Outline

- GOES-R Proving Ground Overview (PG)
- Samples of GOES-R Proxy Products in the PG
- User Input from PG Demonstrations at HWT, NHC, and AWC
- Training
- What's Happening in 2014 and Beyond?
- Summary

GOES-R Proving Ground

– What is the GOES-R Proving Ground?

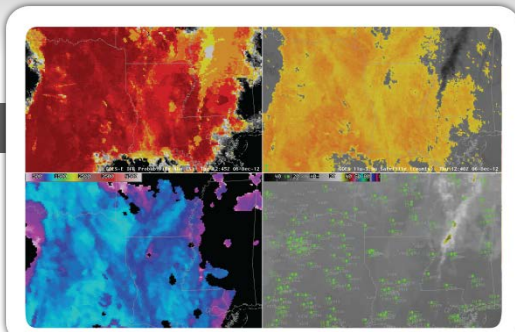

- Collaborative effort between the GOES-R Program Office, selected NOAA/ NASA Cooperative Institutes, NWS forecast offices, NCEP National Centers, JCSDA, and NOAA Testbeds.
- Where proxy and simulated GOES-R products are tested, evaluated and integrated into operations before the GOES-R launch
- A key element of GOES-R User Readiness (Risk Mitigation)

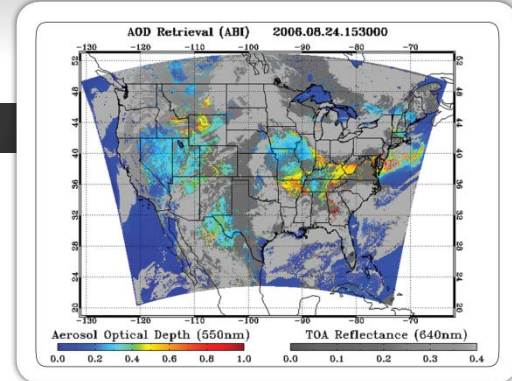

The GOES-R Proving Ground

■ **Aviation Weather Center (AWC) – Kansas City, MO**
IR Imagery of Oceanic Storms

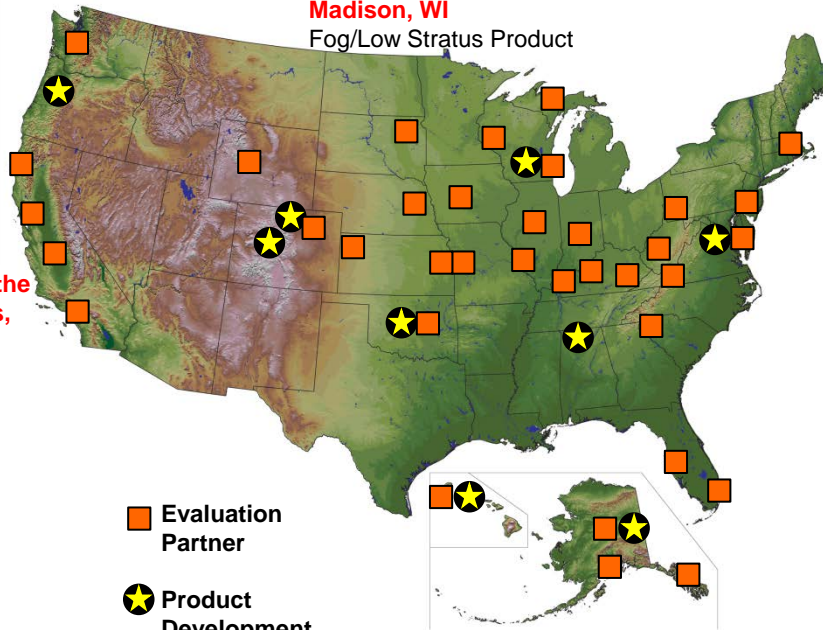

★ **Cooperative Institute for Meteorological Satellite Studies (CIMSS)/Center for Satellite Applications and Research (STAR) – Madison, WI**
Fog/Low Stratus Product

★ **STAR/University of Maryland Baltimore County (UMBC) – College Park, MD**

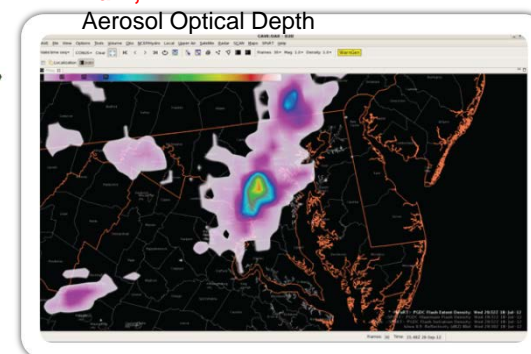

★ **Cooperative Institute for Research in the Atmosphere (CIARA)/STAR – Ft. Collins, CO**
ABI Synthetic Low Cloud Enhancement Imagery

■ Evaluation Partner

★ Product Development Partner

★ **Short-term Prediction Research and Transition Center (SPoRT)/NASA – Huntsville, AL**

■ **Storm Prediction Center (SPC) – Norman, OK**

■ **National Hurricane Center (NHC) – Miami, FL**
RGB Air Mass for Hurricane Sandy

11 AM CDT (16 UTC)

1 PM CDT (18 UTC)

GOES-R NearCast – 0-6 h Forecasts

1500 UTC NearCast Forecasts Valid Between 1500-2100 UTC on 20 May 2013

NearCast Upper-Level Theta-E

NearCast Low-Level Theta-E

NearCast Mid-Low Theta-E Difference

- Upper and Low-Level Theta-E Difference \rightarrow 500-780-hPa Convective Instability
- Cool and dry air progressing east above a northward surge of low-level warm and moist air.
- This results in a destabilization of the region to the east of the cold front and dryline.

A Lagrangian transport model of upper and lower-level moisture observations from the GOES Sounder is used to make short-term predictions of convective instability.

GOES-R CI (Probability Cloud Object Reaching 35 dBZ)

GOES-13 Visible valid 20 May 2013 at 1725 UTC

Determining which portion of a cumulus field will develop can be challenging.

GOES-R CI (Probability Cloud Object Reaching 35 dBZ)

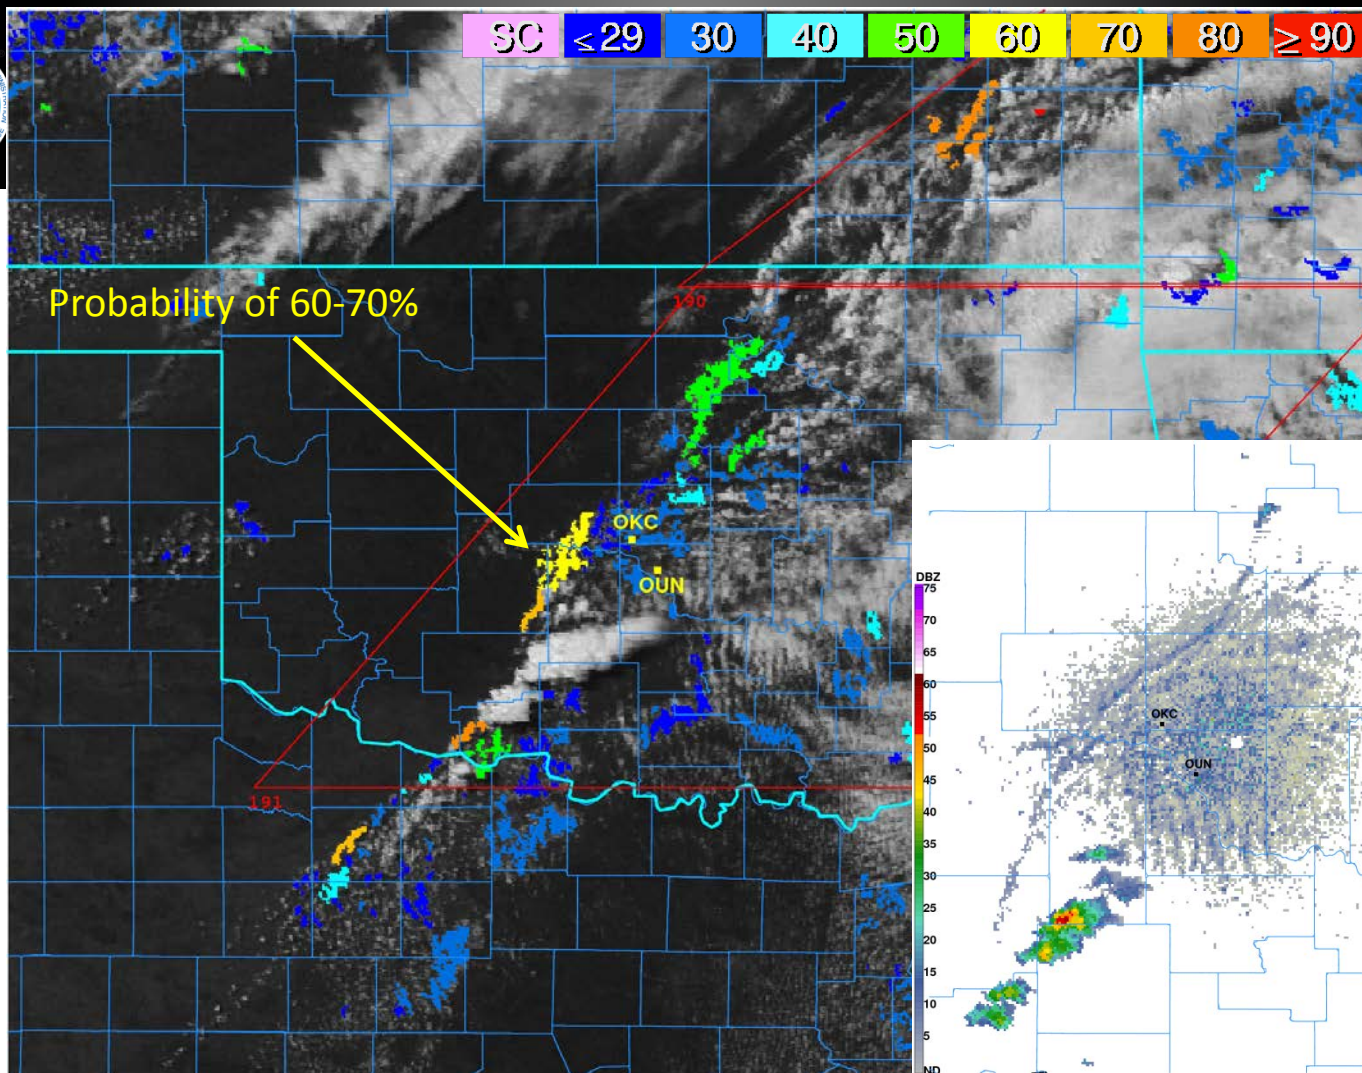

GOES-R CI (%) and GOES-13 Visible valid 20 May 2013 at 1732 UTC

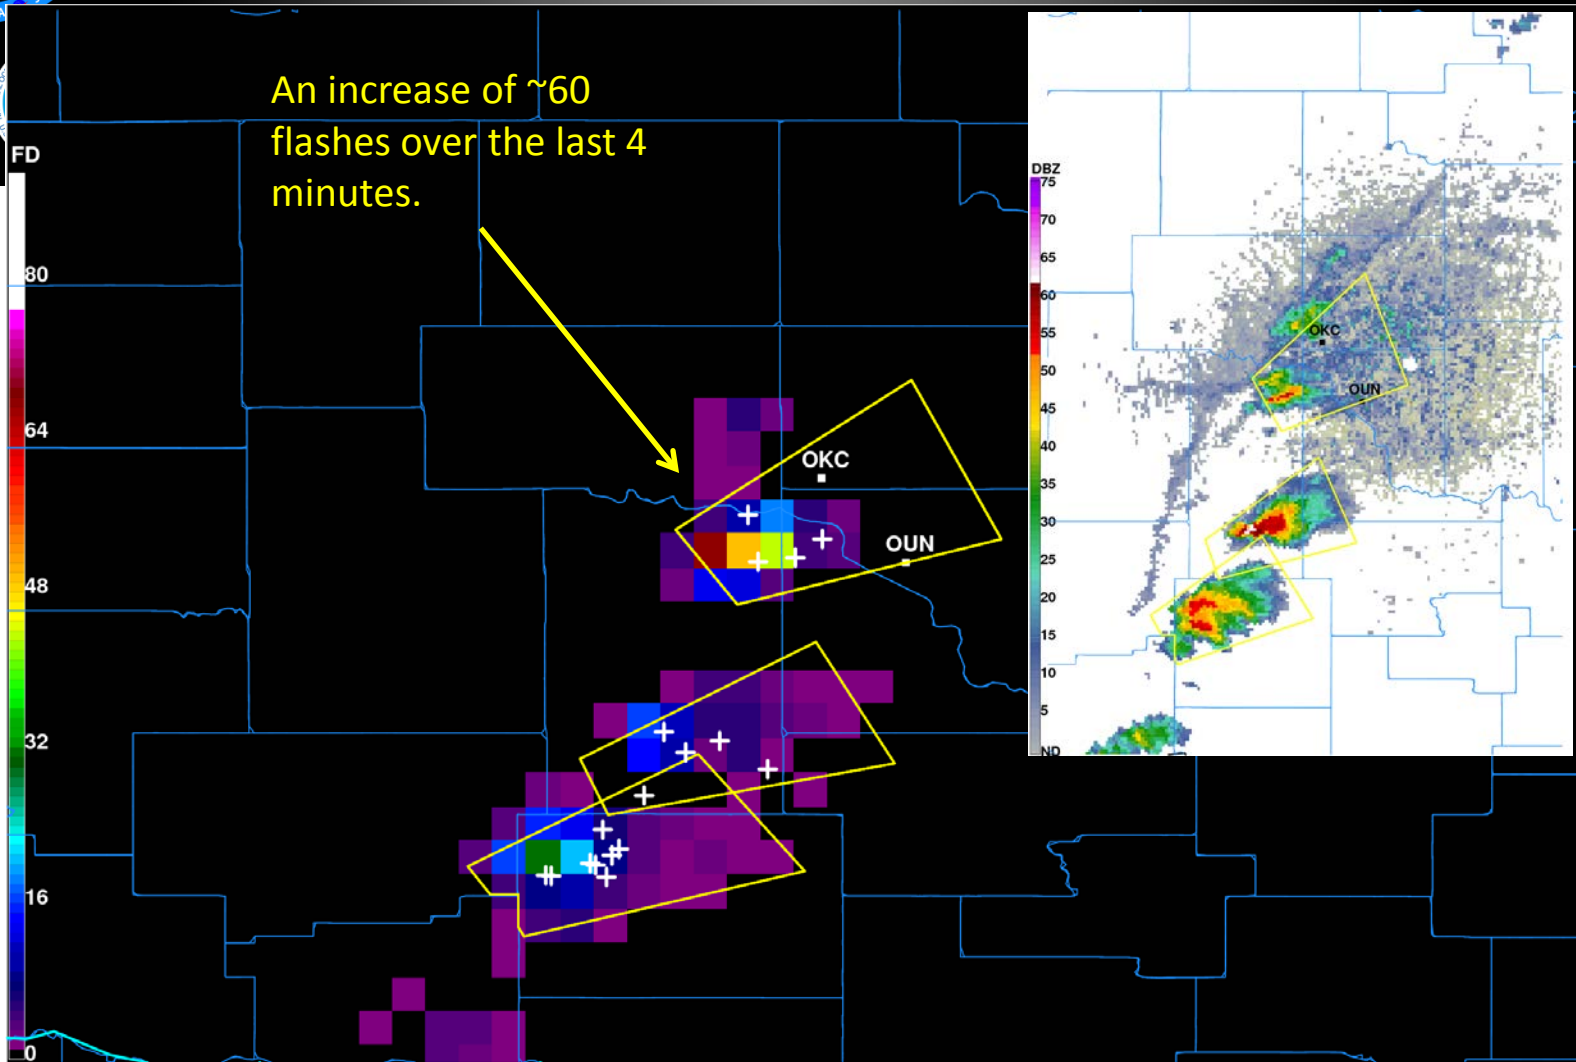

GOES-R CI (Probability Cloud Object Reaching 35 dBZ)

GOES-R CI (%) and GOES-13 Visible valid 20 May 2013 at 1832 UTC
 TLX 1km Base Reflectivity valid 20 May 2013 at 1836 UTC

GOES-R Pseudo Geostationary Lightning Mapper

GOES-R Pseudo GLM Flash Extent Density and 2-min NLDN CG valid 20 May 2013 at 1912 UTC
 TLX 1km Base Reflectivity valid 20 May 2013 at 1912 UTC

Lightning jumps are indicative of a strengthening updraft and often precede severe weather.

CI Probability (%) / 'SC' -> Snow Cover

1745 UTC 2013/05/20

Some Feedback Gathered EWP

- In answer to question “if you could have only one product which would it be?”
 - All products mentioned: CI, Nearcast, CTC, Simulated imagery, PGLM, and RGB
- “The product that stood out for me was the WRF simulated IR imagery....great way to see how the models are doing”
- “CTC is useful. 18 deg. per 15 min gave 1 hr lead time for large hail.”
- PGLM: “biggest benefit is where lightning itself is the main concern (large outdoor events)”. “For warning decisions, could be good for marginal airmass type storms.”
- “Love the theta E difference on Nearcast”

Some Feedback Gathered EWP

- Thursday: CTC working from GOES-15. Initial CTC worked really well over TX panhandle then struggled. Overall larger cooling rates differentiated cells that would blossom from those that would not.
- There was at least one lightning jump with storm over panhandle that produced a brief tornado.
- Nearcast showed lots of instability in TX where storms formed.

Proving Ground Forecaster Feedback

- **“The total lightning data is an excellent tool for monitoring convection...”**
- **“I utilized it as a situational awareness product ...the data gave me more confidence in my warning.”**

“We saw several instances where the total lightning was picking up on storms before the AWIPS lightning [NLDN] program picked up on them. One could see the utility of this in the future, bringing with it a potential for lightning statements and potentially lightning based warnings.”

-Pat Spoden (SOO, NWSFO

The 2013 NHC Proving Ground

- Held from Aug 1-Nov 30, but most products available sooner
- 11 GOES-R products in demo plan
 - Hurricane Intensity Estimate
 - Super Rapid Scan Operations (SRSO) data
 - Tropical Overshooting Tops
 - 7 RGB or multi-spectral color products
 - Rapid Intensification Index with lightning input
- 1 S-NPP Product in demo plan
 - VIIRS Day-Night Band
- Proxy GOES-R ABI data from MSG, current GOES
- Proxy GOES-R GLM data from ground-based WWLLN

2013 NHC Proving Ground Highlights

- Very quiet season in Atlantic, East Pacific also quiet
 - *No Atlantic Rapid Intensification cases, no major hurricanes*
 - *Only one major hurricane in the East Pacific*
- No SRSO cases from GOES-14 due to slow season
- Air Mass and Dust RGBs used often by HSU and TAFB
- Considerable feedback on lightning data
 - Useful for continuity during GOES-east outage
 - Large lightning outbreaks for sheared storms
 - Consistent with rapid intensification algorithm
- Hurricane Intensity Estimate higher refresh rate useful during Humberto
- More efficient access to products obtained through new LDM feed to NHC from SPoRT

RGB Air Mass Product from SEVIRI

AWC 2013 demonstration forecaster input

- Simulated Satellite Forecasts.... Most popular product in winter experiment; also popular in summer experiment
- NearCasting: valuable information on both the likelihood of convective initiation and behavior of ongoing convection
- Fog/Low Cloud: demonstrated in the winter experiment.... Useful at the National Aviation Meteorologist (NAM) desk for short range forecasting
- PGLM: most improvement of any product...new LMAs & better display
- Forecasters pleased with SRSO loops... look forward to operational use

Future Capability: Fog Detection

The GOES-R fog detection product will significantly improve geostationary satellite fog monitoring capabilities because:

- **Improved algorithm technology** - the GOES-R algorithm provides quantitative information on fog probability, while heritage GOES fog detection products are more qualitative in nature
- **Improved sensor technology** - the ABI has greatly improved spectral information, spatial resolution, and temporal resolution

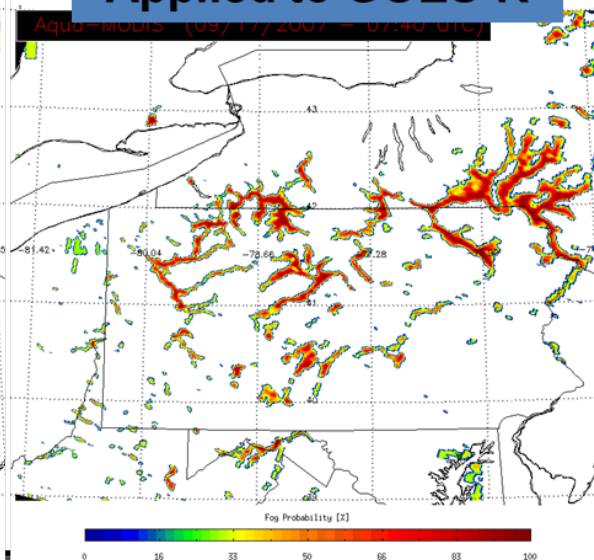

Heritage GOES Fog
Detection

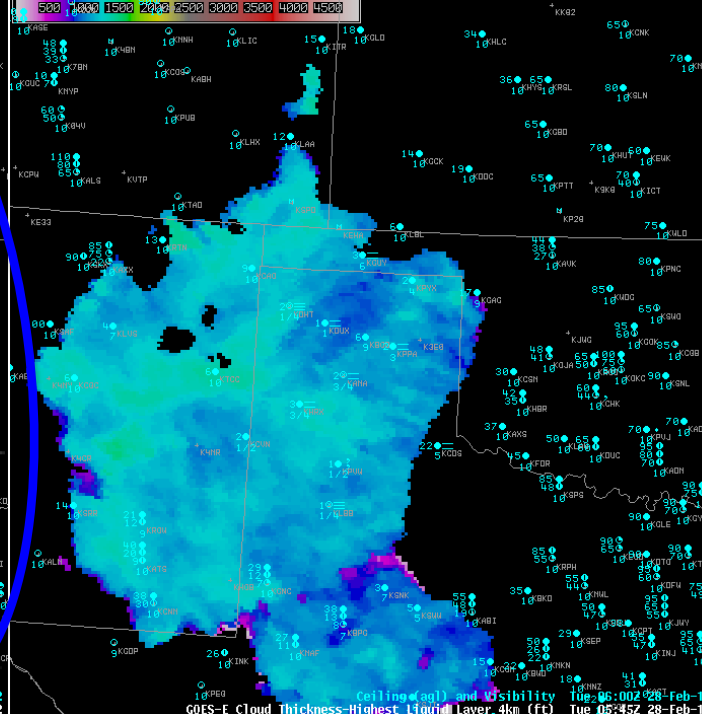

GOES-R Algorithm
Applied to GOES

GOES-R Algorithm
Applied to GOES-R

The majority of the surface stations located where the GOES-R IFR probabilities were elevated (red circle) reported ceilings and/or visibilities the met IFR criteria

None of the surface stations east or northeast of the elevated GOES-R IFR probabilities (blue circle) reported IFR conditions

Product Assessment Highlights

- Fog and low stratus (FLS) products are in process to become operational prior to GOES-R launch
- RGB dust product now used routinely by the Tropical Analysis Forecast Branch (TAFB)
- High Latitude and Arctic Experiment (Alaska Region)
 - Two versions of FLS products available on AWIPS in Alaska
 - MODIS (proxy for GOES-R imagery) used by RFC in Anchorage as input to their hydrological models during spring ice break up
 - GOES-R proxy volcanic ash product picking up cases of re-suspension in addition to new eruptions
- RGB airmass product used in experimental operations at OPC, WPC & SAB
- Simulated satellite forecasts available in experimental ops at AWC

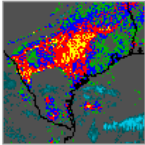

Training and Education

Online Training Modules

- GOES-R: Benefits of Next-Generation Environmental Monitoring (COMET)
- GOES-R 101
- Remote Sensing Using Satellite, 2nd Edition (COMET)
- GOES-R ABI: Next Generation Satellite Imagery (COMET)
- Numerous Microwave modules (COMET)
- GOES Channel Selection v2 (COMET)
- Advanced Satellite Sounding: the Benefits of Hyperspectral observations
- Multispectral Satellite Applications: RGB Products Explained (COMET)
- Coming attractions from COMET:
 - Polar Sat updates on hyperspectral, wildland fires, and VIIRS
 - Nighttime Polar Applications Module
 - Satellite Data Informing NWP
 - Satellite Feature ID: Three Dimensionality of Water Vapor
 - Spanish Translations: 21 modules
 - French Translations: 14 modules

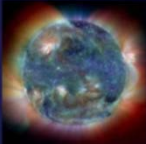

TRAINING

GOES Fog Depth
[Download](#) (for NWS users)
[Launch](#) in browser
[\(user guide\)](#)

This training module focuses on the use of the Fog Depth product within the GOES Aviation suite provided through a collaboration between SpOART and NESDIS. The use of this product along with the Low Cloud Base product is demonstrated in support of aviation forecasts of ceiling and visibility. This module takes 16 minutes to complete and requires the flash plug-in. (May 2008)

GOES-R (Geostationary Operational Environmental Satellite-R Series)

GOES-R Aerosols/Air Quality/Atmospheric Chemistry

June 2010

What Is GOES-R?
 The Geostationary Operational Environmental Satellite - R Series (GOES-R) is the next generation of National Oceanic and Atmospheric Administration (NOAA) geostationary Earth-observing systems. Superior spacecraft and instrument technology will support expanded detection of environmental phenomena, resulting in more timely and accurate forecasts and warnings. The Advanced Baseline Imager (ABI), a sixteen channel imager with two visible channels, four near-infrared channels, and ten infrared channels, will provide three times more spectral information, four times the spatial resolution, and twice the temporal coverage than the current system. Other advanced instruments will include total lightning detection (in-cloud and cloud-to-ground flashes) and mapping from the Geostationary

NOAA profiles of nitrogen that are precursors to photochemical smog emissions derived from GOES-R observations for July 2008 (observations for July 2008) and forest fires in California. The map shows the spatial distribution of nitrogen dioxide (NO₂) in the atmosphere. On certain days in July 2008, NO₂ emissions in northern California were as high as 325 tons daily below 10 km for regions where fires occurred. Emissions less than 40 tons are shown in yellow and emissions greater than 40 tons are red.

Future Plans: 2014 And Beyond

- Continue to apply lessons learned to incorporate new improvements each year. Example:
 - Based on forecaster input, switched to probabilistic CI forecast
- Demonstrate products and decision aids in NOAA Testbeds, NCEP Centers, WFOs, and the NWS Proving Ground at Training Center
- Transition from Warning Related Products to remaining Baseline Products, Day 2 Future Capability, fused products, Decision Aids, Decision Support Services
- Continue to develop, demonstrate, and test as part of decision support services
- Use Himawari as a source of ABI proxy data
- Enhanced JPSS, international, and broadcaster community collaboration

Summary

- GOES-R Proving Ground provides mechanism to:
 - Involve CIs, AWG, National Centers, NOAA Testbeds and WFOs in user readiness
 - Get prototype GOES-R products in hands of forecasters
 - Keep lines of communication open between developers and forecasters
 - Allow end user to have say in final product, how it is displayed and integrated into operations
- With adjustments based on user feedback...Proving Ground continues to grow and plans are in place for 2014 and beyond.
- For GOES-R to be a success, forecasters must be able to use GOES-R products on Day 1!

Thank you!
