TABLE 5.5.3b ALASKA REGION FISH BYCATCH BY STOCKS AND SPECIES (2013) Species bycatch ratio = total regional bycatch of a species / (total regional landings of the species + total regional bycatch of the species). Landings data were not available at the stock level. Bycatch ratio cells are left blank when landings = 0.

## FOOTNOTES:

- a Landings of this species are prohibited in the federal groundfish fisheries.
- b Greenland halibut (Reinhardtius hippoglossoides) is also commonly called Greenland turbot and this is the market name and fishery name for this species in Alaska.
- c Species is not landed in the federal groundfish fisheries (forage/non-target species).
- d Flathead sole as currently managed by the North Pacific Fishery Management Council in the BSAI represents a two-species complex consisting of true flathead sole (*Hippoglossoides elassodon*) and its morphologically-similar congener Bering flounder (*H. robustus*).

  f Prior to the 2012/2013 groundfish harvest specifications, dusky rockfish were managed as part of the Gulf of Alaska pelagic shelf rockfish complex with widow and yellowtail rockfish. In the 2012/2013 groundfish harvest specifications, widow and yellowtail rockfish were removed from the complex and included with the 'other rockfish' species group. Dusky rockfish were managed as a separate, individual species.
- g Landings of this species are prohibited in the federal groundfish fisheries. Prior to 2013, bycatch values reflected prohibited species catch. As of 2013, bycatch values also include discards in the directed halibut fishery. Regulations require halibut less than 32 inches in length be discarded in the directed halibut fishery.
