

TABLE 4.5.2b SOUTHEAST REGION FISH BYCATCH BY STOCKS AND SPECIES (2012) Species bycatch ratio = total regional bycatch of a species / (total regional landings of the species + total regional bycatch of the species). Landings data were not available at the stock level. In addition, landings are not available for species groups because it was impossible to determine the exact composition of the bycatch group and the proportions of bycatch and landings to allocate to each species. Some bycatch ratios (marked **) could not be developed, e.g., where bycatch was by weight and numbers of individuals, and landings were in pounds. Bycatch ratio cells are left blank when landings = 0.
