate: One of the natural gas liquids, mostly pentanes and heavier hydrocarbons, recovered and separated as liquids at gas inlet separators or scrubbers in processing plants.

Process Fuel: All energy consumed in the acquisition, processing, and transportation of energy. Quantifiable process fuel includes three categories: natural gas lease and plant operations, natural gas pipeline operations, and oil refinery operations.

Processing Gain: The volumetric amount by which total output is greater than input for a given period of time. This difference is due to the processing of crude oil into products which, in total, have a lower specific gravity than the crude oil processed.

Processing Loss: The volumetric amount by which total refinery output is less than input for a given period of time. This difference is due to the processing of crude oil into products which, in total, have a higher specific gravity than the crude oil processed.

Processing Plant (Natural Gas): A surface installation designed to separate and recover natural gas liquids from a stream of produced natural gas through the processes of condensation, absorption, refrigeration, or other methods, and to control the quality of natural gas marketed or returned to oil or gas reservoirs for pressure maintenance, repressuring, or cycling.

Propane: A normally gaseous straight-chain hydrocarbon (C_3H_8). It is a colorless paraffinic gas that boils at a temperature of -43.67 degrees Fahrenheit. It is extracted from natural gas or refinery gas streams. It includes all products designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial propane and HD-5 propane.

Propylene: An olefinic hydrocarbon (C_3H_6) recovered from refinery processes or petrochemical processes.

Proved Reserves, Crude Oil: The estimated quantities of all liquids defined as crude oil that geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Proved Reserves, Lease Condensate: The volumes of lease condensate expected to be recovered in future years in conjunction with the production of proved reserves of natural gas based on the recovery efficiency of lease and/or field separation facilities installed.

Proved Reserves, Natural Gas: The estimated quantities of natural gas that analysis of geological and engineering data demonstrates with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Proved Reserves, Natural Gas Liquids: Those volumes of natural gas liquids (including lease condensate) demonstrated with reasonable certainty to be separable in the future from proved natural gas reserves, under existing economic and operating conditions.

Pumped Storage: See **Hydroelectric Pumped Storage**.

Real Price: A price that has been adjusted to remove the effect of changes in the purchasing power of the dollar. Real prices, which are expressed in constant dollars, usually reflect buying power relative to a base year. See **Chained Dollars**.

Refiner Acquisition Cost of Crude Oil: The cost of crude oil to the refiner, including transportation and other fees. The composite cost is the weighted average of domestic and imported crude oil costs. The refiner acquisition cost does not include the cost of crude oil purchased for the Strategic Petroleum Reserve.

Refinery Input: The raw materials and intermediate materials processed at refineries to produce finished petroleum products. They include crude oil, products of natural gas processing plants, unfinished oils, other hydrocarbons and alcohol, motor gasoline and aviation gasoline blending components, and finished petroleum products.

Refinery Output: The total amount of petroleum products produced at a refinery. Includes petroleum consumed by the refinery.

Refinery (Petroleum): An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol.

Renewable Energy: Energy obtained from sources that are essentially inexhaustible (unlike, for example, fossil fuels, which are in finite supply). Renewable sources of energy include conventional hydroelectric power, wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Repressuring: The injection of gas into oil or gas formations to effect greater ultimate recovery.

Residential Sector: An energy-consuming sector that consists of living quarters for private households. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a variety of other appliances. The residential sector excludes institutional living quarters. *Note:* Various EIA programs differ in sectoral coverage. For further explanation see <http://www.eia.doe.gov/neic/datadefinitions/Guideforwebres.htm>.

Residual Fuel Oil: The heavier oils, known as No. 5 and No. 6 fuel oils, that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations. It conforms to ASTM Specifications D396 and D975 and Federal Specification VV-F-815C. No. 5, a residual fuel oil of medium viscosity, is also known as Navy Special and is defined in Military Specification MIL-F-859E, including Amendment 2 (NATO Symbol F-770). It is used in steam-powered vessels in government service and inshore powerplants. No. 6 fuel oil includes Bunker C fuel oil and is used for the production of electric power, space heating, vessel bunkering, and various industrial purposes.

Road Oil: Any heavy petroleum oil, including residual asphaltic oil, used as a dust palliative and surface treatment on roads and highways. It is generally produced in six grades, from 0, the most liquid, to 5, the most viscous.

Rotary Rig: A machine used for drilling wells that employs a rotating tube attached to a bit for boring holes through rock.

Royalty Interest: An interest in a mineral property provided through a royalty contract.

Short Ton (Coal): A unit of weight equal to 2,000 pounds.

Solar Energy: The radiant energy of the sun, which can be converted into other forms of energy, such as heat or electricity.

Solar Thermal Collector: A device designed to receive solar radiation and convert it to thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber, together with appropriate insulation. The heat collected by the solar thermal collector may be used immediately or stored for later use. Solar collectors are used for space heating, domestic hot water heating, and heating swimming pools, hot tubs, or spas.

Space Heating: The use of energy to generate heat for warmth in housing units using space-heating equipment. The equipment could be the main space-heating equipment or secondary space-heating equipment. It does not include the use of energy to operate appliances (such as lights, televisions, and refrigerators) that give off heat as a byproduct.

Special Naphthas: All finished products within the naphtha boiling range that are used as paint thinners, cleaners, or solvents. Those products are refined to a specified flash point. Special naphthas include all commercial hexane and cleaning solvents conforming to ASTM Specifications D1836 and D484, respectively. Naphthas to be blended or marketed as motor gasoline or aviation gasoline or that are to be used as petrochemical and synthetic natural gas (SNG) feedstocks are excluded.

Spent Liquor: The liquid residue left after an industrial process; can be a component of waste materials used as fuel.

Spot Market Price: See **Spot Price**.

Spot Price: The price for a one-time open market transaction for immediate delivery of the specific quantity of product at a specific location where the commodity is purchased “on the spot” at current market rates.

Steam-Electric Power Plant: A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned.

Still Gas (Refinery Gas): Any form or mixture of gases produced in refineries by distillation, cracking, reforming, and other processes. The principal constituents are methane, ethane, ethylene, normal butane, butylene, propane, propylene, etc. Still gas is used as a refinery fuel and a petrochemical feedstock. The conversion factor is 6 million Btus per fuel oil equivalent barrel.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Stocks: Inventories of fuel stored for future use.

Subbituminous Coal: A coal with properties ranging from those of lignite to those of bituminous coal and used primarily as fuel for steam-electric power generation. It may be dull, dark brown to black, soft and crumbly, at the lower end of the range, to bright, jet black, hard, and relatively strong, at the upper end. Subbituminous coal contains 20 to 30 percent inherent moisture by weight. The heat content of subbituminous coal ranges from 17 to 24 million Btu per short ton on a moist, mineral-matter-free basis. The heat content of subbituminous coal consumed in the United States averages 17 to 18 million Btu per short ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter).

Sulfur Dioxide (SO₂): A toxic, irritating, colorless gas soluble in water, alcohol, and ether. Used as a chemical intermediate, in paper pulping and ore refining, and as a solvent.

Sulfur Hexafluoride (SF₆): A colorless gas soluble in alcohol and ether, and slightly less soluble in water. It is used as a dielectric in electronics. It possesses the highest 100-year Global Warming Potential of any gas (23,900).

Supplemental Gaseous Fuels: Any gaseous substance introduced into or commingled with natural gas that increased the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke-oven gas, still gas, manufactured gas, biomass gas, or air or inerts added for Btu stabilization.

Synthetic Natural Gas (SNG): (Also referred to as substitute natural gas) A manufactured product, chemically similar in most respects to natural gas, resulting from the conversion or reforming of petroleum hydrocarbons that may easily be substituted for or interchanged with pipeline-quality natural gas.

Transportation Sector: An energy-consuming sector that consists of all vehicles whose primary purpose is transporting people and/or goods from one physical location to another. Included are automobiles; trucks; buses; motorcycles; trains, subways, and other rail vehicles; aircraft; and ships, barges, and other waterborne vehicles. Vehicles whose primary purpose is not transportation (e.g., construction cranes and bulldozers, farming vehicles, and warehouse tractors and forklifts) are classified in the sector of their primary use. *Note:* Various EIA programs differ in sectoral coverage. For more information see <http://www.eia.doe.gov/neic/datadefinitions/Guideforwebtrans.htm>.

Unaccounted-for Crude Oil: Represents the arithmetic difference between the calculated supply and the calculated disposition of crude oil. The calculated supply is the sum of crude oil production plus imports minus changes in crude oil stocks. The calculated disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

Unaccounted-for Natural Gas: Represents differences between the sum of the components of natural gas supply and the sum of components of natural gas disposition. These differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperatures and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar-period time frames; and imbalances resulting from the merger of data reporting systems that vary in scope, format, definitions, and type of respondents.

Underground Gas Storage: The use of sub-surface facilities for storing gas that has been transferred from its original location. The facilities are usually hollowed-out salt domes, geological reservoirs (depleted oil or gas fields) or water-bearing sands topped by an impermeable cap rock (aquifer).

Undiscovered Recoverable Reserves (Crude Oil and Natural Gas): Those economic resources of crude oil and natural gas, yet undiscovered, that are estimated to exist in favorable geologic settings.

Unfinished Oils: All oils requiring further processing, except those requiring only mechanical blending. Unfinished oils are produced by partial refining of crude oil and include naphthas and lighter oils, kerosene and light gas oils, heavy gas oils, and residuum.

Unfractionated Streams: Mixtures of unsegregated natural gas liquid components, excluding those in plant condensate. This product is extracted from natural gas.

United States: The 50 States and the District of Columbia. *Note:* The United States has varying degrees of jurisdiction over a number of territories and other political entities outside the 50 States and the District of Columbia, including Puerto Rico, the U.S. Virgin Islands, Guam, American Samoa, Johnston Atoll, Midway Islands, Wake Island, and the Northern Mariana Islands. EIA data programs may include data from some or all of these areas in U.S. Totals. For these programs, data products will contain notes explaining the extent of geographic coverage included under the term "United States."

Uranium: A heavy, naturally radioactive, metallic element (atomic number 92). Its two principally occurring isotopes are uranium-235 and uranium-238. Uranium-235 is indispensable to the nuclear industry because it is the only isotope existing in nature, to any appreciable extent, that is fissionable by thermal neutrons. Uranium-238 is also important because it absorbs neutrons to produce a radioactive isotope that subsequently decays to the isotope plutonium-239, which also is fissionable by thermal neutrons.

Uranium Concentrate: A yellow or brown powder obtained by the milling of uranium ore, processing of in situ leach mining solutions, or as a by-product of phosphoric acid production.

Uranium Ore: Rock containing uranium mineralization in concentrations that can be mined economically, typically one to four pounds of U_3O_8 per ton or 0.05 percent to 0.2 percent U_3O_8 .

Uranium oxide: Uranium concentrate or yellowcake. Abbreviated as U_3O_8 .

Uranium Resource Categories: Three categories of uranium resources defined by the international community to reflect differing levels of confidence in the existence of the resources. Reasonably assured resources (RAR), estimated additional resources (EAR), and speculative resources (SR) are described below.

Reasonably assured resources (RAR): Uranium that occurs in known mineral deposits of such size, grade, and configuration that it could be recovered within the given production cost ranges, with currently proven mining and processing technology. Estimates of tonnage and grade are based on specific sample data and measurements of the deposits and on knowledge of deposit characteristics. *Note:* RAR corresponds to DOE's uranium reserves category.

Estimated additional resources (EAR): Uranium in addition to RAR that is expected to occur, mostly on the basis of geological evidence, in extensions of well-explored deposits, in little-explored deposits, and in undiscovered deposits believed to exist along well-defined geological trends with known deposits. This uranium can subsequently be recovered within the given cost ranges. Estimates of tonnage and grade are based on available sampling data and on knowledge of the deposit characteristics, as determined in the best-known parts of the deposit or in similar deposits. *Note:* EAR corresponds to DOE's probable potential resources category.

Speculative resources (SR): Uranium in addition to EAR that is thought to exist, mostly on the basis of indirect evidence and geological extrapolations, in deposits discoverable with existing exploration techniques. The location of deposits in this category can generally be specified only as being somewhere within given regions or geological trends. The estimates in this category are less reliable than estimates of RAR and EAR. *Note:* SR corresponds to the combination of DOE's possible potential resources and speculative potential resources categories.

Useful Thermal Output: The thermal energy made available in a combined-heat-and-power system for use in any industrial or commercial process, heating or cooling application, or delivered to other end users, i.e., total thermal energy made available for processes and applications other than electrical generation.

U.S.S.R.: The Union of Soviet Socialist Republics consisted of 15 constituent republics: Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. As a political entity, the U.S.S.R. ceased to exist as of December 31, 1991.

Vented Natural Gas: Gas released into the air on the production site or at processing plants.

Vessel Bunkering: Includes sales for the fueling of commercial or private boats, such as pleasure craft, fishing boats, tugboats, and ocean-going vessels, including vessels operated by oil companies. Excluded are volumes sold to the U.S. Armed Forces.

Waste Energy: Municipal solid waste, landfill gas, methane, digester gas, liquid acetonitrile waste, tall oil, waste alcohol, medical waste, paper pellets, sludge waste, solid byproducts, tires, agricultural byproducts, closed loop biomass, fish oil, and straw used as fuel.

Waxes: Solid or semi-solid materials derived from petroleum distillates or residues by such treatments as chilling, precipitating with a solvent, or de-oiling. It is a light-colored, more-or-less translucent crystalline mass, slightly greasy to the touch, consisting of a mixture of solid hydrocarbons in which the paraffin series predominates. Includes all marketable wax, whether crude scale or fully refined. The three grades included are microcrystalline, crystalline-fully refined, and crystalline-other. The conversion factor is 280 pounds per 42 U.S. gallons per barrel.

Well: A hole drilled in the Earth for the purpose of (1) finding or producing crude oil or natural gas; or (2) producing services related to the production of crude or natural gas.

Wellhead: The point at which the crude (and/or natural gas) exits the ground. Following historical precedent, the volume and price for crude oil production are labeled as "wellhead," even though the cost and volume are

now generally measured at the lease boundary. In the context of domestic crude price data, the term "wellhead" is the generic term used to reference the production site or lease property.

Wellhead price: The value of crude oil or natural gas at the mouth of the well. See **Natural Gas Wellhead Price**.

Well Servicing Unit: Truck-mounted equipment generally used for downhole services after a well is drilled. Services include well completions and recompletions, maintenance, repairs, workovers, and well plugging and abandonments. Jobs range from minor operations, such as pulling the rods and rod pumps out of an oil well, to major workovers, such as milling out and repairing collapsed casing. Well depth and characteristics determine the type of equipment used.

Western Europe: Includes Austria, Belgium, Bosnia and Herzegovina, Croatia, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Macedonia (The Former Yugoslav Republic of), Malta, Netherlands, Norway, Portugal, Serbia and Montenegro, Slovenia, Spain, Sweden, Switzerland, Turkey, and the United Kingdom.

Wind Energy: Energy present in wind motion that can be converted to mechanical energy for driving pumps, mills, and electric power generators. Wind pushes against sails, vanes, or blades radiating from a central rotating shaft.

Wood Energy: Wood and wood products used as fuel, including round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

Working Gas: The volume of gas in the reservoir that is in addition to the cushion or base gas. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any season.

Integrated Historical Energy Data Sources ...from the Energy Information Administration

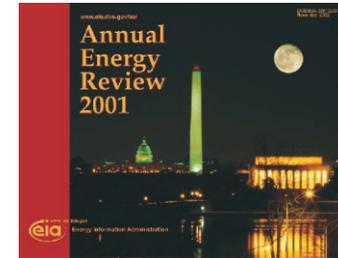

Monthly Energy Review

Current monthly data on production, consumption, stocks, trade, and prices of the principal energy commodities in the United States. Also available in print.

<http://eia.doe.gov/mer/>

Annual Energy Review

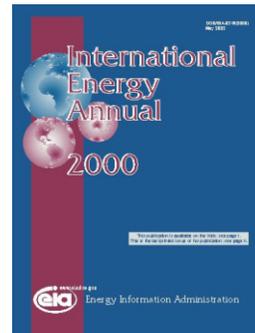

Long-term historical annual data on U.S. energy production, consumption, stocks, trade, and prices. Most series begin in 1949. Also available in print.

<http://eia.doe.gov/aer/>

International Energy Annual

Annual data for production, consumption, and trade of primary energy commodities in more than 220 countries, dependencies, and areas of special sovereignty. Also included are prices of crude oil and petroleum products in selected countries.

<http://eia.doe.gov/iea/>

State Energy Data

Annual energy consumption, price, and expenditure estimates at the State and national levels by energy source and by major sector (residential, commercial, industrial, transportation, and electric utilities). Consumption data begin with 1960; price and expenditure data begin with 1970.
